

**EXHIBIT JJN-1**

## What is an IP Address – Definition and Explanation

### IP address definition

An IP address is a unique address that identifies a device on the internet or a local network. IP stands for "Internet Protocol," which is the set of rules governing the format of data sent via the internet or local network.

In essence, IP addresses are the identifier that allows information to be sent between devices on a network: they contain location information and make devices accessible for communication. The internet needs a way to differentiate between different computers, routers, and websites. IP addresses provide a way of doing so and form an essential part of how the internet works.

## What is an IP Address?

An IP address is a string of numbers separated by periods. IP addresses are expressed as a set of four numbers — an example address might be 192.158.1.38. Each number in the set can range from 0 to 255. So, the full IP addressing range goes from 0.0.0.0 to 255.255.255.255.

IP addresses are not random. They are mathematically produced and allocated by the [Internet Assigned Numbers Authority \(IANA\)](#), a division of the [Internet Corporation for Assigned Names and Numbers \(ICANN\)](#). ICANN is a non-profit organization that was established in the United States in 1998 to help maintain the security of the internet and allow it to be usable by all. Each time anyone registers a domain on the internet, they go through a domain name registrar, who pays a small fee to ICANN to register the domain.

Watch this video to learn what IP address is, why IP address is important and how to protect it from hackers:

## How do IP addresses work

If you want to understand why a particular device is not connecting in the way you would expect or you want to troubleshoot why your network may not be working, it helps understand how IP addresses work.

Internet Protocol works the same way as any other language, by communicating using set guidelines to pass information. All devices find, send, and exchange information with other connected devices using this protocol. By speaking the same language, any computer in any location can talk to one another.

The use of IP addresses typically happens behind the scenes. The process works like this:

1. Your device indirectly connects to the internet by connecting at first to a network connected to the internet, which then grants your device access to the internet.
2. When you are at home, that network will probably be your Internet Service Provider (ISP). At work, it will be your company network.
3. Your IP address is assigned to your device by your ISP.
4. Your internet activity goes through the ISP, and they route it back to you, using your IP address. Since they are giving you access to the internet, it is their role to assign an IP address to your device.
5. However, your IP address can change. For example, turning your modem or router on or off can change it. Or you can contact your ISP, and they can change it for you.
6. When you are out and about – for example, traveling – and you take your device with you, your home IP address does not come with you. This is because you will be using another network (Wi-Fi at a hotel, airport, or coffee shop, etc.) to access the internet and

As the process implies, there are different types of IP addresses, which we explore below.

## Types of IP addresses

There are different categories of IP addresses, and within each category, different types.

### Consumer IP addresses

Every individual or business with an internet service plan will have two types of IP addresses: their private IP addresses and their public IP address. The terms public and private relate to the network location — that is, a private IP address is used inside a network, while a public one is used outside a network.

### Private IP addresses

Every device that connects to your internet network has a private IP address. This includes computers, smartphones, and tablets but also any Bluetooth-enabled devices like speakers, printers, or smart TVs. With the growing [internet of things](#), the number of private IP addresses you have at home is probably growing. Your router needs a way to identify these items separately, and many items need a way to recognize each other. Therefore, your router generates private IP addresses that are unique identifiers for each device that differentiate them on the network.

### Public IP addresses

A public IP address is the primary address associated with your whole network. While each connected device has its own IP address, they are also included within the main IP address for your network. As described above, your public IP address is provided to your router by your ISP. Typically, ISPs have a large pool of IP addresses that they distribute to their customers. Your public IP address is the address that all the devices outside your internet network will use to recognize your network.

### Public IP addresses

Public IP addresses come in two forms – dynamic and static.

### Dynamic IP addresses

Dynamic IP addresses change automatically and regularly. ISPs buy a large pool of IP addresses and assign them automatically to their customers. Periodically, they re-assign them and put the older IP addresses back into the pool to be used for other customers. The

establish a customer's IP address if they move home, for example. There are security benefits, too, because a changing IP address makes it harder for criminals to hack into your network interface.

## Static IP addresses

In contrast to dynamic IP addresses, static addresses remain consistent. Once the network assigns an IP address, it remains the same. Most individuals and businesses do not need a static IP address, but for businesses that plan to host their own server, it is crucial to have one. This is because a static IP address ensures that websites and email addresses tied to it will have a consistent IP address – vital if you want other devices to be able to find them consistently on the web.

This leads to the next point – which is the two types of website IP addresses.

### There are two types of website IP addresses

For website owners who don't host their own server, and instead rely on a web hosting package – which is the case for most websites – there are two types of website IP addresses. These are shared and dedicated.

### Shared IP addresses

Websites that rely on shared hosting plans from web hosting providers will typically be one of many websites hosted on the same server. This tends to be the case for individual websites or SME websites, where traffic volumes are manageable, and the sites themselves are limited in terms of the number of pages, etc. Websites hosted in this way will have shared IP addresses.

### Dedicated IP addresses

Some web hosting plans have the option to purchase a dedicated IP address (or addresses). This can make obtaining an SSL certificate easier and allows you to run your own File Transfer Protocol (FTP) server. This makes it easier to share and transfer files with multiple people within an organization and allow anonymous FTP sharing options. A dedicated IP address also allows you to access your website using the IP address alone rather than the domain name – useful if you want to build and test it before registering your domain.

## How to look up IP addresses

The simplest way to check your router's public IP address is to search "What is my IP address?" on Google. Google will show you the answer at the top of the page.

information. The site [IPLocation](#) goes further by showing the name of your ISP and your city.

Generally, you will only receive an approximation of location using this technique — where the provider is, but not the actual device location. If you are doing this, remember to log out of your VPN too. Obtaining the actual physical location address for the public IP address usually requires a search warrant to be submitted to the ISP.

Finding your private IP address varies by platform:

### **In Windows:**

- Use the command prompt.
- Search for "cmd" (without the quotes) using Windows search
- In the resulting pop-up box, type "ipconfig" (no quote marks) to find the information.

### **On a Mac:**

- Go to System Preferences
- Select network – and the information should be visible.

### **On an iPhone:**

- Go to Settings
- Select Wi-Fi and click the "i" in a circle (i) next to the network you are on – the IP address should be visible under the DHCP tab.

If you need to check the IP addresses of other devices on your network, go into the router. How you access the router depends on the brand and the software it uses. Generally, you should be able to type the router's gateway IP address into a web browser on the same network to access it. From there, you will need to navigate to something like "attached devices," which should display a list of all the devices currently or recently attached to the network — including their IP addresses.

## **IP address security threats**

Cybercriminals can use various techniques to obtain your IP address. Two of the most common are social engineering and online stalking.

Attackers can use social engineering to deceive you into revealing your IP address. For example, they can find you through Skype or a similar instant messaging application, which uses IP addresses to communicate. If you chat with strangers using these apps, it is

## Online stalking

Criminals can track down your IP address by merely stalking your online activity. Any number of online activities can reveal your IP address, from playing video games to commenting on websites and forums.

Once they have your IP address, attackers can go to an IP address tracking website, such as [whatismyipaddress.com](https://whatismyipaddress.com), type it in, and then get an idea of your location. They can then cross-reference other open-source data if they want to validate whether the IP address is associated with you specifically. They can then use LinkedIn, Facebook, or other social networks that show where you live, and then see if that matches the area given.

If a Facebook stalker uses a [phishing](#) attack against people with your name to install spying [malware](#), the IP address associated with your system would likely confirm your identity to the stalker.

If cybercriminals know your IP address, they can launch attacks against you or even impersonate you. It is important to be aware of the risks and how to mitigate them. Risks include:

## Downloading illegal content using your IP address

Hackers are known to use hacked IP addresses to download illegal content and anything else they do not want to be traced back to them. For example, using the identity of your IP address, criminals could download pirated movies, music, and video – which would breach your ISP's terms of use – and much more seriously, content related to terrorism or child pornography. This could mean that you – through no fault of your own – could attract the attention of law enforcement.

## Tracking down your location

If they know your IP address, hackers can use geolocation technology to identify your region, city, and state. They only need to do a little more digging on social media to identify your home and potentially burgle it when they know you are away.

## Directly attacking your network

Criminals can directly target your network and launch a variety of assaults. One of the most popular is a [DDoS attack](#) (distributed denial-of-service). This type of cyberattack occurs when hackers use previously infected machines to generate a high volume of requests to flood the targeted system or server. This creates too much traffic for the server to handle, resulting in a disruption of services. Essentially, it shuts down your internet. While this attack

this, as their screen is visible while streaming (on which an IP address can be discovered).

### Hacking into your device

The internet uses ports as well as your IP address to connect. There are thousands of ports for every IP address, and a hacker who knows your IP can try those ports to attempt to force a connection. For example, they could take over your phone and steal your information. If a criminal does obtain access to your device, they could install malware on it.

## How to protect and hide your IP address

Hiding your IP address is a way to protect your personal information and online identity. The two primary ways to hide your IP address are:

1. Using a proxy server
2. Using a virtual private network (VPN)

A proxy server is an intermediary server through which your traffic is routed:

- When those servers send information back to you, it goes to the proxy server, which then routes it to you.

A drawback of proxy servers is that some of the services can spy on you — so you need to trust it. Depending on which one you use, they can also insert ads into your browser.

VPN offers a better solution:

- When you connect your computer – or smartphone or tablet – to a VPN, the device acts as if it is on the same local network as the VPN.
- All your network traffic is sent over a secure connection to the VPN.
- Because your computer behaves as if it is on the network, you can securely access local network resources even when you are in another country.
- You can also use the internet as if you were present at the VPN's location, which has benefits if you are using public Wi-Fi or want to access geo-blocked websites.

[Kaspersky Secure Connection](#) is a VPN that protects you on public Wi-Fi, keeps your communications private, and ensures that you are not exposed to phishing, malware, viruses, and other cyber threats.

## When should you use VPN

Using a VPN hides your IP address and redirects your traffic through a separate server, making it much safer for you online. Situations where you might use a VPN include:

### When using public Wi-Fi

When using a [public Wi-Fi network](#), even one that is password-protected, a VPN is advisable. If a hacker is on the same Wi-Fi network, it is easy for them to snoop on your data. The basic security that the average public Wi-Fi network employs does not provide robust protection from other users on the same network.

Using a VPN will add an extra layer of security to your data, ensuring you bypass the public Wi-Fi's ISP and encrypting all your communication.

### When you are traveling

If you are traveling to a foreign country – for example, China, where sites like Facebook are blocked – a VPN can help you access services that may not be available in that country.

issues. Using a VPN can enable you to use the service as if you were at home. Travelers may also be able to find cheaper airfare when using a VPN, as prices can vary from region to region.

### **When you are working remotely**

This is especially relevant in the post-COVID world, where many [people are working remotely](#). Often employers require the use of a VPN to access company services remotely for security reasons. A VPN that connects to your office's server can give you access to internal company networks and resources when you are not in the office. It can do the same for your home network while you are out and about.

### **When you just want some privacy**

Even in the comfort of your own home, using the internet for everyday purposes, using a VPN can be a good idea. Whenever you access a website, the server you connect to logs your IP address and attaches it to all the other data the site can learn about you: your browsing habits, what you click on, how long you spend looking at a particular page. They can sell this data to advertising companies who use it to tailor ads straight to you. This is why ads on the internet sometimes feel oddly personal: it's because they are. Your IP address can also be used to track your location, even when your location services are turned off. Using a VPN prevents you from leaving footprints on the web.

Don't forget your mobile devices, either. They have IP addresses too, and you probably use them in a wider variety of locations than your home computer, including public Wi-Fi hotspots. [It is advisable to use a VPN on your mobile](#) when connecting to a network you may not fully trust.

## **Other ways to protect your privacy**

### **Change privacy settings on instant messaging applications**

Apps installed on your device are a major source of IP address hacking. Instant messaging and other calling apps can be used as a tool by cybercriminals. Using IM apps only allows direct connections from contacts and doesn't accept calls or messages from people you don't know. Changing your privacy settings makes it harder to find your IP address because people who don't know you cannot connect with you.

### **Create unique passwords**

Your device password is the only barrier that can restrict people from accessing your device. Some people prefer to stick to their devices' default passwords, which makes them

---

case letters, numerals, and characters. This will help to safeguard your device against IP address hacking.

### **Stay alert to phishing emails and malicious content**

A high proportion of malware and device tracking software is installed via phishing emails. When you connect with any site, this provides the site with access to your IP address and device location, making it vulnerable to hacking. Be vigilant when opening emails from unknown senders and avoid clicking on links that could send you to unauthorized sites. Pay close attention to the emails' content, even if they appear to come from well-known sites and legitimate businesses.

### **Use a good antivirus solution and keep it up to date**

Install comprehensive antivirus software and keep it up to date. For example, [Kaspersky's Anti-i-Virus protection](#) guards you from viruses on your PC and Android devices, secures and stores your passwords and private documents, and encrypts the data you send and receive online with VPN.

Protecting your IP address is a crucial aspect of protecting your online identity. Securing it through these steps is a way to stay safe against the wide variety of cybercriminals' attacks.

## Digital Guide

(<https://www.ionos.com/digitalguide/>)

09/16/2020 | Domain extensions (<https://www.ionos.com/digitalguide/domains/domain-extensions/>)

/digitalguide/domains.c

## Country domains: a comprehensive ccTLD list

Every internet address, or domain, has a domain ending, also known as a top-level domain. **Country code top-level domains (ccTLDs)** are used to indicate the site's relation to a specific country or region (i.e. *.uk* for the United Kingdom or *.eu* for the European Union) and are therefore referred to as country code TLDs (<https://www.ionos.com/digitalguide/domains/domain-extensions/cctlds-all-you-need-to-know-about-country-code-domains/>).

ICANN (Internet Corporation for Assigned Names and Numbers)

(<https://www.ionos.com/digitalguide/domains/domain-news/domain-registration-behind-icann-and-neustar/>) is the company that regulates the allocation of all ccTLDs. Meanwhile an NIC (Network Information Center, also known as the Domain Name Registry) is the body responsible for the management and registration of all regional domain extensions in a country. In total there are now more than 200 ccTLDs, all of which can be found in the top-level domain list below.

### Contents

# Characteristics of ccTLDs

## Digital Guide

Country-specific domain extensions generally indicate the **region or language** that the website's content is relevant for. Furthermore, ccTLDs always include two letters of the Latin alphabet. The only **exceptions** to this rule are the countries with **IDN-ccTLDs** (internationalized country code top-level domains). In addition to the standard ccTLD, these countries have one or more variants of the same ccTLD in a language that doesn't use the Latin alphabet. An example of a country with several variations of the same ccTLD is Sri Lanka; as well as the country code, *.lk*, Sri Lanka also uses the TLDs, *.ලංකා* and *.இலங்கை*, which refer to the country in Sinhalese and Tamil, respectively.

## Alternative uses for ccTLDs

Generic top-level domains (<https://www.ionos.com/digitalguide/domains/domain-extensions/what-is-a-generic-top-level-domain-gtld/>) provide the counterpart to ccTLDs. These don't have a regional domain extension, but rather refer to a specific theme (such as *.com* for commercial/business enterprise or *.org* for an organization) and can include more than two letters. However, some **ccTLDs are repurposed** and, like gTLDs, can be used to indicate particular types of websites or the genre of content or products. Wordplay with certain country codes is also quite common. Examples of this include:

- FORA.tv: this video hosting platform and live streaming channel uses the **Tuvaluan ccTLD** to offer users all kinds of video uploading, editing, and streaming services. The *.tv* domain extension is particularly popular in the area of television, film, and video streaming sites (further examples include *ustream.tv* and *green.tv*).
- Last.fm: this is the web address of a UK-based music streaming service, which uses the **county code of the Federated States of Micronesia**, *.fm*. As the abbreviation also stands for 'frequency modulation', it shares a connection with FM radio, and therefore enjoys popularity among websites that are connected to radio shows, music, and podcasts (further examples include the internet radio platform *di.fm* and the music website, *libre.fm*).
- CanIStream.It (<https://www.ionos.com/digitalguide/websites/web-development/web-app-of-the-week-can-i-streamit/>): CanIStream.It is an online platform that provides links to on demand video services. By using the **Italian ccTLD**, the domain spells out exactly what service the website provides.
- Meet.me: this is the most expensive **Montenegrin domain** ever sold (for \$450,000). MeetMe is the name of a US-based social network that was able to express its brand name fully in the domain name with the help of Montenegro's ccTLD.

The *.tk* domain ending (<https://www.ionos.com/digitalguide/domains/domain-news/the-tokelau-domain-miracle/>) is a **special case** when it comes to country domains. Over 30 million websites use this ccTLD, even though the island state of Tokelau, which officially presides over this domain extension, has less than 2 million inhabitants. The mass registration of *.tk* websites can be put down to the fact that in the past, it was completely free of charge to secure an internet address with this ccTLD. Even now, website owners with a *.tk* TLD can run their sites without paying a dime for the first 12 months after registering.

## Country code top-level domain list

The following domain extensions list includes every country domain in existence. With this table, you can not only discover which **country or area** the domain extensions belong to, but also whether the respective ccTLD is available with DNSSEC (<https://www.ionos.com/digitalguide/server/know-how/dnssec-internet-standards-for-authenticated-name-resolution/>). Websites can use **DNSSEC internet standards** in order to protect the domain name system (<https://www.ionos.com/digitalguide/server/know-how/domain-name-system/>) from manipulation, which includes, for example, phishing websites, which can request sensitive data using fake webpages.

The column on the right indicates whether a web address registered under the respective ccTLD can also be allocated an **internationalized domain name (IDN)**. As mentioned above, these internationalized domain names (<https://www.ionos.com/digitalguide/domains/domain-administration/what-is-an-internationalized-domain-name-idn/>) can use characters from the Latin alphabet, including those with accents, in addition to characters from other alphabets. These characters are located in the second-level domain (i.e. the name of the website *before* the country code top-level domain). One example of this is the Canadian weather website, *méto.ca*, which includes an accented letter.

**Top-level domains that have an IDN** can be accessed using both Latin characters as well as characters from their respective alphabet. However, this doesn't mean that the corresponding top-level domain is also offered as an **IDN ccTLD** at the same time – as is the case with the aforementioned example of Sri Lanka. A good example of this is Germany's *.de* domain extension; although there is no alternative for the *.de* country code, German website owners can use many special characters, including three vowels with umlauts (ä, ö, ü), the 'ß' character, as well as further characters that contain accents (à, á, â, ã etc.). Since the German language is based on the Latin alphabet and can be optimally expressed with a ccTLD (unlike Sri Lanka), it's also not necessary.

ccTLD	DigitalCountry (or region)	DNSSEC	IDN

## ccTLDs – what’s the deal with country domain names?

09/16/2020 | Domain extensions

ICANN manages a list of different top-level domains specific to varying geographic regions. The guidelines these country code top-level domains (ccTLDs) follow (examples: .us (USA), .ca (Canada), or .mx (Mexico), are individually determined by their respective countries, leading to some substantial differences in how they are managed. But what other ccTLDs are out there? And what are the...

# What is a TLD (Top Level Domain)?

12/20/2022 | Domain extensions

What should you do if your desired domain has already been taken? The range of available .com or .org domains has gotten smaller over the years. Now there is a solution to this problem: new top-level domains! Instead of using complicated and unclear abbreviations, choose short and concise domains from the new TLDs. Local companies can especially profit from nTLDs.

# THE DOMAIN NAME INDUSTRY BRIEF

**VOLUME 20 – ISSUE 1**  
MARCH 2023

**VERISIGN®**

## THE DOMAIN NAME INDUSTRY BRIEF

As a global provider of domain name registry services and internet infrastructure, Verisign reviews the state of the domain name industry each quarter through a variety of statistical and analytical research, as well as relevant industry insights. Verisign provides this brief to highlight important trends in domain name registrations, including key performance indicators and growth opportunities, to industry analysts, media, and businesses.

## EXECUTIVE SUMMARY

The fourth quarter of 2022 closed with 350.4 million domain name registrations across all top-level domains (TLDs), an increase of 0.5 million domain name registrations, or 0.1%, compared to the third quarter of 2022.<sup>1,2</sup> Domain name registrations have increased by 8.7 million, or 2.6%, year over year.<sup>1,2</sup>

The .com and .net TLDs had a combined total of 173.8 million domain name registrations in the domain name base<sup>3</sup> at the end of the fourth quarter of 2022, a decrease of 0.4 million domain name registrations, or 0.2%, compared to the third quarter of 2022. The .com and .net TLDs had a combined increase of 0.3 million domain name registrations, or 0.2%, year over year. As of Dec. 31, 2022, the .com domain name base totaled 160.5 million domain name registrations, and the .net domain name base totaled 13.2 million domain name registrations.

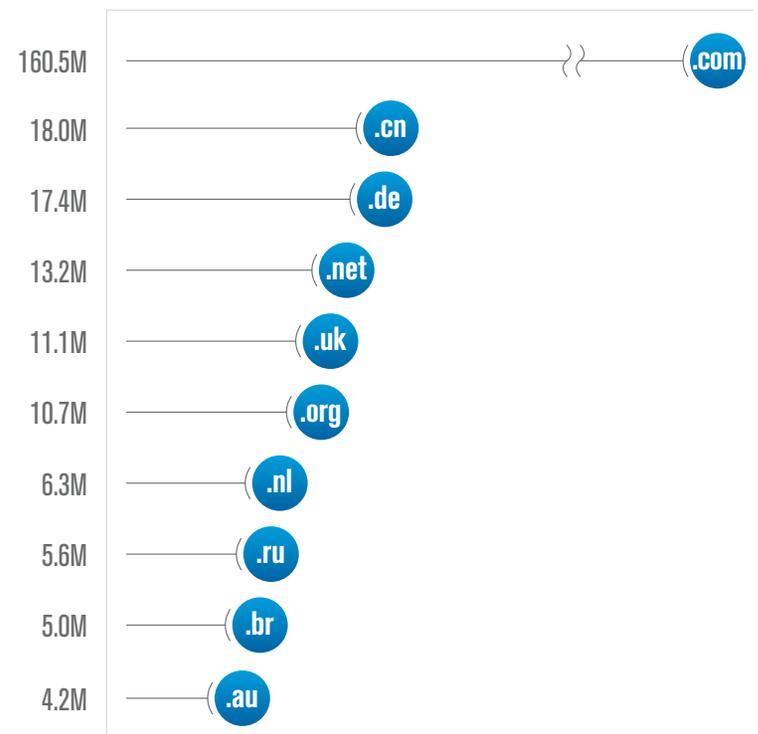

New .com and .net domain name registrations totaled 9.7 million at the end of the fourth quarter of 2022, compared to 10.6 million domain name registrations at the end of the fourth quarter of 2021.

Total country-code TLD (ccTLD) domain name registrations were 133.1 million at the end of the fourth quarter of 2022, an increase of 0.7 million domain name registrations, or 0.5%, compared to the third quarter of 2022.<sup>1,2</sup> ccTLDs increased by 5.7 million domain name registrations, or 4.5%, year over year.<sup>1,2</sup>

Total new generic TLD (ngTLD) domain name registrations were 27.4 million at the end of the fourth quarter of 2022, an increase of 0.1 million domain name registrations, or 0.5%, compared to the third quarter of 2022. ngTLDs increased by 2.7 million domain name registrations, or 11.1%, year over year.

## TOP 10 LARGEST TLDs BY NUMBER OF REPORTED DOMAIN NAMES

Source: ZookNIC, Q4 2022; Verisign, Q4 2022; Centralized Zone Data Service, Q4 2022

As of Dec. 31, 2022, the 10 largest TLDs by number of reported domain names were .com, .cn, .de, .net, .uk, .org, .nl, .ru, .br, and .au.<sup>1,2,4</sup>

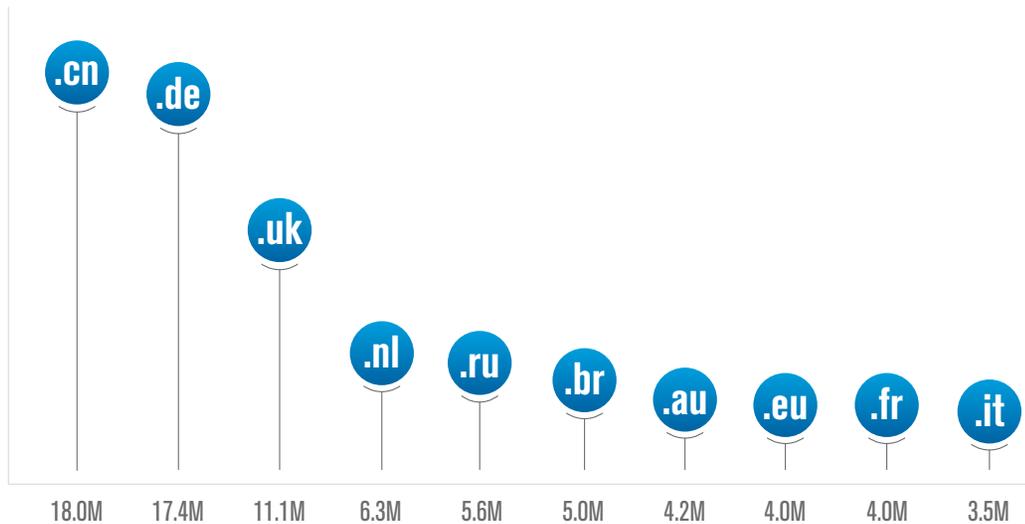

## TOP 10 LARGEST ccTLDs BY NUMBER OF REPORTED DOMAIN NAMES

Source: ZookNIC, Q4 2022

For further information on *The Domain Name Industry Brief* methodology, please see the Editor's Note contained in [Vol. 19, Issue 1 of \*The Domain Name Industry Brief\*](#).

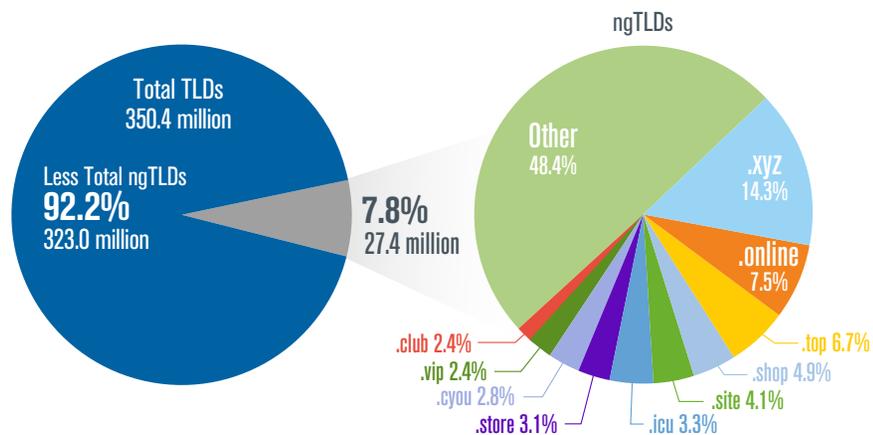

The top 10 ccTLDs, as of Dec. 31, 2022, were .cn, .de, .uk, .nl, .ru, .br, .au, .eu, .fr, and .it.<sup>1,2</sup> As of Dec. 31, 2022, there were 308 global ccTLD extensions delegated in the root zone, including internationalized domain names, with the top 10 ccTLDs comprising 59.4% of all ccTLD domain name registrations.<sup>1,2</sup>

## ngTLDs AS PERCENTAGE OF TOTAL TLDs

Source: ZookNIC, Q4 2022; Verisign, Q4 2022; and Centralized Zone Data Service, Q4 2022

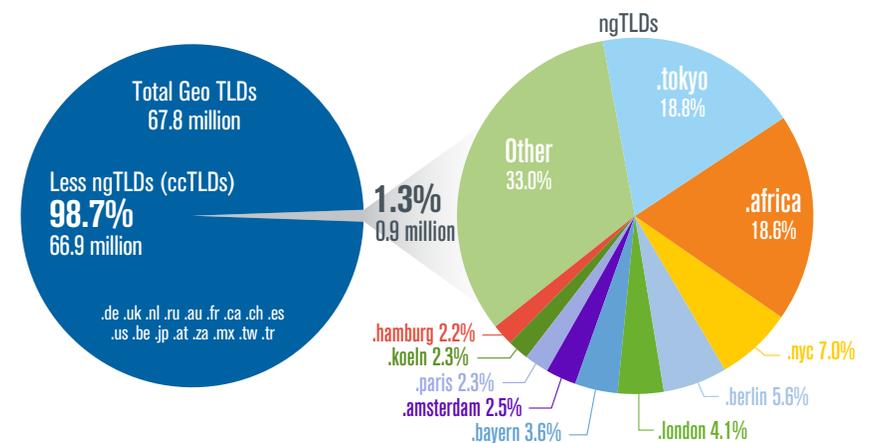

The top 10 ngTLDs represented 51.6% of all ngTLD domain name registrations. The following chart shows ngTLD domain name registrations as a percentage of overall TLD domain name registrations, of which they represent 7.8%. In addition, the chart on the right highlights the top 10 ngTLDs as a percentage of all ngTLD domain name registrations for the fourth quarter of 2022.

## GEOGRAPHICAL ngTLDs AS PERCENTAGE OF TOTAL CORRESPONDING GEOGRAPHICAL TLDs

Source: ZookNIC, Q4 2022 and Centralized Zone Data Service, Q4 2022

As of Dec. 31, 2022, there were 50 ngTLDs delegated that met the following criteria: 1) had a geographical focus and 2) had more than 1,000 domain name registrations since entering general availability. The chart on the left summarizes the domain name registrations as of Dec. 31, 2022, for the listed ccTLDs and the corresponding geographical ngTLDs within the same geographic region. In addition, the chart on the right highlights the top 10 geographical ngTLDs as a percentage of the total geographical TLDs.

## NEW ON THE VERISIGN BLOG / Oct. – Dec. 2022

### **CELEBRATING 35 YEARS OF THE DNS PROTOCOL**

November of 1987 saw the establishment of the Domain Name System protocol suite as internet standards. This was a development that not only would begin to open the internet to individuals and businesses globally, but also would arguably redefine communications, commerce and access to information for future generations.

VERISIGN®

## ABOUT VERISIGN

Verisign, a global provider of domain name registry services and internet infrastructure, enables internet navigation for many of the world's most recognized domain names. Verisign enables the security, stability, and resiliency of key internet infrastructure and services, including providing root zone maintainer services, operating two of the 13 global internet root servers, and providing registration services and authoritative resolution for the .com and .net top-level domains, which support the majority of global e-commerce. To learn more about what it means to be Powered by Verisign, please visit [verisign.com](https://verisign.com).

## LEARN MORE

To access the archives for *The Domain Name Industry Brief*, please go to [verisign.com/dnibarchives](https://verisign.com/dnibarchives). Email your comments or questions to [domainbrief@verisign.com](mailto:domainbrief@verisign.com).

## METHODOLOGY

The data presented in this brief, including quarter-over-quarter and year-over-year metrics, reflects information available to Verisign at the time of this brief and may incorporate changes and adjustments to previously reported periods based on additional information received since the date of such prior reports, so as to more accurately reflect the growth rate of domain name registrations. In addition, the data available for this brief may not include data for all of the 308 ccTLD extensions that are delegated to the root zone, and includes only the data available at the time of the preparation of this brief. Beginning with [Vol. 19, Issue 1 of \*The Domain Name Industry Brief\*](#), the .tk, .cf, .ga, .gq, and .ml ccTLDs have been excluded from all applicable calculations. The historical data has been adjusted from Vol. 19, Issue 1 forward.

For generic TLD and ccTLD data cited with ZookNIC as a source, the ZookNIC analysis uses a comparison of domain name root zone file changes supplemented with other authoritative data sources and independent approximations. For more information, see [zooknic.com](https://zooknic.com).

1 Per the Editor's Note in [Vol. 19, Issue 1 of \*The Domain Name Industry Brief\*](#), all figure(s) exclude domain names in the .tk, .cf, .ga, .gq, and .ml ccTLDs operated by Freenom. Quarterly and year-over-year trends have been calculated relative to historical figures that have also been adjusted to exclude these five ccTLDs.  
2 The generic TLD, ngTLD, and ccTLD data cited in this brief: (i) includes ccTLD internationalized domain names, (ii) is an estimate as of the time this brief was developed and (iii) is subject to change as more complete data is received. Some numbers in this brief may reflect standard rounding.  
3 The domain name base is the active zone plus the number of domain names that are registered but not configured for use in the respective TLD zone file plus the number of domain names that are in a client or server hold status. The .com and .net domain name registration figures are as reported in Verisign's most recent SEC filings.  
4 Line break indicates that the .com line has been shortened for display considerations.

*Supporting the implementation of Union policy and law regarding cybersecurity.*

## NIS Directive

On 16 January 2023, the Directive (EU) 2022/2555 (known as NIS2) entered into force replacing Directive (EU) 2016/1148. ENISA considers that NIS2 improves the existing cyber security status across EU in different ways by:

- creating the necessary cyber crisis management structure (CyCLONe)
- increasing the level of harmonization regarding security requirements and reporting obligations
- encouraging Member States to introduce new areas of interest such as supply chain, vulnerability management, core internet and cyber hygiene their national cybersecurity strategies
- bringing novel ideas such as the peer reviews for enhancing collaboration and knowledge sharing amongst the Member States
- covering a larger share of the economy and society by including more sectors which means that more entities are obliged to take measures in order to increase their level of cybersecurity.

NIS2 assigns to ENISA a number of significant new tasks such as:

- The development and maintenance of a European vulnerability registry
- The secretariat of the European Cyber Crises Liaison Organisation Network (CyCLONe)
- The publication of an annual report on the state of cybersecurity in the EU
- To support the organisation of peer reviews between member states
- The creation and maintenance of a registry for entities providing cross-border services e.g. DNS service providers, TLD name registries, entities providing domain name registration services, cloud computing service providers and data centre service providers.

ENISA already plays a key role in the implementation of the NIS Directive by providing assistance to the Member States regarding its transposition, by supporting several working streams of the Cooperation Group with technical expertise and by providing the secretariat for the CSIRTs Network and organising the CyberEurope Exercise.

In addition, the Agency assists Member States as well as the Cooperation Group in their tasks by:

- Identifying good practices in the Member States regarding the implementation of the NIS directive;
- Supporting the EU-wide reporting process for cybersecurity incidents, by developing thresholds, templates and tools;
- Agreeing on common approaches and procedures;
- Helping Member States to address common cybersecurity issues.

ENISA will continue to support the implementation of the NIS directive as part of its mandate and its work programme. The Member States have 21 months in order to transpose NIS2 to their national legislative framework.

# DIRECTIVES

## DIRECTIVE (EU) 2022/2555 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 14 December 2022

**on measures for a high common level of cybersecurity across the Union, amending Regulation (EU) No 910/2014 and Directive (EU) 2018/1972, and repealing Directive (EU) 2016/1148 (NIS 2 Directive)**

(Text with EEA relevance)

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty on the Functioning of the European Union, and in particular Article 114 thereof,

Having regard to the proposal from the European Commission,

After transmission of the draft legislative act to the national parliaments,

Having regard to the opinion of the European Central Bank <sup>(1)</sup>,

Having regard to the opinion of the European Economic and Social Committee <sup>(2)</sup>,

After consulting the Committee of the Regions,

Acting in accordance with the ordinary legislative procedure <sup>(3)</sup>,

Whereas:

- (1) Directive (EU) 2016/1148 of the European Parliament and the Council <sup>(4)</sup> aimed to build cybersecurity capabilities across the Union, mitigate threats to network and information systems used to provide essential services in key sectors and ensure the continuity of such services when facing incidents, thus contributing to the Union's security and to the effective functioning of its economy and society.
- (2) Since the entry into force of Directive (EU) 2016/1148, significant progress has been made in increasing the Union's level of cyber resilience. The review of that Directive has shown that it has served as a catalyst for the institutional and regulatory approach to cybersecurity in the Union, paving the way for a significant change in mind-set. That Directive has ensured the completion of national frameworks on the security of network and information systems by establishing national strategies on security of network and information systems and establishing national capabilities and by implementing regulatory measures covering essential infrastructures and entities identified by each Member State. Directive (EU) 2016/1148 has also contributed to cooperation at Union level through the establishment of the Cooperation Group and the network of national computer security incident response teams. Notwithstanding those achievements, the review of Directive (EU) 2016/1148 has revealed inherent shortcomings that prevent it from addressing effectively current and emerging cybersecurity challenges.
- (3) Network and information systems have developed into a central feature of everyday life with the speedy digital transformation and interconnectedness of society, including in cross-border exchanges. That development has led to an expansion of the cyber threat landscape, bringing about new challenges, which require adapted, coordinated and innovative responses in all Member States. The number, magnitude, sophistication, frequency and impact of incidents are increasing, and present a major threat to the functioning of network and information systems. As a result, incidents can impede the pursuit of economic activities in the internal market, generate financial loss,

<sup>(1)</sup> OJ C 233, 16.6.2022, p. 22.

<sup>(2)</sup> OJ C 286, 16.7.2021, p. 170.

<sup>(3)</sup> Position of the European Parliament of 10 November 2022 (not yet published in the Official Journal) and decision of the Council of 28 November 2022.

<sup>(4)</sup> Directive (EU) 2016/1148 of the European Parliament and of the Council of 6 July 2016 concerning measures for a high common level of security of network and information systems across the Union (OJ L 194, 19.7.2016, p. 1).

undermine user confidence and cause major damage to the Union's economy and society. Cybersecurity preparedness and effectiveness are therefore now more essential than ever to the proper functioning of the internal market. Moreover, cybersecurity is a key enabler for many critical sectors to successfully embrace the digital transformation and to fully grasp the economic, social and sustainable benefits of digitalisation.

- (4) The legal basis of Directive (EU) 2016/1148 was Article 114 of the Treaty on the Functioning of the European Union (TFEU), the objective of which is the establishment and functioning of the internal market by enhancing measures for the approximation of national rules. The cybersecurity requirements imposed on entities providing services or carrying out activities which are economically significant vary considerably among Member States in terms of type of requirement, their level of detail and the method of supervision. Those disparities entail additional costs and create difficulties for entities that offer goods or services across borders. Requirements imposed by one Member State that are different from, or even in conflict with, those imposed by another Member State, may substantially affect such cross-border activities. Furthermore, the possibility of the inadequate design or implementation of cybersecurity requirements in one Member State is likely to have repercussions at the level of cybersecurity of other Member States, in particular given the intensity of cross-border exchanges. The review of Directive (EU) 2016/1148 has shown a wide divergence in its implementation by Member States, including in relation to its scope, the delimitation of which was very largely left to the discretion of the Member States. Directive (EU) 2016/1148 also provided the Member States with very wide discretion as regards the implementation of the security and incident reporting obligations laid down therein. Those obligations were therefore implemented in significantly different ways at national level. There are similar divergences in the implementation of the provisions of Directive (EU) 2016/1148 on supervision and enforcement.
- (5) All those divergences entail a fragmentation of the internal market and can have a prejudicial effect on its functioning, affecting in particular the cross-border provision of services and the level of cyber resilience due to the application of a variety of measures. Ultimately, those divergences could lead to the higher vulnerability of some Member States to cyber threats, with potential spill-over effects across the Union. This Directive aims to remove such wide divergences among Member States, in particular by setting out minimum rules regarding the functioning of a coordinated regulatory framework, by laying down mechanisms for effective cooperation among the responsible authorities in each Member State, by updating the list of sectors and activities subject to cybersecurity obligations and by providing effective remedies and enforcement measures which are key to the effective enforcement of those obligations. Therefore, Directive (EU) 2016/1148 should be repealed and replaced by this Directive.
- (6) With the repeal of Directive (EU) 2016/1148, the scope of application by sectors should be extended to a larger part of the economy to provide a comprehensive coverage of sectors and services of vital importance to key societal and economic activities in the internal market. In particular, this Directive aims to overcome the shortcomings of the differentiation between operators of essential services and digital service providers, which has been proven to be obsolete, since it does not reflect the importance of the sectors or services for the societal and economic activities in the internal market.
- (7) Under Directive (EU) 2016/1148, Member States were responsible for identifying the entities which met the criteria to qualify as operators of essential services. In order to eliminate the wide divergences among Member States in that regard and ensure legal certainty as regards the cybersecurity risk-management measures and reporting obligations for all relevant entities, a uniform criterion should be established that determines the entities falling within the scope of this Directive. That criterion should consist of the application of a size-cap rule, whereby all entities which qualify as medium-sized enterprises under Article 2 of the Annex to Commission Recommendation 2003/361/EC <sup>(5)</sup>, or exceed the ceilings for medium-sized enterprises provided for in paragraph 1 of that Article, and which operate within the sectors and provide the types of service or carry out the activities covered by this

---

<sup>(5)</sup> Commission Recommendation 2003/361/EC of 6 May 2003 concerning the definition of micro, small and medium-sized enterprises (OJ L 124, 20.5.2003, p. 36).

Directive fall within its scope. Member States should also provide for certain small enterprises and microenterprises, as defined in Article 2(2) and (3) of that Annex, which fulfil specific criteria that indicate a key role for society, the economy or for particular sectors or types of service to fall within the scope of this Directive.

- (8) The exclusion of public administration entities from the scope of this Directive should apply to entities whose activities are predominantly carried out in the areas of national security, public security, defence or law enforcement, including the prevention, investigation, detection and prosecution of criminal offences. However, public administration entities whose activities are only marginally related to those areas should not be excluded from the scope of this Directive. For the purposes of this Directive, entities with regulatory competences are not considered to be carrying out activities in the area of law enforcement and are therefore not excluded on that ground from the scope of this Directive. Public administration entities that are jointly established with a third country in accordance with an international agreement are excluded from the scope of this Directive. This Directive does not apply to Member States' diplomatic and consular missions in third countries or to their network and information systems, insofar as such systems are located in the premises of the mission or are operated for users in a third country.
- (9) Member States should be able to take the necessary measures to ensure the protection of the essential interests of national security, to safeguard public policy and public security, and to allow for the prevention, investigation, detection and prosecution of criminal offences. To that end, Member States should be able to exempt specific entities which carry out activities in the areas of national security, public security, defence or law enforcement, including the prevention, investigation, detection and prosecution of criminal offences, from certain obligations laid down in this Directive with regard to those activities. Where an entity provides services exclusively to a public administration entity that is excluded from the scope of this Directive, Member States should be able to exempt that entity from certain obligations laid down in this Directive with regard to those services. Furthermore, no Member State should be required to supply information the disclosure of which would be contrary to the essential interests of its national security, public security or defence. Union or national rules for the protection of classified information, non-disclosure agreements, and informal non-disclosure agreements such as the traffic light protocol should be taken into account in that context. The traffic light protocol is to be understood as a means to provide information about any limitations with regard to the further spreading of information. It is used in almost all computer security incident response teams (CSIRTs) and in some information analysis and sharing centres.
- (10) Although this Directive applies to entities carrying out activities in the production of electricity from nuclear power plants, some of those activities may be linked to national security. Where that is the case, a Member State should be able to exercise its responsibility for safeguarding national security with respect to those activities, including activities within the nuclear value chain, in accordance with the Treaties.
- (11) Some entities carry out activities in the areas of national security, public security, defence or law enforcement, including the prevention, investigation, detection and prosecution of criminal offences, while also providing trust services. Trust service providers which fall within the scope of Regulation (EU) No 910/2014 of the European Parliament and of the Council <sup>(9)</sup> should fall within the scope of this Directive in order to secure the same level of security requirements and supervision as that which was previously laid down in that Regulation in respect of trust service providers. In line with the exclusion of certain specific services from Regulation (EU) No 910/2014, this Directive should not apply to the provision of trust services that are used exclusively within closed systems resulting from national law or from agreements between a defined set of participants.

<sup>(9)</sup> Regulation (EU) No 910/2014 of the European Parliament and of the Council of 23 July 2014 on electronic identification and trust services for electronic transactions in the internal market and repealing Directive 1999/93/EC (OJ L 257, 28.8.2014, p. 73).

- (12) Postal service providers as defined in Directive 97/67/EC of the European Parliament and of the Council (<sup>(7)</sup>), including providers of courier services, should be subject to this Directive if they provide at least one of the steps in the postal delivery chain, in particular clearance, sorting, transport or distribution of postal items, including pick-up services, while taking account of the degree of their dependence on network and information systems. Transport services that are not undertaken in conjunction with one of those steps should be excluded from the scope of postal services.
- (13) Given the intensification and increased sophistication of cyber threats, Member States should strive to ensure that entities that are excluded from the scope of this Directive achieve a high level of cybersecurity and to support the implementation of equivalent cybersecurity risk-management measures that reflect the sensitive nature of those entities.
- (14) Union data protection law and Union privacy law applies to any processing of personal data under this Directive. In particular, this Directive is without prejudice to Regulation (EU) 2016/679 of the European Parliament and of the Council (<sup>(8)</sup>) and Directive 2002/58/EC of the European Parliament and of the Council (<sup>(9)</sup>). This Directive should therefore not affect, inter alia, the tasks and powers of the authorities competent to monitor compliance with the applicable Union data protection law and Union privacy law.
- (15) Entities falling within the scope of this Directive for the purpose of compliance with cybersecurity risk-management measures and reporting obligations should be classified into two categories, essential entities and important entities, reflecting the extent to which they are critical as regards their sector or the type of service they provide, as well as their size. In that regard, due account should be taken of any relevant sectoral risk assessments or guidance by the competent authorities, where applicable. The supervisory and enforcement regimes for those two categories of entities should be differentiated to ensure a fair balance between risk-based requirements and obligations on the one hand, and the administrative burden stemming from the supervision of compliance on the other.
- (16) In order to avoid entities that have partner enterprises or that are linked enterprises being considered to be essential or important entities where this would be disproportionate, Member States are able to take into account the degree of independence an entity enjoys in relation to its partner or linked enterprises when applying Article 6(2) of the Annex to Recommendation 2003/361/EC. In particular, Member States are able to take into account the fact that an entity is independent from its partner or linked enterprises in terms of the network and information systems that that entity uses in the provision of its services and in terms of the services that the entity provides. On that basis, where appropriate, Member States are able to consider that such an entity does not qualify as a medium-sized enterprise under Article 2 of the Annex to Recommendation 2003/361/EC, or does not exceed the ceilings for a medium-sized enterprise provided for in paragraph 1 of that Article, if, after taking into account the degree of independence of that entity, that entity would not have been considered to qualify as a medium-sized enterprise or to exceed those ceilings in the event that only its own data had been taken into account. This leaves unaffected the obligations laid down in this Directive of partner and linked enterprises which fall within the scope of this Directive.
- (17) Member States should be able to decide that entities identified before the entry into force of this Directive as operators of essential services in accordance with Directive (EU) 2016/1148 are to be considered to be essential entities.

(<sup>7</sup>) Directive 97/67/EC of the European Parliament and of the Council of 15 December 1997 on common rules for the development of the internal market of Community postal services and the improvement of quality of service (OJ L 15, 21.1.1998, p. 14).

(<sup>8</sup>) Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC (General Data Protection Regulation) (OJ L 119, 4.5.2016, p. 1).

(<sup>9</sup>) Directive 2002/58/EC of the European Parliament and of the Council of 12 July 2002 concerning the processing of personal data and the protection of privacy in the electronic communications sector (Directive on privacy and electronic communications) (OJ L 201, 31.7.2002, p. 37).

- (18) In order to ensure a clear overview of the entities falling within the scope of this Directive, Member States should establish a list of essential and important entities as well as entities providing domain name registration services. For that purpose, Member States should require entities to submit at least the following information to the competent authorities, namely, the name, address and up-to-date contact details, including the email addresses, IP ranges and telephone numbers of the entity, and, where applicable, the relevant sector and subsector referred to in the annexes, as well as, where applicable, a list of the Member States where they provide services falling within the scope of this Directive. To that end, the Commission, with the assistance of the European Union Agency for Cybersecurity (ENISA), should, without undue delay, provide guidelines and templates regarding the obligation to submit information. To facilitate the establishing and updating of the list of essential and important entities as well as entities providing domain name registration services, Member States should be able to establish national mechanisms for entities to register themselves. Where registers exist at national level, Member States can decide on the appropriate mechanisms that allow for the identification of entities falling within the scope of this Directive.
- (19) Member States should be responsible for submitting to the Commission at least the number of essential and important entities for each sector and subsector referred to in the annexes, as well as relevant information about the number of identified entities and the provision, from among those laid down in this Directive, on the basis of which they were identified, and the type of service that they provide. Member States are encouraged to exchange with the Commission information about essential and important entities and, in the case of a large-scale cybersecurity incident, relevant information such as the name of the entity concerned.
- (20) The Commission should, in cooperation with the Cooperation Group and after consulting the relevant stakeholders, provide guidelines on the implementation of the criteria applicable to microenterprises and small enterprises for the assessment of whether they fall within the scope of this Directive. The Commission should also ensure that appropriate guidance is given to microenterprises and small enterprises falling within the scope of this Directive. The Commission should, with the assistance of the Member States, make information available to microenterprises and small enterprises in that regard.
- (21) The Commission could provide guidance to assist Member States in implementing the provisions of this Directive on scope and evaluating the proportionality of the measures to be taken pursuant to this Directive, in particular as regards entities with complex business models or operating environments, whereby an entity may simultaneously fulfil the criteria assigned to both essential and important entities or may simultaneously carry out activities, some of which fall within and some of which are excluded from the scope of this Directive.
- (22) This Directive sets out the baseline for cybersecurity risk-management measures and reporting obligations across the sectors that fall within its scope. In order to avoid the fragmentation of cybersecurity provisions of Union legal acts, where further sector-specific Union legal acts pertaining to cybersecurity risk-management measures and reporting obligations are considered to be necessary to ensure a high level of cybersecurity across the Union, the Commission should assess whether such further provisions could be stipulated in an implementing act under this Directive. Should such an implementing act not be suitable for that purpose, sector-specific Union legal acts could contribute to ensuring a high level of cybersecurity across the Union, while taking full account of the specificities and complexities of the sectors concerned. To that end, this Directive does not preclude the adoption of further sector-specific Union legal acts addressing cybersecurity risk-management measures and reporting obligations that take due account of the need for a comprehensive and consistent cybersecurity framework. This Directive is without prejudice to the existing implementing powers that have been conferred on the Commission in a number of sectors, including transport and energy.
- (23) Where a sector-specific Union legal act contains provisions requiring essential or important entities to adopt cybersecurity risk-management measures or to notify significant incidents, and where those requirements are at least equivalent in effect to the obligations laid down in this Directive, those provisions, including on supervision

and enforcement, should apply to such entities. If a sector-specific Union legal act does not cover all entities in a specific sector falling within the scope of this Directive, the relevant provisions of this Directive should continue to apply to the entities not covered by that act.

- (24) Where provisions of a sector-specific Union legal act require essential or important entities to comply with reporting obligations that are at least equivalent in effect to the reporting obligations laid down in this Directive, the consistency and effectiveness of the handling of incident notifications should be ensured. To that end, the provisions relating to incident notifications of the sector-specific Union legal act should provide the CSIRTs, the competent authorities or the single points of contact on cybersecurity (single points of contact) under this Directive with an immediate access to the incident notifications submitted in accordance with the sector-specific Union legal act. In particular, such immediate access can be ensured if incident notifications are being forwarded without undue delay to the CSIRT, the competent authority or the single point of contact under this Directive. Where appropriate, Member States should put in place an automatic and direct reporting mechanism that ensures systematic and immediate sharing of information with the CSIRTs, the competent authorities or the single points of contact concerning the handling of such incident notifications. For the purpose of simplifying reporting and of implementing the automatic and direct reporting mechanism, Member States could, in accordance with the sector-specific Union legal act, use a single entry point.
- (25) Sector-specific Union legal acts which provide for cybersecurity risk-management measures or reporting obligations that are at least equivalent in effect to those laid down in this Directive could provide that the competent authorities under such acts exercise their supervisory and enforcement powers in relation to such measures or obligations with the assistance of the competent authorities under this Directive. The competent authorities concerned could establish cooperation arrangements for that purpose. Such cooperation arrangements could specify, inter alia, the procedures concerning the coordination of supervisory activities, including the procedures of investigations and on-site inspections in accordance with national law, and a mechanism for the exchange of relevant information on supervision and enforcement between the competent authorities, including access to cyber-related information requested by the competent authorities under this Directive.
- (26) Where sector-specific Union legal acts require or provide incentives to entities to notify significant cyber threats, Member States should also encourage the sharing of significant cyber threats with the CSIRTs, the competent authorities or the single points of contact under this Directive, in order to ensure an enhanced level of those bodies' awareness of the cyber threat landscape and to enable them to respond effectively and in a timely manner should the significant cyber threats materialise.
- (27) Future sector-specific Union legal acts should take due account of the definitions and the supervisory and enforcement framework laid down in this Directive.
- (28) Regulation (EU) 2022/2554 of the European Parliament and of the Council <sup>(10)</sup> should be considered to be a sector-specific Union legal act in relation to this Directive with regard to financial entities. The provisions of Regulation (EU) 2022/2554 relating to information and communication technology (ICT) risk management, management of ICT-related incidents and, in particular, major ICT-related incident reporting, as well as on digital operational resilience testing, information-sharing arrangements and ICT third-party risk should apply instead of those provided for in this Directive. Member States should therefore not apply the provisions of this Directive on cybersecurity risk-management and reporting obligations, and supervision and enforcement, to financial entities covered by Regulation (EU) 2022/2554. At the same time, it is important to maintain a strong relationship and the exchange of information with the financial sector under this Directive. To that end, Regulation (EU) 2022/2554 allows the European Supervisory Authorities (ESAs) and the competent authorities under that Regulation to participate in the activities of the Cooperation Group and to exchange information and cooperate with the single points of contact, as well as with the CSIRTs and the competent authorities under this Directive. The competent authorities under Regulation (EU) 2022/2554 should also transmit details of major ICT-related incidents and, where relevant, significant cyber threats to the CSIRTs, the competent authorities or the single points of contact under this Directive. This is achievable by providing immediate access to incident notifications and forwarding them either

<sup>(10)</sup> Regulation (EU) 2022/2554 of the European Parliament and of the Council of 14 December 2022 on digital operational resilience for the financial sector and amending Regulations (EC) No 1060/2009, (EU) No 648/2012, (EU) No 600/2014, (EU) No 909/2014 and (EU) 2016/1011 (see page 1 of this Official Journal).

directly or through a single entry point. Moreover, Member States should continue to include the financial sector in their cybersecurity strategies and CSIRTs can cover the financial sector in their activities.

- (29) In order to avoid gaps between or duplications of cybersecurity obligations imposed on entities in the aviation sector, national authorities under Regulations (EC) No 300/2008 <sup>(1)</sup> and (EU) 2018/1139 <sup>(12)</sup> of the European Parliament and of the Council and the competent authorities under this Directive should cooperate in relation to the implementation of cybersecurity risk-management measures and the supervision of compliance with those measures at national level. The compliance of an entity with the security requirements laid down in Regulations (EC) No 300/2008 and (EU) 2018/1139 and in the relevant delegated and implementing acts adopted pursuant to those Regulations could be considered by the competent authorities under this Directive to constitute compliance with the corresponding requirements laid down in this Directive.
- (30) In view of the interlinkages between cybersecurity and the physical security of entities, a coherent approach should be ensured between Directive (EU) 2022/2557 of the European Parliament and of the Council <sup>(13)</sup> and this Directive. To achieve this, entities identified as critical entities under Directive (EU) 2022/2557 should be considered to be essential entities under this Directive. Moreover, each Member State should ensure that its national cybersecurity strategy provides for a policy framework for enhanced coordination within that Member State between its competent authorities under this Directive and those under Directive (EU) 2022/2557 in the context of information sharing about risks, cyber threats, and incidents as well as on non-cyber risks, threats and incidents, and the exercise of supervisory tasks. The competent authorities under this Directive and those under Directive (EU) 2022/2557 should cooperate and exchange information without undue delay, in particular in relation to the identification of critical entities, risks, cyber threats, and incidents as well as in relation to non-cyber risks, threats and incidents affecting critical entities, including the cybersecurity and physical measures taken by critical entities as well as the results of supervisory activities carried out with regard to such entities.

Furthermore, in order to streamline supervisory activities between the competent authorities under this Directive and those under Directive (EU) 2022/2557 and in order to minimise the administrative burden for the entities concerned, those competent authorities should endeavour to harmonise incident notification templates and supervisory processes. Where appropriate, the competent authorities under Directive (EU) 2022/2557, should be able to request the competent authorities under this Directive to exercise their supervisory and enforcement powers in relation to an entity that is identified as a critical entity under Directive (EU) 2022/2557. The competent authorities under this Directive and those under Directive (EU) 2022/2557 should, where possible in real time, cooperate and exchange information for that purpose.

- (31) Entities belonging to the digital infrastructure sector are in essence based on network and information systems and therefore the obligations imposed on those entities pursuant to this Directive should address in a comprehensive manner the physical security of such systems as part of their cybersecurity risk-management measures and reporting obligations. Since those matters are covered by this Directive, the obligations laid down in Chapters III, IV and VI of Directive (EU) 2022/2557 do not apply to such entities.

<sup>(1)</sup> Regulation (EC) No 300/2008 of the European Parliament and of the Council of 11 March 2008 on common rules in the field of civil aviation security and repealing Regulation (EC) No 2320/2002 (OJ L 97, 9.4.2008, p. 72).

<sup>(12)</sup> Regulation (EU) 2018/1139 of the European Parliament and of the Council of 4 July 2018 on common rules in the field of civil aviation and establishing a European Union Aviation Safety Agency, and amending Regulations (EC) No 2111/2005, (EC) No 1008/2008, (EU) No 996/2010, (EU) No 376/2014 and Directives 2014/30/EU and 2014/53/EU of the European Parliament and of the Council, and repealing Regulations (EC) No 552/2004 and (EC) No 216/2008 of the European Parliament and of the Council and Council Regulation (EEC) No 3922/91 (OJ L 212, 22.8.2018, p. 1).

<sup>(13)</sup> Directive (EU) 2022/2557 of the European Parliament and of the Council of 14 December 2022 on the resilience of critical entities and repealing Council Directive 2008/114/EC (see page 164 of this Official Journal).

- (32) Upholding and preserving a reliable, resilient and secure domain name system (DNS) are key factors in maintaining the integrity of the internet and are essential for its continuous and stable operation, on which the digital economy and society depend. Therefore, this Directive should apply to top-level-domain (TLD) name registries, and DNS service providers that are to be understood as entities providing publicly available recursive domain name resolution services for internet end-users or authoritative domain name resolution services for third-party usage. This Directive should not apply to root name servers.
- (33) Cloud computing services should cover digital services that enable on-demand administration and broad remote access to a scalable and elastic pool of shareable computing resources, including where such resources are distributed across several locations. Computing resources include resources such as networks, servers or other infrastructure, operating systems, software, storage, applications and services. The service models of cloud computing include, inter alia, Infrastructure as a Service (IaaS), Platform as a Service (PaaS), Software as a Service (SaaS) and Network as a Service (NaaS). The deployment models of cloud computing should include private, community, public and hybrid cloud. The cloud computing service and deployment models have the same meaning as the terms of service and deployment models defined under ISO/IEC 17788:2014 standard. The capability of the cloud computing user to unilaterally self-provision computing capabilities, such as server time or network storage, without any human interaction by the cloud computing service provider could be described as on-demand administration.

The term 'broad remote access' is used to describe that the cloud capabilities are provided over the network and accessed through mechanisms promoting use of heterogeneous thin or thick client platforms, including mobile phones, tablets, laptops and workstations. The term 'scalable' refers to computing resources that are flexibly allocated by the cloud service provider, irrespective of the geographical location of the resources, in order to handle fluctuations in demand. The term 'elastic pool' is used to describe computing resources that are provided and released according to demand in order to rapidly increase and decrease resources available depending on workload. The term 'shareable' is used to describe computing resources that are provided to multiple users who share a common access to the service, but where the processing is carried out separately for each user, although the service is provided from the same electronic equipment. The term 'distributed' is used to describe computing resources that are located on different networked computers or devices and which communicate and coordinate among themselves by message passing.

- (34) Given the emergence of innovative technologies and new business models, new cloud computing service and deployment models are expected to appear in the internal market in response to evolving customer needs. In that context, cloud computing services may be delivered in a highly distributed form, even closer to where data are being generated or collected, thus moving from the traditional model to a highly distributed one (edge computing).
- (35) Services offered by data centre service providers may not always be provided in the form of a cloud computing service. Accordingly, data centres may not always constitute a part of cloud computing infrastructure. In order to manage all the risks posed to the security of network and information systems, this Directive should therefore cover providers of data centre services that are not cloud computing services. For the purposes of this Directive, the term 'data centre service' should cover provision of a service that encompasses structures, or groups of structures, dedicated to the centralised accommodation, interconnection and operation of information technology (IT) and network equipment providing data storage, processing and transport services together with all the facilities and infrastructures for power distribution and environmental control. The term 'data centre service' should not apply to in-house corporate data centres owned and operated by the entity concerned, for its own purposes.
- (36) Research activities play a key role in the development of new products and processes. Many of those activities are carried out by entities that share, disseminate or exploit the results of their research for commercial purposes. Those entities can therefore be important players in value chains, which makes the security of their network and information systems an integral part of the overall cybersecurity of the internal market. Research organisations should be understood to include entities which focus the essential part of their activities on the conduct of applied

research or experimental development, within the meaning of the Organisation for Economic Cooperation and Development's Frascati Manual 2015: Guidelines for Collecting and Reporting Data on Research and Experimental Development, with a view to exploiting their results for commercial purposes, such as the manufacturing or development of a product or process, the provision of a service, or the marketing thereof.

- (37) The growing interdependencies are the result of an increasingly cross-border and interdependent network of service provision using key infrastructures across the Union in sectors such as energy, transport, digital infrastructure, drinking water and waste water, health, certain aspects of public administration, as well as space in so far as the provision of certain services depending on ground-based infrastructures that are owned, managed and operated either by Member States or by private parties is concerned, therefore not covering infrastructures owned, managed or operated by or on behalf of the Union as part of its space programme. Those interdependencies mean that any disruption, even one initially confined to one entity or one sector, can have cascading effects more broadly, potentially resulting in far-reaching and long-lasting negative impacts in the delivery of services across the internal market. The intensified cyberattacks during the COVID-19 pandemic have shown the vulnerability of increasingly interdependent societies in the face of low-probability risks.
- (38) In view of the differences in national governance structures and in order to safeguard already existing sectoral arrangements or Union supervisory and regulatory bodies, Member States should be able to designate or establish one or more competent authorities responsible for cybersecurity and for the supervisory tasks under this Directive.
- (39) In order to facilitate cross-border cooperation and communication among authorities and to enable this Directive to be implemented effectively, it is necessary for each Member State to designate a single point of contact responsible for coordinating issues related to the security of network and information systems and cross-border cooperation at Union level.
- (40) The single points of contact should ensure effective cross-border cooperation with relevant authorities of other Member States and, where appropriate, with the Commission and ENISA. The single points of contact should therefore be tasked with forwarding notifications of significant incidents with cross-border impact to the single points of contact of other affected Member States upon the request of the CSIRT or the competent authority. At national level, the single points of contact should enable smooth cross-sectoral cooperation with other competent authorities. The single points of contact could also be the addressees of relevant information about incidents concerning financial entities from the competent authorities under Regulation (EU) 2022/2554 which they should be able to forward, as appropriate, to the CSIRTs or the competent authorities under this Directive.
- (41) Member States should be adequately equipped, in terms of both technical and organisational capabilities, to prevent, detect, respond to and mitigate incidents and risks. Member States should therefore establish or designate one or more CSIRTs under this Directive and ensure that they have adequate resources and technical capabilities. The CSIRTs should comply with the requirements laid down in this Directive in order to guarantee effective and compatible capabilities to deal with incidents and risks and to ensure efficient cooperation at Union level. Member States should be able to designate existing computer emergency response teams (CERTs) as CSIRTs. In order to enhance the trust relationship between the entities and the CSIRTs, where a CSIRT is part of a competent authority, Member States should be able to consider functional separation between the operational tasks provided by the CSIRTs, in particular in relation to information sharing and assistance provided to the entities, and the supervisory activities of the competent authorities.
- (42) The CSIRTs are tasked with incident handling. This includes the processing of large volumes of sometimes sensitive data. Member States should ensure that the CSIRTs have an infrastructure for information sharing and processing, as well as well-equipped staff, which ensures the confidentiality and trustworthiness of their operations. The CSIRTs could also adopt codes of conduct in that respect.

- (43) As regards personal data, the CSIRTs should be able to provide, in accordance with Regulation (EU) 2016/679, upon the request of an essential or important entity, a proactive scanning of the network and information systems used for the provision of the entity's services. Where applicable, Member States should aim to ensure an equal level of technical capabilities for all sectoral CSIRTs. Member States should be able to request the assistance of ENISA in developing their CSIRTs.
- (44) The CSIRTs should have the ability, upon an essential or important entity's request, to monitor the entity's internet-facing assets, both on and off premises, in order to identify, understand and manage the entity's overall organisational risks as regards newly identified supply chain compromises or critical vulnerabilities. The entity should be encouraged to communicate to the CSIRT whether it runs a privileged management interface, as this could affect the speed of undertaking mitigating actions.
- (45) Given the importance of international cooperation on cybersecurity, the CSIRTs should be able to participate in international cooperation networks in addition to the CSIRTs network established by this Directive. Therefore, for the purpose of carrying out their tasks, the CSIRTs and the competent authorities should be able to exchange information, including personal data, with the national computer security incident response teams or competent authorities of third countries provided that the conditions under Union data protection law for transfers of personal data to third countries, inter alia those of Article 49 of Regulation (EU) 2016/679, are met.
- (46) Ensuring adequate resources to meet the objectives of this Directive and to enable the competent authorities and the CSIRTs to carry out the tasks laid down herein is essential. The Member States can introduce at the national level a financing mechanism to cover necessary expenditure in relation to the conduct of tasks of public entities responsible for cybersecurity in the Member State pursuant to this Directive. Such mechanism should comply with Union law and should be proportionate and non-discriminatory and should take into account different approaches to providing secure services.
- (47) The CSIRTs network should continue to contribute to strengthening confidence and trust and to promote swift and effective operational cooperation among Member States. In order to enhance operational cooperation at Union level, the CSIRTs network should consider inviting Union bodies and agencies involved in cybersecurity policy, such as Europol, to participate in its work.
- (48) For the purpose of achieving and maintaining a high level of cybersecurity, the national cybersecurity strategies required under this Directive should consist of coherent frameworks providing strategic objectives and priorities in the area of cybersecurity and the governance to achieve them. Those strategies can be composed of one or more legislative or non-legislative instruments.
- (49) Cyber hygiene policies provide the foundations for protecting network and information system infrastructures, hardware, software and online application security, and business or end-user data upon which entities rely. Cyber hygiene policies comprising a common baseline set of practices, including software and hardware updates, password changes, the management of new installs, the limitation of administrator-level access accounts, and the backing-up of data, enable a proactive framework of preparedness and overall safety and security in the event of incidents or cyber threats. ENISA should monitor and analyse Member States' cyber hygiene policies.
- (50) Cybersecurity awareness and cyber hygiene are essential to enhance the level of cybersecurity within the Union, in particular in light of the growing number of connected devices that are increasingly used in cyberattacks. Efforts should be made to enhance the overall awareness of risks related to such devices, while assessments at Union level could help ensure a common understanding of such risks within the internal market.

- (51) Member States should encourage the use of any innovative technology, including artificial intelligence, the use of which could improve the detection and prevention of cyberattacks, enabling resources to be diverted towards cyberattacks more effectively. Member States should therefore encourage in their national cybersecurity strategy activities in research and development to facilitate the use of such technologies, in particular those relating to automated or semi-automated tools in cybersecurity, and, where relevant, the sharing of data needed for training users of such technology and for improving it. The use of any innovative technology, including artificial intelligence, should comply with Union data protection law, including the data protection principles of data accuracy, data minimisation, fairness and transparency, and data security, such as state-of-the-art encryption. The requirements of data protection by design and by default laid down in Regulation (EU) 2016/679 should be fully exploited.
- (52) Open-source cybersecurity tools and applications can contribute to a higher degree of openness and can have a positive impact on the efficiency of industrial innovation. Open standards facilitate interoperability between security tools, benefitting the security of industrial stakeholders. Open-source cybersecurity tools and applications can leverage the wider developer community, enabling diversification of suppliers. Open source can lead to a more transparent verification process of cybersecurity related tools and a community-driven process of discovering vulnerabilities. Member States should therefore be able to promote the use of open-source software and open standards by pursuing policies relating to the use of open data and open-source as part of security through transparency. Policies promoting the introduction and sustainable use of open-source cybersecurity tools are of particular importance for small and medium-sized enterprises facing significant costs for implementation, which could be minimised by reducing the need for specific applications or tools.
- (53) Utilities are increasingly connected to digital networks in cities, for the purpose of improving urban transport networks, upgrading water supply and waste disposal facilities and increasing the efficiency of lighting and the heating of buildings. Those digitalised utilities are vulnerable to cyberattacks and run the risk, in the event of a successful cyberattack, of harming citizens at a large scale due to their interconnectedness. Member States should develop a policy that addresses the development of such connected or smart cities, and their potential effects on society, as part of their national cybersecurity strategy.
- (54) In recent years, the Union has faced an exponential increase in ransomware attacks, in which malware encrypts data and systems and demands a ransom payment for release. The increasing frequency and severity of ransomware attacks can be driven by several factors, such as different attack patterns, criminal business models around 'ransomware as a service' and cryptocurrencies, ransom demands, and the rise of supply chain attacks. Member States should develop a policy addressing the rise of ransomware attacks as part of their national cybersecurity strategy.
- (55) Public-private partnerships (PPPs) in the field of cybersecurity can provide an appropriate framework for knowledge exchange, the sharing of best practices and the establishment of a common level of understanding among stakeholders. Member States should promote policies underpinning the establishment of cybersecurity-specific PPPs. Those policies should clarify, inter alia, the scope and stakeholders involved, the governance model, the available funding options and the interaction among participating stakeholders with regard to PPPs. PPPs can leverage the expertise of private-sector entities to assist the competent authorities in developing state-of-the-art services and processes including information exchange, early warnings, cyber threat and incident exercises, crisis management and resilience planning.
- (56) Member States should, in their national cybersecurity strategies, address the specific cybersecurity needs of small and medium-sized enterprises. Small and medium-sized enterprises represent, across the Union, a large percentage of the industrial and business market and often struggle to adapt to new business practices in a more connected world and to the digital environment, with employees working from home and business increasingly being conducted online. Some small and medium-sized enterprises face specific cybersecurity challenges such as low cyber-awareness, a lack of remote IT security, the high cost of cybersecurity solutions and an increased level of threat, such as ransomware, for which they should receive guidance and assistance. Small and medium-sized enterprises are increasingly becoming the target of supply chain attacks due to their less rigorous cybersecurity risk-management measures and attack management, and the fact that they have limited security resources. Such supply chain attacks not only have an impact on small and medium-sized enterprises and their operations in isolation but can also have a cascading effect on larger attacks on entities to which they provided supplies. Member States should, through their national

cybersecurity strategies, help small and medium-sized enterprises to address the challenges faced in their supply chains. Member States should have a point of contact for small and medium-sized enterprises at national or regional level, which either provides guidance and assistance to small and medium-sized enterprises or directs them to the appropriate bodies for guidance and assistance with regard to cybersecurity related issues. Member States are also encouraged to offer services such as website configuration and logging enabling to microenterprises and small enterprises that lack those capabilities.

- (57) As part of their national cybersecurity strategies, Member States should adopt policies on the promotion of active cyber protection as part of a wider defensive strategy. Rather than responding reactively, active cyber protection is the prevention, detection, monitoring, analysis and mitigation of network security breaches in an active manner, combined with the use of capabilities deployed within and outside the victim network. This could include Member States offering free services or tools to certain entities, including self-service checks, detection tools and takedown services. The ability to rapidly and automatically share and understand threat information and analysis, cyber activity alerts, and response action is critical to enable a unity of effort in successfully preventing, detecting, addressing and blocking attacks against network and information systems. Active cyber protection is based on a defensive strategy that excludes offensive measures.
- (58) Since the exploitation of vulnerabilities in network and information systems may cause significant disruption and harm, swiftly identifying and remedying such vulnerabilities is an important factor in reducing risk. Entities that develop or administer network and information systems should therefore establish appropriate procedures to handle vulnerabilities when they are discovered. Since vulnerabilities are often discovered and disclosed by third parties, the manufacturer or provider of ICT products or ICT services should also put in place the necessary procedures to receive vulnerability information from third parties. In that regard, international standards ISO/IEC 30111 and ISO/IEC 29147 provide guidance on vulnerability handling and vulnerability disclosure. Strengthening the coordination between reporting natural and legal persons and manufacturers or providers of ICT products or ICT services is particularly important for the purpose of facilitating the voluntary framework of vulnerability disclosure. Coordinated vulnerability disclosure specifies a structured process through which vulnerabilities are reported to the manufacturer or provider of the potentially vulnerable ICT products or ICT services in a manner allowing it to diagnose and remedy the vulnerability before detailed vulnerability information is disclosed to third parties or to the public. Coordinated vulnerability disclosure should also include coordination between the reporting natural or legal person and the manufacturer or provider of the potentially vulnerable ICT products or ICT services as regards the timing of remediation and publication of vulnerabilities.
- (59) The Commission, ENISA and the Member States should continue to foster alignments with international standards and existing industry best practices in the area of cybersecurity risk management, for example in the areas of supply chain security assessments, information sharing and vulnerability disclosure.
- (60) Member States, in cooperation with ENISA, should take measures to facilitate coordinated vulnerability disclosure by establishing a relevant national policy. As part of their national policy, Member States should aim to address, to the extent possible, the challenges faced by vulnerability researchers, including their potential exposure to criminal liability, in accordance with national law. Given that natural and legal persons researching vulnerabilities could in some Member States be exposed to criminal and civil liability, Member States are encouraged to adopt guidelines as regards the non-prosecution of information security researchers and an exemption from civil liability for their activities.
- (61) Member States should designate one of its CSIRTs as a coordinator, acting as a trusted intermediary between the reporting natural or legal persons and the manufacturers or providers of ICT products or ICT services, which are likely to be affected by the vulnerability, where necessary. The tasks of the CSIRT designated as coordinator should include identifying and contacting the entities concerned, assisting the natural or legal persons reporting a vulnerability, negotiating disclosure timelines and managing vulnerabilities that affect multiple entities (multi-party

coordinated vulnerability disclosure). Where the reported vulnerability could have significant impact on entities in more than one Member State, the CSIRTs designated as coordinators should cooperate within the CSIRTs network, where appropriate.

- (62) Access to correct and timely information about vulnerabilities affecting ICT products and ICT services contributes to an enhanced cybersecurity risk management. Sources of publicly available information about vulnerabilities are an important tool for the entities and for the users of their services, but also for the competent authorities and the CSIRTs. For that reason, ENISA should establish a European vulnerability database where entities, regardless of whether they fall within the scope of this Directive, and their suppliers of network and information systems, as well as the competent authorities and the CSIRTs, can disclose and register, on a voluntary basis, publicly known vulnerabilities for the purpose of allowing users to take appropriate mitigating measures. The aim of that database is to address the unique challenges posed by risks to Union entities. Furthermore, ENISA should establish an appropriate procedure regarding the publication process in order to give entities the time to take mitigating measures as regards their vulnerabilities and employ state-of-the-art cybersecurity risk-management measures as well as machine-readable datasets and corresponding interfaces. To encourage a culture of disclosure of vulnerabilities, disclosure should have no detrimental effects on the reporting natural or legal person.
- (63) Although similar vulnerability registries or databases exist, they are hosted and maintained by entities which are not established in the Union. A European vulnerability database maintained by ENISA would provide improved transparency regarding the publication process before the vulnerability is publicly disclosed, and resilience in the event of a disruption or an interruption of the provision of similar services. In order, to the extent possible, to avoid a duplication of efforts and to seek complementarity, ENISA should explore the possibility of entering into structured cooperation agreements with similar registries or databases that fall under third-country jurisdiction. In particular, ENISA should explore the possibility of close cooperation with the operators of the Common Vulnerabilities and Exposures (CVE) system.
- (64) The Cooperation Group should support and facilitate strategic cooperation and the exchange of information, as well as strengthen trust and confidence among Member States. The Cooperation Group should establish a work programme every two years. The work programme should include the actions to be undertaken by the Cooperation Group to implement its objectives and tasks. The timeframe for the establishment of the first work programme under this Directive should be aligned with the timeframe of the last work programme established under Directive (EU) 2016/1148 in order to avoid potential disruptions in the work of the Cooperation Group.
- (65) When developing guidance documents, the Cooperation Group should consistently map national solutions and experiences, assess the impact of Cooperation Group deliverables on national approaches, discuss implementation challenges and formulate specific recommendations, in particular as regards facilitating an alignment of the transposition of this Directive among Member States, to be addressed through a better implementation of existing rules. The Cooperation Group could also map the national solutions in order to promote compatibility of cybersecurity solutions applied to each specific sector across the Union. This is particularly relevant to sectors that have an international or cross-border nature.
- (66) The Cooperation Group should remain a flexible forum and be able to react to changing and new policy priorities and challenges while taking into account the availability of resources. It could organise regular joint meetings with relevant private stakeholders from across the Union to discuss activities carried out by the Cooperation Group and gather data and input on emerging policy challenges. Additionally, the Cooperation Group should carry out a regular assessment of the state of play of cyber threats or incidents, such as ransomware. In order to enhance cooperation at Union level, the Cooperation Group should consider inviting relevant Union institutions, bodies, offices and agencies involved in cybersecurity policy, such as the European Parliament, Europol, the European Data

Protection Board, the European Union Aviation Safety Agency, established by Regulation (EU) 2018/1139, and the European Union Agency for Space Programme, established by Regulation (EU) 2021/696 of the European Parliament and the Council <sup>(14)</sup>, to participate in its work.

- (67) The competent authorities and the CSIRTs should be able to participate in exchange schemes for officials from other Member States, within a specific framework and, where applicable, subject to the required security clearance of officials participating in such exchange schemes, in order to improve cooperation and strengthen trust among Member States. The competent authorities should take the necessary measures to enable officials from other Member States to play an effective role in the activities of the host competent authority or the host CSIRT.
- (68) Member States should contribute to the establishment of the EU Cybersecurity Crisis Response Framework as set out in Commission Recommendation (EU) 2017/1584 <sup>(15)</sup> through the existing cooperation networks, in particular the European cyber crisis liaison organisation network (EU-CyCLONe), the CSIRTs network and the Cooperation Group. EU-CyCLONe and the CSIRTs network should cooperate on the basis of procedural arrangements that specify the details of that cooperation and avoid any duplication of tasks. EU-CyCLONe's rules of procedure should further specify the arrangements through which that network should function, including the network's roles, means of cooperation, interactions with other relevant actors and templates for information sharing, as well as means of communication. For crisis management at Union level, relevant parties should rely on the EU Integrated Political Crisis Response arrangements under Council Implementing Decision (EU) 2018/1993 <sup>(16)</sup> (IPCR arrangements). The Commission should use the ARGUS high-level cross-sectoral crisis coordination process for that purpose. If the crisis entails an important external or Common Security and Defence Policy dimension, the European External Action Service Crisis Response Mechanism should be activated.
- (69) In accordance with the Annex to Recommendation (EU) 2017/1584, a large-scale cybersecurity incident should mean an incident which causes a level of disruption that exceeds a Member State's capacity to respond to it or which has a significant impact on at least two Member States. Depending on their cause and impact, large-scale cybersecurity incidents may escalate and turn into fully-fledged crises not allowing the proper functioning of the internal market or posing serious public security and safety risks for entities or citizens in several Member States or the Union as a whole. Given the wide-ranging scope and, in most cases, the cross-border nature of such incidents, Member States and the relevant Union institutions, bodies, offices and agencies should cooperate at technical, operational and political level to properly coordinate the response across the Union.
- (70) Large-scale cybersecurity incidents and crises at Union level require coordinated action to ensure a rapid and effective response because of the high degree of interdependence between sectors and Member States. The availability of cyber-resilient network and information systems and the availability, confidentiality and integrity of data are vital for the security of the Union and for the protection of its citizens, businesses and institutions against incidents and cyber threats, as well as for enhancing the trust of individuals and organisations in the Union's ability to promote and protect a global, open, free, stable and secure cyberspace grounded in human rights, fundamental freedoms, democracy and the rule of law.

<sup>(14)</sup> Regulation (EU) 2021/696 of the European Parliament and of the Council of 28 April 2021 establishing the Union Space Programme and the European Union Agency for the Space Programme and repealing Regulations (EU) No 912/2010, (EU) No 1285/2013 and (EU) No 377/2014 and Decision No 541/2014/EU (OJ L 170, 12.5.2021, p. 69).

<sup>(15)</sup> Commission Recommendation (EU) 2017/1584 of 13 September 2017 on coordinated response to large-scale cybersecurity incidents and crises (OJ L 239, 19.9.2017, p. 36).

<sup>(16)</sup> Council Implementing Decision (EU) 2018/1993 of 11 December 2018 on the EU Integrated Political Crisis Response Arrangements (OJ L 320, 17.12.2018, p. 28).

- (71) EU-CyCLONE should work as an intermediary between the technical and political level during large-scale cybersecurity incidents and crises and should enhance cooperation at operational level and support decision-making at political level. In cooperation with the Commission, having regard to the Commission's competence in the area of crisis management, EU-CyCLONE should build on the CSIRTs network findings and use its own capabilities to create impact analysis of large-scale cybersecurity incidents and crises.
- (72) Cyberattacks are of a cross-border nature, and a significant incident can disrupt and damage critical information infrastructures on which the smooth functioning of the internal market depends. Recommendation (EU) 2017/1584 addresses the role of all relevant actors. Furthermore, the Commission is responsible, within the framework of the Union Civil Protection Mechanism, established by Decision No 1313/2013/EU of the European Parliament and of the Council <sup>(17)</sup>, for general preparedness actions including managing the Emergency Response Coordination Centre and the Common Emergency Communication and Information System, maintaining and further developing situational awareness and analysis capability, and establishing and managing the capability to mobilise and dispatch expert teams in the event of a request for assistance from a Member State or third country. The Commission is also responsible for providing analytical reports for the IPCR arrangements under Implementing Decision (EU) 2018/1993, including in relation to cybersecurity situational awareness and preparedness, as well as for situational awareness and crisis response in the areas of agriculture, adverse weather conditions, conflict mapping and forecasts, early warning systems for natural disasters, health emergencies, infection disease surveillance, plant health, chemical incidents, food and feed safety, animal health, migration, customs, nuclear and radiological emergencies, and energy.
- (73) The Union can, where appropriate, conclude international agreements, in accordance with Article 218 TFEU, with third countries or international organisations, allowing and organising their participation in particular activities of the Cooperation Group, the CSIRTs network and EU-CyCLONE. Such agreements should ensure the Union's interests and the adequate protection of data. This should not preclude the right of Member States to cooperate with third countries on management of vulnerabilities and cybersecurity risk management, facilitating reporting and general information sharing in accordance with Union law.
- (74) In order to facilitate the effective implementation of this Directive with regard, inter alia, to the management of vulnerabilities, cybersecurity risk-management measures, reporting obligations and cybersecurity information-sharing arrangements, Member States can cooperate with third countries and undertake activities that are considered to be appropriate for that purpose, including information exchange on cyber threats, incidents, vulnerabilities, tools and methods, tactics, techniques and procedures, cybersecurity crisis management preparedness and exercises, training, trust building and structured information-sharing arrangements.
- (75) Peer reviews should be introduced to help learn from shared experiences, strengthen mutual trust and achieve a high common level of cybersecurity. Peer reviews can lead to valuable insights and recommendations strengthening the overall cybersecurity capabilities, creating another functional path for the sharing of best practices across Member States and contributing to enhance the Member States' levels of maturity in cybersecurity. Furthermore, peer reviews should take account of the results of similar mechanisms, such as the peer-review system of the CSIRTs network, and should add value and avoid duplication. The implementation of peer reviews should be without prejudice to Union or national law on the protection of confidential or classified information.
- (76) The Cooperation Group should establish a self-assessment methodology for Member States, aiming to cover factors such as the level of implementation of the cybersecurity risk-management measures and reporting obligations, the level of capabilities and the effectiveness of the exercise of the tasks of the competent authorities, the operational capabilities of the CSIRTs, the level of implementation of mutual assistance, the level of implementation of the cybersecurity information-sharing arrangements, or specific issues of cross-border or cross-sector nature. Member States should be encouraged to carry out self-assessments on a regular basis, and to present and discuss the results of their self-assessment within the Cooperation Group.

---

<sup>(17)</sup> Decision No 1313/2013/EU of the European Parliament and of the Council of 17 December 2013 on a Union Civil Protection Mechanism (OJ L 347, 20.12.2013, p. 924).

- (77) Responsibility for ensuring the security of network and information system lies, to a great extent, with essential and important entities. A culture of risk management, involving risk assessments and the implementation of cybersecurity risk-management measures appropriate to the risks faced, should be promoted and developed.
- (78) Cybersecurity risk-management measures should take into account the degree of dependence of the essential or important entity on network and information systems and include measures to identify any risks of incidents, to prevent, detect, respond to and recover from incidents and to mitigate their impact. The security of network and information systems should include the security of stored, transmitted and processed data. Cybersecurity risk-management measures should provide for systemic analysis, taking into account the human factor, in order to have a complete picture of the security of the network and information system.
- (79) As threats to the security of network and information systems can have different origins, cybersecurity risk-management measures should be based on an all-hazards approach, which aims to protect network and information systems and the physical environment of those systems from events such as theft, fire, flood, telecommunication or power failures, or unauthorised physical access and damage to, and interference with, an essential or important entity's information and information processing facilities, which could compromise the availability, authenticity, integrity or confidentiality of stored, transmitted or processed data or of the services offered by, or accessible via, network and information systems. The cybersecurity risk-management measures should therefore also address the physical and environmental security of network and information systems by including measures to protect such systems from system failures, human error, malicious acts or natural phenomena, in line with European and international standards, such as those included in the ISO/IEC 27000 series. In that regard, essential and important entities should, as part of their cybersecurity risk-management measures, also address human resources security and have in place appropriate access control policies. Those measures should be consistent with Directive (EU) 2022/2557.
- (80) For the purpose of demonstrating compliance with cybersecurity risk-management measures and in the absence of appropriate European cybersecurity certification schemes adopted in accordance with Regulation (EU) 2019/881 of the European Parliament and of the Council <sup>(18)</sup>, Member States should, in consultation with the Cooperation Group and the European Cybersecurity Certification Group, promote the use of relevant European and international standards by essential and important entities or may require entities to use certified ICT products, ICT services and ICT processes.
- (81) In order to avoid imposing a disproportionate financial and administrative burden on essential and important entities, the cybersecurity risk-management measures should be proportionate to the risks posed to the network and information system concerned, taking into account the state-of-the-art of such measures, and, where applicable, relevant European and international standards, as well as the cost for their implementation.
- (82) Cybersecurity risk-management measures should be proportionate to the degree of the essential or important entity's exposure to risks and to the societal and economic impact that an incident would have. When establishing cybersecurity risk-management measures adapted to essential and important entities, due account should be taken of the divergent risk exposure of essential and important entities, such as the criticality of the entity, the risks, including societal risks, to which it is exposed, the entity's size and the likelihood of occurrence of incidents and their severity, including their societal and economic impact.

---

<sup>(18)</sup> Regulation (EU) 2019/881 of the European Parliament and of the Council of 17 April 2019 on ENISA (the European Union Agency for Cybersecurity) and on information and communications technology cybersecurity certification and repealing Regulation (EU) No 526/2013 (Cybersecurity Act) (OJ L 151, 7.6.2019, p. 15).

- (83) Essential and important entities should ensure the security of the network and information systems which they use in their activities. Those systems are primarily private network and information systems managed by the essential and important entities' internal IT staff or the security of which has been outsourced. The cybersecurity risk-management measures and reporting obligations laid down in this Directive should apply to the relevant essential and important entities regardless of whether those entities maintain their network and information systems internally or outsource the maintenance thereof.
- (84) Taking account of their cross-border nature, DNS service providers, TLD name registries, cloud computing service providers, data centre service providers, content delivery network providers, managed service providers, managed security service providers, providers of online marketplaces, of online search engines and of social networking services platforms, and trust service providers should be subject to a high degree of harmonisation at Union level. The implementation of cybersecurity risk-management measures with regard to those entities should therefore be facilitated by an implementing act.
- (85) Addressing risks stemming from an entity's supply chain and its relationship with its suppliers, such as providers of data storage and processing services or managed security service providers and software editors, is particularly important given the prevalence of incidents where entities have been the victim of cyberattacks and where malicious perpetrators were able to compromise the security of an entity's network and information systems by exploiting vulnerabilities affecting third-party products and services. Essential and important entities should therefore assess and take into account the overall quality and resilience of products and services, the cybersecurity risk-management measures embedded in them, and the cybersecurity practices of their suppliers and service providers, including their secure development procedures. Essential and important entities should in particular be encouraged to incorporate cybersecurity risk-management measures into contractual arrangements with their direct suppliers and service providers. Those entities could consider risks stemming from other levels of suppliers and service providers.
- (86) Among service providers, managed security service providers in areas such as incident response, penetration testing, security audits and consultancy play a particularly important role in assisting entities in their efforts to prevent, detect, respond to or recover from incidents. Managed security service providers have however also themselves been the target of cyberattacks and, because of their close integration in the operations of entities pose a particular risk. Essential and important entities should therefore exercise increased diligence in selecting a managed security service provider.
- (87) The competent authorities, in the context of their supervisory tasks, may also benefit from cybersecurity services such as security audits, penetration testing or incident responses.
- (88) Essential and important entities should also address risks stemming from their interactions and relationships with other stakeholders within a broader ecosystem, including with regard to countering industrial espionage and protecting trade secrets. In particular, those entities should take appropriate measures to ensure that their cooperation with academic and research institutions takes place in line with their cybersecurity policies and follows good practices as regards secure access and dissemination of information in general and the protection of intellectual property in particular. Similarly, given the importance and value of data for the activities of essential and important entities, when relying on data transformation and data analytics services from third parties, those entities should take all appropriate cybersecurity risk-management measures.
- (89) Essential and important entities should adopt a wide range of basic cyber hygiene practices, such as zero-trust principles, software updates, device configuration, network segmentation, identity and access management or user awareness, organise training for their staff and raise awareness concerning cyber threats, phishing or social engineering techniques. Furthermore, those entities should evaluate their own cybersecurity capabilities and, where appropriate, pursue the integration of cybersecurity enhancing technologies, such as artificial intelligence or machine-learning systems to enhance their capabilities and the security of network and information systems.

- (90) To further address key supply chain risks and assist essential and important entities operating in sectors covered by this Directive to appropriately manage supply chain and supplier related risks, the Cooperation Group, in cooperation with the Commission and ENISA, and where appropriate after consulting relevant stakeholders including from the industry, should carry out coordinated security risk assessments of critical supply chains, as carried out for 5G networks following Commission Recommendation (EU) 2019/534 <sup>(19)</sup>, with the aim of identifying, per sector, the critical ICT services, ICT systems or ICT products, relevant threats and vulnerabilities. Such coordinated security risk assessments should identify measures, mitigation plans and best practices to counter critical dependencies, potential single points of failure, threats, vulnerabilities and other risks associated with the supply chain and should explore ways to further encourage their wider adoption by essential and important entities. Potential non-technical risk factors, such as undue influence by a third country on suppliers and service providers, in particular in the case of alternative models of governance, include concealed vulnerabilities or backdoors and potential systemic supply disruptions, in particular in the case of technological lock-in or provider dependency.
- (91) The coordinated security risk assessments of critical supply chains, in light of the features of the sector concerned, should take into account both technical and, where relevant, non-technical factors including those defined in Recommendation (EU) 2019/534, in the EU coordinated risk assessment of the cybersecurity of 5G networks and in the EU Toolbox on 5G cybersecurity agreed by the Cooperation Group. To identify the supply chains that should be subject to a coordinated security risk assessment, the following criteria should be taken into account: (i) the extent to which essential and important entities use and rely on specific critical ICT services, ICT systems or ICT products; (ii) the relevance of specific critical ICT services, ICT systems or ICT products for performing critical or sensitive functions, including the processing of personal data; (iii) the availability of alternative ICT services, ICT systems or ICT products; (iv) the resilience of the overall supply chain of ICT services, ICT systems or ICT products throughout their lifecycle against disruptive events; and (v) for emerging ICT services, ICT systems or ICT products, their potential future significance for the entities' activities. Furthermore, particular emphasis should be placed on ICT services, ICT systems or ICT products that are subject to specific requirements stemming from third countries.
- (92) In order to streamline the obligations imposed on providers of public electronic communications networks or of publicly available electronic communications services, and trust service providers, related to the security of their network and information systems, as well as to enable those entities and the competent authorities under Directive (EU) 2018/1972 of the European Parliament and of the Council <sup>(20)</sup> and Regulation (EU) No 910/2014 respectively to benefit from the legal framework established by this Directive, including the designation of a CSIRT responsible for incident handling, the participation of the competent authorities concerned in the activities of the Cooperation Group and the CSIRTs network, those entities should fall within the scope of this Directive. The corresponding provisions laid down in Regulation (EU) No 910/2014 and Directive (EU) 2018/1972 related to the imposition of security and notification requirements on those types of entity should therefore be deleted. The rules on reporting obligations laid down in this Directive should be without prejudice to Regulation (EU) 2016/679 and Directive 2002/58/EC.
- (93) The cybersecurity obligations laid down in this Directive should be considered to be complementary to the requirements imposed on trust service providers under Regulation (EU) No 910/2014. Trust service providers should be required to take all appropriate and proportionate measures to manage the risks posed to their services, including in relation to customers and relying third parties, and to report incidents under this Directive. Such cybersecurity and reporting obligations should also concern the physical protection of the services provided. The requirements for qualified trust service providers laid down in Article 24 of Regulation (EU) No 910/2014 continue to apply.

<sup>(19)</sup> Commission Recommendation (EU) 2019/534 of 26 March 2019 – Cybersecurity of 5G networks (OJ L 88, 29.3.2019, p. 42).

<sup>(20)</sup> Directive (EU) 2018/1972 of the European Parliament and of the Council of 11 December 2018 establishing the European Electronic Communications Code (OJ L 321, 17.12.2018, p. 36).

- (94) Member States can assign the role of the competent authorities for trust services to the supervisory bodies under Regulation (EU) No 910/2014 in order to ensure the continuation of current practices and to build on the knowledge and experience gained in the application of that Regulation. In such a case, the competent authorities under this Directive should cooperate closely and in a timely manner with those supervisory bodies by exchanging relevant information in order to ensure effective supervision and compliance of trust service providers with the requirements laid down in this Directive and in Regulation (EU) No 910/2014. Where applicable, the CSIRT or the competent authority under this Directive should immediately inform the supervisory body under Regulation (EU) No 910/2014 about any notified significant cyber threat or incident affecting trust services as well as about any infringements by a trust service provider of this Directive. For the purpose of reporting, Member States can, where applicable, use the single entry point established to achieve a common and automatic incident reporting to both the supervisory body under Regulation (EU) No 910/2014 and the CSIRT or the competent authority under this Directive.
- (95) Where appropriate and in order to avoid unnecessary disruption, existing national guidelines adopted for the transposition of the rules related to security measures laid down in Articles 40 and 41 of Directive (EU) 2018/1972 should be taken into account in the transposition of this Directive, thereby building on the knowledge and skills already acquired under Directive (EU) 2018/1972 concerning security measures and incident notifications. ENISA can also develop guidance on security requirements and on reporting obligations for providers of public electronic communications networks or of publicly available electronic communications services to facilitate harmonisation and transition and to minimise disruption. Member States can assign the role of the competent authorities for electronic communications to the national regulatory authorities under Directive (EU) 2018/1972 in order to ensure the continuation of current practices and to build on the knowledge and experience gained as a result of the implementation of that Directive.
- (96) Given the growing importance of number-independent interpersonal communications services as defined in Directive (EU) 2018/1972, it is necessary to ensure that such services are also subject to appropriate security requirements in view of their specific nature and economic importance. As the attack surface continues to expand, number-independent interpersonal communications services, such as messaging services, are becoming widespread attack vectors. Malicious perpetrators use platforms to communicate and attract victims to open compromised web pages, therefore increasing the likelihood of incidents involving the exploitation of personal data, and, by extension, the security of network and information systems. Providers of number-independent interpersonal communications services should ensure a level of security of network and information systems appropriate to the risks posed. Given that providers of number-independent interpersonal communications services normally do not exercise actual control over the transmission of signals over networks, the degree of risks posed to such services can be considered in some respects to be lower than for traditional electronic communications services. The same applies to interpersonal communications services as defined in Directive (EU) 2018/1972 which make use of numbers and which do not exercise actual control over signal transmission.
- (97) The internal market is more reliant on the functioning of the internet than ever. The services of almost all essential and important entities are dependent on services provided over the internet. In order to ensure the smooth provision of services provided by essential and important entities, it is important that all providers of public electronic communications networks have appropriate cybersecurity risk-management measures in place and report significant incidents in relation thereto. Member States should ensure that the security of the public electronic communications networks is maintained and that their vital security interests are protected from sabotage and espionage. Since international connectivity enhances and accelerates the competitive digitalisation of the Union and its economy, incidents affecting undersea communications cables should be reported to the CSIRT or, where applicable, the competent authority. The national cybersecurity strategy should, where relevant, take into account the cybersecurity of undersea communications cables and include a mapping of potential cybersecurity risks and mitigation measures to secure the highest level of their protection.

- (98) In order to safeguard the security of public electronic communications networks and publicly available electronic communications services, the use of encryption technologies, in particular end-to-end encryption as well as data-centric security concepts, such as cartography, segmentation, tagging, access policy and access management, and automated access decisions, should be promoted. Where necessary, the use of encryption, in particular end-to-end encryption should be mandatory for providers of public electronic communications networks or of publicly available electronic communications services in accordance with the principles of security and privacy by default and by design for the purposes of this Directive. The use of end-to-end encryption should be reconciled with the Member States' powers to ensure the protection of their essential security interests and public security, and to allow for the prevention, investigation, detection and prosecution of criminal offences in accordance with Union law. However, this should not weaken end-to-end encryption, which is a critical technology for the effective protection of data and privacy and the security of communications.
- (99) In order to safeguard the security, and to prevent abuse and manipulation, of public electronic communications networks and of publicly available electronic communications services, the use of secure routing standards should be promoted to ensure the integrity and robustness of routing functions across the ecosystem of internet access service providers.
- (100) In order to safeguard the functionality and integrity of the internet and to promote the security and resilience of the DNS, relevant stakeholders including Union private-sector entities, providers of publicly available electronic communications services, in particular internet access service providers, and providers of online search engines should be encouraged to adopt a DNS resolution diversification strategy. Furthermore, Member States should encourage the development and use of a public and secure European DNS resolver service.
- (101) This Directive lays down a multiple-stage approach to the reporting of significant incidents in order to strike the right balance between, on the one hand, swift reporting that helps mitigate the potential spread of significant incidents and allows essential and important entities to seek assistance, and, on the other, in-depth reporting that draws valuable lessons from individual incidents and improves over time the cyber resilience of individual entities and entire sectors. In that regard, this Directive should include the reporting of incidents that, based on an initial assessment carried out by the entity concerned, could cause severe operational disruption of the services or financial loss for that entity or affect other natural or legal persons by causing considerable material or non-material damage. Such initial assessment should take into account, inter alia, the affected network and information systems, in particular their importance in the provision of the entity's services, the severity and technical characteristics of a cyber threat and any underlying vulnerabilities that are being exploited as well as the entity's experience with similar incidents. Indicators such as the extent to which the functioning of the service is affected, the duration of an incident or the number of affected recipients of services could play an important role in identifying whether the operational disruption of the service is severe.
- (102) Where essential or important entities become aware of a significant incident, they should be required to submit an early warning without undue delay and in any event within 24 hours. That early warning should be followed by an incident notification. The entities concerned should submit an incident notification without undue delay and in any event within 72 hours of becoming aware of the significant incident, with the aim, in particular, of updating information submitted through the early warning and indicating an initial assessment of the significant incident, including its severity and impact, as well as indicators of compromise, where available. A final report should be submitted not later than one month after the incident notification. The early warning should only include the information necessary to make the CSIRT, or where applicable the competent authority, aware of the significant incident and allow the entity concerned to seek assistance, if required. Such early warning, where applicable, should indicate whether the significant incident is suspected of being caused by unlawful or malicious acts, and whether it is likely to have a cross-border impact. Member States should ensure that the obligation to submit that early warning, or the subsequent incident notification, does not divert the notifying entity's resources from activities related to incident handling that should be prioritised, in order to prevent incident reporting obligations from either diverting resources from significant incident response handling or otherwise compromising the entity's efforts in that respect.

In the event of an ongoing incident at the time of the submission of the final report, Member States should ensure that entities concerned provide a progress report at that time, and a final report within one month of their handling of the significant incident.

- (103) Where applicable, essential and important entities should communicate, without undue delay, to their service recipients any measures or remedies that they can take to mitigate the resulting risks from a significant cyber threat. Those entities should, where appropriate and in particular where the significant cyber threat is likely to materialise, also inform their service recipients of the threat itself. The requirement to inform those recipients of significant cyber threats should be met on a best efforts basis but should not discharge those entities from the obligation to take, at their own expense, appropriate and immediate measures to prevent or remedy any such threats and restore the normal security level of the service. The provision of such information about significant cyber threats to the service recipients should be free of charge and drafted in easily comprehensible language.
- (104) Providers of public electronic communications networks or of publicly available electronic communications services should implement security by design and by default, and inform their service recipients of significant cyber threats and of measures they can take to protect the security of their devices and communications, for example by using specific types of software or encryption technologies.
- (105) A proactive approach to cyber threats is a vital component of cybersecurity risk management that should enable the competent authorities to effectively prevent cyber threats from materialising into incidents that may cause considerable material or non-material damage. For that purpose, the notification of cyber threats is of key importance. To that end, entities are encouraged to report on a voluntary basis cyber threats.
- (106) In order to simplify the reporting of information required under this Directive as well as to decrease the administrative burden for entities, Member States should provide technical means such as a single entry point, automated systems, online forms, user-friendly interfaces, templates, dedicated platforms for the use of entities, regardless of whether they fall within the scope of this Directive, for the submission of the relevant information to be reported. Union funding supporting the implementation of this Directive, in particular within the Digital Europe programme, established by Regulation (EU) 2021/694 of the European Parliament and of the Council <sup>(21)</sup>, could include support for single entry points. Furthermore, entities are often in a situation where a particular incident, because of its features, needs to be reported to various authorities as a result of notification obligations included in various legal instruments. Such cases create additional administrative burden and could also lead to uncertainties with regard to the format and procedures of such notifications. Where a single entry point is established, Member States are encouraged also to use that single entry point for notifications of security incidents required under other Union law, such as Regulation (EU) 2016/679 and Directive 2002/58/EC. The use of such single entry point for reporting of security incidents under Regulation (EU) 2016/679 and Directive 2002/58/EC should not affect the application of the provisions of Regulation (EU) 2016/679 and Directive 2002/58/EC, in particular those relating to the independence of the authorities referred to therein. ENISA, in cooperation with the Cooperation Group, should develop common notification templates by means of guidelines to simplify and streamline the information to be reported under Union law and decrease the administrative burden on notifying entities.
- (107) Where it is suspected that an incident is related to serious criminal activities under Union or national law, Member States should encourage essential and important entities, on the basis of applicable criminal proceedings rules in accordance with Union law, to report incidents of a suspected serious criminal nature to the relevant law enforcement authorities. Where appropriate, and without prejudice to the personal data protection rules applying to Europol, it is desirable that coordination between the competent authorities and the law enforcement authorities of different Member States be facilitated by the European Cybercrime Centre (EC3) and ENISA.

<sup>(21)</sup> Regulation (EU) 2021/694 of the European Parliament and of the Council of 29 April 2021 establishing the Digital Europe Programme and repealing Decision (EU) 2015/2240 (OJ L 166, 11.5.2021, p. 1).

- (108) Personal data are in many cases compromised as a result of incidents. In that context, the competent authorities should cooperate and exchange information about all relevant matters with the authorities referred to in Regulation (EU) 2016/679 and Directive 2002/58/EC.
- (109) Maintaining accurate and complete databases of domain name registration data (WHOIS data) and providing lawful access to such data is essential to ensure the security, stability and resilience of the DNS, which in turn contributes to a high common level of cybersecurity across the Union. For that specific purpose, TLD name registries and entities providing domain name registration services should be required to process certain data necessary to achieve that purpose. Such processing should constitute a legal obligation within the meaning of Article 6(1), point (c), of Regulation (EU) 2016/679. That obligation is without prejudice to the possibility to collect domain name registration data for other purposes, for example on the basis of contractual arrangements or legal requirements established in other Union or national law. That obligation aims to achieve a complete and accurate set of registration data and should not result in collecting the same data multiple times. The TLD name registries and the entities providing domain name registration services should cooperate with each other in order to avoid the duplication of that task.
- (110) The availability and timely accessibility of domain name registration data to legitimate access seekers is essential for the prevention and combating of DNS abuse, and for the prevention and detection of and response to incidents. Legitimate access seekers are to be understood as any natural or legal person making a request pursuant to Union or national law. They can include authorities that are competent under this Directive and those that are competent under Union or national law for the prevention, investigation, detection or prosecution of criminal offences, and CERTs or CSIRTs. TLD name registries and entities providing domain name registration services should be required to enable lawful access to specific domain name registration data, which are necessary for the purposes of the access request, to legitimate access seekers in accordance with Union and national law. The request of legitimate access seekers should be accompanied by a statement of reasons permitting the assessment of the necessity of access to the data.
- (111) In order to ensure the availability of accurate and complete domain name registration data, TLD name registries and entities providing domain name registration services should collect and guarantee the integrity and availability of domain name registration data. In particular, TLD name registries and entities providing domain name registration services should establish policies and procedures to collect and maintain accurate and complete domain name registration data, as well as to prevent and correct inaccurate registration data, in accordance with Union data protection law. Those policies and procedures should take into account, to the extent possible, the standards developed by the multi-stakeholder governance structures at international level. The TLD name registries and the entities providing domain name registration services should adopt and implement proportionate procedures to verify domain name registration data. Those procedures should reflect the best practices used within the industry and, to the extent possible, the progress made in the field of electronic identification. Examples of verification procedures may include *ex ante* controls carried out at the time of the registration and *ex post* controls carried out after the registration. The TLD name registries and the entities providing domain name registration services should, in particular, verify at least one means of contact of the registrant.
- (112) TLD name registries and entities providing domain name registration services should be required to make publicly available domain name registration data that fall outside the scope of Union data protection law, such as data that concern legal persons, in line with the preamble of Regulation (EU) 2016/679. For legal persons, the TLD name registries and the entities providing domain name registration services should make publicly available at least the name of the registrant and the contact telephone number. The contact email address should also be published, provided that it does not contain any personal data, such as in the case of email aliases or functional accounts. TLD name registries and entities providing domain name registration services should also enable lawful access to specific domain name registration data concerning natural persons to legitimate access seekers, in accordance with Union data protection law. Member States should require TLD name registries and entities providing domain name registration services to respond without undue delay to requests for the disclosure of domain name registration data from legitimate access seekers. TLD name registries and entities providing domain name registration services should establish policies and procedures for the publication and disclosure of registration data, including service level agreements to deal with requests for access from legitimate access seekers. Those policies and procedures should take into account, to the extent possible, any guidance and the standards developed by the multi-stakeholder

governance structures at international level. The access procedure could include the use of an interface, portal or other technical tool to provide an efficient system for requesting and accessing registration data. With a view to promoting harmonised practices across the internal market, the Commission can, without prejudice to the competences of the European Data Protection Board, provide guidelines with regard to such procedures, which take into account, to the extent possible, the standards developed by the multi-stakeholder governance structures at international level. Member States should ensure that all types of access to personal and non-personal domain name registration data are free of charge.

- (113) Entities falling within the scope of this Directive should be considered to fall under the jurisdiction of the Member State in which they are established. However, providers of public electronic communications networks or providers of publicly available electronic communications services should be considered to fall under the jurisdiction of the Member State in which they provide their services. DNS service providers, TLD name registries, entities providing domain name registration services, cloud computing service providers, data centre service providers, content delivery network providers, managed service providers, managed security service providers, as well as providers of online marketplaces, of online search engines and of social networking services platforms should be considered to fall under the jurisdiction of the Member State in which they have their main establishment in the Union. Public administration entities should fall under the jurisdiction of the Member State which established them. If the entity provides services or is established in more than one Member State, it should fall under the separate and concurrent jurisdiction of each of those Member States. The competent authorities of those Member States should cooperate, provide mutual assistance to each other and, where appropriate, carry out joint supervisory actions. Where Member States exercise jurisdiction, they should not impose enforcement measures or penalties more than once for the same conduct, in line with the principle of *ne bis in idem*.
- (114) In order to take account of the cross-border nature of the services and operations of DNS service providers, TLD name registries, entities providing domain name registration services, cloud computing service providers, data centre service providers, content delivery network providers, managed service providers, managed security service providers, as well as providers of online marketplaces, of online search engines and of social networking services platforms, only one Member State should have jurisdiction over those entities. Jurisdiction should be attributed to the Member State in which the entity concerned has its main establishment in the Union. The criterion of establishment for the purposes of this Directive implies the effective exercise of activity through stable arrangements. The legal form of such arrangements, whether through a branch or a subsidiary with a legal personality, is not the determining factor in that respect. Whether that criterion is fulfilled should not depend on whether the network and information systems are physically located in a given place; the presence and use of such systems do not, in themselves, constitute such main establishment and are therefore not decisive criteria for determining the main establishment. The main establishment should be considered to be in the Member State where the decisions related to the cybersecurity risk-management measures are predominantly taken in the Union. This will typically correspond to the place of the entities' central administration in the Union. If such a Member State cannot be determined or if such decisions are not taken in the Union, the main establishment should be considered to be in the Member State where cybersecurity operations are carried out. If such a Member State cannot be determined, the main establishment should be considered to be in the Member State where the entity has the establishment with the highest number of employees in the Union. Where the services are carried out by a group of undertakings, the main establishment of the controlling undertaking should be considered to be the main establishment of the group of undertakings.
- (115) Where a publicly available recursive DNS service is provided by a provider of public electronic communications networks or of publicly available electronic communications services only as a part of the internet access service, the entity should be considered to fall under the jurisdiction of all the Member States where its services are provided.

- (116) Where a DNS service provider, a TLD name registry, an entity providing domain name registration services, a cloud computing service provider, a data centre service provider, a content delivery network provider, a managed service provider, a managed security service provider or a provider of an online marketplace, of an online search engine or of a social networking services platform, which is not established in the Union, offers services within the Union, it should designate a representative in the Union. In order to determine whether such an entity is offering services within the Union, it should be ascertained whether the entity is planning to offer services to persons in one or more Member States. The mere accessibility in the Union of the entity's or an intermediary's website or of an email address or other contact details, or the use of a language generally used in the third country where the entity is established, should be considered to be insufficient to ascertain such an intention. However, factors such as the use of a language or a currency generally used in one or more Member States with the possibility of ordering services in that language, or the mentioning of customers or users who are in the Union, could make it apparent that the entity is planning to offer services within the Union. The representative should act on behalf of the entity and it should be possible for the competent authorities or the CSIRTs to address the representative. The representative should be explicitly designated by a written mandate of the entity to act on the latter's behalf with regard to the latter's obligations laid down in this Directive, including incident reporting.
- (117) In order to ensure a clear overview of DNS service providers, TLD name registries, entities providing domain name registration services, cloud computing service providers, data centre service providers, content delivery network providers, managed service providers, managed security service providers, as well as providers of online marketplaces, of online search engines and of social networking services platforms, which provide services across the Union that fall within the scope of this Directive, ENISA should create and maintain a registry of such entities, based on the information received by Member States, where applicable through national mechanisms established for entities to register themselves. The single points of contact should forward to ENISA the information and any changes thereto. With a view to ensuring the accuracy and completeness of the information that is to be included in that registry, Member States can submit to ENISA the information available in any national registries on those entities. ENISA and the Member States should take measures to facilitate the interoperability of such registries, while ensuring protection of confidential or classified information. ENISA should establish appropriate information classification and management protocols to ensure the security and confidentiality of disclosed information and restrict the access, storage, and transmission of such information to intended users.
- (118) Where information which is classified in accordance with Union or national law is exchanged, reported or otherwise shared under this Directive, the corresponding rules on the handling of classified information should be applied. In addition, ENISA should have the infrastructure, procedures and rules in place to handle sensitive and classified information in accordance with the applicable security rules for protecting EU classified information.
- (119) With cyber threats becoming more complex and sophisticated, good detection of such threats and their prevention measures depend to a large extent on regular threat and vulnerability intelligence sharing between entities. Information sharing contributes to an increased awareness of cyber threats, which, in turn, enhances entities' capacity to prevent such threats from materialising into incidents and enables entities to better contain the effects of incidents and recover more efficiently. In the absence of guidance at Union level, various factors seem to have inhibited such intelligence sharing, in particular uncertainty over the compatibility with competition and liability rules.
- (120) Entities should be encouraged and assisted by Member States to collectively leverage their individual knowledge and practical experience at strategic, tactical and operational levels with a view to enhancing their capabilities to adequately prevent, detect, respond to or recover from incidents or to mitigate their impact. It is thus necessary to enable the emergence at Union level of voluntary cybersecurity information-sharing arrangements. To that end, Member States should actively assist and encourage entities, such as those providing cybersecurity services and research, as well as relevant entities not falling within the scope of this Directive, to participate in such cybersecurity information-sharing arrangements. Those arrangements should be established in accordance with the Union competition rules and Union data protection law.

- (121) The processing of personal data, to the extent necessary and proportionate for the purpose of ensuring security of network and information systems by essential and important entities, could be considered to be lawful on the basis that such processing complies with a legal obligation to which the controller is subject, in accordance with the requirements of Article 6(1), point (c), and Article 6(3) of Regulation (EU) 2016/679. Processing of personal data could also be necessary for legitimate interests pursued by essential and important entities, as well as providers of security technologies and services acting on behalf of those entities, pursuant to Article 6(1), point (f), of Regulation (EU) 2016/679, including where such processing is necessary for cybersecurity information-sharing arrangements or the voluntary notification of relevant information in accordance with this Directive. Measures related to the prevention, detection, identification, containment, analysis and response to incidents, measures to raise awareness in relation to specific cyber threats, exchange of information in the context of vulnerability remediation and coordinated vulnerability disclosure, the voluntary exchange of information about those incidents, and cyber threats and vulnerabilities, indicators of compromise, tactics, techniques and procedures, cybersecurity alerts and configuration tools could require the processing of certain categories of personal data, such as IP addresses, uniform resources locators (URLs), domain names, email addresses and, where they reveal personal data, time stamps. Processing of personal data by the competent authorities, the single points of contact and the CSIRTs, could constitute a legal obligation or be considered to be necessary for carrying out a task in the public interest or in the exercise of official authority vested in the controller pursuant to Article 6(1), point (c) or (e), and Article 6(3) of Regulation (EU) 2016/679, or for pursuing a legitimate interest of the essential and important entities, as referred to in Article 6(1), point (f), of that Regulation. Furthermore, national law could lay down rules allowing the competent authorities, the single points of contact and the CSIRTs, to the extent that is necessary and proportionate for the purpose of ensuring the security of network and information systems of essential and important entities, to process special categories of personal data in accordance with Article 9 of Regulation (EU) 2016/679, in particular by providing for suitable and specific measures to safeguard the fundamental rights and interests of natural persons, including technical limitations on the re-use of such data and the use of state-of-the-art security and privacy-preserving measures, such as pseudonymisation, or encryption where anonymisation may significantly affect the purpose pursued.
- (122) In order to strengthen the supervisory powers and measures that help ensure effective compliance, this Directive should provide for a minimum list of supervisory measures and means through which the competent authorities can supervise essential and important entities. In addition, this Directive should establish a differentiation of supervisory regime between essential and important entities with a view to ensuring a fair balance of obligations on those entities and on the competent authorities. Therefore, essential entities should be subject to a comprehensive *ex ante* and *ex post* supervisory regime, while important entities should be subject to a light, *ex post* only, supervisory regime. Important entities should therefore not be required to systematically document compliance with cybersecurity risk-management measures, while the competent authorities should implement a reactive *ex post* approach to supervision and, hence, not have a general obligation to supervise those entities. The *ex post* supervision of important entities may be triggered by evidence, indication or information brought to the attention of the competent authorities considered by those authorities to suggest potential infringements of this Directive. For example, such evidence, indication or information could be of the type provided to the competent authorities by other authorities, entities, citizens, media or other sources or publicly available information, or could emerge from other activities conducted by the competent authorities in the fulfilment of their tasks.
- (123) The execution of supervisory tasks by the competent authorities should not unnecessarily hamper the business activities of the entity concerned. Where the competent authorities execute their supervisory tasks in relation to essential entities, including the conduct of on-site inspections and off-site supervision, the investigation of infringements of this Directive and the conduct of security audits or security scans, they should minimise the impact on the business activities of the entity concerned.
- (124) In the exercise of *ex ante* supervision, the competent authorities should be able to decide on the prioritisation of the use of supervisory measures and means at their disposal in a proportionate manner. This entails that the competent authorities can decide on such prioritisation based on supervisory methodologies which should follow a risk-based approach. More specifically, such methodologies could include criteria or benchmarks for the classification of essential entities into risk categories and corresponding supervisory measures and means recommended per risk category, such as the use, frequency or types of on-site inspections, targeted security audits or security scans, the type of information to be requested and the level of detail of that information. Such supervisory methodologies

could also be accompanied by work programmes and be assessed and reviewed on a regular basis, including on aspects such as resource allocation and needs. In relation to public administration entities, the supervisory powers should be exercised in line with the national legislative and institutional frameworks.

- (125) The competent authorities should ensure that their supervisory tasks in relation to essential and important entities are carried out by trained professionals, who should have the necessary skills to carry out those tasks, in particular with regard to conducting on-site inspections and off-site supervision, including the identification of weaknesses in databases, hardware, firewalls, encryption and networks. Those inspections and that supervision should be conducted in an objective manner.
- (126) In duly substantiated cases where it is aware of a significant cyber threat or an imminent risk, the competent authority should be able to take immediate enforcement decisions with the aim of preventing or responding to an incident.
- (127) In order to make enforcement effective, a minimum list of enforcement powers that can be exercised for breach of the cybersecurity risk-management measures and reporting obligations provided for in this Directive should be laid down, setting up a clear and consistent framework for such enforcement across the Union. Due regard should be given to the nature, gravity and duration of the infringement of this Directive, the material or non-material damage caused, whether the infringement was intentional or negligent, actions taken to prevent or mitigate the material or non-material damage, the degree of responsibility or any relevant previous infringements, the degree of cooperation with the competent authority and any other aggravating or mitigating factor. The enforcement measures, including administrative fines, should be proportionate and their imposition should be subject to appropriate procedural safeguards in accordance with the general principles of Union law and the Charter of Fundamental Rights of the European Union (the 'Charter'), including the right to an effective remedy and to a fair trial, the presumption of innocence and the rights of the defence.
- (128) This Directive does not require Member States to provide for criminal or civil liability with regard to natural persons with responsibility for ensuring that an entity complies with this Directive for damage suffered by third parties as a result of an infringement of this Directive.
- (129) In order to ensure effective enforcement of the obligations laid down in this Directive, each competent authority should have the power to impose or request the imposition of administrative fines.
- (130) Where an administrative fine is imposed on an essential or important entity that is an undertaking, an undertaking should be understood to be an undertaking in accordance with Articles 101 and 102 TFEU for those purposes. Where an administrative fine is imposed on a person that is not an undertaking, the competent authority should take account of the general level of income in the Member State as well as the economic situation of the person when considering the appropriate amount of the fine. It should be for the Member States to determine whether and to what extent public authorities should be subject to administrative fines. Imposing an administrative fine does not affect the application of other powers of the competent authorities or of other penalties laid down in the national rules transposing this Directive.
- (131) Member States should be able to lay down the rules on criminal penalties for infringements of the national rules transposing this Directive. However, the imposition of criminal penalties for infringements of such national rules and of related administrative penalties should not lead to a breach of the principle of *ne bis in idem*, as interpreted by the Court of Justice of the European Union.
- (132) Where this Directive does not harmonise administrative penalties or where necessary in other cases, for example in the event of a serious infringement of this Directive, Member States should implement a system which provides for effective, proportionate and dissuasive penalties. The nature of such penalties and whether they are criminal or administrative should be determined by national law.

- (133) In order to further strengthen the effectiveness and dissuasiveness of the enforcement measures applicable to infringements of this Directive, the competent authorities should be empowered to suspend temporarily or to request the temporary suspension of a certification or authorisation concerning part or all of the relevant services provided or activities carried out by an essential entity and request the imposition of a temporary prohibition of the exercise of managerial functions by any natural person discharging managerial responsibilities at chief executive officer or legal representative level. Given their severity and impact on the entities' activities and ultimately on users, such temporary suspensions or prohibitions should only be applied proportionally to the severity of the infringement and taking account of the circumstances of each individual case, including whether the infringement was intentional or negligent, and any actions taken to prevent or mitigate the material or non-material damage. Such temporary suspensions or prohibitions should only be applied as a last resort, namely only after the other relevant enforcement measures laid down in this Directive have been exhausted, and only until the entity concerned takes the necessary action to remedy the deficiencies or comply with the requirements of the competent authority for which such temporary suspensions or prohibitions were applied. The imposition of such temporary suspensions or prohibitions should be subject to appropriate procedural safeguards in accordance with the general principles of Union law and the Charter, including the right to an effective remedy and to a fair trial, the presumption of innocence and the rights of the defence.
- (134) For the purpose of ensuring entities' compliance with their obligations laid down in this Directive, Member States should cooperate with and assist each other with regard to supervisory and enforcement measures, in particular where an entity provides services in more than one Member State or where its network and information systems are located in a Member State other than that where it provides services. When providing assistance, the requested competent authority should take supervisory or enforcement measures in accordance with national law. In order to ensure the smooth functioning of mutual assistance under this Directive, the competent authorities should use the Cooperation Group as a forum to discuss cases and particular requests for assistance.
- (135) In order to ensure effective supervision and enforcement, in particular in a situation with a cross-border dimension, a Member State that has received a request for mutual assistance should, within the limits of that request, take appropriate supervisory and enforcement measures in relation to the entity that is the subject of that request, and that provides services or has a network and information system on the territory of that Member State.
- (136) This Directive should establish cooperation rules between the competent authorities and the supervisory authorities under Regulation (EU) 2016/679 to deal with infringements of this Directive related to personal data.
- (137) This Directive should aim to ensure a high level of responsibility for the cybersecurity risk-management measures and reporting obligations at the level of the essential and important entities. Therefore, the management bodies of the essential and important entities should approve the cybersecurity risk-management measures and oversee their implementation.
- (138) In order to ensure a high common level of cybersecurity across the Union on the basis of this Directive, the power to adopt acts in accordance with Article 290 TFEU should be delegated to the Commission in respect of supplementing this Directive by specifying which categories of essential and important entities are to be required to use certain certified ICT products, ICT services and ICT processes or obtain a certificate under a European cybersecurity certification scheme. It is of particular importance that the Commission carry out appropriate consultations during its preparatory work, including at expert level, and that those consultations be conducted in accordance with the principles laid down in the Interinstitutional Agreement of 13 April 2016 on Better Law-Making<sup>(22)</sup>. In particular, to ensure equal participation in the preparation of delegated acts, the European Parliament and the Council receive all documents at the same time as Member States' experts, and their experts systematically have access to meetings of Commission expert groups dealing with the preparation of delegated acts.

<sup>(22)</sup> OJ L 123, 12.5.2016, p. 1.

- (139) In order to ensure uniform conditions for the implementation of this Directive, implementing powers should be conferred on the Commission to lay down the procedural arrangements necessary for the functioning of the Cooperation Group and the technical and methodological as well as sectoral requirements concerning the cybersecurity risk-management measures, and to further specify the type of information, the format and the procedure of incident, cyber threat and near miss notifications and of significant cyber threat communications, as well as cases in which an incident is to be considered to be significant. Those powers should be exercised in accordance with Regulation (EU) No 182/2011 of the European Parliament and of the Council <sup>(23)</sup>.
- (140) The Commission should periodically review this Directive, after consulting stakeholders, in particular with a view to determining whether it is appropriate to propose amendments in light of changes to societal, political, technological or market conditions. As part of those reviews, the Commission should assess the relevance of the size of the entities concerned, and the sectors, subsectors and types of entity referred to in the annexes to this Directive for the functioning of the economy and society in relation to cybersecurity. The Commission should assess, inter alia, whether providers, falling within the scope of this Directive, that are designated as very large online platforms within the meaning of Article 33 of Regulation (EU) 2022/2065 of the European Parliament and of the Council <sup>(24)</sup> could be identified as essential entities under this Directive.
- (141) This Directive creates new tasks for ENISA, thereby enhancing its role, and could also result in ENISA being required to carry out its existing tasks under Regulation (EU) 2019/881 to a higher level than before. In order to ensure that ENISA has the necessary financial and human resources to carry out existing and new tasks, as well as to meet any higher level of execution of those tasks resulting from its enhanced role, its budget should be increased accordingly. In addition, in order to ensure the efficient use of resources, ENISA should be given greater flexibility in the way that it is able to allocate resources internally for the purpose of effectively carrying out its tasks and meeting expectations.
- (142) Since the objective of this Directive, namely to achieve a high common level of cybersecurity across the Union, cannot be sufficiently achieved by the Member States but can rather, by reason of the effects of the action, be better achieved at Union level, the Union may adopt measures, in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty on European Union. In accordance with the principle of proportionality as set out in that Article, this Directive does not go beyond what is necessary in order to achieve that objective.
- (143) This Directive respects the fundamental rights, and observes the principles, recognised by the Charter, in particular the right to respect for private life and communications, the protection of personal data, the freedom to conduct a business, the right to property, the right to an effective remedy and to a fair trial, the presumption of innocence and the rights of the defence. The right to an effective remedy extends to the recipients of services provided by essential and important entities. This Directive should be implemented in accordance with those rights and principles.
- (144) The European Data Protection Supervisor was consulted in accordance with Article 42(1) of Regulation (EU) 2018/1725 of the European Parliament and of the Council <sup>(25)</sup> and delivered an opinion on 11 March 2021 <sup>(26)</sup>,

<sup>(23)</sup> Regulation (EU) No 182/2011 of the European Parliament and of the Council of 16 February 2011 laying down the rules and general principles concerning mechanisms for control by the Member States of the Commission's exercise of implementing powers (OJ L 55, 28.2.2011, p. 13).

<sup>(24)</sup> Regulation (EU) 2022/2065 of the European Parliament and of the Council of 19 October 2022 on a Single Market For Digital Services and amending Directive 2000/31/EC (Digital Services Act) (OJ L 277, 27.10.2022, p. 1).

<sup>(25)</sup> Regulation (EU) 2018/1725 of the European Parliament and of the Council of 23 October 2018 on the protection of natural persons with regard to the processing of personal data by the Union institutions, bodies, offices and agencies and on the free movement of such data, and repealing Regulation (EC) No 45/2001 and Decision No 1247/2002/EC (OJ L 295, 21.11.2018, p. 39).

<sup>(26)</sup> OJ C 183, 11.5.2021, p. 3.

HAVE ADOPTED THIS DIRECTIVE:

## CHAPTER I

### GENERAL PROVISIONS

#### *Article 1*

#### **Subject matter**

1. This Directive lays down measures that aim to achieve a high common level of cybersecurity across the Union, with a view to improving the functioning of the internal market.
2. To that end, this Directive lays down:
  - (a) obligations that require Member States to adopt national cybersecurity strategies and to designate or establish competent authorities, cyber crisis management authorities, single points of contact on cybersecurity (single points of contact) and computer security incident response teams (CSIRTs);
  - (b) cybersecurity risk-management measures and reporting obligations for entities of a type referred to in Annex I or II as well as for entities identified as critical entities under Directive (EU) 2022/2557;
  - (c) rules and obligations on cybersecurity information sharing;
  - (d) supervisory and enforcement obligations on Member States.

#### *Article 2*

#### **Scope**

1. This Directive applies to public or private entities of a type referred to in Annex I or II which qualify as medium-sized enterprises under Article 2 of the Annex to Recommendation 2003/361/EC, or exceed the ceilings for medium-sized enterprises provided for in paragraph 1 of that Article, and which provide their services or carry out their activities within the Union.

Article 3(4) of the Annex to that Recommendation shall not apply for the purposes of this Directive.

2. Regardless of their size, this Directive also applies to entities of a type referred to in Annex I or II, where:
  - (a) services are provided by:
    - (i) providers of public electronic communications networks or of publicly available electronic communications services;
    - (ii) trust service providers;
    - (iii) top-level domain name registries and domain name system service providers;
  - (b) the entity is the sole provider in a Member State of a service which is essential for the maintenance of critical societal or economic activities;
  - (c) disruption of the service provided by the entity could have a significant impact on public safety, public security or public health;
  - (d) disruption of the service provided by the entity could induce a significant systemic risk, in particular for sectors where such disruption could have a cross-border impact;
  - (e) the entity is critical because of its specific importance at national or regional level for the particular sector or type of service, or for other interdependent sectors in the Member State;

- (f) the entity is a public administration entity:
- (i) of central government as defined by a Member State in accordance with national law; or
  - (ii) at regional level as defined by a Member State in accordance with national law that, following a risk-based assessment, provides services the disruption of which could have a significant impact on critical societal or economic activities.
3. Regardless of their size, this Directive applies to entities identified as critical entities under Directive (EU) 2022/2557.
4. Regardless of their size, this Directive applies to entities providing domain name registration services.
5. Member States may provide for this Directive to apply to:
- (a) public administration entities at local level;
  - (b) education institutions, in particular where they carry out critical research activities.
6. This Directive is without prejudice to the Member States' responsibility for safeguarding national security and their power to safeguard other essential State functions, including ensuring the territorial integrity of the State and maintaining law and order.
7. This Directive does not apply to public administration entities that carry out their activities in the areas of national security, public security, defence or law enforcement, including the prevention, investigation, detection and prosecution of criminal offences.
8. Member States may exempt specific entities which carry out activities in the areas of national security, public security, defence or law enforcement, including the prevention, investigation, detection and prosecution of criminal offences, or which provide services exclusively to the public administration entities referred to in paragraph 7 of this Article, from the obligations laid down in Article 21 or 23 with regard to those activities or services. In such cases, the supervisory and enforcement measures referred to in Chapter VII shall not apply in relation to those specific activities or services. Where the entities carry out activities or provide services exclusively of the type referred to in this paragraph, Member States may decide also to exempt those entities from the obligations laid down in Articles 3 and 27.
9. Paragraphs 7 and 8 shall not apply where an entity acts as a trust service provider.
10. This Directive does not apply to entities which Member States have exempted from the scope of Regulation (EU) 2022/2554 in accordance with Article 2(4) of that Regulation.
11. The obligations laid down in this Directive shall not entail the supply of information the disclosure of which would be contrary to the essential interests of Member States' national security, public security or defence.
12. This Directive applies without prejudice to Regulation (EU) 2016/679, Directive 2002/58/EC, Directives 2011/93/EU <sup>(27)</sup> and 2013/40/EU <sup>(28)</sup> of the European Parliament and of the Council and Directive (EU) 2022/2557.
13. Without prejudice to Article 346 TFEU, information that is confidential pursuant to Union or national rules, such as rules on business confidentiality, shall be exchanged with the Commission and other relevant authorities in accordance with this Directive only where that exchange is necessary for the application of this Directive. The information exchanged shall be limited to that which is relevant and proportionate to the purpose of that exchange. The exchange of information shall preserve the confidentiality of that information and protect the security and commercial interests of entities concerned.

<sup>(27)</sup> Directive 2011/93/EU of the European Parliament and of the Council of 13 December 2011 on combating the sexual abuse and sexual exploitation of children and child pornography, and replacing Council Framework Decision 2004/68/JHA (OJ L 335, 17.12.2011, p. 1).

<sup>(28)</sup> Directive 2013/40/EU of the European Parliament and of the Council of 12 August 2013 on attacks against information systems and replacing Council Framework Decision 2005/222/JHA (OJ L 218, 14.8.2013, p. 8).

14. Entities, the competent authorities, the single points of contact and the CSIRTs shall process personal data to the extent necessary for the purposes of this Directive and in accordance with Regulation (EU) 2016/679, in particular such processing shall rely on Article 6 thereof.

The processing of personal data pursuant to this Directive by providers of public electronic communications networks or providers of publicly available electronic communications services shall be carried out in accordance with Union data protection law and Union privacy law, in particular Directive 2002/58/EC.

### Article 3

#### Essential and important entities

1. For the purposes of this Directive, the following entities shall be considered to be essential entities:
  - (a) entities of a type referred to in Annex I which exceed the ceilings for medium-sized enterprises provided for in Article 2(1) of the Annex to Recommendation 2003/361/EC;
  - (b) qualified trust service providers and top-level domain name registries as well as DNS service providers, regardless of their size;
  - (c) providers of public electronic communications networks or of publicly available electronic communications services which qualify as medium-sized enterprises under Article 2 of the Annex to Recommendation 2003/361/EC;
  - (d) public administration entities referred to in Article 2(2), point (f)(i);
  - (e) any other entities of a type referred to in Annex I or II that are identified by a Member State as essential entities pursuant to Article 2(2), points (b) to (e);
  - (f) entities identified as critical entities under Directive (EU) 2022/2557, referred to in Article 2(3) of this Directive;
  - (g) if the Member State so provides, entities which that Member State identified before 16 January 2023 as operators of essential services in accordance with Directive (EU) 2016/1148 or national law.
2. For the purposes of this Directive, entities of a type referred to in Annex I or II which do not qualify as essential entities pursuant to paragraph 1 of this Article shall be considered to be important entities. This includes entities identified by Member States as important entities pursuant to Article 2(2), points (b) to (e).
3. By 17 April 2025, Member States shall establish a list of essential and important entities as well as entities providing domain name registration services. Member States shall review and, where appropriate, update that list on a regular basis and at least every two years thereafter.
4. For the purpose of establishing the list referred to in paragraph 3, Member States shall require the entities referred to in that paragraph to submit at least the following information to the competent authorities:
  - (a) the name of the entity;
  - (b) the address and up-to-date contact details, including email addresses, IP ranges and telephone numbers;
  - (c) where applicable, the relevant sector and subsector referred to in Annex I or II; and
  - (d) where applicable, a list of the Member States where they provide services falling within the scope of this Directive.

The entities referred to in paragraph 3 shall notify any changes to the details submitted pursuant to the first subparagraph of this paragraph without delay, and, in any event, within two weeks of the date of the change.

The Commission, with the assistance of the European Union Agency for Cybersecurity (ENISA), shall without undue delay provide guidelines and templates regarding the obligations laid down in this paragraph.

Member States may establish national mechanisms for entities to register themselves.

5. By 17 April 2025 and every two years thereafter, the competent authorities shall notify:
  - (a) the Commission and the Cooperation Group of the number of essential and important entities listed pursuant to paragraph 3 for each sector and subsector referred to in Annex I or II; and
  - (b) the Commission of relevant information about the number of essential and important entities identified pursuant to Article 2(2), points (b) to (e), the sector and subsector referred to in Annex I or II to which they belong, the type of service that they provide, and the provision, from among those laid down in Article 2(2), points (b) to (e), pursuant to which they were identified.
6. Until 17 April 2025 and upon request of the Commission, Member States may notify the Commission of the names of the essential and important entities referred to in paragraph 5, point (b).

#### *Article 4*

### **Sector-specific Union legal acts**

1. Where sector-specific Union legal acts require essential or important entities to adopt cybersecurity risk-management measures or to notify significant incidents and where those requirements are at least equivalent in effect to the obligations laid down in this Directive, the relevant provisions of this Directive, including the provisions on supervision and enforcement laid down in Chapter VII, shall not apply to such entities. Where sector-specific Union legal acts do not cover all entities in a specific sector falling within the scope of this Directive, the relevant provisions of this Directive shall continue to apply to the entities not covered by those sector-specific Union legal acts.
2. The requirements referred to in paragraph 1 of this Article shall be considered to be equivalent in effect to the obligations laid down in this Directive where:
  - (a) cybersecurity risk-management measures are at least equivalent in effect to those laid down in Article 21(1) and (2); or
  - (b) the sector-specific Union legal act provides for immediate access, where appropriate automatic and direct, to the incident notifications by the CSIRTs, the competent authorities or the single points of contact under this Directive and where requirements to notify significant incidents are at least equivalent in effect to those laid down in Article 23(1) to (6) of this Directive.
3. The Commission shall, by 17 July 2023, provide guidelines clarifying the application of paragraphs 1 and 2. The Commission shall review those guidelines on a regular basis. When preparing those guidelines, the Commission shall take into account any observations of the Cooperation Group and ENISA.

#### *Article 5*

### **Minimum harmonisation**

This Directive shall not preclude Member States from adopting or maintaining provisions ensuring a higher level of cybersecurity, provided that such provisions are consistent with Member States' obligations laid down in Union law.

#### *Article 6*

### **Definitions**

For the purposes of this Directive, the following definitions apply:

- (1) 'network and information system' means:
  - (a) an electronic communications network as defined in Article 2, point (1), of Directive (EU) 2018/1972;

- (b) any device or group of interconnected or related devices, one or more of which, pursuant to a programme, carry out automatic processing of digital data; or
- (c) digital data stored, processed, retrieved or transmitted by elements covered under points (a) and (b) for the purposes of their operation, use, protection and maintenance;
- (2) 'security of network and information systems' means the ability of network and information systems to resist, at a given level of confidence, any event that may compromise the availability, authenticity, integrity or confidentiality of stored, transmitted or processed data or of the services offered by, or accessible via, those network and information systems;
- (3) 'cybersecurity' means cybersecurity as defined in Article 2, point (1), of Regulation (EU) 2019/881;
- (4) 'national cybersecurity strategy' means a coherent framework of a Member State providing strategic objectives and priorities in the area of cybersecurity and the governance to achieve them in that Member State;
- (5) 'near miss' means an event that could have compromised the availability, authenticity, integrity or confidentiality of stored, transmitted or processed data or of the services offered by, or accessible via, network and information systems, but that was successfully prevented from materialising or that did not materialise;
- (6) 'incident' means an event compromising the availability, authenticity, integrity or confidentiality of stored, transmitted or processed data or of the services offered by, or accessible via, network and information systems;
- (7) 'large-scale cybersecurity incident' means an incident which causes a level of disruption that exceeds a Member State's capacity to respond to it or which has a significant impact on at least two Member States;
- (8) 'incident handling' means any actions and procedures aiming to prevent, detect, analyse, and contain or to respond to and recover from an incident;
- (9) 'risk' means the potential for loss or disruption caused by an incident and is to be expressed as a combination of the magnitude of such loss or disruption and the likelihood of occurrence of the incident;
- (10) 'cyber threat' means a cyber threat as defined in Article 2, point (8), of Regulation (EU) 2019/881;
- (11) 'significant cyber threat' means a cyber threat which, based on its technical characteristics, can be assumed to have the potential to have a severe impact on the network and information systems of an entity or the users of the entity's services by causing considerable material or non-material damage;
- (12) 'ICT product' means an ICT product as defined in Article 2, point (12), of Regulation (EU) 2019/881;
- (13) 'ICT service' means an ICT service as defined in Article 2, point (13), of Regulation (EU) 2019/881;
- (14) 'ICT process' means an ICT process as defined in Article 2, point (14), of Regulation (EU) 2019/881;
- (15) 'vulnerability' means a weakness, susceptibility or flaw of ICT products or ICT services that can be exploited by a cyber threat;
- (16) 'standard' means a standard as defined in Article 2, point (1), of Regulation (EU) No 1025/2012 of the European Parliament and of the Council <sup>(29)</sup>;
- (17) 'technical specification' means a technical specification as defined in Article 2, point (4), of Regulation (EU) No 1025/2012;

<sup>(29)</sup> Regulation (EU) No 1025/2012 of the European Parliament and of the Council of 25 October 2012 on European standardisation, amending Council Directives 89/686/EEC and 93/15/EEC and Directives 94/9/EC, 94/25/EC, 95/16/EC, 97/23/EC, 98/34/EC, 2004/22/EC, 2007/23/EC, 2009/23/EC and 2009/105/EC of the European Parliament and of the Council and repealing Council decision 87/95/EEC and Decision No 1673/2006/EC of the European Parliament and of the Council (OJ L 316, 14.11.2012, p. 12).

- (18) 'internet exchange point' means a network facility which enables the interconnection of more than two independent networks (autonomous systems), primarily for the purpose of facilitating the exchange of internet traffic, which provides interconnection only for autonomous systems and which neither requires the internet traffic passing between any pair of participating autonomous systems to pass through any third autonomous system nor alters or otherwise interferes with such traffic;
- (19) 'domain name system' or 'DNS' means a hierarchical distributed naming system which enables the identification of internet services and resources, allowing end-user devices to use internet routing and connectivity services to reach those services and resources;
- (20) 'DNS service provider' means an entity that provides:
- (a) publicly available recursive domain name resolution services for internet end-users; or
  - (b) authoritative domain name resolution services for third-party use, with the exception of root name servers;
- (21) 'top-level domain name registry' or 'TLD name registry' means an entity which has been delegated a specific TLD and is responsible for administering the TLD including the registration of domain names under the TLD and the technical operation of the TLD, including the operation of its name servers, the maintenance of its databases and the distribution of TLD zone files across name servers, irrespective of whether any of those operations are carried out by the entity itself or are outsourced, but excluding situations where TLD names are used by a registry only for its own use;
- (22) 'entity providing domain name registration services' means a registrar or an agent acting on behalf of registrars, such as a privacy or proxy registration service provider or reseller;
- (23) 'digital service' means a service as defined in Article 1(1), point (b), of Directive (EU) 2015/1535 of the European Parliament and of the Council <sup>(30)</sup>;
- (24) 'trust service' means a trust service as defined in Article 3, point (16), of Regulation (EU) No 910/2014;
- (25) 'trust service provider' means a trust service provider as defined in Article 3, point (19), of Regulation (EU) No 910/2014;
- (26) 'qualified trust service' means a qualified trust service as defined in Article 3, point (17), of Regulation (EU) No 910/2014;
- (27) 'qualified trust service provider' means a qualified trust service provider as defined in Article 3, point (20), of Regulation (EU) No 910/2014;
- (28) 'online marketplace' means an online marketplace as defined in Article 2, point (n), of Directive 2005/29/EC of the European Parliament and of the Council <sup>(31)</sup>;
- (29) 'online search engine' means an online search engine as defined in Article 2, point (5), of Regulation (EU) 2019/1150 of the European Parliament and of the Council <sup>(32)</sup>;
- (30) 'cloud computing service' means a digital service that enables on-demand administration and broad remote access to a scalable and elastic pool of shareable computing resources, including where such resources are distributed across several locations;

<sup>(30)</sup> Directive (EU) 2015/1535 of the European Parliament and of the Council of 9 September 2015 laying down a procedure for the provision of information in the field of technical regulations and of rules on Information Society services (OJ L 241, 17.9.2015, p. 1).

<sup>(31)</sup> Directive 2005/29/EC of the European Parliament and of the Council of 11 May 2005 concerning unfair business-to-consumer commercial practices in the internal market and amending Council Directive 84/450/EEC, Directives 97/7/EC, 98/27/EC and 2002/65/EC of the European Parliament and of the Council and Regulation (EC) No 2006/2004 of the European Parliament and of the Council ('Unfair Commercial Practices Directive') (OJ L 149, 11.6.2005, p. 22).

<sup>(32)</sup> Regulation (EU) 2019/1150 of the European Parliament and of the Council of 20 June 2019 on promoting fairness and transparency for business users of online intermediation services (OJ L 186, 11.7.2019, p. 57).

- (31) 'data centre service' means a service that encompasses structures, or groups of structures, dedicated to the centralised accommodation, interconnection and operation of IT and network equipment providing data storage, processing and transport services together with all the facilities and infrastructures for power distribution and environmental control;
- (32) 'content delivery network' means a network of geographically distributed servers for the purpose of ensuring high availability, accessibility or fast delivery of digital content and services to internet users on behalf of content and service providers;
- (33) 'social networking services platform' means a platform that enables end-users to connect, share, discover and communicate with each other across multiple devices, in particular via chats, posts, videos and recommendations;
- (34) 'representative' means a natural or legal person established in the Union explicitly designated to act on behalf of a DNS service provider, a TLD name registry, an entity providing domain name registration services, a cloud computing service provider, a data centre service provider, a content delivery network provider, a managed service provider, a managed security service provider, or a provider of an online marketplace, of an online search engine or of a social networking services platform that is not established in the Union, which may be addressed by a competent authority or a CSIRT in the place of the entity itself with regard to the obligations of that entity under this Directive;
- (35) 'public administration entity' means an entity recognised as such in a Member State in accordance with national law, not including the judiciary, parliaments or central banks, which complies with the following criteria:
- (a) it is established for the purpose of meeting needs in the general interest and does not have an industrial or commercial character;
  - (b) it has legal personality or is entitled by law to act on behalf of another entity with legal personality;
  - (c) it is financed, for the most part, by the State, regional authorities or by other bodies governed by public law, is subject to management supervision by those authorities or bodies, or has an administrative, managerial or supervisory board, more than half of whose members are appointed by the State, regional authorities or by other bodies governed by public law;
  - (d) it has the power to address to natural or legal persons administrative or regulatory decisions affecting their rights in the cross-border movement of persons, goods, services or capital;
- (36) 'public electronic communications network' means a public electronic communications network as defined in Article 2, point (8), of Directive (EU) 2018/1972;
- (37) 'electronic communications service' means an electronic communications service as defined in Article 2, point (4), of Directive (EU) 2018/1972;
- (38) 'entity' means a natural or legal person created and recognised as such under the national law of its place of establishment, which may, acting under its own name, exercise rights and be subject to obligations;
- (39) 'managed service provider' means an entity that provides services related to the installation, management, operation or maintenance of ICT products, networks, infrastructure, applications or any other network and information systems, via assistance or active administration carried out either on customers' premises or remotely;
- (40) 'managed security service provider' means a managed service provider that carries out or provides assistance for activities relating to cybersecurity risk management;
- (41) 'research organisation' means an entity which has as its primary goal to conduct applied research or experimental development with a view to exploiting the results of that research for commercial purposes, but which does not include educational institutions.

## CHAPTER II

## COORDINATED CYBERSECURITY FRAMEWORKS

*Article 7***National cybersecurity strategy**

1. Each Member State shall adopt a national cybersecurity strategy that provides for the strategic objectives, the resources required to achieve those objectives, and appropriate policy and regulatory measures, with a view to achieving and maintaining a high level of cybersecurity. The national cybersecurity strategy shall include:

- (a) objectives and priorities of the Member State's cybersecurity strategy covering in particular the sectors referred to in Annexes I and II;
- (b) a governance framework to achieve the objectives and priorities referred to in point (a) of this paragraph, including the policies referred to in paragraph 2;
- (c) a governance framework clarifying the roles and responsibilities of relevant stakeholders at national level, underpinning the cooperation and coordination at the national level between the competent authorities, the single points of contact, and the CSIRTs under this Directive, as well as coordination and cooperation between those bodies and competent authorities under sector-specific Union legal acts;
- (d) a mechanism to identify relevant assets and an assessment of the risks in that Member State;
- (e) an identification of the measures ensuring preparedness for, responsiveness to and recovery from incidents, including cooperation between the public and private sectors;
- (f) a list of the various authorities and stakeholders involved in the implementation of the national cybersecurity strategy;
- (g) a policy framework for enhanced coordination between the competent authorities under this Directive and the competent authorities under Directive (EU) 2022/2557 for the purpose of information sharing on risks, cyber threats, and incidents as well as on non-cyber risks, threats and incidents and the exercise of supervisory tasks, as appropriate;
- (h) a plan, including necessary measures, to enhance the general level of cybersecurity awareness among citizens.

2. As part of the national cybersecurity strategy, Member States shall in particular adopt policies:

- (a) addressing cybersecurity in the supply chain for ICT products and ICT services used by entities for the provision of their services;
- (b) on the inclusion and specification of cybersecurity-related requirements for ICT products and ICT services in public procurement, including in relation to cybersecurity certification, encryption and the use of open-source cybersecurity products;
- (c) managing vulnerabilities, encompassing the promotion and facilitation of coordinated vulnerability disclosure under Article 12(1);
- (d) related to sustaining the general availability, integrity and confidentiality of the public core of the open internet, including, where relevant, the cybersecurity of undersea communications cables;
- (e) promoting the development and integration of relevant advanced technologies aiming to implement state-of-the-art cybersecurity risk-management measures;
- (f) promoting and developing education and training on cybersecurity, cybersecurity skills, awareness raising and research and development initiatives, as well as guidance on good cyber hygiene practices and controls, aimed at citizens, stakeholders and entities;

- (g) supporting academic and research institutions to develop, enhance and promote the deployment of cybersecurity tools and secure network infrastructure;
- (h) including relevant procedures and appropriate information-sharing tools to support voluntary cybersecurity information sharing between entities in accordance with Union law;
- (i) strengthening the cyber resilience and the cyber hygiene baseline of small and medium-sized enterprises, in particular those excluded from the scope of this Directive, by providing easily accessible guidance and assistance for their specific needs;
- (j) promoting active cyber protection.

3. Member States shall notify their national cybersecurity strategies to the Commission within three months of their adoption. Member States may exclude information which relates to their national security from such notifications.

4. Member States shall assess their national cybersecurity strategies on a regular basis and at least every five years on the basis of key performance indicators and, where necessary, update them. ENISA shall assist Member States, upon their request, in the development or the update of a national cybersecurity strategy and of key performance indicators for the assessment of that strategy, in order to align it with the requirements and obligations laid down in this Directive.

#### *Article 8*

### **Competent authorities and single points of contact**

1. Each Member State shall designate or establish one or more competent authorities responsible for cybersecurity and for the supervisory tasks referred to in Chapter VII (competent authorities).
2. The competent authorities referred to in paragraph 1 shall monitor the implementation of this Directive at national level.
3. Each Member State shall designate or establish a single point of contact. Where a Member State designates or establishes only one competent authority pursuant to paragraph 1, that competent authority shall also be the single point of contact for that Member State.
4. Each single point of contact shall exercise a liaison function to ensure cross-border cooperation of its Member State's authorities with the relevant authorities of other Member States, and, where appropriate, with the Commission and ENISA, as well as to ensure cross-sectoral cooperation with other competent authorities within its Member State.
5. Member States shall ensure that their competent authorities and single points of contact have adequate resources to carry out, in an effective and efficient manner, the tasks assigned to them and thereby to fulfil the objectives of this Directive.
6. Each Member State shall notify the Commission without undue delay of the identity of the competent authority referred to in paragraph 1 and of the single point of contact referred to in paragraph 3, of the tasks of those authorities, and of any subsequent changes thereto. Each Member State shall make public the identity of its competent authority. The Commission shall make a list of the single points of contact publicly available.

#### *Article 9*

### **National cyber crisis management frameworks**

1. Each Member State shall designate or establish one or more competent authorities responsible for the management of large-scale cybersecurity incidents and crises (cyber crisis management authorities). Member States shall ensure that those authorities have adequate resources to carry out, in an effective and efficient manner, the tasks assigned to them. Member States shall ensure coherence with the existing frameworks for general national crisis management.

2. Where a Member State designates or establishes more than one cyber crisis management authority pursuant to paragraph 1, it shall clearly indicate which of those authorities is to serve as the coordinator for the management of large-scale cybersecurity incidents and crises.
3. Each Member State shall identify capabilities, assets and procedures that can be deployed in the case of a crisis for the purposes of this Directive.
4. Each Member State shall adopt a national large-scale cybersecurity incident and crisis response plan where the objectives of and arrangements for the management of large-scale cybersecurity incidents and crises are set out. That plan shall lay down, in particular:
  - (a) the objectives of national preparedness measures and activities;
  - (b) the tasks and responsibilities of the cyber crisis management authorities;
  - (c) the cyber crisis management procedures, including their integration into the general national crisis management framework and information exchange channels;
  - (d) national preparedness measures, including exercises and training activities;
  - (e) the relevant public and private stakeholders and infrastructure involved;
  - (f) national procedures and arrangements between relevant national authorities and bodies to ensure the Member State's effective participation in and support of the coordinated management of large-scale cybersecurity incidents and crises at Union level.
5. Within three months of the designation or establishment of the cyber crisis management authority referred to in paragraph 1, each Member State shall notify the Commission of the identity of its authority and of any subsequent changes thereto. Member States shall submit to the Commission and to the European cyber crisis liaison organisation network (EU-CyCLONe) relevant information relating to the requirements of paragraph 4 about their national large-scale cybersecurity incident and crisis response plans within three months of the adoption of those plans. Member States may exclude information where and to the extent that such exclusion is necessary for their national security.

#### Article 10

#### **Computer security incident response teams (CSIRTs)**

1. Each Member State shall designate or establish one or more CSIRTs. The CSIRTs may be designated or established within a competent authority. The CSIRTs shall comply with the requirements set out in Article 11(1), shall cover at least the sectors, subsectors and types of entity referred to in Annexes I and II, and shall be responsible for incident handling in accordance with a well-defined process.
2. Member States shall ensure that each CSIRT has adequate resources to carry out effectively its tasks as set out in Article 11(3).
3. Member States shall ensure that each CSIRT has at its disposal an appropriate, secure, and resilient communication and information infrastructure through which to exchange information with essential and important entities and other relevant stakeholders. To that end, Member States shall ensure that each CSIRT contributes to the deployment of secure information-sharing tools.
4. The CSIRTs shall cooperate and, where appropriate, exchange relevant information in accordance with Article 29 with sectoral or cross-sectoral communities of essential and important entities.
5. The CSIRTs shall participate in peer reviews organised in accordance with Article 19.
6. Member States shall ensure the effective, efficient and secure cooperation of their CSIRTs in the CSIRTs network.

7. The CSIRTs may establish cooperation relationships with third countries' national computer security incident response teams. As part of such cooperation relationships, Member States shall facilitate effective, efficient and secure information exchange with those third countries' national computer security incident response teams, using relevant information-sharing protocols, including the traffic light protocol. The CSIRTs may exchange relevant information with third countries' national computer security incident response teams, including personal data in accordance with Union data protection law.
8. The CSIRTs may cooperate with third countries' national computer security incident response teams or equivalent third-country bodies, in particular for the purpose of providing them with cybersecurity assistance.
9. Each Member State shall notify the Commission without undue delay of the identity of the CSIRT referred to in paragraph 1 of this Article and the CSIRT designated as coordinator pursuant to Article 12(1), of their respective tasks in relation to essential and important entities, and of any subsequent changes thereto.
10. Member States may request the assistance of ENISA in developing their CSIRTs.

#### Article 11

#### **Requirements, technical capabilities and tasks of CSIRTs**

1. The CSIRTs shall comply with the following requirements:
  - (a) the CSIRTs shall ensure a high level of availability of their communication channels by avoiding single points of failure, and shall have several means for being contacted and for contacting others at all times; they shall clearly specify the communication channels and make them known to constituency and cooperative partners;
  - (b) the CSIRTs' premises and the supporting information systems shall be located at secure sites;
  - (c) the CSIRTs shall be equipped with an appropriate system for managing and routing requests, in particular to facilitate effective and efficient handovers;
  - (d) the CSIRTs shall ensure the confidentiality and trustworthiness of their operations;
  - (e) the CSIRTs shall be adequately staffed to ensure availability of their services at all times and they shall ensure that their staff is trained appropriately;
  - (f) the CSIRTs shall be equipped with redundant systems and backup working space to ensure continuity of their services.

The CSIRTs may participate in international cooperation networks.

2. Member States shall ensure that their CSIRTs jointly have the technical capabilities necessary to carry out the tasks referred to in paragraph 3. Member States shall ensure that sufficient resources are allocated to their CSIRTs to ensure adequate staffing levels for the purpose of enabling the CSIRTs to develop their technical capabilities.
3. The CSIRTs shall have the following tasks:
  - (a) monitoring and analysing cyber threats, vulnerabilities and incidents at national level and, upon request, providing assistance to essential and important entities concerned regarding real-time or near real-time monitoring of their network and information systems;
  - (b) providing early warnings, alerts, announcements and dissemination of information to essential and important entities concerned as well as to the competent authorities and other relevant stakeholders on cyber threats, vulnerabilities and incidents, if possible in near real-time;
  - (c) responding to incidents and providing assistance to the essential and important entities concerned, where applicable;
  - (d) collecting and analysing forensic data and providing dynamic risk and incident analysis and situational awareness regarding cybersecurity;

- (e) providing, upon the request of an essential or important entity, a proactive scanning of the network and information systems of the entity concerned to detect vulnerabilities with a potential significant impact;
- (f) participating in the CSIRTs network and providing mutual assistance in accordance with their capacities and competencies to other members of the CSIRTs network upon their request;
- (g) where applicable, acting as a coordinator for the purposes of the coordinated vulnerability disclosure under Article 12(1);
- (h) contributing to the deployment of secure information-sharing tools pursuant to Article 10(3).

The CSIRTs may carry out proactive non-intrusive scanning of publicly accessible network and information systems of essential and important entities. Such scanning shall be carried out to detect vulnerable or insecurely configured network and information systems and inform the entities concerned. Such scanning shall not have any negative impact on the functioning of the entities' services.

When carrying out the tasks referred to in the first subparagraph, the CSIRTs may prioritise particular tasks on the basis of a risk-based approach.

4. The CSIRTs shall establish cooperation relationships with relevant stakeholders in the private sector, with a view to achieving the objectives of this Directive.

5. In order to facilitate cooperation referred to in paragraph 4, the CSIRTs shall promote the adoption and use of common or standardised practices, classification schemes and taxonomies in relation to:

- (a) incident-handling procedures;
- (b) crisis management; and
- (c) coordinated vulnerability disclosure under Article 12(1).

#### *Article 12*

### **Coordinated vulnerability disclosure and a European vulnerability database**

1. Each Member State shall designate one of its CSIRTs as a coordinator for the purposes of coordinated vulnerability disclosure. The CSIRT designated as coordinator shall act as a trusted intermediary, facilitating, where necessary, the interaction between the natural or legal person reporting a vulnerability and the manufacturer or provider of the potentially vulnerable ICT products or ICT services, upon the request of either party. The tasks of the CSIRT designated as coordinator shall include:

- (a) identifying and contacting the entities concerned;
- (b) assisting the natural or legal persons reporting a vulnerability; and
- (c) negotiating disclosure timelines and managing vulnerabilities that affect multiple entities.

Member States shall ensure that natural or legal persons are able to report, anonymously where they so request, a vulnerability to the CSIRT designated as coordinator. The CSIRT designated as coordinator shall ensure that diligent follow-up action is carried out with regard to the reported vulnerability and shall ensure the anonymity of the natural or legal person reporting the vulnerability. Where a reported vulnerability could have a significant impact on entities in more than one Member State, the CSIRT designated as coordinator of each Member State concerned shall, where appropriate, cooperate with other CSIRTs designated as coordinators within the CSIRTs network.

2. ENISA shall develop and maintain, after consulting the Cooperation Group, a European vulnerability database. To that end, ENISA shall establish and maintain the appropriate information systems, policies and procedures, and shall adopt the necessary technical and organisational measures to ensure the security and integrity of the European vulnerability database, with a view in particular to enabling entities, regardless of whether they fall within the scope of this Directive, and their suppliers of network and information systems, to disclose and register, on a voluntary basis, publicly known vulnerabilities in ICT products or ICT services. All stakeholders shall be provided access to the information about the vulnerabilities contained in the European vulnerability database. That database shall include:

- (a) information describing the vulnerability;
- (b) the affected ICT products or ICT services and the severity of the vulnerability in terms of the circumstances under which it may be exploited;
- (c) the availability of related patches and, in the absence of available patches, guidance provided by the competent authorities or the CSIRTs addressed to users of vulnerable ICT products and ICT services as to how the risks resulting from disclosed vulnerabilities can be mitigated.

#### Article 13

### Cooperation at national level

1. Where they are separate, the competent authorities, the single point of contact and the CSIRTs of the same Member State shall cooperate with each other with regard to the fulfilment of the obligations laid down in this Directive.

2. Member States shall ensure that their CSIRTs or, where applicable, their competent authorities, receive notifications of significant incidents pursuant to Article 23, and incidents, cyber threats and near misses pursuant to Article 30.

3. Member States shall ensure that their CSIRTs or, where applicable, their competent authorities inform their single points of contact of notifications of incidents, cyber threats and near misses submitted pursuant to this Directive.

4. In order to ensure that the tasks and obligations of the competent authorities, the single points of contact and the CSIRTs are carried out effectively, Member States shall, to the extent possible, ensure appropriate cooperation between those bodies and law enforcement authorities, data protection authorities, the national authorities under Regulations (EC) No 300/2008 and (EU) 2018/1139, the supervisory bodies under Regulation (EU) No 910/2014, the competent authorities under Regulation (EU) 2022/2554, the national regulatory authorities under Directive (EU) 2018/1972, the competent authorities under Directive (EU) 2022/2557, as well as the competent authorities under other sector-specific Union legal acts, within that Member State.

5. Member States shall ensure that their competent authorities under this Directive and their competent authorities under Directive (EU) 2022/2557 cooperate and exchange information on a regular basis with regard to the identification of critical entities, on risks, cyber threats, and incidents as well as on non-cyber risks, threats and incidents affecting entities identified as critical entities under Directive (EU) 2022/2557, and the measures taken in response to such risks, threats and incidents. Member States shall also ensure that their competent authorities under this Directive and their competent authorities under Regulation (EU) No 910/2014, Regulation (EU) 2022/2554 and Directive (EU) 2018/1972 exchange relevant information on a regular basis, including with regard to relevant incidents and cyber threats.

6. Member States shall simplify the reporting through technical means for notifications referred to in Articles 23 and 30.

## CHAPTER III

## COOPERATION AT UNION AND INTERNATIONAL LEVEL

## Article 14

**Cooperation Group**

1. In order to support and facilitate strategic cooperation and the exchange of information among Member States, as well as to strengthen trust and confidence, a Cooperation Group is established.
2. The Cooperation Group shall carry out its tasks on the basis of biennial work programmes referred to in paragraph 7.
3. The Cooperation Group shall be composed of representatives of Member States, the Commission and ENISA. The European External Action Service shall participate in the activities of the Cooperation Group as an observer. The European Supervisory Authorities (ESAs) and the competent authorities under Regulation (EU) 2022/2554 may participate in the activities of the Cooperation Group in accordance with Article 47(1) of that Regulation.

Where appropriate, the Cooperation Group may invite the European Parliament and representatives of relevant stakeholders to participate in its work.

The Commission shall provide the secretariat.

4. The Cooperation Group shall have the following tasks:
  - (a) to provide guidance to the competent authorities in relation to the transposition and implementation of this Directive;
  - (b) to provide guidance to the competent authorities in relation to the development and implementation of policies on coordinated vulnerability disclosure, as referred to in Article 7(2), point (c);
  - (c) to exchange best practices and information in relation to the implementation of this Directive, including in relation to cyber threats, incidents, vulnerabilities, near misses, awareness-raising initiatives, training, exercises and skills, capacity building, standards and technical specifications as well as the identification of essential and important entities pursuant to Article 2(2), points (b) to (e);
  - (d) to exchange advice and cooperate with the Commission on emerging cybersecurity policy initiatives and the overall consistency of sector-specific cybersecurity requirements;
  - (e) to exchange advice and cooperate with the Commission on draft delegated or implementing acts adopted pursuant to this Directive;
  - (f) to exchange best practices and information with relevant Union institutions, bodies, offices and agencies;
  - (g) to exchange views on the implementation of sector-specific Union legal acts that contain provisions on cybersecurity;
  - (h) where relevant, to discuss reports on the peer review referred to in Article 19(9) and draw up conclusions and recommendations;
  - (i) to carry out coordinated security risk assessments of critical supply chains in accordance with Article 22(1);
  - (j) to discuss cases of mutual assistance, including experiences and results from cross-border joint supervisory actions as referred to in Article 37;
  - (k) upon the request of one or more Member States concerned, to discuss specific requests for mutual assistance as referred to in Article 37;
  - (l) to provide strategic guidance to the CSIRTs network and EU-CyCLONe on specific emerging issues;

- (m) to exchange views on the policy on follow-up actions following large-scale cybersecurity incidents and crises on the basis of lessons learned of the CSIRTs network and EU-CyCLONe;
- (n) to contribute to cybersecurity capabilities across the Union by facilitating the exchange of national officials through a capacity building programme involving staff from the competent authorities or the CSIRTs;
- (o) to organise regular joint meetings with relevant private stakeholders from across the Union to discuss activities carried out by the Cooperation Group and gather input on emerging policy challenges;
- (p) to discuss the work undertaken in relation to cybersecurity exercises, including the work done by ENISA;
- (q) to establish the methodology and organisational aspects of the peer reviews referred to in Article 19(1), as well as to lay down the self-assessment methodology for Member States in accordance with Article 19(5), with the assistance of the Commission and ENISA, and, in cooperation with the Commission and ENISA, to develop codes of conduct underpinning the working methods of designated cybersecurity experts in accordance with Article 19(6);
- (r) to prepare reports for the purpose of the review referred to in Article 40 on the experience gained at a strategic level and from peer reviews;
- (s) to discuss and carry out on a regular basis an assessment of the state of play of cyber threats or incidents, such as ransomware.

The Cooperation Group shall submit the reports referred to in the first subparagraph, point (r), to the Commission, to the European Parliament and to the Council.

5. Member States shall ensure effective, efficient and secure cooperation of their representatives in the Cooperation Group.

6. The Cooperation Group may request from the CSIRTs network a technical report on selected topics.

7. By 1 February 2024 and every two years thereafter, the Cooperation Group shall establish a work programme in respect of actions to be undertaken to implement its objectives and tasks.

8. The Commission may adopt implementing acts laying down procedural arrangements necessary for the functioning of the Cooperation Group.

Those implementing acts shall be adopted in accordance with the examination procedure referred to in Article 39(2).

The Commission shall exchange advice and cooperate with the Cooperation Group on the draft implementing acts referred to in the first subparagraph of this paragraph in accordance with paragraph (4), point (e).

9. The Cooperation Group shall meet on a regular basis and in any event at least once a year with the Critical Entities Resilience Group established under Directive (EU) 2022/2557 to promote and facilitate strategic cooperation and the exchange of information.

#### Article 15

#### **CSIRTs network**

1. In order to contribute to the development of confidence and trust and to promote swift and effective operational cooperation among Member States, a network of national CSIRTs is established.

2. The CSIRTs network shall be composed of representatives of the CSIRTs designated or established pursuant to Article 10 and the computer emergency response team for the Union's institutions, bodies and agencies (CERT-EU). The Commission shall participate in the CSIRTs network as an observer. ENISA shall provide the secretariat and shall actively provide assistance for the cooperation among the CSIRTs.

3. The CSIRTs network shall have the following tasks:
- (a) to exchange information about the CSIRTs' capabilities;
  - (b) to facilitate the sharing, transfer and exchange of technology and relevant measures, policies, tools, processes, best practices and frameworks among the CSIRTs;
  - (c) to exchange relevant information about incidents, near misses, cyber threats, risks and vulnerabilities;
  - (d) to exchange information with regard to cybersecurity publications and recommendations;
  - (e) to ensure interoperability with regard to information-sharing specifications and protocols;
  - (f) at the request of a member of the CSIRTs network potentially affected by an incident, to exchange and discuss information in relation to that incident and associated cyber threats, risks and vulnerabilities;
  - (g) at the request of a member of the CSIRTs network, to discuss and, where possible, implement a coordinated response to an incident that has been identified within the jurisdiction of that Member State;
  - (h) to provide Member States with assistance in addressing cross-border incidents pursuant to this Directive;
  - (i) to cooperate, exchange best practices and provide assistance to the CSIRTs designated as coordinators pursuant to Article 12(1) with regard to the management of the coordinated disclosure of vulnerabilities which could have a significant impact on entities in more than one Member State;
  - (j) to discuss and identify further forms of operational cooperation, including in relation to:
    - (i) categories of cyber threats and incidents;
    - (ii) early warnings;
    - (iii) mutual assistance;
    - (iv) principles and arrangements for coordination in response to cross-border risks and incidents;
    - (v) contribution to the national large-scale cybersecurity incident and crisis response plan referred to in Article 9(4) at the request of a Member State;
  - (k) to inform the Cooperation Group of its activities and of the further forms of operational cooperation discussed pursuant to point (j), and, where necessary, request guidance in that regard;
  - (l) to take stock of cybersecurity exercises, including those organised by ENISA;
  - (m) at the request of an individual CSIRT, to discuss the capabilities and preparedness of that CSIRT;
  - (n) to cooperate and exchange information with regional and Union-level Security Operations Centres (SOCs) in order to improve common situational awareness on incidents and cyber threats across the Union;
  - (o) where relevant, to discuss the peer-review reports referred to in Article 19(9);
  - (p) to provide guidelines in order to facilitate the convergence of operational practices with regard to the application of the provisions of this Article concerning operational cooperation.

4. By 17 January 2025, and every two years thereafter, the CSIRTs network shall, for the purpose of the review referred to in Article 40, assess the progress made with regard to the operational cooperation and adopt a report. The report shall, in particular, draw up conclusions and recommendations on the basis of the outcome of the peer reviews referred to in Article 19, which are carried out in relation to the national CSIRTs. That report shall be submitted to the Cooperation Group.

5. The CSIRTs network shall adopt its rules of procedure.
6. The CSIRTs network and EU-CyCLONe shall agree on procedural arrangements and cooperate on the basis thereof.

#### Article 16

#### **European cyber crisis liaison organisation network (EU-CyCLONe)**

1. EU-CyCLONe is established to support the coordinated management of large-scale cybersecurity incidents and crises at operational level and to ensure the regular exchange of relevant information among Member States and Union institutions, bodies, offices and agencies.

2. EU-CyCLONe shall be composed of the representatives of Member States' cyber crisis management authorities as well as, in cases where a potential or ongoing large-scale cybersecurity incident has or is likely to have a significant impact on services and activities falling within the scope of this Directive, the Commission. In other cases, the Commission shall participate in the activities of EU-CyCLONe as an observer.

ENISA shall provide the secretariat of EU-CyCLONe and support the secure exchange of information as well as provide necessary tools to support cooperation between Member States ensuring secure exchange of information.

Where appropriate, EU-CyCLONe may invite representatives of relevant stakeholders to participate in its work as observers.

3. EU-CyCLONe shall have the following tasks:

- (a) to increase the level of preparedness of the management of large-scale cybersecurity incidents and crises;
- (b) to develop a shared situational awareness for large-scale cybersecurity incidents and crises;
- (c) to assess the consequences and impact of relevant large-scale cybersecurity incidents and crises and propose possible mitigation measures;
- (d) to coordinate the management of large-scale cybersecurity incidents and crises and support decision-making at political level in relation to such incidents and crises;
- (e) to discuss, upon the request of a Member State concerned, national large-scale cybersecurity incident and crisis response plans referred to in Article 9(4).

4. EU-CyCLONe shall adopt its rules of procedure.

5. EU-CyCLONe shall report on a regular basis to the Cooperation Group on the management of large-scale cybersecurity incidents and crises, as well as trends, focusing in particular on their impact on essential and important entities.

6. EU-CyCLONe shall cooperate with the CSIRTs network on the basis of agreed procedural arrangements provided for in Article 15(6).

7. By 17 July 2024 and every 18 months thereafter, EU-CyCLONe shall submit to the European Parliament and to the Council a report assessing its work.

#### Article 17

#### **International cooperation**

The Union may, where appropriate, conclude international agreements, in accordance with Article 218 TFEU, with third countries or international organisations, allowing and organising their participation in particular activities of the Cooperation Group, the CSIRTs network and EU-CyCLONe. Such agreements shall comply with Union data protection law.

*Article 18***Report on the state of cybersecurity in the Union**

1. ENISA shall adopt, in cooperation with the Commission and the Cooperation Group, a biennial report on the state of cybersecurity in the Union and shall submit and present that report to the European Parliament. The report shall, inter alia, be made available in machine-readable data and include the following:

- (a) a Union-level cybersecurity risk assessment, taking account of the cyber threat landscape;
- (b) an assessment of the development of cybersecurity capabilities in the public and private sectors across the Union;
- (c) an assessment of the general level of cybersecurity awareness and cyber hygiene among citizens and entities, including small and medium-sized enterprises;
- (d) an aggregated assessment of the outcome of the peer reviews referred to in Article 19;
- (e) an aggregated assessment of the level of maturity of cybersecurity capabilities and resources across the Union, including those at sector level, as well as of the extent to which the Member States' national cybersecurity strategies are aligned.

2. The report shall include particular policy recommendations, with a view to addressing shortcomings and increasing the level of cybersecurity across the Union, and a summary of the findings for the particular period from the EU Cybersecurity Technical Situation Reports on incidents and cyber threats prepared by ENISA in accordance with Article 7(6) of Regulation (EU) 2019/881.

3. ENISA, in cooperation with the Commission, the Cooperation Group and the CSIRTs network, shall develop the methodology, including the relevant variables, such as quantitative and qualitative indicators, of the aggregated assessment referred to in paragraph 1, point (e).

*Article 19***Peer reviews**

1. The Cooperation Group shall, on 17 January 2025, establish, with the assistance of the Commission and ENISA, and, where relevant, the CSIRTs network, the methodology and organisational aspects of peer reviews with a view to learning from shared experiences, strengthening mutual trust, achieving a high common level of cybersecurity, as well as enhancing Member States' cybersecurity capabilities and policies necessary to implement this Directive. Participation in peer reviews is voluntary. The peer reviews shall be carried out by cybersecurity experts. The cybersecurity experts shall be designated by at least two Member States, different from the Member State being reviewed.

The peer reviews shall cover at least one of the following:

- (a) the level of implementation of the cybersecurity risk-management measures and reporting obligations laid down in Articles 21 and 23;
- (b) the level of capabilities, including the available financial, technical and human resources, and the effectiveness of the exercise of the tasks of the competent authorities;
- (c) the operational capabilities of the CSIRTs;
- (d) the level of implementation of mutual assistance referred to in Article 37;
- (e) the level of implementation of the cybersecurity information-sharing arrangements referred to in Article 29;
- (f) specific issues of cross-border or cross-sector nature.

2. The methodology referred to in paragraph 1 shall include objective, non-discriminatory, fair and transparent criteria on the basis of which the Member States designate cybersecurity experts eligible to carry out the peer reviews. The Commission and ENISA shall participate as observers in the peer reviews.

3. Member States may identify specific issues as referred to in paragraph 1, point (f), for the purposes of a peer review.
4. Before commencing a peer review as referred to in paragraph 1, Member States shall notify the participating Member States of its scope, including the specific issues identified pursuant to paragraph 3.
5. Prior to the commencement of the peer review, Member States may carry out a self-assessment of the reviewed aspects and provide that self-assessment to the designated cybersecurity experts. The Cooperation Group shall, with the assistance of the Commission and ENISA, lay down the methodology for the Member States' self-assessment.
6. Peer reviews shall entail physical or virtual on-site visits and off-site exchanges of information. In line with the principle of good cooperation, the Member State subject to the peer review shall provide the designated cybersecurity experts with the information necessary for the assessment, without prejudice to Union or national law concerning the protection of confidential or classified information and to the safeguarding of essential State functions, such as national security. The Cooperation Group, in cooperation with the Commission and ENISA, shall develop appropriate codes of conduct underpinning the working methods of designated cybersecurity experts. Any information obtained through the peer review shall be used solely for that purpose. The cybersecurity experts participating in the peer review shall not disclose any sensitive or confidential information obtained in the course of that peer review to any third parties.
7. Once subject to a peer review, the same aspects reviewed in a Member State shall not be subject to a further peer review in that Member State for two years following the conclusion of the peer review, unless otherwise requested by the Member State or agreed upon after a proposal of the Cooperation Group.
8. Member States shall ensure that any risk of conflict of interest concerning the designated cybersecurity experts is revealed to the other Member States, the Cooperation Group, the Commission and ENISA, before the commencement of the peer review. The Member State subject to the peer review may object to the designation of particular cybersecurity experts on duly substantiated grounds communicated to the designating Member State.
9. Cybersecurity experts participating in peer reviews shall draft reports on the findings and conclusions of the peer reviews. Member States subject to a peer review may provide comments on the draft reports concerning them and such comments shall be attached to the reports. The reports shall include recommendations to enable improvement on the aspects covered by the peer review. The reports shall be submitted to the Cooperation Group and the CSIRTs network where relevant. A Member State subject to the peer review may decide to make its report, or a redacted version of it, publicly available.

#### CHAPTER IV

#### CYBERSECURITY RISK-MANAGEMENT MEASURES AND REPORTING OBLIGATIONS

##### *Article 20*

##### **Governance**

1. Member States shall ensure that the management bodies of essential and important entities approve the cybersecurity risk-management measures taken by those entities in order to comply with Article 21, oversee its implementation and can be held liable for infringements by the entities of that Article.

The application of this paragraph shall be without prejudice to national law as regards the liability rules applicable to public institutions, as well as the liability of public servants and elected or appointed officials.

2. Member States shall ensure that the members of the management bodies of essential and important entities are required to follow training, and shall encourage essential and important entities to offer similar training to their employees on a regular basis, in order that they gain sufficient knowledge and skills to enable them to identify risks and assess cybersecurity risk-management practices and their impact on the services provided by the entity.

#### Article 21

### Cybersecurity risk-management measures

1. Member States shall ensure that essential and important entities take appropriate and proportionate technical, operational and organisational measures to manage the risks posed to the security of network and information systems which those entities use for their operations or for the provision of their services, and to prevent or minimise the impact of incidents on recipients of their services and on other services.

Taking into account the state-of-the-art and, where applicable, relevant European and international standards, as well as the cost of implementation, the measures referred to in the first subparagraph shall ensure a level of security of network and information systems appropriate to the risks posed. When assessing the proportionality of those measures, due account shall be taken of the degree of the entity's exposure to risks, the entity's size and the likelihood of occurrence of incidents and their severity, including their societal and economic impact.

2. The measures referred to in paragraph 1 shall be based on an all-hazards approach that aims to protect network and information systems and the physical environment of those systems from incidents, and shall include at least the following:

- (a) policies on risk analysis and information system security;
- (b) incident handling;
- (c) business continuity, such as backup management and disaster recovery, and crisis management;
- (d) supply chain security, including security-related aspects concerning the relationships between each entity and its direct suppliers or service providers;
- (e) security in network and information systems acquisition, development and maintenance, including vulnerability handling and disclosure;
- (f) policies and procedures to assess the effectiveness of cybersecurity risk-management measures;
- (g) basic cyber hygiene practices and cybersecurity training;
- (h) policies and procedures regarding the use of cryptography and, where appropriate, encryption;
- (i) human resources security, access control policies and asset management;
- (j) the use of multi-factor authentication or continuous authentication solutions, secured voice, video and text communications and secured emergency communication systems within the entity, where appropriate.

3. Member States shall ensure that, when considering which measures referred to in paragraph 2, point (d), of this Article are appropriate, entities take into account the vulnerabilities specific to each direct supplier and service provider and the overall quality of products and cybersecurity practices of their suppliers and service providers, including their secure development procedures. Member States shall also ensure that, when considering which measures referred to in that point are appropriate, entities are required to take into account the results of the coordinated security risk assessments of critical supply chains carried out in accordance with Article 22(1).

4. Member States shall ensure that an entity that finds that it does not comply with the measures provided for in paragraph 2 takes, without undue delay, all necessary, appropriate and proportionate corrective measures.

5. By 17 October 2024, the Commission shall adopt implementing acts laying down the technical and the methodological requirements of the measures referred to in paragraph 2 with regard to DNS service providers, TLD name registries, cloud computing service providers, data centre service providers, content delivery network providers, managed service providers, managed security service providers, providers of online market places, of online search engines and of social networking services platforms, and trust service providers.

The Commission may adopt implementing acts laying down the technical and the methodological requirements, as well as sectoral requirements, as necessary, of the measures referred to in paragraph 2 with regard to essential and important entities other than those referred to in the first subparagraph of this paragraph.

When preparing the implementing acts referred to in the first and second subparagraphs of this paragraph, the Commission shall, to the extent possible, follow European and international standards, as well as relevant technical specifications. The Commission shall exchange advice and cooperate with the Cooperation Group and ENISA on the draft implementing acts in accordance with Article 14(4), point (e).

Those implementing acts shall be adopted in accordance with the examination procedure referred to in Article 39(2).

#### Article 22

### **Union level coordinated security risk assessments of critical supply chains**

1. The Cooperation Group, in cooperation with the Commission and ENISA, may carry out coordinated security risk assessments of specific critical ICT services, ICT systems or ICT products supply chains, taking into account technical and, where relevant, non-technical risk factors.
2. The Commission, after consulting the Cooperation Group and ENISA, and, where necessary, relevant stakeholders, shall identify the specific critical ICT services, ICT systems or ICT products that may be subject to the coordinated security risk assessment referred to in paragraph 1.

#### Article 23

### **Reporting obligations**

1. Each Member State shall ensure that essential and important entities notify, without undue delay, its CSIRT or, where applicable, its competent authority in accordance with paragraph 4 of any incident that has a significant impact on the provision of their services as referred to in paragraph 3 (significant incident). Where appropriate, entities concerned shall notify, without undue delay, the recipients of their services of significant incidents that are likely to adversely affect the provision of those services. Each Member State shall ensure that those entities report, inter alia, any information enabling the CSIRT or, where applicable, the competent authority to determine any cross-border impact of the incident. The mere act of notification shall not subject the notifying entity to increased liability.

Where the entities concerned notify the competent authority of a significant incident under the first subparagraph, the Member State shall ensure that that competent authority forwards the notification to the CSIRT upon receipt.

In the case of a cross-border or cross-sectoral significant incident, Member States shall ensure that their single points of contact are provided in due time with relevant information notified in accordance with paragraph 4.

2. Where applicable, Member States shall ensure that essential and important entities communicate, without undue delay, to the recipients of their services that are potentially affected by a significant cyber threat any measures or remedies that those recipients are able to take in response to that threat. Where appropriate, the entities shall also inform those recipients of the significant cyber threat itself.

3. An incident shall be considered to be significant if:
  - (a) it has caused or is capable of causing severe operational disruption of the services or financial loss for the entity concerned;
  - (b) it has affected or is capable of affecting other natural or legal persons by causing considerable material or non-material damage.
  
4. Member States shall ensure that, for the purpose of notification under paragraph 1, the entities concerned submit to the CSIRT or, where applicable, the competent authority:
  - (a) without undue delay and in any event within 24 hours of becoming aware of the significant incident, an early warning, which, where applicable, shall indicate whether the significant incident is suspected of being caused by unlawful or malicious acts or could have a cross-border impact;
  - (b) without undue delay and in any event within 72 hours of becoming aware of the significant incident, an incident notification, which, where applicable, shall update the information referred to in point (a) and indicate an initial assessment of the significant incident, including its severity and impact, as well as, where available, the indicators of compromise;
  - (c) upon the request of a CSIRT or, where applicable, the competent authority, an intermediate report on relevant status updates;
  - (d) a final report not later than one month after the submission of the incident notification under point (b), including the following:
    - (i) a detailed description of the incident, including its severity and impact;
    - (ii) the type of threat or root cause that is likely to have triggered the incident;
    - (iii) applied and ongoing mitigation measures;
    - (iv) where applicable, the cross-border impact of the incident;
  - (e) in the event of an ongoing incident at the time of the submission of the final report referred to in point (d), Member States shall ensure that entities concerned provide a progress report at that time and a final report within one month of their handling of the incident.

By way of derogation from the first subparagraph, point (b), a trust service provider shall, with regard to significant incidents that have an impact on the provision of its trust services, notify the CSIRT or, where applicable, the competent authority, without undue delay and in any event within 24 hours of becoming aware of the significant incident.

5. The CSIRT or the competent authority shall provide, without undue delay and where possible within 24 hours of receiving the early warning referred to in paragraph 4, point (a), a response to the notifying entity, including initial feedback on the significant incident and, upon request of the entity, guidance or operational advice on the implementation of possible mitigation measures. Where the CSIRT is not the initial recipient of the notification referred to in paragraph 1, the guidance shall be provided by the competent authority in cooperation with the CSIRT. The CSIRT shall provide additional technical support if the entity concerned so requests. Where the significant incident is suspected to be of criminal nature, the CSIRT or the competent authority shall also provide guidance on reporting the significant incident to law enforcement authorities.

6. Where appropriate, and in particular where the significant incident concerns two or more Member States, the CSIRT, the competent authority or the single point of contact shall inform, without undue delay, the other affected Member States and ENISA of the significant incident. Such information shall include the type of information received in accordance with paragraph 4. In so doing, the CSIRT, the competent authority or the single point of contact shall, in accordance with Union or national law, preserve the entity's security and commercial interests as well as the confidentiality of the information provided.

7. Where public awareness is necessary to prevent a significant incident or to deal with an ongoing significant incident, or where disclosure of the significant incident is otherwise in the public interest, a Member State's CSIRT or, where applicable, its competent authority, and, where appropriate, the CSIRTs or the competent authorities of other Member States concerned, may, after consulting the entity concerned, inform the public about the significant incident or require the entity to do so.

8. At the request of the CSIRT or the competent authority, the single point of contact shall forward notifications received pursuant to paragraph 1 to the single points of contact of other affected Member States.

9. The single point of contact shall submit to ENISA every three months a summary report, including anonymised and aggregated data on significant incidents, incidents, cyber threats and near misses notified in accordance with paragraph 1 of this Article and with Article 30. In order to contribute to the provision of comparable information, ENISA may adopt technical guidance on the parameters of the information to be included in the summary report. ENISA shall inform the Cooperation Group and the CSIRTs network about its findings on notifications received every six months.

10. The CSIRTs or, where applicable, the competent authorities shall provide to the competent authorities under Directive (EU) 2022/2557 information about significant incidents, incidents, cyber threats and near misses notified in accordance with paragraph 1 of this Article and with Article 30 by entities identified as critical entities under Directive (EU) 2022/2557.

11. The Commission may adopt implementing acts further specifying the type of information, the format and the procedure of a notification submitted pursuant to paragraph 1 of this Article and to Article 30 and of a communication submitted pursuant to paragraph 2 of this Article.

By 17 October 2024, the Commission shall, with regard to DNS service providers, TLD name registries, cloud computing service providers, data centre service providers, content delivery network providers, managed service providers, managed security service providers, as well as providers of online marketplaces, of online search engines and of social networking services platforms, adopt implementing acts further specifying the cases in which an incident shall be considered to be significant as referred to in paragraph 3. The Commission may adopt such implementing acts with regard to other essential and important entities.

The Commission shall exchange advice and cooperate with the Cooperation Group on the draft implementing acts referred to in the first and second subparagraphs of this paragraph in accordance with Article 14(4), point (e).

Those implementing acts shall be adopted in accordance with the examination procedure referred to in Article 39(2).

#### *Article 24*

### **Use of European cybersecurity certification schemes**

1. In order to demonstrate compliance with particular requirements of Article 21, Member States may require essential and important entities to use particular ICT products, ICT services and ICT processes, developed by the essential or important entity or procured from third parties, that are certified under European cybersecurity certification schemes adopted pursuant to Article 49 of Regulation (EU) 2019/881. Furthermore, Member States shall encourage essential and important entities to use qualified trust services.

2. The Commission is empowered to adopt delegated acts, in accordance with Article 38, to supplement this Directive by specifying which categories of essential and important entities are to be required to use certain certified ICT products, ICT services and ICT processes or obtain a certificate under a European cybersecurity certification scheme adopted pursuant to Article 49 of Regulation (EU) 2019/881. Those delegated acts shall be adopted where insufficient levels of cybersecurity have been identified and shall include an implementation period.

Before adopting such delegated acts, the Commission shall carry out an impact assessment and shall carry out consultations in accordance with Article 56 of Regulation (EU) 2019/881.

3. Where no appropriate European cybersecurity certification scheme for the purposes of paragraph 2 of this Article is available, the Commission may, after consulting the Cooperation Group and the European Cybersecurity Certification Group, request ENISA to prepare a candidate scheme pursuant to Article 48(2) of Regulation (EU) 2019/881.

#### Article 25

##### **Standardisation**

1. In order to promote the convergent implementation of Article 21(1) and (2), Member States shall, without imposing or discriminating in favour of the use of a particular type of technology, encourage the use of European and international standards and technical specifications relevant to the security of network and information systems.

2. ENISA, in cooperation with Member States, and, where appropriate, after consulting relevant stakeholders, shall draw up advice and guidelines regarding the technical areas to be considered in relation to paragraph 1 as well as regarding already existing standards, including national standards, which would allow for those areas to be covered.

#### CHAPTER V

##### **JURISDICTION AND REGISTRATION**

#### Article 26

##### **Jurisdiction and territoriality**

1. Entities falling within the scope of this Directive shall be considered to fall under the jurisdiction of the Member State in which they are established, except in the case of:

- (a) providers of public electronic communications networks or providers of publicly available electronic communications services, which shall be considered to fall under the jurisdiction of the Member State in which they provide their services;
- (b) DNS service providers, TLD name registries, entities providing domain name registration services, cloud computing service providers, data centre service providers, content delivery network providers, managed service providers, managed security service providers, as well as providers of online marketplaces, of online search engines or of social networking services platforms, which shall be considered to fall under the jurisdiction of the Member State in which they have their main establishment in the Union under paragraph 2;
- (c) public administration entities, which shall be considered to fall under the jurisdiction of the Member State which established them.

2. For the purposes of this Directive, an entity as referred to in paragraph 1, point (b), shall be considered to have its main establishment in the Union in the Member State where the decisions related to the cybersecurity risk-management measures are predominantly taken. If such a Member State cannot be determined or if such decisions are not taken in the Union, the main establishment shall be considered to be in the Member State where cybersecurity operations are carried out. If such a Member State cannot be determined, the main establishment shall be considered to be in the Member State where the entity concerned has the establishment with the highest number of employees in the Union.

3. If an entity as referred to in paragraph 1, point (b), is not established in the Union, but offers services within the Union, it shall designate a representative in the Union. The representative shall be established in one of those Member States where the services are offered. Such an entity shall be considered to fall under the jurisdiction of the Member State where the representative is established. In the absence of a representative in the Union designated under this paragraph, any Member State in which the entity provides services may take legal actions against the entity for the infringement of this Directive.

4. The designation of a representative by an entity as referred to in paragraph 1, point (b), shall be without prejudice to legal actions, which could be initiated against the entity itself.

5. Member States that have received a request for mutual assistance in relation to an entity as referred to in paragraph 1, point (b), may, within the limits of that request, take appropriate supervisory and enforcement measures in relation to the entity concerned that provides services or which has a network and information system on their territory.

#### Article 27

##### **Registry of entities**

1. ENISA shall create and maintain a registry of DNS service providers, TLD name registries, entities providing domain name registration services, cloud computing service providers, data centre service providers, content delivery network providers, managed service providers, managed security service providers, as well as providers of online marketplaces, of online search engines and of social networking services platforms, on the basis of the information received from the single points of contact in accordance with paragraph 4. Upon request, ENISA shall allow the competent authorities access to that registry, while ensuring that the confidentiality of information is protected where applicable.

2. Member States shall require entities referred to in paragraph 1 to submit the following information to the competent authorities by 17 January 2025:

- (a) the name of the entity;
- (b) the relevant sector, subsector and type of entity referred to in Annex I or II, where applicable;
- (c) the address of the entity's main establishment and its other legal establishments in the Union or, if not established in the Union, of its representative designated pursuant to Article 26(3);
- (d) up-to-date contact details, including email addresses and telephone numbers of the entity and, where applicable, its representative designated pursuant to Article 26(3);
- (e) the Member States where the entity provides services; and
- (f) the entity's IP ranges.

3. Member States shall ensure that the entities referred to in paragraph 1 notify the competent authority about any changes to the information they submitted under paragraph 2 without delay and in any event within three months of the date of the change.

4. Upon receipt of the information referred to in paragraphs 2 and 3, except for that referred to in paragraph 2, point (f), the single point of contact of the Member State concerned shall, without undue delay, forward it to ENISA.

5. Where applicable, the information referred to in paragraphs 2 and 3 of this Article shall be submitted through the national mechanism referred to in Article 3(4), fourth subparagraph.

#### Article 28

##### **Database of domain name registration data**

1. For the purpose of contributing to the security, stability and resilience of the DNS, Member States shall require TLD name registries and entities providing domain name registration services to collect and maintain accurate and complete domain name registration data in a dedicated database with due diligence in accordance with Union data protection law as regards data which are personal data.

2. For the purposes of paragraph 1, Member States shall require the database of domain name registration data to contain the necessary information to identify and contact the holders of the domain names and the points of contact administering the domain names under the TLDs. Such information shall include:

- (a) the domain name;
- (b) the date of registration;

- (c) the registrant's name, contact email address and telephone number;
  - (d) the contact email address and telephone number of the point of contact administering the domain name in the event that they are different from those of the registrant.
3. Member States shall require the TLD name registries and the entities providing domain name registration services to have policies and procedures, including verification procedures, in place to ensure that the databases referred to in paragraph 1 include accurate and complete information. Member States shall require such policies and procedures to be made publicly available.
4. Member States shall require the TLD name registries and the entities providing domain name registration services to make publicly available, without undue delay after the registration of a domain name, the domain name registration data which are not personal data.
5. Member States shall require the TLD name registries and the entities providing domain name registration services to provide access to specific domain name registration data upon lawful and duly substantiated requests by legitimate access seekers, in accordance with Union data protection law. Member States shall require the TLD name registries and the entities providing domain name registration services to reply without undue delay and in any event within 72 hours of receipt of any requests for access. Member States shall require policies and procedures with regard to the disclosure of such data to be made publicly available.
6. Compliance with the obligations laid down in paragraphs 1 to 5 shall not result in a duplication of collecting domain name registration data. To that end, Member States shall require TLD name registries and entities providing domain name registration services to cooperate with each other.

## CHAPTER VI

### INFORMATION SHARING

#### *Article 29*

#### **Cybersecurity information-sharing arrangements**

1. Member States shall ensure that entities falling within the scope of this Directive and, where relevant, other entities not falling within the scope of this Directive are able to exchange on a voluntary basis relevant cybersecurity information among themselves, including information relating to cyber threats, near misses, vulnerabilities, techniques and procedures, indicators of compromise, adversarial tactics, threat-actor-specific information, cybersecurity alerts and recommendations regarding configuration of cybersecurity tools to detect cyberattacks, where such information sharing:
- (a) aims to prevent, detect, respond to or recover from incidents or to mitigate their impact;
  - (b) enhances the level of cybersecurity, in particular through raising awareness in relation to cyber threats, limiting or impeding the ability of such threats to spread, supporting a range of defensive capabilities, vulnerability remediation and disclosure, threat detection, containment and prevention techniques, mitigation strategies, or response and recovery stages or promoting collaborative cyber threat research between public and private entities.
2. Member States shall ensure that the exchange of information takes place within communities of essential and important entities, and where relevant, their suppliers or service providers. Such exchange shall be implemented through cybersecurity information-sharing arrangements in respect of the potentially sensitive nature of the information shared.

3. Member States shall facilitate the establishment of cybersecurity information-sharing arrangements referred to in paragraph 2 of this Article. Such arrangements may specify operational elements, including the use of dedicated ICT platforms and automation tools, content and conditions of the information-sharing arrangements. In laying down the details of the involvement of public authorities in such arrangements, Member States may impose conditions on the information made available by the competent authorities or the CSIRTs. Member States shall offer assistance for the application of such arrangements in accordance with their policies referred to in Article 7(2), point (h).

4. Member States shall ensure that essential and important entities notify the competent authorities of their participation in the cybersecurity information-sharing arrangements referred to in paragraph 2, upon entering into such arrangements, or, as applicable, of their withdrawal from such arrangements, once the withdrawal takes effect.

5. ENISA shall provide assistance for the establishment of cybersecurity information-sharing arrangements referred to in paragraph 2 by exchanging best practices and providing guidance.

#### *Article 30*

### **Voluntary notification of relevant information**

1. Member States shall ensure that, in addition to the notification obligation provided for in Article 23, notifications can be submitted to the CSIRTs or, where applicable, the competent authorities, on a voluntary basis, by:

- (a) essential and important entities with regard to incidents, cyber threats and near misses;
- (b) entities other than those referred to in point (a), regardless of whether they fall within the scope of this Directive, with regard to significant incidents, cyber threats and near misses.

2. Member States shall process the notifications referred to in paragraph 1 of this Article in accordance with the procedure laid down in Article 23. Member States may prioritise the processing of mandatory notifications over voluntary notifications.

Where necessary, the CSIRTs and, where applicable, the competent authorities shall provide the single points of contact with the information about notifications received pursuant to this Article, while ensuring the confidentiality and appropriate protection of the information provided by the notifying entity. Without prejudice to the prevention, investigation, detection and prosecution of criminal offences, voluntary reporting shall not result in the imposition of any additional obligations upon the notifying entity to which it would not have been subject had it not submitted the notification.

## CHAPTER VII

### **SUPERVISION AND ENFORCEMENT**

#### *Article 31*

### **General aspects concerning supervision and enforcement**

1. Member States shall ensure that their competent authorities effectively supervise and take the measures necessary to ensure compliance with this Directive.

2. Member States may allow their competent authorities to prioritise supervisory tasks. Such prioritisation shall be based on a risk-based approach. To that end, when exercising their supervisory tasks provided for in Articles 32 and 33, the competent authorities may establish supervisory methodologies allowing for a prioritisation of such tasks following a risk-based approach.

3. The competent authorities shall work in close cooperation with supervisory authorities under Regulation (EU) 2016/679 when addressing incidents resulting in personal data breaches, without prejudice to the competence and tasks of the supervisory authorities under that Regulation.

4. Without prejudice to national legislative and institutional frameworks, Member States shall ensure that, in the supervision of compliance of public administration entities with this Directive and the imposition of enforcement measures with regard to infringements of this Directive, the competent authorities have appropriate powers to carry out such tasks with operational independence vis-à-vis the public administration entities supervised. Member States may decide on the imposition of appropriate, proportionate and effective supervisory and enforcement measures in relation to those entities in accordance with the national legislative and institutional frameworks.

#### Article 32

##### **Supervisory and enforcement measures in relation to essential entities**

1. Member States shall ensure that the supervisory or enforcement measures imposed on essential entities in respect of the obligations laid down in this Directive are effective, proportionate and dissuasive, taking into account the circumstances of each individual case.

2. Member States shall ensure that the competent authorities, when exercising their supervisory tasks in relation to essential entities, have the power to subject those entities at least to:

- (a) on-site inspections and off-site supervision, including random checks conducted by trained professionals;
- (b) regular and targeted security audits carried out by an independent body or a competent authority;
- (c) ad hoc audits, including where justified on the ground of a significant incident or an infringement of this Directive by the essential entity;
- (d) security scans based on objective, non-discriminatory, fair and transparent risk assessment criteria, where necessary with the cooperation of the entity concerned;
- (e) requests for information necessary to assess the cybersecurity risk-management measures adopted by the entity concerned, including documented cybersecurity policies, as well as compliance with the obligation to submit information to the competent authorities pursuant to Article 27;
- (f) requests to access data, documents and information necessary to carry out their supervisory tasks;
- (g) requests for evidence of implementation of cybersecurity policies, such as the results of security audits carried out by a qualified auditor and the respective underlying evidence.

The targeted security audits referred to in the first subparagraph, point (b), shall be based on risk assessments conducted by the competent authority or the audited entity, or on other risk-related available information.

The results of any targeted security audit shall be made available to the competent authority. The costs of such targeted security audit carried out by an independent body shall be paid by the audited entity, except in duly substantiated cases when the competent authority decides otherwise.

3. When exercising their powers under paragraph 2, point (e), (f) or (g), the competent authorities shall state the purpose of the request and specify the information requested.

4. Member States shall ensure that their competent authorities, when exercising their enforcement powers in relation to essential entities, have the power at least to:

- (a) issue warnings about infringements of this Directive by the entities concerned;

- (b) adopt binding instructions, including with regard to measures necessary to prevent or remedy an incident, as well as time-limits for the implementation of such measures and for reporting on their implementation, or an order requiring the entities concerned to remedy the deficiencies identified or the infringements of this Directive;
- (c) order the entities concerned to cease conduct that infringes this Directive and desist from repeating that conduct;
- (d) order the entities concerned to ensure that their cybersecurity risk-management measures comply with Article 21 or to fulfil the reporting obligations laid down in Article 23, in a specified manner and within a specified period;
- (e) order the entities concerned to inform the natural or legal persons with regard to which they provide services or carry out activities which are potentially affected by a significant cyber threat of the nature of the threat, as well as of any possible protective or remedial measures which can be taken by those natural or legal persons in response to that threat;
- (f) order the entities concerned to implement the recommendations provided as a result of a security audit within a reasonable deadline;
- (g) designate a monitoring officer with well-defined tasks for a determined period of time to oversee the compliance of the entities concerned with Articles 21 and 23;
- (h) order the entities concerned to make public aspects of infringements of this Directive in a specified manner;
- (i) impose, or request the imposition by the relevant bodies, courts or tribunals, in accordance with national law, of an administrative fine pursuant to Article 34 in addition to any of the measures referred to in points (a) to (h) of this paragraph.

5. Where enforcement measures adopted pursuant to paragraph 4, points (a) to (d) and (f), are ineffective, Member States shall ensure that their competent authorities have the power to establish a deadline by which the essential entity is requested to take the necessary action to remedy the deficiencies or to comply with the requirements of those authorities. If the requested action is not taken within the deadline set, Member States shall ensure that their competent authorities have the power to:

- (a) suspend temporarily, or request a certification or authorisation body, or a court or tribunal, in accordance with national law, to suspend temporarily a certification or authorisation concerning part or all of the relevant services provided or activities carried out by the essential entity;
- (b) request that the relevant bodies, courts or tribunals, in accordance with national law, prohibit temporarily any natural person who is responsible for discharging managerial responsibilities at chief executive officer or legal representative level in the essential entity from exercising managerial functions in that entity.

Temporary suspensions or prohibitions imposed pursuant to this paragraph shall be applied only until the entity concerned takes the necessary action to remedy the deficiencies or comply with the requirements of the competent authority for which such enforcement measures were applied. The imposition of such temporary suspensions or prohibitions shall be subject to appropriate procedural safeguards in accordance with the general principles of Union law and the Charter, including the right to an effective remedy and to a fair trial, the presumption of innocence and the rights of the defence.

The enforcement measures provided for in this paragraph shall not be applicable to public administration entities that are subject to this Directive.

6. Member States shall ensure that any natural person responsible for or acting as a legal representative of an essential entity on the basis of the power to represent it, the authority to take decisions on its behalf or the authority to exercise control of it has the power to ensure its compliance with this Directive. Member States shall ensure that it is possible to hold such natural persons liable for breach of their duties to ensure compliance with this Directive.

As regards public administration entities, this paragraph shall be without prejudice to national law as regards the liability of public servants and elected or appointed officials.

7. When taking any of the enforcement measures referred to in paragraph 4 or 5, the competent authorities shall comply with the rights of the defence and take account of the circumstances of each individual case and, as a minimum, take due account of:

- (a) the seriousness of the infringement and the importance of the provisions breached, the following, *inter alia*, constituting serious infringement in any event:
  - (i) repeated violations;
  - (ii) a failure to notify or remedy significant incidents;
  - (iii) a failure to remedy deficiencies following binding instructions from competent authorities;
  - (iv) the obstruction of audits or monitoring activities ordered by the competent authority following the finding of an infringement;
  - (v) providing false or grossly inaccurate information in relation to cybersecurity risk-management measures or reporting obligations laid down in Articles 21 and 23;
- (b) the duration of the infringement;
- (c) any relevant previous infringements by the entity concerned;
- (d) any material or non-material damage caused, including any financial or economic loss, effects on other services and the number of users affected;
- (e) any intent or negligence on the part of the perpetrator of the infringement;
- (f) any measures taken by the entity to prevent or mitigate the material or non-material damage;
- (g) any adherence to approved codes of conduct or approved certification mechanisms;
- (h) the level of cooperation of the natural or legal persons held responsible with the competent authorities.

8. The competent authorities shall set out a detailed reasoning for their enforcement measures. Before adopting such measures, the competent authorities shall notify the entities concerned of their preliminary findings. They shall also allow a reasonable time for those entities to submit observations, except in duly substantiated cases where immediate action to prevent or respond to incidents would otherwise be impeded.

9. Member States shall ensure that their competent authorities under this Directive inform the relevant competent authorities within the same Member State under Directive (EU) 2022/2557 when exercising their supervisory and enforcement powers aiming to ensure compliance of an entity identified as a critical entity under Directive (EU) 2022/2557 with this Directive. Where appropriate, the competent authorities under Directive (EU) 2022/2557 may request the competent authorities under this Directive to exercise their supervisory and enforcement powers in relation to an entity that is identified as a critical entity under Directive (EU) 2022/2557.

10. Member States shall ensure that their competent authorities under this Directive cooperate with the relevant competent authorities of the Member State concerned under Regulation (EU) 2022/2554. In particular, Member States shall ensure that their competent authorities under this Directive inform the Oversight Forum established pursuant to Article 32(1) of Regulation (EU) 2022/2554 when exercising their supervisory and enforcement powers aimed at ensuring compliance of an essential entity that is designated as a critical ICT third-party service provider pursuant to Article 31 of Regulation (EU) 2022/2554. with this Directive.

### Article 33

#### **Supervisory and enforcement measures in relation to important entities**

1. When provided with evidence, indication or information that an important entity allegedly does not comply with this Directive, in particular Articles 21 and 23 thereof, Member States shall ensure that the competent authorities take action, where necessary, through *ex post* supervisory measures. Member States shall ensure that those measures are effective, proportionate and dissuasive, taking into account the circumstances of each individual case.

2. Member States shall ensure that the competent authorities, when exercising their supervisory tasks in relation to important entities, have the power to subject those entities at least to:

- (a) on-site inspections and off-site *ex post* supervision conducted by trained professionals;
- (b) targeted security audits carried out by an independent body or a competent authority;
- (c) security scans based on objective, non-discriminatory, fair and transparent risk assessment criteria, where necessary with the cooperation of the entity concerned;
- (d) requests for information necessary to assess, *ex post*, the cybersecurity risk-management measures adopted by the entity concerned, including documented cybersecurity policies, as well as compliance with the obligation to submit information to the competent authorities pursuant to Article 27;
- (e) requests to access data, documents and information necessary to carry out their supervisory tasks;
- (f) requests for evidence of implementation of cybersecurity policies, such as the results of security audits carried out by a qualified auditor and the respective underlying evidence.

The targeted security audits referred to in the first subparagraph, point (b), shall be based on risk assessments conducted by the competent authority or the audited entity, or on other risk-related available information.

The results of any targeted security audit shall be made available to the competent authority. The costs of such targeted security audit carried out by an independent body shall be paid by the audited entity, except in duly substantiated cases when the competent authority decides otherwise.

3. When exercising their powers under paragraph 2, point (d), (e) or (f), the competent authorities shall state the purpose of the request and specify the information requested.

4. Member States shall ensure that the competent authorities, when exercising their enforcement powers in relation to important entities, have the power at least to:

- (a) issue warnings about infringements of this Directive by the entities concerned;
- (b) adopt binding instructions or an order requiring the entities concerned to remedy the deficiencies identified or the infringement of this Directive;
- (c) order the entities concerned to cease conduct that infringes this Directive and desist from repeating that conduct;
- (d) order the entities concerned to ensure that their cybersecurity risk-management measures comply with Article 21 or to fulfil the reporting obligations laid down in Article 23, in a specified manner and within a specified period;
- (e) order the entities concerned to inform the natural or legal persons with regard to which they provide services or carry out activities which are potentially affected by a significant cyber threat of the nature of the threat, as well as of any possible protective or remedial measures which can be taken by those natural or legal persons in response to that threat;
- (f) order the entities concerned to implement the recommendations provided as a result of a security audit within a reasonable deadline;
- (g) order the entities concerned to make public aspects of infringements of this Directive in a specified manner;
- (h) impose, or request the imposition by the relevant bodies, courts or tribunals, in accordance with national law, of an administrative fine pursuant to Article 34 in addition to any of the measures referred to in points (a) to (g) of this paragraph.

5. Article 32(6), (7) and (8) shall apply *mutatis mutandis* to the supervisory and enforcement measures provided for in this Article for important entities.

6. Member States shall ensure that their competent authorities under this Directive cooperate with the relevant competent authorities of the Member State concerned under Regulation (EU) 2022/2554. In particular, Member States shall ensure that their competent authorities under this Directive inform the Oversight Forum established pursuant to Article 32(1) of Regulation (EU) 2022/2554 when exercising their supervisory and enforcement powers aimed at ensuring compliance of an important entity that is designated as a critical ICT third-party service provider pursuant to Article 31 of Regulation (EU) 2022/2554. with this Directive.

#### Article 34

##### **General conditions for imposing administrative fines on essential and important entities**

1. Member States shall ensure that the administrative fines imposed on essential and important entities pursuant to this Article in respect of infringements of this Directive are effective, proportionate and dissuasive, taking into account the circumstances of each individual case.
2. Administrative fines shall be imposed in addition to any of the measures referred to in Article 32(4), points (a) to (h), Article 32(5) and Article 33(4), points (a) to (g).
3. When deciding whether to impose an administrative fine and deciding on its amount in each individual case, due regard shall be given, as a minimum, to the elements provided for in Article 32(7).
4. Member States shall ensure that where they infringe Article 21 or 23, essential entities are subject, in accordance with paragraphs 2 and 3 of this Article, to administrative fines of a maximum of at least EUR 10 000 000 or of a maximum of at least 2 % of the total worldwide annual turnover in the preceding financial year of the undertaking to which the essential entity belongs, whichever is higher.
5. Member States shall ensure that where they infringe Article 21 or 23, important entities are subject, in accordance with paragraphs 2 and 3 of this Article, to administrative fines of a maximum of at least EUR 7 000 000 or of a maximum of at least 1,4 % of the total worldwide annual turnover in the preceding financial year of the undertaking to which the important entity belongs, whichever is higher.
6. Member States may provide for the power to impose periodic penalty payments in order to compel an essential or important entity to cease an infringement of this Directive in accordance with a prior decision of the competent authority.
7. Without prejudice to the powers of the competent authorities pursuant to Articles 32 and 33, each Member State may lay down the rules on whether and to what extent administrative fines may be imposed on public administration entities.
8. Where the legal system of a Member State does not provide for administrative fines, that Member State shall ensure that this Article is applied in such a manner that the fine is initiated by the competent authority and imposed by competent national courts or tribunals, while ensuring that those legal remedies are effective and have an equivalent effect to the administrative fines imposed by the competent authorities. In any event, the fines imposed shall be effective, proportionate and dissuasive. The Member State shall notify to the Commission the provisions of the laws which it adopts pursuant to this paragraph by 17 October 2024 and, without delay, any subsequent amendment law or amendment affecting them.

#### Article 35

##### **Infringements entailing a personal data breach**

1. Where the competent authorities become aware in the course of supervision or enforcement that the infringement by an essential or important entity of the obligations laid down in Articles 21 and 23 of this Directive can entail a personal data breach, as defined in Article 4, point (12), of Regulation (EU) 2016/679 which is to be notified pursuant to Article 33 of that Regulation, they shall, without undue delay, inform the supervisory authorities as referred to in Article 55 or 56 of that Regulation.

2. Where the supervisory authorities as referred to in Article 55 or 56 of Regulation (EU) 2016/679 impose an administrative fine pursuant to Article 58(2), point (i), of that Regulation, the competent authorities shall not impose an administrative fine pursuant to Article 34 of this Directive for an infringement referred to in paragraph 1 of this Article arising from the same conduct as that which was the subject of the administrative fine under Article 58(2), point (i), of Regulation (EU) 2016/679. The competent authorities may, however, impose the enforcement measures provided for in Article 32(4), points (a) to (h), Article 32(5) and Article 33(4), points (a) to (g), of this Directive.

3. Where the supervisory authority competent pursuant to Regulation (EU) 2016/679 is established in another Member State than the competent authority, the competent authority shall inform the supervisory authority established in its own Member State of the potential data breach referred to in paragraph 1.

#### *Article 36*

### **Penalties**

Member States shall lay down rules on penalties applicable to infringements of national measures adopted pursuant to this Directive and shall take all measures necessary to ensure that they are implemented. The penalties provided for shall be effective, proportionate and dissuasive. Member States shall, by 17 January 2025, notify the Commission of those rules and of those measures and shall notify it, without delay of any subsequent amendment affecting them.

#### *Article 37*

### **Mutual assistance**

1. Where an entity provides services in more than one Member State, or provides services in one or more Member States and its network and information systems are located in one or more other Member States, the competent authorities of the Member States concerned shall cooperate with and assist each other as necessary. That cooperation shall entail, at least, that:

- (a) the competent authorities applying supervisory or enforcement measures in a Member State shall, via the single point of contact, inform and consult the competent authorities in the other Member States concerned on the supervisory and enforcement measures taken;
- (b) a competent authority may request another competent authority to take supervisory or enforcement measures;
- (c) a competent authority shall, upon receipt of a substantiated request from another competent authority, provide the other competent authority with mutual assistance proportionate to its own resources so that the supervisory or enforcement measures can be implemented in an effective, efficient and consistent manner.

The mutual assistance referred to in the first subparagraph, point (c), may cover information requests and supervisory measures, including requests to carry out on-site inspections or off-site supervision or targeted security audits. A competent authority to which a request for assistance is addressed shall not refuse that request unless it is established that it does not have the competence to provide the requested assistance, the requested assistance is not proportionate to the supervisory tasks of the competent authority, or the request concerns information or entails activities which, if disclosed or carried out, would be contrary to the essential interests of the Member State's national security, public security or defence. Before refusing such a request, the competent authority shall consult the other competent authorities concerned as well as, upon the request of one of the Member States concerned, the Commission and ENISA.

2. Where appropriate and with common agreement, the competent authorities of various Member States may carry out joint supervisory actions.

## CHAPTER VIII

## DELEGATED AND IMPLEMENTING ACTS

## Article 38

**Exercise of the delegation**

1. The power to adopt delegated acts is conferred on the Commission subject to the conditions laid down in this Article.
2. The power to adopt delegated acts referred to in Article 24(2) shall be conferred on the Commission for a period of five years from 16 January 2023.
3. The delegation of power referred to in Article 24(2) may be revoked at any time by the European Parliament or by the Council. A decision to revoke shall put an end to the delegation of the power specified in that decision. It shall take effect the day following the publication of the decision in the *Official Journal of the European Union* or at a later date specified therein. It shall not affect the validity of any delegated acts already in force.
4. Before adopting a delegated act, the Commission shall consult experts designated by each Member State in accordance with the principles laid down in the Interinstitutional Agreement of 13 April 2016 on Better Law-Making.
5. As soon as it adopts a delegated act, the Commission shall notify it simultaneously to the European Parliament and to the Council.
6. A delegated act adopted pursuant to Article 24(2) shall enter into force only if no objection has been expressed either by the European Parliament or by the Council within a period of two months of notification of that act to the European Parliament and to the Council or if, before the expiry of that period, the European Parliament and the Council have both informed the Commission that they will not object. That period shall be extended by two months at the initiative of the European Parliament or of the Council.

## Article 39

**Committee procedure**

1. The Commission shall be assisted by a committee. That committee shall be a committee within the meaning of Regulation (EU) No 182/2011.
2. Where reference is made to this paragraph, Article 5 of Regulation (EU) No 182/2011 shall apply.
3. Where the opinion of the committee is to be obtained by written procedure, that procedure shall be terminated without result when, within the time-limit for delivery of the opinion, the chair of the committee so decides or a committee member so requests.

## CHAPTER IX

## FINAL PROVISIONS

## Article 40

**Review**

By 17 October 2027 and every 36 months thereafter, the Commission shall review the functioning of this Directive, and report to the European Parliament and to the Council. The report shall in particular assess the relevance of the size of the entities concerned, and the sectors, subsectors and types of entity referred to in Annexes I and II for the functioning of the economy and society in relation to cybersecurity. To that end and with a view to further advancing the strategic and operational cooperation, the Commission shall take into account the reports of the Cooperation Group and the CSIRTs network on the experience gained at a strategic and operational level. The report shall be accompanied, where necessary, by a legislative proposal.

*Article 41***Transposition**

1. By 17 October 2024, Member States shall adopt and publish the measures necessary to comply with this Directive. They shall immediately inform the Commission thereof.

They shall apply those measures from 18 October 2024.

2. When Member States adopt the measures referred to in paragraph 1, they shall contain a reference to this Directive or shall be accompanied by such reference on the occasion of their official publication. The methods of making such reference shall be laid down by Member States.

*Article 42***Amendment of Regulation (EU) No 910/2014**

In Regulation (EU) No 910/2014, Article 19 is deleted with effect from 18 October 2024.

*Article 43***Amendment of Directive (EU) 2018/1972**

In Directive (EU) 2018/1972, Articles 40 and 41 are deleted with effect from 18 October 2024.

*Article 44***Repeal**

Directive (EU) 2016/1148 is repealed with effect from 18 October 2024.

References to the repealed Directive shall be construed as references to this Directive and shall be read in accordance with the correlation table set out in Annex III.

*Article 45***Entry into force**

This Directive shall enter into force on the twentieth day following that of its publication in the *Official Journal of the European Union*.

*Article 46***Addressees**

This Directive is addressed to the Member States.

Done at Strasbourg, 14 December 2022.

*For the European Parliament*  
*The President*  
R. METSOLA

*For the Council*  
*The President*

# The NIS2 Directive

## A high common level of cybersecurity in the EU

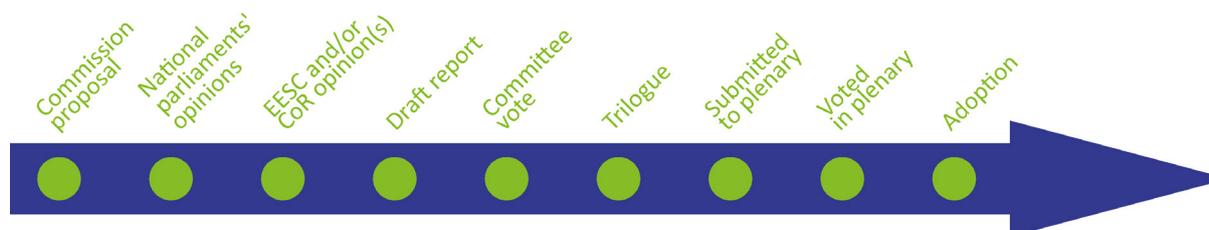

### OVERVIEW

The Network and Information Security (NIS) Directive is the first piece of EU-wide legislation on cybersecurity, and its specific aim was to achieve a high common level of cybersecurity across the Member States. While it increased the Member States' cybersecurity capabilities, its implementation proved difficult, resulting in fragmentation at different levels across the internal market.

To respond to the growing threats posed with digitalisation and the surge in cyber-attacks, the Commission has submitted a proposal to replace the NIS Directive and thereby strengthen the security requirements, address the security of supply chains, streamline reporting obligations, and introduce more stringent supervisory measures and stricter enforcement requirements, including harmonised sanctions across the EU. The proposed expansion of the scope covered by NIS2, by effectively obliging more entities and sectors to take measures, would assist in increasing the level of cybersecurity in Europe in the longer term.

Within the European Parliament, the file was assigned to the Committee on Industry, Research and Energy. The committee adopted its report on 28 October 2021, while the Council agreed its position on 3 December 2021. The co-legislators reached a provisional agreement on the text on 13 May 2022. The political agreement was formally adopted by the Parliament and then the Council in November 2022. It entered into force on 16 January 2023, and Member States now have 21 months, until 17 October 2024, to transpose its measures into national law.

<b>Proposal for a directive on measures for a high common level of cybersecurity across the Union</b>

## Introduction

Cyber-attacks, besides being among the fastest-growing form of crime worldwide, are also growing in scale, cost and sophistication. In 2017, [Cybersecurity Ventures](#) forecast that global ransomware damage costs would reach US\$20 billion by 2021, 57 times more than the amount in 2015. It also predicted that companies would be suffering a ransomware attack every 11 seconds by 2021, up from every 40 seconds in 2016. As a result, businesses have to invest more money to make cyberspace safer for themselves and their customers. Not only companies but also citizens and entire countries have been affected; the first known cyber-attack on a country was mounted on Estonia in April 2007, affecting the online services of banks, media outlets and government bodies for weeks. Since then, many other countries have suffered cyber-attacks, including on critical infrastructure, such as on [electric power systems](#), [hospitals](#) or [water plants](#). According to a [Eurobarometer survey](#), about three quarters (76 %) of respondents believe that they are facing an increasing risk of falling victim to cybercrime. In 2019, [about 64 %](#) of the US population experienced a data breach and [88 % of organisations worldwide](#) experienced 'spear-phishing' attempts.

Given the growing number and cost of cyber-attacks, spending on information security is also increasing worldwide. The global security market is currently worth around US\$150 billion, a figure that [many predict](#) will rise to US\$208 billion in 2023 and US\$400 billion in 2026.

Critical sectors, such as transport, energy, health and finance, have become increasingly dependent on digital technologies to run their core business. While growing digital connectivity brings enormous opportunities, it also exposes economies and societies to cyber-threats. The number, complexity and scale of cybersecurity incidents are growing, as is their economic and social impact.

The coronavirus pandemic has triggered an unforeseen acceleration in the [digital transformation](#) of societies around the world. Yet, it has also exacerbated existing problems, such as the digital divide, and contributed to a global rise in cybersecurity incidents. During this unprecedented situation, there has been an increase in malicious cyber-activity across Member States, as revealed by a recent Europol [report](#). Cybersecurity issues are becoming a day-to-day struggle for the EU.

According to monitoring reports from the EU Agency for Network Information Security (ENISA), cybercrime is becoming increasingly monetised, particularly in the case of major cyber-attacks that use ransomware. Likewise, increased [e-commerce and cashless payments](#) bring heightened risks of cybercrime attacks and cybersecurity breaches. With payments becoming increasingly cashless, online theft – of money and also of personal data – has been on the rise. An ENISA Threat Landscape 2021 report demonstrates that cyber-attacks are becoming more sophisticated, targeted, widespread and undetected, and concludes that societies face a long road ahead before they can ensure a more secure digital environment. According to [Verizon](#), 86 % of breaches committed in 2019 were financially motivated and 10 % by espionage. About 45 % of breaches featured hacking, 17 % involved malware and 22 % involved phishing. This trend is expected to increase further, in parallel with technological developments such as the proliferation of devices linked to the Internet of Things (IoT). In an increasingly connected world, where 22.3 billion IoT devices are expected to be in use by 2024, the growing challenges in the cybersecurity landscape have led the EU to reflect on how to enhance the protection of its citizens and companies against cyber-threats and attacks.

## Existing situation

The first step towards the creation and development of an EU cybersecurity ecosystem was the adoption of a cybersecurity strategy in 2013. The [strategy](#) identified the achievement of cyber-resilience and the development of industrial and technological resources for cybersecurity as its key objectives. The [Directive on Security of Network and Information Systems across the EU](#) (the NIS Directive), which had to be transposed by Member States by 9 May 2018, represents the first piece of EU-wide legislation on cybersecurity. It provided for legal measures to boost the overall level of cybersecurity in the EU, with a focus on protecting critical infrastructure. Among other things, it

established the NIS Cooperation Group, and the network of Computer Security Incident Response Teams (CSIRTs), to ensure both the exchange of information on cybersecurity and cooperation on specific cybersecurity incidents.

In view of the impending deadlines for its transposition into national legislation (by 9 May 2018) and the identification of operators of essential services (by 9 November 2018), the Commission adopted on 13 September 2017 a [communication](#) aimed at supporting Member States in their efforts to implement the directive swiftly and coherently across the EU. It introduced an NIS toolkit providing information to Member States on the best practices related to implementing the directive as well as clarifications on some of its provisions.

By 2020, all Member States had [communicated](#) to the Commission that they had fully transposed the directive into their national legislation.

Other legislative initiatives linked to cybersecurity date back to 2017, when the Commission submitted a [package of cybersecurity measures](#) to further improve the resilience and incident-response capacities of public and private entities, competent authorities and the EU as a whole in the field of cybersecurity and critical infrastructure protection. It also asked for a permanent and enhanced role for the EU cybersecurity agency and the creation of the first EU cybersecurity certification framework, which resulted in the [Cybersecurity Act](#).

Since then, a new EU [cybersecurity strategy](#) for 2020-2025 has been adopted, proposing among many things the review of the NIS Directive, the adoption of a new critical entities resilience (CER) directive, a network of security operations centres (SOCs) and new measures to strengthen the EU cyber-diplomacy toolbox. It is in line with the Commission's priorities to make [Europe fit for the digital age](#) and to build a future-ready economy that works for the people.

The threat landscape has changed considerably since the NIS Directive was adopted in 2016, and the scope of the directive needs updating and expanding to meet current risks and future challenges, one such challenge being to ensure that 5G technology is secure. In addition, its transposition and implementation has brought to light inherent flaws in certain provisions or approaches, such as the unclear delimitation of the scope of the directive. Furthermore, since the onset of the coronavirus crisis, the EU economy has grown more dependent on network and information systems than ever before, and sectors and services are increasingly interconnected.

The pandemic has more than confirmed the importance of preparing the EU for the digital decade as well as the need to continually improve cyber-resilience, particularly for those who operate essential services such as healthcare and energy.

Funding for EU cybersecurity initiatives has increased in the 2021-2027 programming period through a mix of instruments such as the [Digital Europe Programme](#), [Horizon Europe](#), the [European Defence Fund](#), and the [EU Recovery and Resilience Facility](#). The EU objective is to reach up to [€4.5 billion](#) of combined investment. Notably to go to SMEs under the recently established [Cybersecurity Competence Centre and Network of Coordination Centres](#).

In terms of existing case law, the Court of Justice of the EU in its judgment in [Case C-58/08 Vodafone and others](#) has shown the need for establishing clear common rules on the scope of application of the NIS Directive and on harmonising the rules on cybersecurity risk management and incident reporting. Current disparities in this area at the legislative, supervisory, national and EU level are obstacles to the internal market, because entities that engage in cross-border activities face different, and possibly overlapping, regulatory requirements and/or their application, to the detriment of the exercise of their freedoms of establishment and of provision of services.

## Parliament's starting position

In a [resolution](#) of 12 March 2019, the European Parliament called '... on the Commission to assess the need to further enlarge the scope of the NIS Directive to other critical sectors and services that are not covered by sector-specific legislation'.

In a [resolution](#) of 3 October 2017 on the fight against cybercrime, in the light of the increasing number of connected appliances, Parliament called for attention to be drawn to the safety of all devices and for action to promote the security-by-design approach. It urged Member States to speed up the setting-up of computer emergency response teams to which businesses and consumers can report malicious emails and websites, as envisaged by the NIS Directive.

In its [resolution](#) of 16 January 2016, Towards a Digital Single Market Act, Parliament called for the Commission to put in place a strong cybersecurity agency. More specifically, it called for efforts to be made to improve resilience against cyber-attacks, with an increased role for ENISA.

## Council and European Council starting position

In its [conclusions](#) of 2 December 2020 on the security of connected devices, the Council encouraged the Commission to assess the complementary sector-specific regulations that should define what level of cybersecurity should be met by the connected device to ensure that specific security and privacy requirements are put in place for devices with higher security risks.

In its [conclusions](#) of 2 October 2020, the Council called for accelerating the deployment of very high capacity and secure network infrastructures (including fibre and 5G) all over the EU, and for enhancing the EU's ability to protect itself. It furthermore called on the EU and the Member States to make full use of the 5G cybersecurity toolbox adopted on 29 January 2020.

In its [conclusions](#) of 9 June 2020, the Council welcomed '...the Commission's plans to ensure consistent rules for market operators and facilitate secure, robust and appropriate information-sharing on threats as well as incidents, including through a review of the Directive on security of network and information systems (NIS Directive), to pursue options for improved cyber-resilience and more effective responses to cyber-attacks, particularly on essential economic and societal activities, whilst respecting Member States' competences, including the responsibility for their national security'.

## Preparation of the proposal

To underpin the proposal and collect evidence, the Commission [ran](#) an open public consultation (OPC), launched stakeholder interviews, country visits, workshops and surveys, carried out a study on NIS investment and an impact assessment, and drew up a roadmap.

The main results of some of the finalised input activities are briefly described below.

### Open public consultation

The [OPC](#) contributed to the evaluation and impact assessment of the NIS Directive. It included questions targeting citizens, stakeholders and cybersecurity experts. The OPC was carried out over a 12-week period, starting on 7 July 2020 and closing on 2 October 2020. A total of 206 replies were collected online, 182 of which were from respondents located in the EU-27. The hottest topic was the lack of a harmonised approach, resulting in significant inconsistencies in the way Member States draw up lists of operators of essential services (OESs) and digital service providers (DSPs). Consequently, companies of the same type might face different requirements depending on the Member State in which they operate. Likewise, a company might be identified as an OES in one Member State and a DSP in another Member State,<sup>1</sup> or as a service provider, thus being excluded from the scope of the NIS Directive in yet another Member State. The responses relating to the identification of OESs suggest that Member States' approaches are often highly heterogeneous. To that end, it was suggested to establish a common set of criteria to ensure a harmonised process of OES identification.

The OPC concluded that some identification practices used by Member States can have a negative impact on the level playing field in the internal market, and potentially render entities more vulnerable to cross-border cyber-threats.

An overwhelming majority of the OPC respondents agreed that common EU rules are needed to address cyber-threats, given that cyber-risks can propagate across borders at high speed.

The overall results revealed that OPC respondents on average show significantly more support for the inclusion of public administrations and data centres within the scope of the NIS Directive.

Figure 1: The number of OESs identified differs significantly across the EU

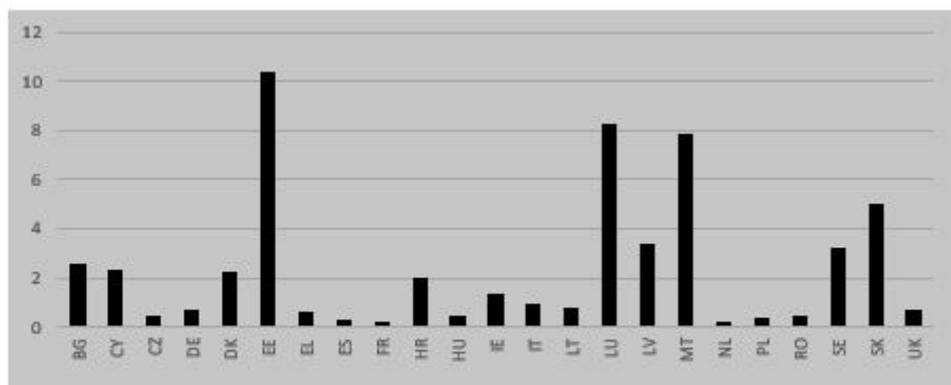

Figure 1: Operators of essential services identified by Member States across all sectors per 100 000 inhabitants<sup>1</sup>

Source: European Commission, 2020.

## ENISA study on investments

A December 2020 ENISA [NIS investments report](#) presents the findings of a survey of 251 organisations of OESs and DSPs from France, Germany, Italy, Spain and Poland, examining their approaches to cybersecurity spending. The survey showed that 82 % of OESs and DSPs find that the NIS Directive has had a positive effect. However, gaps in investment still exist. When comparing organisations from the EU to their US counterparts, data shows that EU organisations allocate on average 41 % less to cybersecurity than their US counterparts.

## Impact assessment

The Commission conducted an [impact assessment \(IA\)](#) for the current proposal, comprising three different documents. The IA explored four different policy options for the NIS review, including the baseline option: 0) maintaining the status quo; 1) non-legislative measures to align the transposition; 2) limited changes to the NIS Directive for further harmonisation; and 3) systemic and structural changes to the NIS Directive. Option 1 was discarded at an early stage, as it does not depart considerably from the status quo. The analysis led to the conclusion that option 3 – systemic and structural changes to the NIS framework – is the preferred one. Option 3 would envisage a more fundamental shift of approach towards covering a wider segment of the economies across the EU, yet with a more focused supervision targeting proportionally big and key companies, while clearly determining the scope of application. It would also streamline and further harmonise companies' security-related obligations, create a more effective setting for operational aspects, establish a clear basis for shared responsibilities and accountability of the entities concerned, and incentivise information sharing.

The IA was submitted to the Regulatory Scrutiny Board (RSB) on 23 October 2020 and received its feedback in the form of a positive opinion with [comments](#) on 20 November 2020. The RSB insisted that the IA should clearly distinguish between 'essential' and 'important' sectors, clarify the criteria for establishing these categories, and consider whether alternative approaches are possible. It asked the Commission to expand on whether the definition of sectoral coverage risks shifting the danger of exposure to other sectors and to analyse how the choice of sectors could be made future proof.

The RSB also observed that the IA should reinforce the problem analysis to better focus on the problems the directive aims to solve. Furthermore, the IA should include a more complete set of options on reporting, supervision and crisis response. It should include ways to interact with the linked European Critical Infrastructure Directive, which is also under revision. Finally, the IA should strengthen the analysis of compliance costs, especially for medium-sized enterprises.

The [initial appraisal drawn up by EPRS provides a detailed analysis of the IA](#). According to it, the NIS2 proposal appears to follow the general considerations of the IA. The preferred option identified in the IA is at the core of the proposal. The monitoring provisions however do not appear to have been laid out in the proposal with the same level of detail as in the IA.

## NIS evaluation

Article 23 of the NIS Directive requires the Commission to review the functioning of the NIS Directive periodically. As part of its key policy objective to make 'Europe fit for the digital age' as well as in line with the objectives of the security union, the Commission announced in its [work programme 2020](#) that it would conduct the review by the end of 2020.

On 25 June 2020, the Commission published a [combined evaluation roadmap/inception impact assessment](#) on the revision of the NIS Directive, according to which it planned to 'evaluate the functioning of the NIS Directive based on the level of security of network and information systems in the Member States'. The Commission underlined that in addition to the requirement under Article 23 of the NIS Directive, the revision was 'further justified by the sudden increase in the dependence on information technology during the Covid-19 crisis'. The Commission stated that 'depending on the results from the evaluation of the functioning of the NIS Directive, an open public consultation and an impact assessment, the Commission might propose measures aimed at enhancing the level of cybersecurity within the Union'.

The Commission evaluation analysed the NIS directive for its relevance, EU added value, coherence, effectiveness and efficiency. Its main findings were that the scope of the NIS Directive is too limited in terms of the sectors covered, mainly due to: i) increased digitalisation in recent years and a higher degree of interconnectedness; and ii) the scope of the NIS Directive no longer reflecting all digitalised sectors providing key services to the economy and society as a whole.

Furthermore, the evaluation concluded that the NIS Directive does not provide sufficient clarity as regards the scope criteria for OESs or the national competence over digital service providers. This has led to a situation in which certain types of entities have not been identified in some Member States and are therefore not required to put in place security measures and report incidents. For example, certain major hospitals in a Member State do not fall within the scope of the NIS Directive and hence are not required to implement the resulting security measures, while in another Member State almost every single healthcare provider is covered by the NIS security requirements.

The NIS Directive afforded Member States broad discretion when laying down security and incident reporting requirements for OESs. The evaluation shows that in some instances Member States have implemented these requirements in significantly different ways, creating an additional burden for companies operating in more than one Member State.

The supervision and enforcement regime of the NIS Directive is ineffective. The financial and human resources set aside by Member States for fulfilling their tasks (such as OES identification or supervision), and consequently the different levels of proficiency in dealing with cybersecurity risks, vary greatly. This further exacerbates the differences in cyber-resilience among Member States.

Member States do not share information systematically with one another, with negative consequences in particular for the effectiveness of the cybersecurity measures and the level of joint situational awareness at EU level. This is also the case for information-sharing among private entities and for the engagement between the EU level cooperation structures and private entities.

## The changes the proposal would bring

The Commission [presented](#) on 16 December 2020 a proposal for a directive on measures for a high common level of cybersecurity across the Union (NIS 2), which would repeal and replace the existing NIS Directive (NIS1). The proposed directive aims to tackle the limitations of the current NIS1 regime. The legal basis for both NIS1 and the proposed NIS2 is Article 114 of the Treaty on the Functioning of the European Union, whose objective is the establishment and functioning of the internal market by enhancing measures for the approximation of national rules.

The proposed expansion of the scope covered by NIS2, which would effectively oblige [more entities and sectors](#) to take measures, would assist in increasing the level of cybersecurity in Europe in the longer term.

Overall, the NIS2 proposal sets itself three general objectives:

- Increase the level of cyber-resilience of a comprehensive set of businesses operating in the European Union across all relevant sectors, by putting in place rules that ensure that all public and private entities across the internal market, which fulfil important functions for the economy and society as a whole, are required to take adequate cybersecurity measures.<sup>2</sup> For instance, the proposal extends significantly the scope of the current directive by adding new sectors such as telecoms, social media platforms and the public administration (see this [factsheet](#)). It establishes that all medium-sized and large entities active in the sectors covered by the NIS2 framework would hence have to comply with the security rules put forward in the proposal, and removes the possibility for Member States to tailor the requirements in certain cases<sup>3</sup> (which had led to much fragmentation with NIS1 implementation, see impact assessment). It removes the distinction made between OESs and digital DSPs, which currently fall into three categories: online marketplaces, search engines and cloud service providers. Finally, it addresses, for the first time, cybersecurity of the ICT supply chain (of special importance in the case of the IoT).
- Reduce inconsistencies in resilience across the internal market in the sectors already covered by the directive, by further aligning i) the de facto scope; ii) the security and incident reporting requirements; iii) the provisions governing national supervision and enforcement; and iv) the capabilities of the Member States' relevant competent authorities. The proposal includes a list of seven key elements that all companies must address or implement as part of the measures they take, including incident response, supply chain security, encryption and vulnerability disclosure. In addition, the proposal envisages a two-stage approach to incident reporting. Affected companies have 24 hours from when they first become aware of an incident to submit an initial report, followed by a final report no later than one month later. Regarding enforcement, it establishes a minimum list of administrative sanctions whenever entities breach the rules regarding cybersecurity risk management or their reporting obligations laid down in the NIS Directive. These sanctions include binding instructions, an order to implement the recommendations of a security audit, an order to bring security measures into line with NIS requirements, and administrative fines (up to €10 million or 2 % of the entities' total turnover worldwide, whichever is higher).
- Improve the level of joint situational awareness and the collective capability to prepare and respond, by i) taking measures to increase the level of trust between competent authorities; ii) by sharing more information; and iii) setting rules and procedures in the event of a large-scale incident or crisis. The proposed new rules improve the way the EU prevents, handles and responds to large-scale cybersecurity incidents and crises by introducing clear responsibilities, appropriate planning and more EU cooperation. The revised directive would establish an EU crisis management

framework, requiring Member States to adopt a plan and designate national competent authorities responsible for participating in the response to cybersecurity incidents and crises at the EU level. The proposed directive would establish an EU-Cyber Crises Liaison Organisation Network (EU-CyCLONe) to support the coordinated management of EU-wide cybersecurity incidents, as well as to ensure the regular exchange of information. The proposed directive would also strengthen the role of the [NIS Cooperation Group](#) in making decisions and increasing cooperation between Member States. Member States would still be required to adopt a national cybersecurity strategy and to designate one or more national competent authorities to supervise compliance with the directive; and to designate CSIRTs to handle incident notifications and single points of contact (SPOC) to act as a liaison point with other Member States.

In order to ensure consistency and coherence with related EU legislation, the NIS Directive review in particular takes into account the following three Commission initiatives:

- the [review of the Resilience of Critical Entities \(CER\) Directive](#), which was proposed alongside the NIS2 proposal, with the objective of improving the resilience of critical entities against physical threats in a large number of sectors. The proposal expands both the scope and depth of the current 2008 directive, including the coverage of 10 sectors: energy, transport, banking, financial market infrastructures, health, drinking water, waste water, digital infrastructure, public administration and space;
- the [initiative](#) on a digital operational resilience act for the financial sector (DORA);
- the [initiative](#) on a network code on cybersecurity with sector-specific rules for cross-border electricity flows (see [snapshot](#) analysis from the SPEAR project).

As regards the financial sector, [the DORA proposal](#) would provide legal clarity on whether and how digital operational provisions apply, especially to cross-border financial entities, and it would eliminate the need for Member States to individually improve rules, standards and expectations regarding operational resilience and cybersecurity as a response to the current limited coverage of EU rules and the general nature of the NIS1 Directive. At the same time, it is important to maintain a strong relationship for the exchange of information between the financial sector and the other sectors covered by NIS2. To that end, under the DORA proposal, all financial supervisors, the European supervisory authorities (ESAs) for the financial sector and the financial sector-related national competent authorities would be able to participate in the discussions of the NIS Cooperation Group, and to exchange information and cooperate with the single points of contact and with the national CSIRTs under NIS2. Moreover, Member States should continue to include the financial sector in their cybersecurity strategies, and national CSIRTs may cover the financial sector in their activities.

Furthermore, the Commission has aligned the scope in the NIS2 proposal with the proposal for a review of the CER Directive.

As regards ENISA, it would see increased responsibilities within its existing mandate, which involves overseeing the implementation of the NIS. ENISA would be tasked to prepare a report every two years on the state of cybersecurity in the EU and to maintain a European vulnerability registry providing access to information on the vulnerabilities of ICT products and services disclosed on a voluntary basis by essential and important entities and their ICT suppliers. At the same time, ENISA would be required to create and maintain a registry, in which certain types of entities including domain name system service providers, top level domain name registries, cloud computing service providers, data centre service providers, content delivery network providers, as well as online marketplaces, online search engines and social networking platforms would notify where they are established in the EU. This is to ensure that such entities do not face a multitude of different legal requirements, given that they provide services across borders to a particularly high extent.

To address key supply chain risks and to assist entities in managing cybersecurity risks related to the ICT supply chain, the NIS Cooperation Group, together with the Commission and ENISA, would be tasked to carry out a coordinated risk assessment per sector of critical ICT services, systems, or products including relevant threats and vulnerabilities. The supply chain risk assessments would consider both technical factors (hardware- or software-related) and, where relevant, non-technical factors (such as suppliers being subject to interference by a non-EU country or state-backed players). This approach largely builds on the previous work of the Commission and the NIS Cooperation Group on the security of 5G networks. The Commission [published](#) on 29 January 2020 the 5G risk management toolbox, which listed measures to mitigate the security threats associated with 5G networks. Among others, the EU 5G risk assessment identified security risks related to 5G networks and the 5G supply chain at the EU level. To ensure that entities comply with their obligations addressing ICT supply chain security, the new directive would enable Member States to require essential and important entities to certify specific ICT products, services and processes under the [EU Cybersecurity Act](#). In this context, the draft directive would empower the Commission to lay down which categories of essential entities (due to their criticality) would be required to obtain certification.

The [European Electronic Communications Code \(EECC\)](#) regulates since December 2020 the security of telecoms providers when they are providing electronic communications services in the EU. However, telecoms providers are covered by the current NIS framework if they provide non-telecoms services that fall within the scope of the directive, i.e. cloud computing services. The proposed directive would therefore repeal the corresponding EECC security provisions and entirely regulate the security of telecoms providers, also in cases where they are providing ECS-related services. The same would apply to the security provisions for trust service providers currently found in the [eIDAS Regulation](#).

## Advisory committees

The European Economic and Social Committee (EESC) adopted [an opinion](#) on the proposal during its plenary session of 27-28 April 2021.

The EESC notes that some of the provisions in both the NIS2 and CER proposals overlap, as they are closely linked and complementary. The EESC therefore calls for the possibility of combining the two proposals to form one single text. Furthermore, given the relevance and sensitivity of the objectives pursued by the two proposals, it finds that a regulation would have been preferable to a directive.

In addition, the EESC points out that clearer guidelines are needed for distinguishing between 'essential' and 'important' entities, and that the respective requirements to be met should be more precisely defined.

Finally, the EESC agrees that ENISA plays a key role in the overall European institutional and operational cybersecurity system. Thus, in addition to the proposed two-yearly report on the state of cybersecurity in the Union, it should also publish regular, up-to-date information on cybersecurity incidents and sector-specific warnings online.

The European Committee of the Regions (CoR) has not prepared an opinion on the proposal.

## National parliaments

The subsidiarity deadline for the submission of reasoned opinions was 17 March 2021. No national parliament submitted any reasoned [opinion](#).

## Stakeholder views<sup>4</sup>

From 25 June 2020 to 13 August 2020, all interested stakeholders could provide feedback on the inception impact assessment and roadmap on a dedicated Commission [webpage](#). A total of 42 responses were received from stakeholders, the private sector, research organisations and

citizens from the EU and internationally. Stakeholders broadly pointed to the current fragmentation in the implementation of NIS at the national level, particularly regarding OESs and DSPs. They furthermore emphasised the need to improve EU-level coordination of cyber-attack responses and with other related EU legislation.

The [GSMA](#) mobile association strongly recommends that the Commission address the shortcomings and persisting inefficiencies in the NIS Directive by: including software and hardware providers in the scope of the NIS, to ensure robust end-to-end security; reducing red tape and fragmentation, by streamlining processes, security requirements and incident notifications obligations; and improving harmonisation and consistency for providers of Electronic Communications Services, by closely aligning the NIS Directive with other legal instruments (the Cybersecurity Act, the EEC Directive and the European Critical Infrastructure (ECI) Directive).

[Eurosmart](#), the association representing the European digital security industry, believes that 'DSPs should use physical infrastructure exclusively located in Europe. The NIS Directive should leverage the European certification schemes created in the framework of the Cybersecurity Act (CSA) to demonstrate the ability of OES and DSP to meet a high level of protection. Following a risk-based approach, certification of highly critical products must be done at a level 'High' pursuant to the CSA. Security certificate at level 'High' ensures continuous monitoring and maintenance of the certification scheme by a community of recognised experts from the industry. It is the only way to ensure "the state of the art" of security for critical infrastructures'.

The [Software Alliance \(BSA\)](#) states that the general spirit of the existing provisions should be kept, but with a better level of harmonisation and implementation, in particular with regard to service definitions, thresholds, reporting modalities, and the categories of (sub-)sectors recognised as OESs and DSPs across the EU. With regard to the call to expand the scope of the NIS to software products, the BSA also underlines that the sector is already covered by force of the inclusion of cloud services in Annex III, notably through the 'software as a service' principle. For the very limited cases where software would not be delivered or serviced through the cloud (i.e. when embedded), the incident-reporting obligations would be irrelevant, as the manufacturer would not have the visibility of the incident affecting that specific piece of software.

[Digital Europe](#), the industry association, believes that the current NIS scope should be maintained. The review should, however, ensure that Member States are more closely aligned in defining OESs and DSPs to avoid fragmentation.

[BEUC](#), the European consumer association, states that the scope of the NIS is not broad enough, especially when it comes to DSPs. As regards OESs, the discrepancies in their selection criteria has created legal fragmentation in the EU.

The [European Data Protection Supervisor](#) (EDPS) published an opinion on the cybersecurity strategy and the NIS 2 Directive on 11 March 2021 in which, among other things, he issues specific recommendations to ensure that the proposal correctly and effectively complements existing Union legislation on personal data protection, in particular the GDPR and the ePrivacy Directive. He also asks to clarify the different use of the terms 'cybersecurity' and 'security of network and information systems' across the text: to use the term 'cybersecurity' in general, and the term 'security of network and information systems' only for technical purposes when the context allows it.

The Body of European Regulators for Electronic Communications (BEREC) has published [an opinion](#) on 19 May 2021, on the NIS2 proposal recommending that the security of the telecoms sector should continue to be regulated under the EEC Directive. According to BEREC, including the telecoms sector under the scope of NIS2 risks reducing the security level already established through sector-specific regulatory practice since the Framework Directive came into effect in 2009.

## Legislative process

In the European Parliament, the Committee on Industry, Research and Energy (ITRE) was assigned the [file](#) (rapporteur: Bart Groothuis, Renew, the Netherlands). The Committees on Foreign Affairs (AFET), on Internal Market and Consumer Protection (IMCO), on Transport and Tourism (TRAN) and on Civil Liberties, Justice and Home Affairs (LIBE) all submitted opinions.

On 13 April 2021, the European Commission presented the legislative proposal to Parliament's lead committee, ITRE. MEPs welcomed the proposed review of NIS. The most common concern raised by MEPs was about its compatibility with other proposed or existing EU legislation, including DORA, CER, the Cybersecurity Act, the EECC and the GDPR.

The ITRE draft report was published on 3 May 2021, and the four committee opinions were adopted in July 2021. The ITRE committee adopted its [report](#) on 28 October 2021, with 70 votes in favour to 3 against, with 1 abstention. MEPs also voted to open trilogue negotiations with Council, with this mandate confirmed in plenary in November.

The report calls for tighter cybersecurity obligations in terms of risk management, reporting obligations and information-sharing. It aims to lower the administrative burden and to improve cybersecurity incident reporting. In addition, the report states that EU countries would have to meet stricter supervisory and enforcement measures, and harmonise their sanctions regimes.

The report also states that the Commission should ensure that appropriate guidance is given to all micro- and small enterprises falling within the scope of the NIS2 Directive. The report also supports policies promoting the use of open-source cybersecurity tools, which are of particular importance for SMEs as they face significant costs for implementing cybersecurity tools.

Among other things, the rapporteur added the notion of 'active defence'<sup>15</sup> in his draft report. The report as adopted says that Member States should adopt policies on the promotion of active cyber-defence as part of their national cybersecurity strategies.

The report intends to broaden the sectorial scope to also include academic, knowledge and research institutions which had been left outside the scope of NIS2 by the Commission, while many national cybersecurity strategies cover them.

In June 2021, the Council took stock of [progress](#) on NIS2. One of its concerns related to the interaction of NIS2 with sectoral legislation, in particular CER and DORA. During the discussions, most Member States stated that it was imperative to view NIS2 as the horizontal framework for cybersecurity in the EU and that it should serve as a baseline standard for minimum harmonisation of all relevant sectoral legislation in this field. Other concerns raised related to the significant expansion of the scope of the revised rules, the size-cap criteria as the sole element to be considered when identifying essential and important entities to be covered, the proposed legal basis (i.e. single market), and national security concerns.

The Council [adopted](#) its negotiating position on 3 December 2021. Compared to the initial proposal for NIS2, the Council introduced a number of significant changes. For instance it introduced additional criteria to determine the entities to be covered by NIS2, excluding from its scope entities operating in defence and national security, public security, law enforcement and the judiciary, as well as parliaments and central banks. It aligned the text with other related proposed legislation, such as the CER Directive and DORA. Furthermore, it simplified the incident-reporting obligations, to avoid over-reporting, and extended the period for Member States to transpose NIS2 into national law to two years, instead of 18 months.

Interinstitutional trilogue negotiations started on 13 January 2022 and a second meeting took place on 17 February. On 13 May, during the third trilogue meeting, the Parliament and Council reached a political agreement. The revised directive sets out minimum rules for a regulatory framework, and lays down cooperation mechanisms among relevant authorities in each Member State. It expands the list of sectors and activities subject to cybersecurity obligations, and improves their

enforcement, providing for remedies and sanctions which would vary between essential services and important entities. Parliament negotiators had insisted on the need for clear and precise rules for companies. The reporting obligations have been simplified and streamlined to give entities more time to report than the initial 24 hours proposed by the Commission. This is in order to avoid over-reporting and creating an excessive burden on the entities covered. The text has been aligned with sector-specific legislation, in particular with the DORA Regulation and the CER Directive, to provide legal clarity and ensure coherence.

The NIS2 directive would introduce a size-cap rule for determining which entities meet the criteria to qualify as operators of essential services and important entities. This means that all medium-sized and large entities operating within the sectors covered by the directive or providing services covered by the directive would fall within its scope. The co-legislators maintain this general rule but with additional provisions to ensure proportionality and clear-cut criticality criteria for determining them. Such entities would fall under the jurisdiction of the Member State in which they are established, not of the Member State in which they provide their services.

The directive would also formally establish the EU-CyCLONe network, which will support the coordination and management of large-scale incidents.

In addition, a voluntary peer-learning mechanism would be established to support learning from good practice.

As demanded by the Council, the directive would not apply to entities carrying out activities in areas such as defence and national security, public security, law enforcement and the judiciary. Parliaments and central banks are also excluded from the scope. However, as demanded by the Parliament it will apply to public administration entities at central and regional level. In addition, Member States may also decide that it applies to entities at local level.

The political agreement was endorsed by the ITRE committee on 13 July 2022, and then adopted by Parliament in plenary on 10 November 2022, with 577 votes in favour, 6 against and 31 abstentions. The text was then adopted by the Council on 28 November 2022 and signed by both co-legislators on 14 December 2022. It was published in the [Official Journal](#) on 27 December 2022, and entered into force on 16 January 2023. Member States have 21 months – until 17 October 2024 – to transpose the directive into national law.

## EP SUPPORTING ANALYSIS

Zygierewicz A., [Directive on security of network and information systems \(NIS Directive\)](#), Implementation appraisal briefing, EPRS, European Parliament, November 2020.

Kononenko V., [Improving the common level of cybersecurity across the EU](#), Initial Appraisal of a European Commission Impact Assessment, EPRS, European Parliament, February 2021.

Negreiro M., [ENISA and a new cybersecurity act](#), Briefing, EPRS, European Parliament, July 2019.

Negreiro M. with Belluomini A., [The new European cybersecurity competence centre and network](#), Briefing, EPRS, European Parliament, July 2020.

## OTHER SOURCES

[High common level of cybersecurity across the Union – NIS 2 Directive](#), European Parliament Legislative Observatory.

[Challenges to effective EU cybersecurity policy](#), European Court of Auditors (ECA) Briefing Paper, March 2019.

[Report](#) assessing the consistency of the approaches in the identification of operators of essential services, European Commission, 2020.

[Internet organised crime threat assessment \(IOCTA\) 2020](#), Europol, 2020.

## ENDNOTES

- <sup>1</sup> In addition to the OPC, the Commission gathered evidence through a [commissioned study](#) assessing the consistency of the approaches in the identification of operators of essential services. Besides giving an overview of how Member States have identified operators of essential services, the study assesses whether the methodologies used are consistent across the EU.
- <sup>2</sup> The Commission proposal covers the following sectors and subsectors: i) 'essential entities': energy (electricity, district heating and cooling, oil and gas); transport (air, rail, water and road); banking; financial market infrastructures; health; manufacture of pharmaceutical products including vaccines; drinking water; waste water; digital infrastructure (internet exchange points; DNS providers; TLD name registries; cloud computing service providers; data centre service providers; content delivery networks; trust service providers; and public electronic communications networks and electronic communications services); public administration; and space. ii) 'important entities': postal and courier services; waste management; chemicals; food; manufacturing of medical devices, computers and electronics, machinery equipment, motor vehicles; and digital providers (online market places, online search engines, and social networking service platforms).
- <sup>3</sup> Under the NIS2 proposal, 'essential' and 'important' entities are deemed to be under the jurisdiction of the Member State where they provide their services. If the entity provides services in more than one Member State, it should fall under the jurisdiction of each of these Member States. At the same time, certain types of entities would be under the jurisdiction of the Member State in which they have their main establishment in the EU. These entities include, but are not limited to, domain name system service providers, top level domain name registries, cloud computing service providers, data centre service providers, content delivery network providers, as well as online marketplaces, online search engines and social networking platforms.
- <sup>4</sup> This section aims to provide a flavour of the debate and is not intended to be an exhaustive account of all different views on the proposal. Additional information can be found in related publications listed under 'EP supporting analysis'.
- <sup>5</sup> Active cyber defence is the proactive prevention, detection, monitoring, analysis and mitigation of network security breaches, combined with the use of capabilities deployed within and outside the victim network.

# CISA Announces Transfer of the .gov Top-level Domain from U.S. General Services Administration

**Released:** March 08, 2021

**Revised:** March 08, 2021

**RELATED TOPICS:** [CYBERSECURITY BEST PRACTICES](#), [CYBER THREATS AND ADVISORIES](#),

WASHINGTON – The Cybersecurity and Infrastructure Security Agency (CISA) announced today it will begin overseeing the .gov top-level domain (TLD) in April 2021. CISA is working closely with the U.S. General Services Administration, who currently oversees the TLD, to ensure a seamless transition of daily operations for .gov customers.

“Using .gov and increasing trust that government communications are authentic will improve our collective cybersecurity,” said Eric Goldstein, Executive Assistant Director for CISA’s Cybersecurity Division. “People see a .gov website or email address and know they are interacting with an official, U.S.-based government organization. Using .gov also provides security benefits, like two-factor authentication on the .gov registrar and notifications of DNS changes to administrators, over other TLDs. We’ll endeavor to make the TLD more secure for the American public and harder for malicious actors to impersonate.”

.gov is one of the six original TLDs in the internet’s domain name system (DNS). The TLD is actively used by each branch of the federal government, every state in the nation, hundreds of counties and cities, and many tribes and territories as they serve the public on the internet. The DOTGOV Act of 2020 shifted responsibility for managing .gov to CISA as the nation’s civilian cybersecurity agency.

Because the TLD is central to the availability and integrity of thousands of online services relied upon by millions of users, .gov is critical infrastructure for governments throughout the country and all aspects of its administration have cybersecurity significance. Under the actions required by the Act, CISA will work to increase security and decrease complexity for our government partners.

## Verisign Reports Fourth Quarter and Full Year 2022 Results

**RESTON, VA - Feb. 9, 2023** - VeriSign, Inc. (NASDAQ: VRSN), a global provider of domain name registry services and internet infrastructure, today reported financial results for the fourth quarter and full year 2022.

### *Fourth Quarter Financial Results*

VeriSign, Inc. and subsidiaries (“Verisign”) reported revenue of \$369 million for the fourth quarter of 2022, up 8.5 percent from the same quarter in 2021. The operating margin was 66.5 percent for the fourth quarter of 2022 compared to 65.3 percent for the same quarter of 2021. Verisign reported net income of \$179 million and diluted earnings per share (diluted “EPS”) of \$1.70 for the fourth quarter of 2022, compared to net income of \$330 million and diluted EPS of \$2.97 for the same quarter in 2021. Net income for the fourth quarter of 2021 included recognition of a deferred income tax benefit related to the transfer of certain non-US intellectual property between subsidiaries which increased net income by \$165.5 million and increased diluted EPS by \$1.49.

### *2022 Financial Results*

Verisign reported revenue of \$1.42 billion for 2022, up 7.3 percent from 2021. The operating margin for 2022 was 66.2 percent compared to 65.3 percent in 2021. Verisign reported net income of \$674 million and diluted EPS of \$6.24 for 2022, compared to net income of \$785 million and diluted EPS of \$7.00 in 2021. Net income for 2021 included the recognition of a deferred income tax benefit related to the transfer of certain non-US intellectual property between subsidiaries which increased net income by \$165.5 million and increased diluted EPS by \$1.48.

“In 2022, we marked 25 years of uninterrupted availability for our global .com and .net resolution infrastructure. We also delivered solid financial performance for the quarter and the full year,” said Jim Bidzos, Executive Chairman and Chief Executive Officer.

### **Financial Highlights**

- Verisign ended 2022 with cash, cash equivalents, and marketable securities of \$980 million, a decrease of \$225 million from year-end 2021.
- Cash flow from operations was \$217 million for the fourth quarter of 2022 and \$831 million for the full year of 2022 compared with \$206 million for the same quarter in 2021 and \$807 million for the full year of 2021.
- Deferred revenues as of Dec. 31, 2022, totaled \$1.22 billion, an increase of \$66 million from year-end 2021.
- During the fourth quarter of 2022, Verisign repurchased 1.1 million shares of its common stock for \$212 million. During the full year of 2022, Verisign repurchased 5.5 million shares of its common stock for \$1.03 billion. As of Dec. 31, 2022, there was \$859 million remaining for future share repurchases under the share repurchase program which has no expiration date.

## **Business Highlights**

- Verisign ended the fourth quarter of 2022 with 173.8 million .com and .net domain name registrations in the domain name base, a 0.2 percent increase from the end of the fourth quarter of 2021, and a net decrease of 0.4 million registrations during the fourth quarter of 2022.
- In the fourth quarter of 2022, Verisign processed 9.7 million new domain name registrations for .com and .net, as compared to 10.6 million for the same quarter in 2021.
- The final .com and .net renewal rate for the third quarter of 2022 was 73.7 percent compared to 75.0 percent for the same quarter in 2021. Renewal rates are not fully measurable until 45 days after the end of the quarter.
- Verisign announces that it will increase the annual registry-level wholesale fee for each new and renewal .com domain name registration from \$8.97 to \$9.59, effective Sept. 1, 2023.

## **Today's Conference Call**

Verisign will host a live conference call today at 4:30 p.m. (EST) to review the fourth quarter and full year 2022 results. The call will be accessible by direct dial at (888) 676-VRSN (U.S.) or (786) 789-4797 (international), conference ID: Verisign. A listen-only live web cast of the conference call and accompanying slide presentation will also be available at <https://investor.verisign.com>. An audio archive of the call will be available at <https://investor.verisign.com/events.cfm>. This news release and the financial information discussed on today's conference call are available at <https://investor.verisign.com>.

## **About Verisign**

Verisign, a global provider of domain name registry services and internet infrastructure, enables internet navigation for many of the world's most recognized domain names. Verisign enables the security, stability, and resiliency of key internet infrastructure and services, including providing root zone maintainer services, operating two of the 13 global internet root servers, and providing registration services and authoritative resolution for the .com and .net top-level domains, which support the majority of global e-commerce. To learn more about what it means to be Powered by Verisign, please visit [verisign.com](https://verisign.com).

Statements in this announcement other than historical data and information constitute forward-looking statements within the meaning of Section 27A of the Securities Act of 1933 as amended and Section 21E of the Securities Exchange Act of 1934 as amended. These statements involve risks and uncertainties that could cause our actual results to differ materially from those stated or implied by such forward-looking statements. The potential risks and uncertainties include, among others, attempted security breaches, cyber-attacks, and DDoS attacks against our systems and services; the introduction of undetected or unknown defects in our systems; vulnerabilities in the global routing system; system interruptions or system failures; damage or interruptions to our data centers, data center systems or resolution systems; risks arising from our operation of root servers and our performance of the Root Zone Maintainer functions; any loss or modification of our right to operate the .com and .net gTLDs; changes or challenges to the pricing provisions of the .com Registry Agreement; new or existing governmental laws and regulations in the U.S. or other applicable non-U.S. jurisdictions; economic, legal and political risks associated with our international operations; the impact of unfavorable tax rules and regulations; risks from the adoption of ICANN's consensus and temporary policies, technical standards and other processes; the weakening of, changes to, the multi-stakeholder model of internet governance; the outcome of claims, lawsuits, audits or investigations; the effects of the COVID-19 pandemic; our ability to compete in the highly competitive business environment in which we operate; changes in internet practices and behavior and the adoption of substitute technologies, or the negative impact of wholesale price increases; our ability to expand our services into developing and emerging economies; our ability to maintain strong relationships with registrars and their resellers; our ability to attract, retain and motivate highly skilled employees; and our ability to protect and enforce our intellectual property rights. More information about potential factors that could affect our business and financial results is included in our filings with the SEC, including in our Annual Report on Form 10-K for the year ended Dec. 31, 2021, when filed, our Annual Report on Form 10-K for the year ended Dec. 31, 2022, Quarterly Reports on Form 10-Q and Current Reports on Form 8-K. Verisign undertakes no obligation to update any of the forward-looking statements after the date of this announcement.

	Year Ended December 31,	
	2022	2021
Cash flows from operating activities:		
Net income.....	\$ 673.8	\$ 784.8
Adjustments to reconcile net income to net cash provided by operating activities:		
Depreciation of property and equipment .....	46.9	47.9
Stock-based compensation expense.....	58.6	53.4
Other, net .....	(3.9)	6.0
Changes in operating assets and liabilities:		
Other assets .....	9.5	(14.0)
Accounts payable and accrued liabilities .....	(0.1)	15.6
Deferred revenues .....	65.7	90.5
Net deferred income taxes and other long-term tax liabilities .....	(19.4)	(177.0)
Net cash provided by operating activities.....	<u>831.1</u>	<u>807.2</u>
Cash flows from investing activities:		
Proceeds from maturities and sales of marketable securities.....	1,721.5	2,654.5
Purchases of marketable securities .....	(1,338.4)	(2,870.7)
Purchases of property and equipment.....	(27.4)	(53.0)
Net cash provided by (used in) investing activities .....	<u>355.7</u>	<u>(269.2)</u>
Cash flows from financing activities:		
Repurchases of common stock .....	(1,048.1)	(722.6)
Proceeds from employee stock purchase plan .....	12.3	12.4
Repayment of borrowings .....	—	(750.0)
Proceeds from borrowings, net of issuance costs .....	—	741.1
Net cash used in financing activities .....	<u>(1,035.8)</u>	<u>(719.1)</u>
Effect of exchange rate changes on cash, cash equivalents and restricted cash .....	(0.8)	(0.7)
Net increase (decrease) in cash, cash equivalents and restricted cash.....	150.2	(181.8)
Cash, cash equivalents, and restricted cash at beginning of period.....	228.8	410.6
Cash, cash equivalents, and restricted cash at end of period.....	<u>\$ 379.0</u>	<u>\$ 228.8</u>
Supplemental cash flow disclosures:		
Cash paid for interest .....	\$ 72.8	\$ 85.6
Cash paid for income taxes, net of refunds received .....	<u>\$ 211.7</u>	<u>\$ 178.4</u>

**EXHIBIT JJN-9**

UNITED STATES  
SECURITIES AND EXCHANGE COMMISSION  
Washington, D.C. 20549

FORM 10-K

(Mark One)

ANNUAL REPORT PURSUANT TO SECTION 13 OR 15(d) OF THE SECURITIES EXCHANGE ACT OF 1934

For the fiscal year ended December 31, 2022

OR

TRANSITION REPORT PURSUANT TO SECTION 13 OR 15(d) OF THE SECURITIES EXCHANGE ACT OF 1934

For the transition period from \_\_\_\_\_ to \_\_\_\_\_

Commission File Number: 000-23593

**VERISIGN, INC.**

(Exact name of registrant as specified in its charter)

Delaware  
(State or other jurisdiction of  
incorporation or organization)  
12061 Bluemont Way,  
Reston, Virginia  
(Address of principal executive offices)

94-3221585  
(I.R.S. Employer  
Identification No.)  
  
20190  
(Zip Code)

Registrant's telephone number, including area code: (703) 948-3200  
Securities registered pursuant to Section 12(b) of the Act:

Title of each class	Trading Symbol(s)	Name of each exchange on which registered
Common Stock, \$0.001 par value per share	VRSN	Nasdaq Global Select Market

Securities registered pursuant to Section 12(g) of the Act: None

Indicate by check mark if the registrant is a well-known seasoned issuer, as defined in Rule 405 of the Securities Act. Yes  No

Indicate by check mark if the registrant is not required to file reports pursuant to Section 13 or Section 15(d) of the Act. Yes  No

Indicate by check mark whether the registrant (1) has filed all reports required to be filed by Section 13 or 15(d) of the Securities Exchange Act of 1934 during the preceding 12 months (or for such shorter period that the registrant was required to file such reports), and (2) has been subject to such filing requirements for the past 90 days. Yes  No

Indicate by check mark whether the registrant has submitted electronically every Interactive Data File required to be submitted pursuant to Rule 405 of Regulation S-T (§232.405 of this chapter) during the preceding 12 months (or for such shorter period that the registrant was required to submit such files). Yes  No

Indicate by check mark whether the registrant is a large accelerated filer, an accelerated filer, a non-accelerated filer, or a smaller reporting company. See the definitions of "large accelerated filer," "accelerated filer," "smaller reporting company" and "emerging growth company" in Rule 12b-2 of the Exchange Act.

Large accelerated filer	<input checked="" type="checkbox"/>	Accelerated filer	<input type="checkbox"/>
Non-accelerated filer	<input type="checkbox"/>	Smaller reporting company	<input type="checkbox"/>
		Emerging growth company	<input type="checkbox"/>

If an emerging growth company, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards provided pursuant to Section 13(a) of the Exchange Act.

Indicate by check mark whether the registrant has filed a report on and attestation to its management's assessment of the effectiveness of its internal control over financial reporting under Section 404(b) of the Sarbanes-Oxley Act (15 U.S.C. 7262(b)) by the registered public accounting firm that prepared or issued its audit report.

If securities are registered pursuant to Section 12(b) of the Act, indicate by check mark whether the financial statements of the registrant included in the filing reflect the correction of an error to previously issued financial statements.

Indicate by check mark whether any of those error corrections are restatements that required a recovery analysis of incentive-based compensation received by any of the registrant's executive officers during the relevant recovery period pursuant to §240.10D-1(b).

Indicate by check mark whether the registrant is a shell company (as defined in Rule 12b-2 of the Exchange Act.): Yes  No

The aggregate market value of the voting and non-voting common equity stock held by non-affiliates of the Registrant as of June 30, 2022, was \$12.4 billion based upon the last sale price reported for such date on the Nasdaq Global Select Market. For purposes of this disclosure, shares of Common Stock held by persons known to the Registrant (based on information provided by such persons and/or the most recent Schedule 13Gs filed by such persons) to beneficially own more than 5% of the Registrant's Common Stock and shares held by officers and directors of the Registrant have been excluded because such persons may be deemed to be affiliates. This determination is not necessarily a conclusive determination for other purposes.

Number of shares of Common Stock, \$0.001 par value, outstanding as of the close of business on February 10, 2023: 104,879,307 shares.

**DOCUMENTS INCORPORATED BY REFERENCE**

Portions of the Registrant's definitive proxy statement to be delivered to stockholders in connection with the 2023 Annual Meeting of Stockholders are incorporated by reference into Part III of this Annual Report on Form 10-K where indicated.

For purposes of this Annual Report on Form 10-K (this “Form 10-K”), the terms “Verisign”, “the Company”, “we”, “us”, and “our” refer to VeriSign, Inc. and its consolidated subsidiaries.

## PART I

### ITEM 1. BUSINESS

#### Overview

We are a global provider of domain name registry services and internet infrastructure, enabling internet navigation for many of the world’s most recognized domain names. We enable the security, stability, and resiliency of key internet infrastructure and services, including providing Root Zone Maintainer services, operating two of the 13 global internet root servers, and providing registration services and authoritative resolution for the .com and .net top-level domains (“TLDs”), which support the majority of global e-commerce.

We were incorporated in Delaware on April 12, 1995. Our principal executive offices are located at 12061 Bluemont Way, Reston, Virginia 20190. Our telephone number at that address is (703) 948-3200. Our common stock is traded on the Nasdaq Global Select Market under the ticker symbol VRSN. VERISIGN, the VERISIGN logo, and certain other product or service names are registered or unregistered trademarks in the U.S. and other countries. Other names used in this Form 10-K may be trademarks of their respective owners. Our primary website is <https://www.verisign.com>. The information available on, or accessible through, this website is not incorporated in this Form 10-K by reference.

Our Annual Reports on Form 10-K, Quarterly Reports on Form 10-Q, Current Reports on Form 8-K, and amendments to those reports filed or furnished pursuant to Section 13(a) or 15(d) of the Securities Exchange Act of 1934, as amended (the “Exchange Act”), are available, free of charge, on the Investor Relations section of our website as soon as is reasonably practicable after filing such reports with the Securities and Exchange Commission (the “SEC”). The SEC maintains an internet site that contains reports, proxy and information statements, and other information regarding issuers that file electronically with the SEC at <https://www.sec.gov>.

Pursuant to our agreements with the Internet Corporation for Assigned Names and Numbers (“ICANN”), we make available files containing all active domain names registered in the .com and .net registries. Further, we also make available a summary of the active zone count registered in the .com and .net registries and the number of .com and .net domain name registrations in the domain name base. The zone counts and information on how to obtain access to the zone files can be found at <https://www.verisign.com/zone>. The domain name base is the active zone plus the number of domain names that are registered but not configured for use in the respective top-level domain zone file plus the number of domain names that are in a client or server hold status. The domain name base may also reflect compensated or uncompensated judicial or administrative actions to add or remove from the active zone an immaterial number of domain names. These files and the related summary data are updated at least once per day. The update times may vary each day. The number of domain names provided in this Form 10-K are as of midnight of the date reported.

We announce material financial information to our investors using our investor relations website <https://investor.verisign.com>, SEC filings, investor events, news and earnings releases, public conference calls and webcasts. We use these channels as well as social media to communicate with our investors and the public about our company, our products and services, and other issues. It is possible that the information we post on social media could be deemed to be material information. Therefore, we encourage investors, the media, and others interested in our company to review the information we post on the social media channels and websites listed below. This list may be updated from time to time on our investor relations website.

<https://facebook.com/Verisign>  
<https://twitter.com/Verisign>

The contents of these websites are not intended to be incorporated by reference into this Form 10-K or in any other report or document we file.

#### Services

We operate the authoritative directory of and/or the back-end systems for all .com, .net, .cc, .gov, .edu and .name domain names, among others. Our services allow individuals and organizations to establish their online identities, while providing the secure, always-on access they need to communicate and transact reliably with online audiences.

We are the exclusive registry of domain names within the *.com*, *.net*, and *.name* generic top-level domains (“gTLDs”), among others, under agreements with ICANN and also, with respect to the *.com* gTLD, the U.S. Department of Commerce (“DOC”). We are also the exclusive registry of domain names within certain transliterations of *.com* and *.net* in a number of different native languages and scripts (“IDN gTLDs”). As a registry, we maintain the authoritative directory of all second-level domain names (e.g., *example.com* and *example.net*) in these gTLDs and IDN gTLDs. Our global constellation of DNS servers provides internet protocol (“IP”) address information in response to queries, enabling the use of browsers, email systems, and other systems on the internet. In addition, we own and maintain our shared registration system that allows registrars to enter new second-level domain names into Verisign-operated central directories and to submit modifications, transfers, re-registrations, and deletions for existing second-level domain names (“Shared Registration System”).

In addition to our registry agreements with ICANN, we have an agreement with Cocos (Keeling) Islands to operate the country code top-level domain (“ccTLD”) registry for *.cc*, and other agreements to operate the technical systems for the *.gov* and *.edu* sponsored gTLDs. These gTLDs and ccTLDs are also supported by our global constellation of DNS servers and Shared Registration System. On November 15, 2022, we transitioned the operation of the *.tv* ccTLD to another service provider. We also anticipate transitioning the operation of the *.gov* registry to another operator during 2023, but will continue to operate it until such transition.

We also perform the Root Zone Maintainer function under an agreement with ICANN for the core of the internet’s DNS and operate two of the 13 root zone servers that contain authoritative data for the top of the DNS hierarchy.

Domain names can be registered for between one and 10 years. Unlike other gTLDs, the prices we charge for *.com*, *.net* and *.name* domain name registrations are controlled by pricing provisions in our agreements with ICANN and our prices may be increased only according to those provisions. Retail pricing for these domain name registrations is established by registrars. For *.com* and *.name* domain name registrations, we pay ICANN on a quarterly basis \$0.25 for each annual domain name registration. For *.net* domain name registrations, we remit to ICANN a \$0.75 fee per annual *.net* domain name registration that is collected from registrars.

Revenues for *.cc* domain names and our IDN gTLDs are based on prices that are not subject to the same pricing restrictions as those for *.com*, *.net* and *.name*. The fees received from operating the *.gov* gTLD are based on the terms of our agreement with the U.S. government. The fees from our performance of the technical operations for back-end registry services for other gTLDs are based on the terms of our agreements with those respective registry operators.

## Operations Infrastructure

Our main operations infrastructure consists of secure data centers in Dulles, Virginia; Ashburn, Virginia; and New Castle, Delaware; as well as more than 200 other points of presence around the world. Our domain name servers refer requestors to the associated authoritative name servers for second level domains under the gTLDs and ccTLDs we operate, thus enabling DNS resolution for *.com* and *.net* domain names and for domain names in a number of other gTLDs and ccTLDs that we manage, or for which we provide back-end registry services. Our servers process hundreds of billions of transactions daily. Our operations infrastructure operates continuously, supporting the security, integrity and availability of our services, which are critical for our business and internet users. The performance and availability of our infrastructure are critical for our business. Key features of our operations infrastructure include:

- *Distributed Servers:* We operate a large number of high-speed servers globally to support localized transaction volume and performance demands. In conjunction with our proprietary software, processes and procedures, this purpose-built global constellation of servers offers rapid failover, global and local load balancing, and threshold monitoring on critical servers.
- *Networking:* We deploy and maintain a redundant and diverse global network, maintain high-speed, redundant connections to numerous internet service providers, and maintain network interconnection relationships globally to ensure that our critical services are readily accessible to end users.
- *Security and Availability:* We incorporate architectural concepts such as protected domains, restricted nodes, and distributed access control in our system architecture. In addition, we employ firewalls and intrusion detection software, endpoint and network detection and response systems as well as proprietary security mechanisms at many points across our infrastructure. We perform continuous internal vulnerability testing and periodic controls audits, and also contract with third-party security organizations to perform periodic penetration tests and security risk assessments on our systems. We have engineered resiliency and diversity into how we host classes of products throughout our set of interconnected sites to reduce the risk of unknown vendor defects and zero-day security vulnerabilities.
- *Data Integrity:* We use several proprietary systemic integrity checks and validations to ensure data correctness when updating and publishing the DNS records for the gTLDs and ccTLDs we operate.

We continuously enhance our infrastructure and capabilities to meet demands to support normal and peak system load and attack volumes based on what we have experienced historically, as well as to address projected internet attack trends.

*Call Centers and Service Desk:* We provide customer support services over the phone, by email and through web-based self-help systems. Our support teams are staffed with trained technical customer support agents. Support is available for customers 24 hours a day.

*Operations Support and Monitoring:* Through our network operations center, we have an extensive monitoring capability that enables us to track the status and performance of our critical systems, network and services. Our network operations center monitors our systems continuously.

*Disaster Recovery Plans:* We have disaster recovery and business continuity capabilities that are designed to deal with the loss of entire data centers and other facilities. We maintain data centers with mirrored services that allow failover with no data loss and no loss of function or capacity. Our critical data services (including domain name registration and global resolution) use advanced storage systems that provide data protection through techniques such as synchronous mirroring and remote replication. We periodically operate services at alternate data centers during maintenance windows to ensure the availability of our data centers for disaster recovery.

## **Marketing, Sales and Distribution**

We seek to expand our business through focused marketing campaigns and programs that target growth in the *.com* and *.net* domain name base, both domestically and internationally. We provide tools to be used by both registrars and end users to enable them to find relevant domain names. We have marketing and sales offices in several countries around the world.

## **Research and Development**

We believe that timely development of new and enhanced services, including monitoring and visualization, registry provisioning platforms, navigation and resolution services, data services, value added services, and new and enhanced ways to ensure the security, stability, and resiliency of our services, is necessary to remain competitive in the marketplace.

Our future success will depend, in large part, on our ability to continue to maintain and enhance our current technologies and services and to develop new ones. We actively investigate and incubate new concepts and evaluate new business ideas through our innovation pipeline. We expect that most of the future enhancements to our existing services and our new services will be the result of internal development efforts in collaboration with suppliers, other vendors, customers, and the technology community. Under certain circumstances, we may also acquire or license technology from third parties.

## **Competition**

We face competition in the domain name registry space from other gTLD and ccTLD registries that are competing for the business of entities and individuals that are seeking to obtain a domain name registration. In addition to the gTLD and ccTLD registries we operate or for which we provide back-end registry services, there are numerous other operational gTLD registries, ASCII ccTLD registries, IDN ccTLD registries, and IDN gTLD registries. Under our agreements with ICANN, we are subject to certain restrictions in the operation of *.com*, *.net* and *.name* on pricing, bundling, marketing, methods of distribution, introduction of new registry services, and use of registrars, that do not apply to ccTLDs and other gTLDs and therefore may create a competitive disadvantage. Among our competitors operating gTLD and ccTLD registries are China Internet Network Information Center (CNNIC), DENIC, Nominet, Identity Digital, Public Interest Registry (PIR), CentralNic, Google, *.xyz*, GoDaddy, and Radix.

To the extent end-users navigate using search engines or social media, as opposed to direct navigation via domain names, or transact on e-commerce platforms, we face competition from search engines such as Google, Bing, Yahoo!, and Baidu, social media networks such as Facebook and WeChat, e-commerce platforms such as Amazon, eBay and Taobao, and microblogging tools such as Twitter. In addition, we face competition from these social media and e-commerce platforms if they are used by businesses and individuals to establish an online presence rather than through the use of a domain name. Furthermore, we face competition from providers of web and mobile applications that allow end-users to locate and access content.

New technologies and the expansion of existing technologies may increase competitive pressure. Our industry is characterized by collaborative relationships involving our competitors. In the past, certain of our competitors have consolidated. Our ability to participate and benefit from such collaborative arrangements or consolidations may be limited and such collaborative arrangements and consolidations could harm our competitive position and adversely impact our business.

## Industry Regulation

The DNS is governed under a multi-stakeholder model comprising civil society, the private sector, including for-profit and not-for-profit organizations such as ICANN, governments, including the U.S. government, academia, non-governmental organizations, and international organizations. ICANN plays a central coordination role in this bottom-up multi-stakeholder system. ICANN is mandated through its bylaws to uphold a private sector-led multi-stakeholder approach to internet governance for the public benefit. ICANN's multi-stakeholder policy development processes have created, and will continue to create, policies, programs, and standards that directly or indirectly impact our business. Certain policies can be adopted as Consensus or Temporary Policies, which we are obligated to follow under our agreements with ICANN. For example, in response to the General Data Protection Regulation, ICANN issued a Temporary Policy modifying public access to information from Whois services.

We are also subject to country-level laws and regulations in the United States and in international locations. In China, we are required to maintain licenses for *.com*, *.net*, and *.cc* under regulations issued by the Ministry of Industry and Information Technology. The applications to renew the licenses for *.com* and *.net* are currently under review by the Ministry of Industry and Information Technology. Additionally, in many jurisdictions in which we operate, including California, the European Union, the United Kingdom, China and elsewhere, strict new data security and data privacy regulations have been, or are being, adopted. Because we do not possess extensive personal registrant information, we have not yet experienced significant impacts from these regulations. However, compliance costs and other business impacts could become significant if we begin to receive personal registrant information in our *.com* and *.net* gTLDs, as regulatory enforcement increases, as courts interpret these regulations, and as new laws and regulations are adopted. Other regulations, or changes to regulations, may also significantly impact our business operations, including changes to the Digital Services Act or Network and Information Security Directive, in the European Union, or the Communications Decency Act, in the United States, or the Personal Information Protection Law, in China.

### *.com* Generic Top-Level Domain

Our operation of the *.com* gTLD is subject to the terms of a registry agreement with ICANN (as amended, the "*.com* Registry Agreement"). The current term of the *.com* Registry Agreement is six years and must be renewed or extended by November 30, 2024. Although the *.com* Registry Agreement contains a "presumptive" right of renewal, ICANN could terminate or refuse to renew the Registry Agreement in certain prescribed circumstances. See "Risk Factors - Any loss or modification of our right to operate the *.com* and *.net* gTLDs could have a material adverse impact on our business and result in loss of revenues." in Part I, Item 1A of this Form 10-K for further information.

Other significant terms within the *.com* Registry Agreement include performance specifications and service level agreements, including by example, for the availability of our DNS resolution services, our Shared Registration System, and our Whois services. The *.com* Registry Agreement contains marketing limitations, including limitations on our ability to bundle products and the manner in which we provide marketing support to ICANN-accredited registrars. We are also required under the *.com* Registry Agreement to provide ICANN-accredited registrars with nondiscriminatory access to our systems to register or take other actions related to domain names. In order to introduce new Registry Services or make material changes to existing Registry Services, we must follow prescribed procedures which permit ICANN to review and approve such services.

Amendment 3 to the *.com* Registry Agreement permits an increase to the Maximum Price (as defined in the *.com* Registry Agreement) of *.com* domain name registrations by up to 7% over the previous year in each of the final four years of each six-year period. The first such six-year period began on October 26, 2018. Amendment 3 also clarified that the restrictions in the *.com* Registry Agreement relating to vertical integration apply solely to the *.com* gTLD and also clarified that our ability to increase prices by 7% over the previous year due to new ICANN Consensus Policies or documented extraordinary expense may occur only in years where we do not otherwise take the price increases described above.

Our operation of the *.com* gTLD is also subject to the terms of a Cooperative Agreement with the DOC. The Cooperative Agreement has undergone various amendments with the most recent, Amendment 35, on October 26, 2018. Amendment 35 extended the term of the Cooperative Agreement until November 30, 2024, which will automatically renew on the same terms for successive six-year terms unless the DOC provides written notice of non-renewal 120 days prior to the end of the then-current term.

Amendment 35 includes the DOC's consent to the modification of the pricing terms in the *.com* Registry Agreement (as described above). The Cooperative Agreement further provides that we shall be entitled at any time during the term of the *.com* Registry Agreement to seek to remove the pricing restrictions contained in the *.com* Registry Agreement if we demonstrate to the DOC that market conditions no longer warrant pricing restrictions in the *.com* Registry Agreement, as determined by the DOC.

DOC approval of changes to or the renewal of the *.com* Registry Agreement was limited by Amendment 35 to only the following circumstances: (1) changes to the pricing provisions (other than as approved in Amendment 35), (2) changes to the vertical integration provisions (other than the clarification approved in Amendment 35), (3) changes to the security, stability

and resiliency posture as reflected in the functional or performance specifications (including the service level agreements), (4) changes to the conditions for renewal or termination of the .com Registry Agreement, or (5) changes to the Whois service (except as mandated by ICANN through Temporary or Consensus Policies). As was the case with prior amendments, Amendment 35 is not intended to confer federal antitrust immunity on the Company with respect to the .com Registry Agreement.

Finally, Amendment 35 clarified that the restrictions in the .com Registry Agreement relating to vertical integration apply solely to the .com gTLD. As to the .com gTLD, we are not permitted to acquire, directly or indirectly, control of, or a greater than 15% ownership interest in, any ICANN-accredited registrar that sells .com domain names. In addition, under Amendment 35, we have agreed to continue to operate the .com gTLD in a content-neutral manner and to work within ICANN processes to promote the development of content-neutral policies for the operation of the DNS.

#### *.net Generic Top-Level Domain*

Our operation of the .net gTLD is subject to the terms of a registry agreement with ICANN (as amended, the “.net Registry Agreement”). The current term of this agreement is six years and must be renewed or extended by July 1, 2023. The terms of the .net Registry Agreement are substantially similar to the terms of the .com Registry Agreement, except as to ICANN fees as described earlier and that the annual price for new and renewal .net domain name registrations may be increased by 10% each year. Our operation of the .net gTLD is not subject to the terms of the Cooperative Agreement.

#### *Root Operations*

We operate two of the world’s thirteen root servers. Along with the ICANN community, we are involved in discussions to establish criteria for operations of the root server system including the root servers that we operate. We also publish the root zone file, as the Root Zone Maintainer, under the Root Zone Maintainer Service Agreement (“RZMA”) with ICANN. The RZMA will expire on October 19, 2024, with an automatic renewal, unless earlier terminated.

The descriptions of the .com Registry Agreement, the Cooperative Agreement, and the .net Registry Agreement are qualified in their entirety by reference to the text of the complete agreements that are incorporated by reference as exhibits in this Form 10-K.

### **Human Capital Management**

Our employees are mission driven and values focused. Their dedication to these principles forms the backbone that enables Verisign to provide secure, stable, and resilient global connectivity. We recognize the importance of talent and culture in driving an environment that fosters high performance, inclusion, and integrity in all aspects of our work.

We are committed to attracting, developing, and retaining the best talent, and we routinely monitor and present our progress in these areas to executive management and the Compensation Committee of our Board of Directors. As of December 31, 2022, we had 917 employees, of which 914 were full-time. 853 employees (representing approximately 93% of our total workforce) were based in the U.S., and 64 employees (representing approximately 7% of our total workforce) were based outside the U.S. As of December 31, 2022, approximately 28% of our global workforce was female, and approximately 43% of our U.S. employees were ethnically and racially diverse. No U.S.-based employees are represented under collective bargaining agreements. Based on periodic monitoring, we believe that our employee turnover is relatively low compared to competitive benchmarks and historical trends. We attribute our strong retention rates to our passion and focus on the Company’s mission and values, continual development of talent, and the delivery of competitive and equitable reward programs. We regularly review our workforce policies, procedures, and training programs, as well as our overall workforce demographics, in an effort to create a work environment that is diverse, equitable, inclusive, and free from discrimination.

*Employee Engagement:* In order to deliver on our mission, it is essential to have an engaged workforce that exhibits our values, which include: being stewards of the internet, being passionate about technology, respecting others, exhibiting integrity, taking responsibility, and holding ourselves to a higher standard. These principles are integrated into our operating model and are foundational to our ability to attract, retain, and develop top talent. This commitment serves to create engagement and drives a collaborative and inclusive environment where our employees can thrive. To monitor engagement levels and well-being we routinely conduct employee surveys. In our most recent survey in October of 2022, approximately 85% of our employee population participated. The survey results indicated that our employees remain highly engaged and connected with our mission and values. Another engagement indicator is that the average tenure of our employees is approximately 9 years.

*Diversity, Equity and Inclusion (DEI):* We are a diverse organization, and we believe that drives stronger performance, better decision making, and an inclusive culture where differences are valued. We continue to focus on the hiring, retention, and advancement of women and underrepresented populations. In 2022, we continued to build on our strong foundation through roundtable discussions to support open dialogue, training sessions for all employees on the importance of a diverse and inclusive workplace, and growing our employee resource group representation. Verisign continues to partner with organizations that are dedicated to resisting and reversing historical injustice. Our progress is evident through our October 2022 employee

survey results where participants indicated that they understand how to support an inclusive work environment and that Verisign demonstrates a visible commitment to diversity.

*Compensation, Pay Equity, and Employee Benefits:* To align with our philosophy of providing compelling total rewards, we have practices in place to deliver fair and equitable compensation for employees based on their contribution and performance. We benchmark and regularly review our compensation and benefits against the market to confirm they remain competitive. We offer a broad and comprehensive set of benefits to meet the diverse needs of our workforce. In addition, we regularly perform analyses on base pay, annual incentives, and long-term incentives to help calibrate compensation and ensure pay equity.

*Talent Development and Acquisition:* We are committed to the continued development of our people. Strategic talent reviews and succession planning occur on a regular basis. Our management training is designed to increase capability in the areas of communication, engagement, coaching, conflict management, and business skills, while fostering an ethical, supportive work environment free from bias and harassment. We sponsor skill development for all employees through our online learning and development platform. In addition, we host a series of instructor-led and on-demand learning sessions designed to build our team's skills and knowledge required for the future. Our managers regularly hold conversations with employees about career management, coaching, and other development opportunities to help encourage and drive the growth of our talent. We are focused on the competitive labor market, and we are working diligently to attract the best talent from a diverse range of sources. We continue to broaden our sourcing strategies, refresh our employment branding, and develop targeted recruitment strategies for specialized skill sets and underrepresented populations. In 2022, these strategies enabled us to hire a significant number of female and racially or ethnically diverse employees.

*Hybrid Work Posture:* After shifting to remote work during the COVID 19 pandemic, we are now transitioning to a hybrid work posture. Over the latter half of 2022, we piloted our new hybrid work posture with a focus on how work gets done versus where it gets done. Leaders met with their teams to develop team agreements that summarized the operating norms and protocols their teams need to use in this new hybrid environment. The team agreements created the foundation for employees to create work schedules that align with corporate and individual needs as well as provide employees the flexibility to manage work-life balance. Our managers received training on managing in a hybrid environment. The training focused on leading with inclusive practices, effective communication, empathy, and accountability. Our offices remain a place for collaboration, networking, and strategic discussion. We continue to provide our employees with the equipment and resources that they require to accomplish their work regardless of location.

The following table shows a comparison of our consolidated employee headcount, by function:

	As of December 31,		
	2022	2021	2020
Employee headcount by function:			
Cost of revenues	242	235	235
Research and development	255	250	260
Selling, general and administrative	420	419	414
Total	917	904	909

## Intellectual Property

We rely on a combination of copyrighted software, trademarks, service marks, patents, trade secrets, know-how, restrictions on disclosure, and other methods to protect our proprietary assets. We also enter into confidentiality and/or intellectual property assignment agreements with our employees, consultants and current and potential affiliates, customers and business partners. We also control access to and distribution of proprietary documentation and other confidential information.

We have been issued numerous patents in the U.S. and abroad, covering a wide range of our technologies. Additionally, we continue to file patent applications with respect to certain of our technologies in the U.S. Patent and Trademark Office and internationally. Patents may not be awarded with respect to these applications and even if such patents are awarded, such patents may not provide sufficient protection of our technologies. We continue to consider opportunities for strategic growth and use of our patent portfolio.

We have obtained trademark registrations for the VERISIGN mark and VERISIGN logo in the U.S. and certain countries, and have pending trademark applications for the VERISIGN logo in a number of other countries. We have common law rights in other proprietary names. We take steps to enforce and police Verisign's trademarks. We rely on the strength of our Verisign brand to help differentiate ourselves in the marketing of our products and services.

Our principal intellectual property consists of, and our success is dependent upon, proprietary software used in our business and certain methodologies (many of which are patented or for which patent applications are pending) and technical expertise and proprietary know-how we use in both the design and implementation of our current and future registry services. We own our proprietary Shared Registration System through which registrars submit second-level domain name registrations for each of the registries we operate, as well as the ATLAS distributed lookup system which processes hundreds of billions of queries per day. Some of the software and protocols used in our business are in the public domain or are otherwise available to our competitors, and some are based on open standards set by organizations such as the Internet Engineering Task Force. To the extent any of our patents are considered “standard essential patents,” we may be required to license such patents to our competitors on reasonable and non-discriminatory terms or otherwise be limited in our ability to assert such patents.

### Information About Our Executive Officers

The following table sets forth information regarding our executive officers as of February 17, 2023:

<u>Name</u>	<u>Age</u>	<u>Position</u>
D. James Bidzos	67	Executive Chairman and Chief Executive Officer
Todd B. Strubbe	59	President and Chief Operating Officer
George E. Kilguss, III	62	Executive Vice President, Chief Financial Officer
Danny R. McPherson	48	Executive Vice President, Engineering, Operations and Chief Security Officer
Thomas C. Indelicarto	59	Executive Vice President, General Counsel and Secretary

**D. James Bidzos** has served as Executive Chairman since August 2009 and Chief Executive Officer since August 2011. He served as President from August 2011 to February 2020. He served as Executive Chairman and Chief Executive Officer on an interim basis from June 2008 to August 2009 and served as President from June 2008 to January 2009. He served as Chairman of the Board since August 2007 and from April 1995 to December 2001. He served as Vice Chairman of the Board from December 2001 to August 2007. Mr. Bidzos served as a director of VeriSign Japan from March 2008 to August 2010 and served as Representative Director of VeriSign Japan from March 2008 to September 2008. Mr. Bidzos served as Vice Chairman of RSA Security Inc., an internet identity and access management solution provider, from March 1999 to May 2002, and Executive Vice President from July 1996 to February 1999. Prior thereto, he served as President and Chief Executive Officer of RSA Data Security, Inc. from 1986 to February 1999.

**Todd B. Strubbe** has served as Chief Operating Officer since April 2015 and President since February 2020. From September 2009 to April 2015, he served as the President of the Unified Communications Business Segment for West Corporation, a provider of technology-driven communications services. Prior to this, he was a co-founder and Managing Partner of Arbor Capital, LLC. He has also served in executive leadership positions at First Data Corporation and CompuBank, N.A. and as an associate and then as an engagement manager with McKinsey & Company, Inc. He also served for five years as an infantry officer with the United States Army. Mr. Strubbe holds an M.B.A. degree from Harvard Business School and a B.S. degree from the United States Military Academy at West Point.

**George E. Kilguss, III** has served as Chief Financial Officer since May 2012. From April 2008 to May 2012, he was the Chief Financial Officer of Internap Network Services Corporation, an IT infrastructure solutions company. From December 2003 to December 2007, he served as the Chief Financial Officer of Towerstream Corporation, a company that delivers high speed wireless internet access to businesses. From 1997 to 2000, he served as the Chief Financial Officer of Stratos Global Corporation, a mobile satellite services company. Mr. Kilguss holds an M.B.A. degree from the University of Chicago’s Graduate School of Business and a B.S. degree in Economics and Finance from the University of Hartford.

**Danny R. McPherson**, has served as Executive Vice President, Engineering, Operations, and Chief Security Officer since April 2022. From May 2010 to April 2022, he served in various roles of increasing responsibility, including as Chief Security Officer. Prior to joining the Company, Mr. McPherson was Chief Security Officer with Arbor Networks, a cybersecurity solutions company, and prior to that held technical leadership positions in architecture, engineering and operations with Amber Networks, a network technology company, Qwest Communications, Inc., a telecommunications company, Genuity, Inc., a technology company, MCI Communications, Inc., a telecommunications company, and the U.S. Army Signal Corps.

**Thomas C. Indelicarto** has served as General Counsel and Secretary since November 2014. From September 2008 to November 2014, he served as Vice President and Associate General Counsel. From January 2006 to September 2008, he served as Litigation Counsel. Prior to joining the Company, Mr. Indelicarto was in private practice as an associate at Arnold & Porter LLP and Buchanan Ingersoll (now, Buchanan Ingersoll & Rooney, PC). Mr. Indelicarto also served as a U.S. Army officer for nine years. Mr. Indelicarto holds a J.D. degree from the University of Pittsburgh School of Law and a B.S. degree from Indiana University of Pennsylvania.

## ITEM 1A. RISK FACTORS

*Please carefully consider the following discussion of significant factors, events and uncertainties that make an investment in our securities risky. In addition to other information in this Form 10-K, the following risk factors should be carefully considered in evaluating us and our business. When the factors, events and contingencies described below or elsewhere in this Form 10-K materialize, our business, operating results, financial condition, reputation, cash flows or prospects can be materially adversely affected. In such case, the trading price of our common stock could decline and you could lose part or all of your investment. Additional risks and uncertainties not currently known to us or that we currently deem immaterial may also materially adversely affect our business, operating results, financial condition, reputation, cash flows and prospects. Actual results could differ materially from those projected in the forward-looking statements contained in this Form 10-K as a result of the risk factors discussed below and elsewhere in this Form 10-K and in other filings we make with the SEC.*

### **Cybersecurity and Technology Risk Factors**

**Attempted security breaches, including from the exploitation of vulnerabilities, cyber-attacks and Distributed Denial of Service (“DDoS”) attacks against our systems and services increase our costs, expose us to potentially material liability, and could materially harm our business and reputation.**

As an operator of critical internet infrastructure, we experience a high rate of cyber-attacks and attempted security breaches targeting our systems and services, including the most sophisticated forms of attacks, such as advanced persistent threat attacks, exploitation of zero-day vulnerabilities, ransomware attacks, and social engineering attacks. The forms of these attacks are constantly evolving and may involve methods, tools, and strategies that may not have been previously identified and may not have been observed until the moment of launch, or until sometime after, making these attacks virtually impossible to anticipate and difficult to defend against. In addition to external threats, our systems and services are subject to insider threat risks, including physical or electronic break-ins, sabotage, and risks from suppliers, such as consultants and advisors, SaaS providers, hardware, software, and network systems manufacturers, regional internet registries, and other vendors, or from current or former contractors or employees. These threats and any resulting security breaches can arise from intentional or unintentional actions. Our continued exposure to these threats and the potential that they could lead to material liability claims against us requires us to expend significant financial and other resources. We have developed policies, standards, and procedures to identify, protect, detect, respond, and recover from threats posed by cybersecurity risks, and failure to comply with these policies, standards, and procedures by our employees or suppliers could limit our ability to effectively manage threats from these cybersecurity risks. In addition, we must ensure that our employees stay focused on cybersecurity threats especially in our hybrid work environment, or our ability to effectively manage cybersecurity risks could be impacted. Our failure to effectively manage these security risks, including insider threats, could result in material harm to our business, including loss of or delay in revenues, failure to meet service level agreements, material liability claims, failure to maintain market acceptance, injury to our reputation, and increased costs, and could call into question our ability to preserve the security and stability of the internet.

Security vulnerabilities in our systems and our vendors’ systems, including vulnerabilities in third party software and hardware, pose a material risk to our operations. We use externally-developed technology, systems, and services, including both hardware and software, for a variety of purposes, including compute, storage, encryption and authentication, back-office support, and other functions. We have developed policies, standards, and procedures to reduce the impact of security vulnerabilities in system components, as well as at any vendors where our data is stored or processed. However, such measures cannot provide absolute security. While we strive to remediate known vulnerabilities on a timely basis, such vulnerabilities could be exploited before our remediation is effective and if so, could cause systems and service interruptions, data loss and other damages. Our failure to identify, remediate and mitigate security vulnerabilities, including any potential failure to timely replace and upgrade hardware, software, or other technology assets, could result in material harm to our business, including loss of or delay in revenues, failure to meet service level agreements, material liability claims, failure to maintain market acceptance, injury to our reputation, increased costs, and call into question our ability to preserve the security and stability of the internet.

In addition, our networks have been, and likely will continue to be, subject to DDoS attacks. Recent industry experience has demonstrated that DDoS attacks continue to grow in size and sophistication and have the ability to widely disrupt internet services. While we have adopted mitigation techniques, procedures, and strategies to defend against DDoS attacks, and have successfully mitigated DDoS attacks to date, there can be no assurance that we will be able to defend against every attack, especially as the attacks increase in size and sophistication. Any attack, even if only partially successful, could disrupt our networks, increase response time, negatively impact our ability to meet our service level agreements, and generally impede our ability to provide reliable service to our customers and the broader internet community. We have historically incurred, and will continue to incur, significant costs to enable our infrastructure to process levels of attack traffic that can be substantially larger than our normal transaction volume. We are employing new technologies and new and different services and capabilities to help mitigate DDoS attacks. If these new technologies, services and capabilities are not effective, our infrastructure could be

disrupted, our response times could increase, our ability to meet our service level agreements could be negatively impacted, and our ability to provide reliable service to our customers and the broader internet community could be impeded.

In addition, we are subject to social engineering attacks including phishing, spear phishing, whaling, vishing, smishing, and domain spoofing, which are designed to entice people to divulge sensitive information or take actions that, if successful, could pose a material risk to our operations. The number of such attacks is increasing. Social engineering attacks have occurred in concert with ransomware attacks. While we deploy advanced tools and conduct continuous security awareness training to address social engineering attacks, such measures cannot provide absolute security. Similarly, although we implement redundant architecture and multiple recovery solutions, and conduct periodic exercises to mitigate the threat of ransomware, we still may be subject to successful ransomware attacks. Our failure to prevent such attacks, including any successful social engineering attack, could result in our inability to meet our service legal agreements and could otherwise materially harm our business, including from legal claims, governmental investigations and scrutiny, injury to our reputation, and increased costs.

We do not maintain specific reserves for security breaches, cyber-attacks and DDoS attacks against our systems and the amount of insurance coverage we maintain may be inadequate to cover claims or liabilities relating to such attacks.

**We may introduce undetected or unknown defects into our systems or services, which could materially harm our business and harm our vendors or our customers.**

Despite testing, services as complex as those we offer or develop could contain undetected defects or errors, which could result in service outages or disruptions, compromised customer data, including DNS data, diversion of development resources, injury to our reputation, legal claims, increased insurance costs or increased service costs. Performance of our services, whether or not defective, could have unforeseen or unknown adverse effects on the networks over which they are delivered, on internet users and consumers, and on third-party applications and services that use our services, any of which could result in legal claims against us. While we strive to prevent, detect and remediate defects or errors, they can and do occur and they could result in our inability to meet customer expectations in a timely manner, failure to meet our service level agreements, injury to our reputation, and increased costs.

**Our infrastructure and services are subject to vulnerabilities in the global routing system for the internet, as well as risks arising from internet services providers' increasing adoption of the Resource Public Key Infrastructure system.**

Routing on the internet depends on the Border Gateway Protocol ("BGP"), which is a protocol that relies on networks within the internet infrastructure acting in a trustworthy manner when sharing information about destinations for connectivity and the routing of internet traffic. As a trust-based protocol, BGP has a number of vulnerabilities that may lead to outages or disrupt our services, including as a result of "route hijacks" that involve accidental or malicious rerouting of internet traffic, or "route leaks" that involve the malicious or unintentional propagation of routing information beyond the intended scope of the originator, receiver, and/or one of the networks along the route's path. Both route hijacks and route leaks can result in partial or full rerouting of internet traffic for the impacted destinations. These types of events, which are generally beyond our control, could enable an array of attack conditions or service disruptions, and could result in adverse publicity and adversely affect the public's perception of the security of e-commerce and communications over the internet, as well as of the security or reliability of our services.

To address internet routing system vulnerabilities, many internet service providers have adopted and apply internet reachability policies based on a system known as the Resource Public Key Infrastructure ("RPKI") operated by the regional internet registries ("RIRs"). The RIRs allocate internet number resources, such as internet protocol addresses, to enterprises and network operators. We have limited visibility into the maturity of and investment in the RIRs' operational and security controls, which are outside of our control. When the availability, integrity, or confidentiality of any of the information in the RPKI system, or systems used to maintain and administer RPKI data and systems, are impacted or otherwise compromised in any of the RIRs, or any network operator that is a relying party of the RPKI system, or the operations or ingestion of data from the RPKI system are otherwise impacted by a known or unknown vulnerability, our services may be negatively impacted. Such impacts may include degraded or full loss of reachability of service addresses in the global internet routing system, resulting in degradation or complete loss of availability of our registration and resolution services. A compromise of the RPKI system and related services, or unintentional or unauthorized manipulation of data therein, may also result in other denial of service attack conditions for our infrastructure and services. The systemic dependencies introduced by RPKI and the relying parties of the RPKI system, including network service providers, are outside of our control, and systems that depend upon the RPKI may be only as secure as the weakest elements of the RPKI system. Contracting with RIRs for the provision of and access to RPKI services carries material operational risks, as described above, as well as material contractual risks, which may expose us to service disruptions and material liability.

**We could encounter system interruptions or systems failures resulting from activities beyond our direct control that could materially harm our business.**

We depend on the uninterrupted operation of our various systems, secure data centers, and other computer and communication networks. Our systems and operations are vulnerable to damage or interruption from power loss, transmission cable cuts and other telecommunications failures, damage or interruption caused by fire, earthquake, and other natural disasters, intentional acts of vandalism, terrorist attacks, unintentional mistakes, or errors. Our systems and operations also face risks inherent in, or arising from, the terms and conditions of our agreements with service providers to operate our networks and data centers. We are also subject to the risk of state suppression of internet operations. Any of these problems or outages could create potential liability and exposure, including from a failure to meet our service level agreements, and could decrease customer satisfaction, harming our business, or resulting in adverse publicity and damage to our reputation or call into question our ability to preserve the security and stability of the internet.

**Our data centers, our data center systems, including the Shared Registration Systems located at our data centers, and our resolution systems are vulnerable to damage or interruption, which could impede our ability to provide our services, expose us to material liability, and materially harm our reputation.**

Most of the computing infrastructure for our Shared Registration System is located at, and most of our customer information is stored in, data centers we own or lease and operate. In 2019, we expanded some of our data center services to a leased data center facility. These data centers are vulnerable to damage or interruption, including from natural disasters, such as fires, earthquakes, hurricanes, and floods, power loss, hardware or system failures, physical or electronic break-ins, human error or interference. We are also updating our network architecture in several of our new and existing data centers. If our data center facilities or the updated network architecture do not operate as expected, including the ability to quickly switch over between sites, we could experience service interruptions or outages. A failure in the operation of our Shared Registration System could result in the inability of one or more registrars to register or manage domain names for a period of time. If such a registrar has not implemented robust services in a manner that preserves transactions until processed by the registry, then the failure in the operation of our Shared Registration System could result in permanent loss of transactions at the registrar during that period. A failure in the operation of our Shared Registration System could also impact our ability to provide up-to-date information in our resolution systems, which could result in breaches of our service level agreements pertaining to our resolution services and impact the resolution of domain names on the internet. Although we carry insurance, we do not carry insurance or designated financial reserves for such interruptions.

In addition, our services depend on the secure and efficient operation of the internet connections to and from customers to our Shared Registration System residing in our secure data centers. These connections depend upon the secure and efficient operation of internet service providers, internet exchange point operators, and internet backbone service providers. Such providers have encountered periodic operational problems or experienced outages in the past beyond our scope of control and may continue to encounter problems and outages or may choose to discontinue their service. If the providers that our connections depend upon do not protect, maintain, improve, and reinvest in their networks or present inconsistent, incorrect, or invalid data regarding DNS responses through their networks, our business could be harmed.

A failure in the operation or update of the root zone servers, the root zone file, the Root Zone Management System, the TLD name servers, the TLD zone files that we operate, or other network functions, could result in, among other problems, (1) a DNS resolution or other service outage or degradation, (2) the deletion of one or more gTLDs or ccTLDs from the internet, (3) the deletion of one or more second-level domain names from the internet, or (4) a misdirection of one or more domain names to different servers. A failure in the operation or update of the supporting cryptographic and other operational infrastructure that we maintain could result in similar consequences. Any of these problems or outages could create potential material liability and exposure from litigation and investigations, could result in a failure to meet our service level agreements, and could decrease customer satisfaction, harming our business. These problems could also result in adverse publicity, decrease the public's trust in the security of e-commerce, or call into question our ability to preserve the security and stability of the internet.

We retain certain customer and employee information in our data centers and various domain name registration systems. Any physical or electronic break-in or other security breach or compromise of the information stored at our data centers or domain name registration systems may jeopardize the security of information we retain or that is retained in the computer systems and networks of our customers. In such an event, we could face material liability and exposure from litigation and investigations, fail to meet service level agreements, or be at risk for loss of various security and standards-based compliance certifications needed for operation of our businesses, and customers could be reluctant to use our services, any of which could also adversely affect our reputation and harm our business or cause financial losses that are either not insured against or not fully covered through any insurance.

**We face risks from the operation of the root server system and our performance of the Root Zone Maintainer functions under the RZMA.**

Although the overall root server system is redundant and dispersed, a failure or interruption in the operation of the root server system could impact the effectiveness of our *.com* and *.net* authoritative servers and therefore negatively impact directory services necessary for the operation of the internet. We also have an important operational role in support of a key Internet Assigned Numbers Authority (“IANA”) function as the Root Zone Maintainer. In this role, we provision and publish the authoritative root zone data and make it available to all root server operators under the RZMA with ICANN. If we make errors in the publication of the root zone, we may be subject to material claims challenging the RZMA or our performance under it, including tort claims, and we may not have immunity from, or sufficient indemnification or insurance for, such claims.

**Contractual, Regulatory, Legal and Compliance Risk Factors**

**Any loss or modification of our right to operate the *.com* and *.net* gTLDs could have a material adverse impact on our business and result in loss of revenues.**

Substantially all of our revenues are derived from our operation of the *.com* gTLD under our Cooperative Agreement with the DOC and our *.com* Registry Agreement as well as our operation of the *.net* gTLD under our *.net* Registry Agreement. Any loss or modification of our right to operate the *.com* and *.net* gTLDs could materially and adversely impact our ability to conduct our business and result in loss of revenues. Our *.com* and *.net* Registry Agreements contain “presumptive” rights of renewal upon the expiration of their current terms on November 30, 2024 and June 30, 2023, respectively. ICANN could refuse to renew upon expiration or terminate our *.com* Registry Agreement or our *.net* Registry Agreement if, upon proper notice, (1) we fail to cure a fundamental and material breach of certain specified obligations, and (2) we fail to timely comply with a final decision of an arbitrator or court. Additionally, each of the *.com* and *.net* Registry Agreements provide that if certain terms of these agreements are not similar to such terms generally in effect in the registry agreements of the five largest gTLDs, then a renewal of these agreements would be upon terms reasonably necessary to render such terms to be similar to the registry agreements for those other gTLDs. Any such terms, if they apply, could be unfavorable to us and have a material adverse impact on our business.

Standard renewals of the *.com* Registry Agreement do not require further DOC approval, although the prior written approval of the DOC is required for the removal of, or any changes to the pricing section (other than as approved in Amendment 35 to the Cooperative Agreement), and for changes to certain other specified terms whether such removal or changes are made at a renewal or otherwise. We can provide no assurances that DOC approval would be provided upon our request for any of these changes.

In addition, under Amendment 35 to the Cooperative Agreement, we have agreed to continue to operate the *.com* gTLD in a content-neutral manner and to work within ICANN processes to promote the development of content-neutral policies for the operation of the DNS, and under our binding letter of intent with ICANN, we have agreed to work with the ICANN community to develop certain best practices and other commitments for the security, stability and resiliency of the DNS and the internet. Such policies and processes could expose us to compliance costs and substantial liability and result in costly and time-consuming investigations or litigation.

**Changes or challenges to the pricing provisions in the *.com* Registry Agreement could have a material adverse impact on our business.**

Under the terms of the *.com* Registry Agreement, we may increase the annual fee of each *.com* domain name registration or renewal by up to 7% over the previous year in each of the final four years of each six-year period. We can provide no assurance that we will exercise such right to increase the annual fee. In addition to this contractual right, we are entitled to increase the annual fee of each *.com* domain name registration or renewal by up to 7% due to the imposition of any new specifications or policies adopted by ICANN pursuant to the procedures set forth in its bylaws and due process (“Consensus Policies”) or documented extraordinary expense resulting from an attack or threat of attack on the security and stability of the DNS (an “Extraordinary Expense”). In addition, our ability to increase the price for *.com* domain name registrations and renewals due to a Consensus Policy or Extraordinary Expense may occur only in years in which we do not increase the price for *.com* domain name registrations and renewals as described above. It is uncertain whether circumstances would arise that would permit us to take a price increase due to a Consensus Policy or Extraordinary Expense, or if they do, whether we would seek to increase the price for *.com* domain name registrations for this reason. A failure to seek and obtain a price increase due to a Consensus Policy or Extraordinary Expense, when available, could negatively affect our operating results. We also have the right under the Cooperative Agreement to seek the removal of these pricing restrictions on the *.com* gTLD if we demonstrate to the DOC that market conditions no longer warrant these restrictions. However, we can provide no assurances whether we will seek the removal of these restrictions, or whether the DOC would approve the removal of these restrictions.

Our .com Registry Agreement, including its pricing provisions, has faced, and could face in the future, challenges, including possible legal challenges, or challenges under ICANN's accountability mechanisms, from ICANN, registrars, registrants, and others, and any adverse outcome from these challenges could have a material adverse effect on our business.

**Government regulation and the application of new and existing laws in the U.S. and internationally may slow business growth, increase our costs of doing business, create potential material liability and could have a material adverse effect on our business.**

Application of new and existing laws and regulations in the U.S. or internationally to the internet or the domain name industry have imposed and may in the future impose new costs and new restrictions on our business. Laws and regulations, including those designed to restrict who can register and who can distribute domain names or to require registrants to provide additional documentation to register domain names, have, and may in the future, impose significant additional costs on our business and subject us to additional liabilities or could prevent us from operating in certain jurisdictions. For example, the government of China has indicated that it will issue, and has issued, new regulations, and has begun to enforce existing regulations, that impose additional costs on, and risks to, our provision of registry services in China and could impact the demand for domain name registrations in China. Registries, including us, and China-based registrars are also required by some of these regulations to obtain a government-issued license for each gTLD or ccTLD operating in China. Any failure to obtain or renew the required licenses, or to comply with any license requirements or any updates thereto, by us or our China-based registrars could impact our current and future business in China.

We are also subject to changing laws and regulations that impact whether, how, and under what circumstances we may transfer, process and/or receive certain data that is critical to our operations, including data shared between countries or regions in which we operate and data shared among our products and services. For example, following the invalidation of the U.S.-EU Safe Harbor by the European Court of Justice ("EUCJ") in 2015, the European Union and United States agreed to an alternative framework for data transferred from the European Union to the United States, called Privacy Shield. In 2018, Privacy Shield was also invalidated by the EUCJ. In 2022, the United States and European Union announced a new, but undefined data transfer framework, which once finalized, also could be subject to further legal challenges.

**New laws, regulations, directives or ICANN policies that require us to obtain and maintain personal information of registrants of domain names in the .com and .net gTLDs could impose material compliance costs and could create new, material legal and others risks to our business.**

If we are required to, or choose to, obtain and maintain personal information of registrants of domain names in the .com and .net gTLDs we could be required to incur significant compliance and legal costs as a result of GDPR and other similar regulations. For example, we could incur material costs to protect such information from unauthorized disclosure and, under GDPR, to ensure authorized disclosures are permitted. Failure to properly protect such information, or failure to comply with GDPR, could expose the Company to material costs and penalties. In addition, new obligations to obtain and maintain personal information of registrants in the .com and .net gTLDs could conflict with certain laws and regulations that may require such personal information be maintained solely within the jurisdiction of the data subject. In addition, any such new obligations could increase the cost and risks associated with complying with regulations that require verification of registrant personal information, including for purposes of complying with the economic and trade sanctions programs administered by the Office of Foreign Assets Control ("OFAC").

Such laws, regulations, directives or ICANN policies, could give rise to significant claims, inquiries, investigations or other actions against us, which could result in significant costs, damages, fines or penalties and could delay the development of new products, change our current business practices, result in negative publicity, require significant management time and attention, all or any of which could materially harm our business.

**Our international operations expose us and our business to additional economic, legal, regulatory and political risks that could have a material adverse impact on our revenues and business.**

A significant portion of our revenues is derived from customers outside the U.S. Our business operations in international locations have required, and will continue to require, significant management attention and resources. We may also need to tailor some of our services for a particular location and to enter into international distribution and operating relationships. We may fail to maintain our ability to conduct business, including potentially material business operations in some international locations, or we may not succeed in expanding our services into new international locations or expand our presence in existing locations. Failure to do so could materially harm our business. Moreover, local laws and customs in many countries differ significantly from those in the U.S. In many foreign countries, particularly in those with developing economies, it is common for others to engage in business practices that are prohibited by our internal policies and procedures or U.S. law or regulations applicable to us. There can be no assurance that our employees, contractors and agents will not take actions in violation of such policies, procedures, laws and/or regulations. Violations of laws, regulations or internal policies and procedures by our employees, contractors or agents could result in financial reporting problems, investigations, fines, penalties, or prohibition on

the importation or exportation of our products and services and could have a material adverse effect on our business. In addition, we face risks inherent in doing business internationally, including:

- competition with companies in international locations or other domestic companies entering international locations in which we operate, as well as local governments actively promoting ccTLDs that we do not operate;
- political and economic tensions between governments and changes in international trade policies and/or the economic and trade sanctions programs administered by OFAC of the U.S. Department of the Treasury;
- tariffs and other trade barriers and restrictions;
- difficulties in staffing and managing international operations;
- potential problems associated with adapting our services to technical conditions existing in different countries;
- additional vulnerability from terrorist groups targeting U.S. interests abroad;
- potentially conflicting or adverse tax consequences;
- reliance on third parties in international locations in which we only recently started doing business; and
- potential concerns of international governments or customers and prospects regarding doing business with U.S. technology companies due to alleged U.S. government data collection policies.

Escalating political tensions between the United States and China in particular may pose additional risks to our business in China. In 2020 and 2021, the U.S. government announced restrictions on trading with certain Chinese companies. The Chinese government subsequently announced actions that, if implemented, could impose additional restrictions on the Chinese operations of non-Chinese companies. These and future government actions impacting our ability to operate in China may cause our management's attention to be diverted, our reputation to be damaged, or our business in China to be adversely affected.

**Changes in, or interpretations of, tax rules and regulations or our tax positions may materially and adversely affect our income taxes.**

We are subject to income taxes in both the U.S. and numerous international jurisdictions. Significant judgment is required in determining our worldwide provision for income taxes. In the ordinary course of our business, there are many transactions and calculations where the ultimate tax determination is uncertain. Our effective tax rates may fluctuate significantly on a quarterly basis because of a variety of factors, including changes in the mix of earnings and losses in countries with differing statutory tax rates, changes in our business or structure, changes in tax laws that could adversely impact our income or non-income taxes or the expiration of or disputes about certain tax agreements in a particular country. We are subject to audit by various tax authorities. In accordance with U.S. GAAP, we recognize income tax benefits, net of required valuation allowances and accrual for uncertain tax positions. Although we believe our tax estimates are reasonable, the final determination of tax audits and any related litigation could be materially different than that which is reflected in historical income tax provisions and accruals. Should additional taxes be assessed as a result of an audit or litigation, an adverse effect on our results of operations, financial condition and cash flows in the period or periods for which that determination is made could result.

The Organization for Economic Cooperation and Development ("OECD") continues to issue guidance that will provide a long-term, multilateral proposal on the taxation of the digital economy. Similarly, some international tax jurisdictions, independent of the OECD, have enacted or may enact new tax regimes aimed at income resulting from digital services. Although we cannot predict the nature or outcome of such changes or the likelihood of such legislative proposals being adopted in the U.S. or throughout the world, any or all of these changes in tax laws could increase our taxes and adversely impact our financial condition and cash flow.

**Our business faces risks arising from ICANN's consensus and temporary policies, technical standards and other processes.**

Our Registry Agreements with ICANN require us to implement Consensus Policies and changes mandated by ICANN through temporary specifications or policies ("Temporary Policies"). ICANN could adopt Consensus Policies or Temporary Policies that (1) are unfavorable to us as the registry operator of .com, .net and other gTLDs we operate, (2) are inconsistent with our current or future plans, (3) impose substantial costs on our business, (4) subject the Company to additional legal risks, or (5) affect our competitive position. These Consensus Policies or Temporary Policies could have a material adverse effect on our business.

Our Registry Agreements with ICANN require us to implement and comply with various technical standards and specifications published by the Internet Engineering Task Force ("IETF"). ICANN could impose requirements on us through changes to these IETF standards, or new standards, that are inconsistent with our current or future plans, that impose substantial

costs on our business, that subject the Company to additional legal risks, or that affect our competitive position. Any such changes to the IETF standards, or new standards, could have a material adverse effect on our business.

**Weakening of, or changes to, the multi-stakeholder form of internet governance could materially and adversely impact our business.**

The internet is governed under a multi-stakeholder model comprising civil society, the private sector, including for-profit and not-for-profit organizations such as ICANN, governments, including the U.S. government, academia, non-governmental organizations and international organizations. If ICANN fails to uphold, or if the multi-stakeholder model is significantly redefined, it could harm our business. For example, certain governments, governmental organizations, and private actors continue to express dissatisfaction with the multi-stakeholder form of internet governance and have proposed alternatives including oversight by the United Nations or by international treaties. Furthermore, national legislation has been proposed on topics such as information security and access to personal information that effectively supplants the multi-stakeholder process for policy development in the DNS. Substantially weakening or replacing the multi-stakeholder form of internet governance could materially harm our business.

In addition, in 2016 the U.S. government transferred key internet functions to ICANN, who adopted new and enhanced accountability mechanisms in its bylaws such as the creation of the Empowered Community. There can be no assurance that the removal of the U.S. government oversight of these key functions, or the changes to ICANN's bylaws, will not negatively impact our business.

**Claims, lawsuits, audits or investigations in which we are or could become involved may result in material adverse outcomes to our business.**

We are, and may in the future become, involved in claims, lawsuits, audits, and investigations, including intellectual property litigation and infringement claims. Litigation is inherently unpredictable, and unexpected judgments or excessive verdicts do occur. In addition, proceedings that we initially view as immaterial could prove to be material. Adverse outcomes in lawsuits, audits and investigations, could result in significant monetary damages, including indemnification payments, or injunctive relief that could adversely affect our ability to conduct our business, and may have a material adverse effect on our financial condition, results of operations and cash flows. For example, we are engaged in activities to help mitigate security threats and other forms of DNS abuse in the gTLDs and ccTLDs we operate and we are involved in community efforts that could increase and expand such activities including potential new contractual obligations. Such activities include, for example, receiving reports of suspected threats and abuse from appropriate "trusted notifiers" (typically involving national and international law enforcement) and notifying registrars or others of domain names associated with suspected malicious or illegal activity. Our activities may also include disabling one or more domain names in the gTLDs or ccTLDs we operate including in response to governmental directives and orders in those jurisdictions in which we operate. Activities such as these have resulted in, and could in the future result in, significant litigation and could harm our reputation. Given the inherent uncertainties in litigation, even when we are able to reasonably estimate the amount of possible loss or range of loss and therefore record an aggregate litigation accrual for probable and reasonably estimable loss contingencies, the accrual may change in the future due to new developments or changes in approach. In addition, such claims, lawsuits, audits and investigations could involve significant expense and diversion of management's attention and resources from other matters.

**Strategic, Business and Operating Risk Factors**

**Deterioration of economic conditions could materially harm our business.**

Our business is, and could continue to be, adversely affected by the deterioration in national or global economic conditions, including high inflation rates, increasing interest rates, disruption in the supply chain, and currency fluctuations, resulting from the continuing economic effects of the COVID-19 pandemic, war and civil unrest, and other political and economic developments. The severity and duration of a these economic conditions, as well as the timing, strength, and sustainability of any recovery, are unknown and are not within the Company's control.

**The business environment is highly competitive and, if we do not compete effectively, we may suffer material adverse impact to our business, including lower demand for our products, reduced gross margins, and loss of market share.**

We face competition from services that provide an online identity or presence, including other gTLDs and ccTLDs. In order to remain competitive, we must continually demonstrate the security, stability, and resiliency of our services and must adopt and support new technologies to adapt our services to changing technologies, market conditions, and our customers' and internet users' preferences and practices. Also to remain competitive, we have undertaken important initiatives such as our efforts to acquire the .web gTLD, and we may in the future undertake other important initiatives. Any of these initiatives require significant resources, can subject us to regulatory scrutiny and/or negative publicity, and divert management attention from our existing business. Such undertakings, including our efforts to acquire the .web gTLD, may be unsuccessful and costly. In addition, competing technologies developed by others or the emergence of new industry standards may adversely affect our competitive position or render our services or technologies noncompetitive or obsolete. Finally, consolidation within our

industry has occurred and is likely to continue to occur. Our ability to participate and benefit from such consolidations may be limited and consolidation within our industry among our competitors could harm our competitive position and adversely impact our business.

We have been designated as the registry operator for certain new gTLDs, including certain IDN gTLDs. Our new gTLDs may not be as or more successful than the new gTLDs obtained by our competitors. In addition, our new gTLDs may face additional universal acceptance and usability challenges and it is possible that resolution of domain names within some of these new gTLDs may be blocked within certain state or organizational environments, challenging universal resolvability of these strings and their general acceptance and usability.

See the “Competition” section in Part I, Item 1 of this Form 10-K for further information.

**The evolution of technologies or internet practices and behaviors, the adoption of substitute technologies, or wholesale price increases of domain names in the gTLDs we operate may materially and negatively impact the demand for the domain names for which we are the registry operator.**

Technologies relating to online presence, including social media, mobile devices, apps, and search engines, have evolved and continue to evolve, changing the internet practices and behaviors of consumers and businesses. These ongoing changes can negatively impact the demand for our domain names. In addition, registrants purchase domain names for a variety of reasons, including personal, commercial, and investment reasons. Changes in the motivation of domain name registrants can negatively impact our business.

Technology changes to web browser or internet search technologies could reduce demand for domain names. Similarly, if internet users’ preferences or practices shift away from recognizing and relying on web addresses or if internet users were to significantly decrease the use of web browsers in favor of applications to locate and access content, demand for domain names in the gTLDs we operate could be negatively impacted. Demand for domain names in the gTLDs we operate could be negatively impacted by new technologies that significantly decrease the use of traditional domain names to present and protect an online identity. New technologies that encourage internet users to expand the use of third-level domains or alternate identifiers, such as identifiers from social networking, e-commerce platforms and microblogging sites, could also negatively impact the demand for domain names in the gTLDs we operate. In addition, the demand for domain names in the gTLDs we operate could be impacted by alternative namespaces with domain-name-like identifiers that are operated outside the single authoritative DNS root zone, including blockchain namespaces. To the extent that web browsers, applications, DNS registrars and DNS resolvers recognize and support such namespaces, and that internet users are able to perform online operations with identifiers from such namespaces, demand for domain names in gTLDs and ccTLDs in the single authoritative DNS root zone, including the gTLDs we operate, could be negatively impacted.

Some registrars and registrants purchase and resell domain names at an increased price in a secondary market. Adverse changes in the resale value of domain names, changes in the business models for such domain name registrars and registrants, or other factors, including regulations limiting the resale of domain names, could result in a decrease in the demand and/or renewal rates for domain names in the gTLDs we operate.

Some registrars and registrants seek to generate revenues by registering domain names specifically for website advertising. Changes in the way these registrars and registrants are compensated (including changes in methodologies and metrics) by advertisers and advertisement placement networks, such as Google, Baidu and Bing, have adversely affected, and may continue to adversely affect the market for domain names used for this purpose, which has resulted in, and may continue to result in, a decrease in demand and/or the renewal rate for such domain names. In addition, if spending on online advertising and marketing is reduced, this may result in a further decline in the demand for domain names used for this purpose.

Under the terms of the .com and .net Registry Agreements, as amended, we are permitted to increase the annual fee of each .com and .net domain name registration or renewal according to the provisions in these agreements. To the extent we increase our prices, there could be a decrease in the demand and/or renewal rates for .com or .net domain names.

**If we fail to expand our services into developing and emerging economies in international locations, our business may not grow.**

We seek to serve new, developing, and emerging economies in international locations to grow our business. These economies are rapidly evolving and may not grow or even if they do grow, our services may not be widely used or accepted there. Accordingly, the demand for our services in these locations is uncertain. Factors that may affect acceptance or adoption of our services in these locations include:

- regional internet infrastructure development, expansion, penetration and adoption, and the development, maturity and depth of our sales channels;
- acceptance and adoption of substitute products and services that enable online presence without a domain name, including social media, e-commerce platforms, website builders and mobile applications;

- increased acceptance and adoption of other substitute products and services, including ccTLDs or other gTLDs;
- public perception of the security of our products and services;
- the use of mobile applications as the primary engagement mechanism for navigating the internet; and
- government regulations affecting the internet, internet access and availability, domain name registrations or the provision of registry services, data security, privacy, or data localization, e-commerce or telecommunications.

If our services are not widely accepted or adopted in these locations, our business may not grow.

**Our business depends on registrars and their resellers maintaining their focus on marketing our products and services.**

All of the domain name registrations and renewals for the registries we operate occur through registrars. Registrars and their resellers engage in substantial marketing efforts to increase the demand and/or renewal rates for domain names as well as their own associated offerings. Consolidation in the registrar or reseller industry or changes in ownership, management, or strategy among individual registrars or resellers, including vertical integration by registrar or reseller industry participants, could result in significant changes to their businesses, operating models, and cost structures. These changes could include reduced marketing efforts for the gTLDs we operate or other operational changes that could adversely impact the demand and/or the renewal rates for the domain names for which we are the registry operator.

With the introduction of new gTLDs, many of our registrars and resellers have chosen to, and may continue to choose to, focus their short- or long-term marketing efforts on these new offerings and/or reduce the prominence or visibility of our products and services on their e-commerce platforms. Our registrars and resellers sell domain name registrations of other competing registries, including new gTLDs, and some also sell and support their own services for websites such as email, website hosting, and other services. Our registrars and resellers may be more motivated to sell to registrants to whom they can also market their own services. To the extent that registrars and resellers focus more on selling and supporting their services and less on the registration and renewal of domain names in the gTLDs we operate, our revenues could be adversely impacted. Our ability to successfully market our services to, and build and maintain strong relationships with, new and existing registrars or resellers is a factor upon which successful operation of our business is dependent. If we are unable to keep a significant portion of their marketing efforts focused on selling registrations of domain names in the gTLDs we operate, as opposed to other competing gTLDs, including the new gTLDs, or their own services, our business could be harmed.

**We depend on highly skilled employees to maintain and provide innovative solutions for our business, and our business could be materially harmed if we are not able to attract and retain such qualified talent.**

Our business is highly technical and requires individuals skilled and knowledgeable in unique technologies, configurations, operating systems, and software development tools. We depend on the knowledge, experience, and performance of these employees and leaders to effectively manage and provide innovative solutions for our business. For example, we require employees with expertise in DNS operations and with certain cybersecurity specialties. Because such employees are in high demand by our competitors and other companies, we must be able to attract, integrate, retain and motivate such highly skilled employees and leaders. Failure to attract and retain such employees and to effectively implement succession plans for these employees could harm our business.

**Intellectual Property Risk Factors**

**We rely on our intellectual property rights to protect our proprietary assets, and any failure by us to protect or enforce, or any misappropriation of, our intellectual property could materially harm our business.**

Our success depends in part on our internally developed technologies and related intellectual property. Despite our precautions, it may be possible for an external party to copy or otherwise obtain and use our intellectual property without authorization. Furthermore, the laws of other countries may not protect our proprietary rights in those countries to the same extent U.S. law protects these rights in the U.S. In addition, it is possible that others may independently develop substantially equivalent intellectual property. If we do not effectively protect our intellectual property, our business could suffer. Additionally, we have filed patent applications with respect to some of our technology in the U.S. Patent and Trademark Office and patent offices outside the U.S. Patents may not be awarded with respect to these applications and even if such patents are awarded, third parties may seek to oppose or otherwise challenge our patents, and such patents' scope may differ significantly from what was requested in the patent applications and may not provide us with sufficient protection of our intellectual property. In the future, we may have to resort to litigation to enforce and protect our intellectual property rights, to protect our trade secrets or to determine the validity and scope of the proprietary rights of others. This type of litigation is inherently unpredictable and, regardless of its outcome, could result in substantial costs and diversion of management attention and technical resources. Some of the software and protocols used in our business are based on standards set by standards setting organizations such as the IETF. To the extent any of our patents are considered "standards essential patents," in some cases we

may be required to license such patents to our competitors on reasonable and non-discriminatory terms or otherwise be limited in our ability to assert such patents.

We also license externally developed technology that is used in some of our products and services to perform key functions. These externally developed technology licenses may not continue to be available to us on commercially reasonable terms or at all. The loss of, or our inability to obtain or maintain, any of these technology licenses could hinder or increase the cost of our services, launching new products and services, entering into new markets and/or otherwise harm our business. Some of the software and protocols used in our business are in the public domain or may otherwise become publicly available, which means that such software and protocols are or may become equally available to our competitors.

We rely on the strength of our Verisign brand to help differentiate Verisign in the marketing of our products. Dilution of the strength of our brand could harm our business. We are at risk that we will be unable to fully register, build equity in, or enforce the Verisign logo in all markets where Verisign products and services are sold.

#### **ITEM 1B. UNRESOLVED STAFF COMMENTS**

None.

#### **ITEM 2. PROPERTIES**

As of December 31, 2022, we owned each of our significant properties, which include our corporate headquarters facility in Reston, Virginia, and data center facilities in New Castle, Delaware and Dulles, Virginia. We also lease a number of smaller office and data center locations around the world. We believe that our existing facilities, both owned and leased, are in good condition and suitable for the conduct of our business.

#### **ITEM 3. LEGAL PROCEEDINGS**

As previously disclosed, Afilius Domains No. 3 Limited (now called Altanovo Domains Limited) (“Afilius”), a competitor and losing bidder in the .web auction, filed a form of arbitration proceeding against ICANN, an Independent Review Process (“IRP”) under ICANN’s bylaws, on November 14, 2018. Afilius alleges that the agreement between Verisign and Nu Dotco, LLC (“NDC”) pertaining to .web violated ICANN’s new gTLD Applicant Guidebook. As a result, Afilius claims that ICANN had a duty to disqualify NDC’s bid and award the .web gTLD to Afilius. Afilius also claims that ICANN would violate its bylaws pertaining to competition by awarding the .web gTLD to Verisign. Afilius amended its IRP request on March 21, 2019 in part to oppose Verisign’s and NDC’s participation in the IRP. A hearing was held on Verisign’s and NDC’s applications for participation and, on February 12, 2020, the IRP panel permitted Verisign and NDC to participate in aspects of the IRP. In early August 2020, the IRP panel held a hearing on Afilius’ claims.

The IRP panel issued its final decision on May 20, 2021. Consistent with Verisign’s position, the IRP panel dismissed Afilius’ claims for relief seeking to invalidate the .web auction and to award the .web gTLD to Afilius, concluding that such issues were beyond the IRP panel’s jurisdiction. Furthermore, as expected, the IRP panel’s ruling recommended that ICANN’s Board of Directors consider the objections made regarding the .web auction and then make a decision on the delegation of .web. With respect to ICANN, the final decision said that certain actions and/or inaction by ICANN in response to Afilius’ objections did violate aspects of ICANN’s bylaws related to transparency and fairness.

On June 19, 2021, Afilius filed an application to the IRP panel requesting that it interpret certain terms of, and make certain amendments to, the final decision. The IRP panel denied that application in its entirety on December 21, 2021 finding that it was “frivolous” and sanctioning Afilius by directing it to pay ICANN’s attorney fees. On January 16, 2022, ICANN’s Board directed its Board Accountability Mechanisms Committee (“BAMC”) to review the IRP panel’s final decision and to provide the Board with its findings to consider and recommendations to act upon regarding the award and delegation of .web. On May 19, 2022, the BAMC requested that the parties submit detailed summaries of their claims along with supporting materials. All parties submitted the requested materials by August 29, 2022. It is expected that after the BAMC makes its findings and recommendations, the ICANN Board will determine the final disposition of .web.

We are also involved in various investigations, claims and lawsuits arising in the normal conduct of our business, none of which, in our opinion, will have a material adverse effect on our financial condition, results of operations, or cash flows. We cannot assure you that we will prevail in any litigation. Regardless of the outcome, any litigation may require us to incur significant litigation expense and may result in significant diversion of management attention.

#### **ITEM 4. MINE SAFETY DISCLOSURES**

Not applicable.

**PART II****ITEM 5. MARKET FOR REGISTRANT'S COMMON EQUITY, RELATED STOCKHOLDER MATTERS AND ISSUER PURCHASES OF EQUITY SECURITIES****Market Information**

Our common stock is traded on the Nasdaq Global Select Market under the symbol VRSN. On February 10, 2023, there were 323 holders of record of our common stock. We cannot estimate the number of beneficial owners since many brokers and other institutions hold our stock on behalf of stockholders.

**Share Repurchases**

The following table presents the share repurchase activity during the three months ended December 31, 2022:

	Total Number of Shares Purchased	Average Price Paid per Share	Total Number of Shares Purchased as Part of Publicly Announced Plans or Programs (1)	Approximate Dollar Value of Shares That May Yet Be Purchased Under the Plans or Programs (1)(2)
	(Shares in thousands)			
October 1 – 31, 2022	429	\$178.98	429	\$ 993.8 million
November 1 – 30, 2022	339	\$191.75	339	\$ 928.8 million
December 1 – 31, 2022	350	\$200.08	350	\$ 858.8 million
	<u>1,118</u>		<u>1,118</u>	

- (1) Effective February 10, 2022, our Board of Directors authorized the repurchase of our common stock in the amount of \$705.4 million, in addition to the \$294.6 million that remained available for repurchases under the share repurchase program, for a total repurchase authorization of up to \$1.00 billion under the program.
- (2) Effective October 27, 2022, our Board of Directors authorized the repurchase of our common stock in the amount of \$803.0 million, in addition to the \$197.0 million that remained available for repurchases under the share repurchase program, for a total repurchase authorization of up to \$1.00 billion under the program. The share repurchase program has no expiration date. Purchases made under the program could be effected through open market transactions, block purchases, accelerated share repurchase agreements or other negotiated transactions.

**Performance Graph**

The information contained in the Performance Graph shall not be deemed to be “soliciting material” or “filed” with the SEC or subject to the liabilities of Section 18 of the Exchange Act, except to the extent that we specifically incorporate it by reference into a document filed under the Securities Act of 1933, as amended (the “Securities Act”), or the Exchange Act.

The following graph compares the cumulative total stockholder return on our common stock, the Standard and Poor’s (“S&P”) 500 Index, and the S&P 500 Information Technology Index. The graph assumes that \$100 (and the reinvestment of any dividends thereafter) was invested in our common stock, the S&P 500 Index and the S&P 500 Information Technology Index on December 31, 2017, and calculates the return annually through December 31, 2022. The stock price performance on the following graph is not necessarily indicative of future stock price performance.

	12/31/17	12/31/18	12/31/19	12/31/20	12/31/21	12/31/22
VeriSign, Inc.	\$ 100	\$ 130	\$ 168	\$ 189	\$ 222	\$ 180
S&P 500 Index	\$ 100	\$ 96	\$ 126	\$ 149	\$ 191	\$ 157
S&P 500 Information Technology Index	\$ 100	\$ 100	\$ 150	\$ 216	\$ 290	\$ 208

ITEM 6. [Reserved]

## ITEM 7. MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS

### FORWARD-LOOKING STATEMENTS

*This Form 10-K contains forward-looking statements within the meaning of Section 27A of the Securities Act and Section 21E of the Exchange Act. These forward-looking statements are based on current expectations and assumptions and involve risks and uncertainties, including, statements regarding our expectations about the sufficiency of our existing cash, cash equivalents and marketable securities, and funds generated from operations, together with our borrowing capacity under the unsecured revolving credit facility. Forward-looking statements include, among others, those statements including the words "expects," "anticipates," "intends," "believes" and similar language. Our actual results may differ significantly from those projected in the forward-looking statements. Factors that might cause or contribute to such differences include, but are not limited to, those discussed in the section titled "Risk Factors" in Part I, Item 1A of this Form 10-K. You should also carefully review the risks described in other documents we file from time to time with the SEC, including the Quarterly Reports on Form 10-Q or Current Reports on Form 8-K that we file in 2023. You are cautioned not to place undue reliance on the forward-looking statements, which speak only as of the date of this Form 10-K. We undertake no obligation to update publicly or revise such statements, whether as a result of new information, future events, or otherwise, except as required by law.*

*This section of this Form 10-K generally discusses 2022 and 2021 items and year-to-year comparisons between 2022 and 2021. Discussions of 2020 items and year-to-year comparisons between 2021 and 2020 that are not included in this Form 10-K can be found in "Management's Discussion and Analysis of Financial Condition and Results of Operations" in Part II, Item 7 of our Annual Report on Form 10-K for the fiscal year ended December 31, 2021.*

#### Overview

We are a global provider of domain name registry services and internet infrastructure, enabling internet navigation for many of the world's most recognized domain names. We enable the security, stability, and resiliency of key internet infrastructure and services, including providing Root Zone Maintainer services, operating two of the 13 global internet root servers, and providing registration services and authoritative resolution for the .com and .net top-level domains, which support the majority of global e-commerce.

As of December 31, 2022, we had approximately 173.8 million .com and .net registrations in the domain name base. The number of domain names registered is largely driven by continued growth in online advertising, e-commerce, and the number of internet users, which is partially driven by greater availability of internet access, as well as marketing activities carried out by us and our registrars. Growth in the number of domain name registrations under our management may be hindered by certain factors, including overall economic conditions, competition from ccTLDs, other gTLDs, services that offer alternatives for an online presence, such as social media, and ongoing changes in the internet practices and behaviors of consumers and businesses. Factors such as the evolving practices and preferences of internet users, and how they navigate the internet, as well as the motivation of domain name registrants and how they will manage their investment in domain names, can negatively impact our business and the demand for new domain name registrations and renewals.

#### 2022 Business Highlights and Trends

- We recorded revenues of \$1,424.9 million in 2022, which represents an increase of 7% compared to 2021.
- We recorded operating income of \$943.1 million during 2022, which represents an increase of 9% as compared to 2021.
- We finished 2022 with 173.8 million .com and .net registrations in the domain name base, which represents a 0.2% increase from December 31, 2021.
- During 2022, we processed 39.9 million new domain name registrations for .com and .net compared to 44.6 million in 2021.
- The final .com and .net renewal rate for the third quarter of 2022 was 73.7% compared to 75.0% for the same quarter of 2021. Renewal rates are not fully measurable until 45 days after the end of the quarter.
- We repurchased 5.5 million shares of our common stock for an aggregate cost of \$1.03 billion in 2022. As of December 31, 2022, there was \$858.8 million remaining for future share repurchases under the share repurchase program.
- We generated cash flows from operating activities of \$831.1 million in 2022, which represents an increase of 3% as compared to 2021.

- On February 9, 2023, we announced that we will increase the annual registry-level wholesale fee for each new and renewal .com domain name registration from \$8.97 to \$9.59, effective September 1, 2023.

### **Critical Accounting Estimates**

The discussion and analysis of our financial condition and results of operations are based upon our Consolidated Financial Statements, which have been prepared in accordance with U.S. generally accepted accounting principles. The preparation of these financial statements requires management to make estimates and judgments that affect the reported amounts of assets, liabilities, revenues and expenses, and related disclosures of contingent assets and liabilities. On an ongoing basis, management evaluates those estimates. Management bases its estimates on historical experience and on various assumptions that are believed to be reasonable under the circumstances, the results of which form the basis for making judgments about the carrying values of assets and liabilities that are not readily available from other sources. Actual results may differ from these estimates under different assumptions or conditions.

Critical accounting estimates are those estimates made in accordance with generally accepted accounting principles that involve a significant level of estimation uncertainty and have had or are reasonably likely to have a material impact on the financial condition or results of operations of the registrant. We believe the following critical accounting estimates and policies have the most significant impact on our consolidated financial statements:

#### *Income taxes*

We operate in multiple tax jurisdictions in the United States and internationally. Tax laws and regulations in these jurisdictions are complex, interrelated, and periodically changing. Significant judgment or interpretation of these laws and regulations is often required in determining our worldwide provision for income taxes, including, for example, the calculations of taxable income in each jurisdiction, deferred taxes, and the availability and amount of deductions and tax credits. We have recognized \$234.6 million of deferred tax assets, net as of December 31, 2022. Our income tax expense was \$206.4 million for the year ended December 31, 2022.

The final taxes payable are also dependent upon many factors, including negotiations with taxing authorities in various jurisdictions and resolution of disputes arising from various tax examinations. We only recognize or continue to recognize tax positions and tax benefit amounts that are more likely than not to be sustained upon examination. We adjust these amounts in light of changing facts and circumstances; however, due to the complexity of some of these uncertainties, the ultimate resolution may result in an outcome that is materially different from our current estimate of unrecognized tax benefits. See Note 10, "Income Taxes" of our Notes to Consolidated Financial Statements in Item 8 of this Form 10-K for further discussion of the \$165.5 million deferred tax asset and corresponding income tax benefit recognized in the fourth quarter of 2021.

### **Results of Operations**

The following table presents information regarding our results of operations as a percentage of revenues:

	Year Ended December 31,		
	2022	2021	2020
Revenues	100.0 %	100.0 %	100.0 %
Costs and expenses:			
Cost of revenues	14.1	14.5	14.2
Research and development	6.0	6.1	5.9
Selling, general and administrative	13.7	14.1	14.7
Total costs and expenses	33.8	34.7	34.8
Operating income	66.2	65.3	65.2
Interest expense	(5.3)	(6.3)	(7.1)
Non-operating income (loss), net	0.9	(0.1)	1.2
Income before income taxes	61.8	58.9	59.3
Income tax (expense) benefit	(14.5)	0.2	5.1
Net income	47.3 %	59.1 %	64.4 %

#### **Revenues**

Our revenues are primarily derived from registrations for domain names in the .com and .net domain name registries. We also derive revenues from operating domain name registries and technical systems for several other gTLDs and ccTLDs, all of which are not significant in relation to our consolidated revenues. For domain names registered in the .com and .net registries we

receive a fee from registrars per annual registration that is determined pursuant to our agreements with ICANN. Individual customers, called registrants, contract directly with registrars or their resellers, and the registrars, who are our direct customers, in turn register the domain names with Verisign. Changes in revenues are driven largely by changes in the number of new domain name registrations and the renewal rate for existing registrations as well as the impact of new and prior price increases, to the extent permitted by ICANN and the DOC. New registrations and the renewal rate for existing registrations are impacted by continued growth in online advertising, e-commerce, and the number of internet users, as well as marketing activities carried out by us and our registrars. We also offer promotional incentive-based discount programs to registrars based upon market conditions and the business environment in which the registrars operate.

Under the *.com* Registry Agreement, we are permitted to increase the price of a *.com* domain name registration by up to 7% in each of the final four years of each six-year period beginning on October 26, 2018. We increased the annual registry-level wholesale fee for each new and renewal *.com* domain name registration from \$7.85 to \$8.39 effective September 1, 2021, and from \$8.39 to \$8.97 effective September 1, 2022. On February 9, 2023, we announced that we will increase the annual registry-level wholesale fee for each new and renewal *.com* domain name registration from \$8.97 to \$9.59, effective September 1, 2023. We have the contractual right to increase the fees for *.net* domain name registrations by up to 10% each year during the term of our agreement with ICANN, through June 30, 2023. On July 28, 2022, we announced that we will increase the annual registry-level wholesale fee for each new and renewal *.net* domain name registration from \$9.02 to \$9.92, effective February 1, 2023. All fees paid to us for *.com* and *.net* registrations are in U.S. dollars.

A comparison of revenues is presented below:

	Year Ended December 31,				
	2022	% Change	2021	% Change	2020
	(Dollars in millions)				
Revenues	\$ 1,424.9	7 %	\$ 1,327.6	5 %	\$ 1,265.1

The following table compares the *.com* and *.net* domain name registrations in the domain name base:

	As of December 31,				
	2022	% Change	2021	% Change	2020
<i>.com</i> and <i>.net</i> domain name registrations in the domain name base	173.8 million	— %	173.4 million	5 %	165.2 million

Revenues increased by \$97.3 million in 2022 compared to 2021, primarily due to an increase in revenues from the operation of the registry for the *.com* gTLD driven by the price increases that became effective September 1, 2022 and 2021, and to a lesser extent, an increase in the domain name base for *.com*. As discussed in prior periods, we believe that the effects of the COVID-19 pandemic initially led to an increase in the demand for domain names, particularly as businesses and entrepreneurs sought to establish or expand their presence online in the beginning of the pandemic. This increased demand appears to have subsided in 2022. Additionally, revenues from the operation of the *.tv* registry increased by \$6.6 million in 2022 primarily due to the recognition of the remaining deferred revenue as the operation of the *.tv* registry was transitioned to a new operator in November 2022 and upon completion of the transition, we had no remaining performance obligations to our customers.

Demand for domain names has been primarily driven by continued internet growth and marketing activities carried out by us and our registrars. However, competitive pressure from ccTLDs, other gTLDs, services that offer alternatives for an online presence, such as social media, ongoing changes in internet practices and behaviors of consumers and business, as well as the motivation of existing domain name registrants managing their investment in domain names, such as for resale at increased prices or for revenue generation through website advertising, and global economic uncertainty, has limited the demand for domain names and may continue to do so in the future.

### Geographic revenues

We generate revenues in the U.S.; Europe, the Middle East and Africa (“EMEA”); China; and certain other countries, including Canada, Japan and Singapore. The following table presents a comparison of the Company’s geographic revenues:

	Year Ended December 31,				
	2022	% Change	2021	% Change	2020
	(Dollars in millions)				
U.S	\$ 937.6	10 %	\$ 851.3	6 %	\$ 804.7
EMEA	226.0	(2)%	231.7	8 %	214.2
China	106.0	4 %	101.7	(11)%	113.7
Other	155.3	9 %	142.9	8 %	132.5
Total revenues	\$ 1,424.9	7 %	\$ 1,327.6	5 %	\$ 1,265.1

Revenues in the table above are attributed to the country of domicile and the respective regions in which our registrars are located; however, this may differ from the regions where the registrars operate or where registrants are located. Revenue growth for each region may be impacted by registrars reincorporating, relocating, or from acquisitions or changes in affiliations of resellers. Revenues in the U.S. benefited from several such changes during 2022, while revenues in EMEA were negatively impacted. Revenue growth for each region may also be impacted by registrars domiciled in one region, registering domain names in another region. During 2022, revenues increased in all regions except EMEA, which declined due to the factors described above.

### Cost of revenues

Cost of revenues consist primarily of salaries and employee benefits expenses for our personnel who manage the operational systems, depreciation expenses, operational costs associated with the delivery of our services, fees paid to ICANN, customer support and training, costs of facilities and computer equipment used in these activities, telecommunications expense and allocations of indirect costs such as corporate overhead.

A comparison of cost of revenues is presented below:

	Year Ended December 31,				
	2022	% Change	2021	% Change	2020
	(Dollars in millions)				
Cost of revenues	\$ 200.7	5 %	\$ 191.9	7 %	\$ 180.2

Cost of revenues increased by \$8.8 million in 2022 compared to 2021 primarily due to a increases in compensation and benefits expenses, telecommunications expenses, allocated overhead expenses and several other individually insignificant factors. Compensation and benefits expenses increased by \$2.3 million as a result of an increase in expenses related to employee salaries. Telecommunications expenses increased by \$1.9 million due to an increase in network costs supporting our operations. Allocated overhead expenses increased by \$1.9 million primarily due to an increase in total allocable expenses.

### Research and development

Research and development expenses consist primarily of costs related to research and development personnel, including salaries and other personnel-related expenses, consulting fees, facilities costs, computer and communications equipment, support services used in our service and technology development, and allocations of indirect costs such as corporate overhead.

A comparison of research and development expenses is presented below:

	Year Ended December 31,				
	2022	% Change	2021	% Change	2020
	(Dollars in millions)				
Research and development	\$ 85.7	6 %	\$ 80.5	8 %	\$ 74.7

Research and development expenses increased by \$5.2 million in 2022 compared to 2021 primarily due to a decrease in capitalized labor, an increase in allocated overhead expenses and a combination of several other individually insignificant factors. Capitalized labor decreased by \$1.5 million due to a shift in work from capital projects to certain non-capital projects and

maintenance of existing software products. Allocated overhead expenses increased by \$1.3 million primarily due to an increase in total allocable expenses.

### ***Selling, general and administrative***

Selling, general and administrative expenses consist primarily of salaries and other personnel-related expenses for our executive, administrative, legal, finance, information technology, human resources, sales, and marketing personnel, travel and related expenses, trade shows, costs of computer and communications equipment and support services, consulting and professional service fees, costs of marketing programs, costs of facilities, management information systems, support services, and certain tax and license fees, offset by allocations of indirect costs such as facilities and shared services expenses to other cost types.

A comparison of selling, general and administrative expenses is presented below:

	Year Ended December 31,			
	2022	% Change	2021	% Change
	(Dollars in millions)			
Selling, general and administrative	\$ 195.4	4 %	\$ 188.4	1 %
	\$		\$	\$
				186.0

Selling, general and administrative expenses increased by \$7.0 million in 2022 compared to 2021 primarily due to increases in stock-based compensation expenses, equipment and software expenses, compensation and benefits expenses, and several other individually insignificant factors, partially offset by an increase in overhead expenses allocated to other cost types. Stock-based compensation expenses increased by \$3.3 million due to higher projected achievement levels on certain performance-based RSU grants and increases in the total value of RSUs granted in 2022. Equipment and software expenses increased by \$3.1 million due to expenses related to network security and other software services. Compensation and benefits expenses increased by \$1.4 million due to increased employee salaries expenses and insurances related benefits expenses. Overhead expenses allocated to other cost types increased by \$3.1 million due to an increase in the total allocable expenses.

### ***Interest expense***

Interest expense decreased by \$8.0 million in 2022 compared to 2021 primarily due to the lower interest rate on our 2031 Notes compared to the 2023 Notes which were redeemed in June 2021.

### ***Non-operating income (loss), net***

See Note 9, "Non-operating Income (Loss), Net" of our Notes to Consolidated Financial Statements in Item 8 of this Form 10-K.

### ***Income tax expense (benefit)***

	Year Ended December 31,		
	2022	2021	2020
	(Dollars in millions)		
Income tax expense (benefit)	206.4	\$ (2.6)	\$ (64.7)
Effective tax rate	23 %	— %	(9)%

The effective tax rate for each of the periods in the table above differed from the statutory federal rate of 21% due to state income taxes and U.S. taxes on foreign earnings, net of foreign tax credits, offset by a lower foreign effective tax rate.

During 2021, we completed a transfer of intellectual property between certain non-U.S. subsidiaries. This intellectual property did not have any book value, however the transfer created an amortizable tax basis that resulted in the recognition of a \$165.5 million deferred tax asset and a corresponding income tax benefit.

As of December 31, 2022, we had deferred tax assets arising from deductible temporary differences, tax losses, and tax credits of \$236.2 million, net of valuation allowances, but before the offset of certain deferred tax liabilities. With the exception of deferred tax assets related to certain state and foreign net operating loss and foreign tax credit carryforwards, we believe it is more likely than not that the tax effects of the deferred tax liabilities, together with future taxable income, will be sufficient to fully recover the remaining deferred tax assets.

## Liquidity and Capital Resources

The following table presents our principal sources of liquidity:

	As of December 31,	
	2022	2021
	(In millions)	
Cash and cash equivalents	\$ 373.6	\$ 223.5
Marketable securities	606.8	982.3
<b>Total</b>	<b>\$ 980.4</b>	<b>\$ 1,205.8</b>

The marketable securities consist primarily of debt securities issued by the U.S. Treasury meeting the criteria of our investment policy, which is focused on the preservation of our capital through investment in investment grade securities. The cash equivalents consist of amounts invested in money market funds, time deposits and U.S. Treasury bills purchased with original maturities of three months or less. As of December 31, 2022, all of our debt securities have contractual maturities of less than one year. Our cash and cash equivalents are readily accessible. For additional information on our investment portfolio, see Note 2, "Financial Instruments," of our Notes to Consolidated Financial Statements in Item 8 of this Form 10-K.

In 2022, we repurchased 5.5 million shares of our common stock at an average stock price of \$187.07 for an aggregate cost of \$1.03 billion under our share repurchase program. In 2021, we repurchased 3.3 million shares of our common stock at an average stock price of \$215.16 for an aggregate cost of \$700.0 million. Effective October 27, 2022, our Board of Directors authorized the repurchase of our common stock in the amount of \$803.0 million, in addition to the \$197.0 million that remained available for repurchases under the share repurchase program, for a total repurchase authorization of up to \$1.00 billion under the program. As of December 31, 2022, there was approximately \$858.8 million remaining available for future share repurchases under the share repurchase program which has no expiration date.

As of December 31, 2022, we had \$750.0 million principal amount outstanding of the 2.70% senior unsecured notes due 2031, \$550.0 million principal amount outstanding of the 4.75% senior unsecured notes due 2027, \$500.0 million principal amount outstanding of the 5.25% senior unsecured notes due 2025. As of December 31, 2022, there were no borrowings outstanding under our \$200.0 million unsecured revolving credit facility that will expire in 2024.

We believe existing cash, cash equivalents and marketable securities, and funds generated from operations, together with our ability to arrange for additional financing should be sufficient to meet our working capital, capital expenditure requirements, and to service our debt for the next 12 months and beyond. We regularly assess our cash management approach and activities in view of our current and potential future needs. Our most significant future cash requirements include interest and principal payments on the senior notes issuances described above, income tax payments, purchase obligations and registry fees related to the operation of certain top-level domains. These items are detailed in Note 11, "Commitments and Contingencies" of our Notes to Consolidated Financial Statements in Item 8 of this Form 10-K.

In summary, our cash flows for 2022, 2021, and 2020 were as follows:

	Year Ended December 31,		
	2022	2021	2020
	(In millions)		
Net cash provided by operating activities	\$ 831.1	\$ 807.2	\$ 730.2
Net cash provided by (used in) investing activities	355.7	(269.2)	(72.3)
Net cash used in financing activities	(1,035.8)	(719.1)	(764.9)
Effect of exchange rate changes on cash, cash equivalents and restricted cash	(0.8)	(0.7)	—
<b>Net increase (decrease) in cash, cash equivalents and restricted cash</b>	<b>\$ 150.2</b>	<b>\$ (181.8)</b>	<b>\$ (107.0)</b>

### *Cash flows from operating activities*

Our largest source of operating cash flows is cash collections from our customers. Our primary uses of cash from operating activities are for personnel related expenditures, and other general operating expenses, as well as payments related to taxes, interest and facilities.

Net cash provided by operating activities increased in 2022 compared to 2021 primarily due to increases in cash received from customers and interest on investments and a decrease in cash paid for interest, partially offset by an increase in cash paid for income taxes. Cash received from customers increased primarily due to the impact of the .com price increases that were effective on each of September 1, 2021 and September 1, 2022. Cash received from interest on investments increased due to higher interest

rates on our investments in debt securities. Cash paid for interest decreased due to the lower interest rate on our 2031 Notes compared to the 2023 Notes which were refinanced in the second quarter of 2021. Cash paid for income taxes increased primarily due to comparatively higher U.S. federal, state, and foreign income taxes.

#### ***Cash flows from investing activities***

The changes in cash flows from investing activities primarily relate to purchases, maturities and sales of marketable securities, and purchases of property and equipment.

We had net cash inflows from investing activities in 2022, compared to net cash outflows in 2021, primarily due to an increase in proceeds from maturities and sales of marketable securities, net of purchases of marketable securities, and a decrease in purchases of property and equipment.

#### ***Cash flows from financing activities***

The changes in cash flows from financing activities primarily relate to share repurchases, proceeds from borrowings, repayment of borrowings, and our employee stock purchase plan.

Net cash used in financing activities increased in 2022 compared to 2021, primarily due an increase in share repurchases, partially offset by the net impact of the redemption of our 2023 Senior Notes and the issuance of the 2031 Senior Notes during 2021.

#### ***Dilution from RSUs***

Grants of stock-based awards are key components of the compensation packages we provide to attract and retain certain of our employees and align their interests with the interests of existing stockholders. We recognize that these stock-based awards dilute existing stockholders and have sought to control the number granted while providing competitive compensation packages. As of December 31, 2022, there were a total of 0.6 million unvested RSUs which represent potential dilution of less than 1.0%. This maximum potential dilution will only result if all outstanding RSUs vest and are settled. In recent years, our stock repurchase program has more than offset the dilutive effect of RSU grants to employees; however, we may reduce the level of our stock repurchases in the future as we may use our available cash for other purposes.

### **ITEM 7A. QUANTITATIVE AND QUALITATIVE DISCLOSURES ABOUT MARKET RISK**

We are exposed to financial market risks, including changes in interest rates and foreign exchange rates. We have not entered into any market risk sensitive instruments for trading purposes.

#### **Interest Rate Sensitivity**

The fixed income securities in our investment portfolio are subject to interest rate risk. As of December 31, 2022, we had \$776.1 million of fixed income securities, which consisted of U.S. Treasury bills with maturities of less than one year. A hypothetical change in interest rates by 100 basis points would not have a significant impact on the fair value of our investments.

#### **Foreign Exchange Risk Management**

We conduct business in several countries and transact in multiple foreign currencies. The functional currency for all of our international subsidiaries is the U.S. dollar. Our foreign currency risk management program is designed to mitigate foreign exchange risks associated with monetary assets and liabilities of our operations that are denominated in currencies other than the U.S. dollar. The primary objective of this program is to minimize the gains and losses to income resulting from fluctuations in exchange rates. We may choose not to hedge certain foreign exchange exposures due to immateriality, prohibitive economic cost of hedging particular exposures, and limited availability of appropriate hedging instruments. We do not enter into foreign currency transactions for trading or speculative purposes, nor do we hedge foreign currency exposures in a manner that entirely offsets the effects of changes in exchange rates. The program may entail the use of forward or option contracts, which are usually placed and adjusted monthly. These foreign currency forward contracts are derivatives and are recorded at fair market value. We attempt to limit our exposure to credit risk by executing foreign exchange contracts with financial institutions that have investment grade ratings.

As of December 31, 2022, we held foreign currency forward contracts in notional amounts totaling \$32.0 million to mitigate the impact of exchange rate fluctuations associated with certain foreign currencies. Gains or losses on the foreign currency forward contracts would be largely offset by the remeasurement of our foreign currency denominated assets and liabilities, resulting in an insignificant net impact to income.

A hypothetical uniform 10% strengthening or weakening in the value of the U.S. dollar relative to the foreign currencies in which our revenues and expenses are denominated would not result in a significant impact to our financial statements.

**Market Risk Management**

The fair market values of our senior notes are subject to interest rate risk. Generally, the fair market value of fixed interest rate debt will increase as interest rates fall and decrease as interest rates rise. As of December 31, 2022, the aggregate fair value of the senior notes issued in 2015, 2017 and 2021 was \$1.65 billion, based on available market information from public data sources.

## Report of Independent Registered Public Accounting Firm

To the Stockholders and Board of Directors  
VeriSign, Inc.:

### *Opinion on the Consolidated Financial Statements*

We have audited the accompanying consolidated balance sheets of VeriSign, Inc. and subsidiaries (the Company) as of December 31, 2022 and 2021, the related consolidated statements of comprehensive income, stockholders' deficit, and cash flows for each of the years in the three-year period ended December 31, 2022, and the related notes (collectively, the consolidated financial statements). In our opinion, the consolidated financial statements present fairly, in all material respects, the financial position of the Company as of December 31, 2022 and 2021, and the results of its operations and its cash flows for each of the years in the three-year period ended December 31, 2022, in conformity with U.S. generally accepted accounting principles.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States) (PCAOB), the Company's internal control over financial reporting as of December 31, 2022, based on criteria established in Internal Control – Integrated Framework (2013) issued by the Committee of Sponsoring Organizations of the Treadway Commission, and our report dated February 17, 2023 expressed an unqualified opinion on the effectiveness of the Company's internal control over financial reporting.

### *Basis for Opinion*

These consolidated financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these consolidated financial statements based on our audits. We are a public accounting firm registered with the PCAOB and are required to be independent with respect to the Company in accordance with the U.S. federal securities laws and the applicable rules and regulations of the Securities and Exchange Commission and the PCAOB.

We conducted our audits in accordance with the standards of the PCAOB. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the consolidated financial statements are free of material misstatement, whether due to error or fraud. Our audits included performing procedures to assess the risks of material misstatement of the consolidated financial statements, whether due to error or fraud, and performing procedures that respond to those risks. Such procedures included examining, on a test basis, evidence regarding the amounts and disclosures in the consolidated financial statements. Our audits also included evaluating the accounting principles used and significant estimates made by management, as well as evaluating the overall presentation of the consolidated financial statements. We believe that our audits provide a reasonable basis for our opinion.

### *Critical Audit Matter*

The critical audit matter communicated below is a matter arising from the current period audit of the consolidated financial statements that was communicated or required to be communicated to the audit committee and that: (1) relates to accounts or disclosures that are material to the consolidated financial statements and (2) involved our especially challenging, subjective, or complex judgments. The communication of a critical audit matter does not alter in any way our opinion on the consolidated financial statements, taken as a whole, and we are not, by communicating the critical audit matter below, providing a separate opinion on the critical audit matter or on the accounts or disclosures to which it relates.

#### *Evaluation of accounting for income taxes*

As discussed in Notes 1 and 10 to the consolidated financial statements, the Company recognized \$234.6 million of deferred tax assets, net as of December 31, 2022. The Company's income tax expense was \$206.4 million for the year ended December 31, 2022. The Company conducts business globally and consequently is subject to U.S. federal, state, as well as foreign income taxes in the jurisdictions it operates. The Company exercises judgment in the application of complex tax regulations in multiple jurisdictions.

We identified the evaluation of the accounting for income taxes as a critical audit matter. Evaluating the Company's application of complex tax regulations in the domestic and foreign jurisdictions it operates and the impact of those regulations on U.S. federal, state, and foreign income tax provisions required complex auditor judgment, and the use of tax professionals with specialized skills and knowledge.

The following are the primary procedures we performed to address this critical audit matter. We evaluated the design and tested the operating effectiveness of certain internal controls related to the Company's income tax process, including controls related to the application of complex tax regulations in the Company's various tax jurisdictions and the impact on the Company's U.S. federal, state, and foreign income tax provision. We involved domestic and international tax

professionals with specialized skills and knowledge in various tax jurisdictions who assisted in evaluating the Company's analyses over the application of complex tax regulations in those jurisdictions.

/s/ KPMG LLP

We have served as the Company's auditor since 1995.

McLean, Virginia

## Report of Independent Registered Public Accounting Firm

To the Stockholders and Board of Directors  
VeriSign, Inc.:

### *Opinion on Internal Control Over Financial Reporting*

We have audited VeriSign, Inc. and subsidiaries' (the Company) internal control over financial reporting as of December 31, 2022, based on criteria established in Internal Control – Integrated Framework (2013) issued by the Committee of Sponsoring Organizations of the Treadway Commission. In our opinion, the Company maintained, in all material respects, effective internal control over financial reporting as of December 31, 2022, based on criteria established in Internal Control – Integrated Framework (2013) issued by the Committee of Sponsoring Organizations of the Treadway Commission.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States) (PCAOB), the consolidated balance sheets of the Company as of December 31, 2022 and 2021, the related consolidated statements of comprehensive income, stockholders' deficit, and cash flows for each of the years in the three-year period ended December 31, 2022, and the related notes (collectively, the consolidated financial statements), and our report dated February 17, 2023 expressed an unqualified opinion on those consolidated financial statements.

### *Basis for Opinion*

The Company's management is responsible for maintaining effective internal control over financial reporting and for its assessment of the effectiveness of internal control over financial reporting, included in the accompanying Management's Report on Internal Control over Financial Reporting. Our responsibility is to express an opinion on the Company's internal control over financial reporting based on our audit. We are a public accounting firm registered with the PCAOB and are required to be independent with respect to the Company in accordance with the U.S. federal securities laws and the applicable rules and regulations of the Securities and Exchange Commission and the PCAOB.

We conducted our audit in accordance with the standards of the PCAOB. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit of internal control over financial reporting included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, and testing and evaluating the design and operating effectiveness of internal control based on the assessed risk. Our audit also included performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

### *Definition and Limitations of Internal Control Over Financial Reporting*

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS**  
**DECEMBER 31, 2022, 2021 AND 2020**

**Note 1. Description of Business and Summary of Significant Accounting Policies***Description of Business*

VeriSign, Inc. (“Verisign” or “the Company”) was incorporated in Delaware on April 12, 1995. The Company has one reportable segment. The Company enables the security, stability, and resiliency of key internet infrastructure and services, including providing Root Zone Maintainer services, operating two of the 13 global internet root servers, and providing registration services and authoritative resolution for the .com and .net top-level domains, which support the majority of global e-commerce.

*Basis of Presentation*

The accompanying consolidated financial statements of Verisign and its subsidiaries have been prepared in conformity with generally accepted accounting principles (“GAAP”) in the United States (“U.S.”). All significant intercompany accounts and transactions have been eliminated.

The preparation of these consolidated financial statements requires management to make estimates and judgments that affect the reported amounts of assets, liabilities, revenues and expenses, and related disclosures of contingent assets and liabilities. Actual results may differ from these estimates under different assumptions or conditions.

*Reclassifications*

Certain reclassifications have been made to prior period amounts to conform to current period presentation. Such reclassifications have no effect on net income as previously reported.

**Significant Accounting Policies***Cash and Cash Equivalents*

Verisign considers all highly-liquid investments purchased with original maturities of three months or less to be cash equivalents. Cash and cash equivalents include certain money market funds, debt securities and various deposit accounts. Verisign maintains its cash and cash equivalents with financial institutions that have investment grade ratings and, as part of its cash management process, performs periodic evaluations of the relative credit standing of these financial institutions.

*Marketable Securities*

Marketable securities primarily consist of debt securities issued by the U.S. Treasury. All marketable securities are classified as available-for-sale and are carried at fair value. Unrealized gains and losses, net of taxes, are reported as a component of Accumulated other comprehensive loss. The specific identification method is used to determine the cost basis of the marketable securities sold. The Company classifies its marketable securities as current based on their nature and availability for use in current operations.

*Property and Equipment*

Property and equipment are stated at cost less accumulated depreciation. Depreciation is calculated using the straight-line method over the estimated useful lives of the assets of 35 to 47 years for buildings, 10 years for building improvements and three years to five years for computer equipment, software, office equipment, and furniture and fixtures. Leasehold improvements are amortized using the straight-line method over the lesser of the estimated useful lives of the assets or associated lease terms.

*Capitalized Software*

Software included in property and equipment includes amounts paid for purchased software and development costs for internally developed software. The Company capitalized \$10.6 million and \$12.1 million of costs related to internally developed software during 2022 and 2021, respectively.

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

#### *Goodwill and Other Long-lived Assets*

Goodwill represents the excess of purchase consideration over fair value of net assets of businesses acquired. The Company has only one reporting unit, which has a negative carrying value. Therefore, the goodwill is not subject to impairment.

Long-lived assets, such as property, plant, and equipment are reviewed for impairment whenever events or changes in circumstances indicate that the carrying amount of an asset, or asset group, may not be recoverable. Such events or circumstances include, but are not limited to, a significant decrease in the fair value of the underlying business. Recoverability of assets to be held and used is measured by a comparison of the carrying amount of an asset, or asset group, to estimated undiscounted future cash flows expected to be generated by the asset, or asset group. An impairment charge is recognized in the amount by which the carrying amount of the asset exceeds its fair value.

As of December 31, 2022, the Company's assets include a deposit related to the purchase of the contractual rights to the .web gTLD. The amount paid to date has been recorded as a deposit until such time that the contractual rights are transferred to the Company. This asset would be tested for recoverability if the Company were to determine that it is no longer probable that the rights will be transferred. At the time of the transfer of the contractual rights, the Company will record the amount as an indefinite-lived intangible asset subject to review for impairment on an annual basis or more frequently if events or changes in circumstances indicate that an impairment is more likely than not.

#### *Foreign Currency Remeasurement*

Verisign conducts business in several different countries and transacts in multiple currencies. The functional currency for all of Verisign's international subsidiaries is the U.S. dollar. The Company's subsidiaries' financial statements are remeasured into U.S. dollars using a combination of current and historical exchange rates and any remeasurement gains and losses are included in Non-operating income (loss), net. Remeasurement gains and losses were not significant in each of the last three years.

Verisign maintains a foreign currency risk management program designed to mitigate foreign exchange risks associated with the monetary assets and liabilities that are denominated in currencies other than the U.S. dollar. The primary objective of this program is to minimize the gains and losses resulting from fluctuations in exchange rates. The Company does not enter into foreign currency transactions for trading or speculative purposes, nor does it hedge foreign currency exposures in a manner that entirely offsets the effects of changes in exchange rates. The program may entail the use of forward or option contracts, which are usually placed and adjusted monthly. These foreign currency forward contracts are derivatives and are recorded at fair market value. The Company records gains and losses on foreign currency forward contracts in Non-operating income (loss), net. Gains and losses related to foreign currency forward contracts were not significant in each of the last three years.

As of December 31, 2022, Verisign held foreign currency forward contracts in notional amounts totaling \$32.0 million to mitigate the impact of exchange rate fluctuations associated with certain assets and liabilities held in foreign currencies.

#### *Revenue Recognition*

Revenues are recognized when control of the promised services is transferred to customers, in an amount that reflects the consideration the Company expects to be entitled to in exchange for those services. Revenues primarily arise from fixed fees charged to registrars for the initial registration or renewal of .com, .net, and other domain names. Individual customers, called registrants, contract directly with registrars or their resellers, and the registrars, who are our direct customers, in turn register the domain names with Verisign. Fees for domain name registrations and renewals are generally due at the time of registration or renewal. Domain name registration terms range from one year up to ten years.

Most customers either maintain a deposit with Verisign or provide an irrevocable letter of credit in excess of the amounts owed. Verisign also offers promotional incentive-based discount programs to its registrars based upon market conditions and the business environment in which the registrars operate. Amounts payable for these programs are recorded as a reduction of revenue.

#### Performance Obligations

A performance obligation is a promise in a contract to transfer a distinct good or service to the customer. A contract's transaction price is allocated to each distinct performance obligation and recognized as revenue when, or as, the performance obligation is satisfied. Each domain name registration or renewal is considered a separate optional purchase and represents a single performance obligation, which is to allow its registration and maintain that registration (by allowing updates, Domain Name System ("DNS") resolution and Whois services, which allow users to find information about registered domain names) through the registration term. These services are provided continuously throughout each registration term, and as such, revenues

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

from the initial registration or renewal of domain names are deferred and recognized ratably over the registration term. Fees for renewals and advance extensions to the existing term are deferred until the new incremental period commences. These fees are then recognized ratably over the renewal or extension term.

#### Costs Incurred to Obtain a Contract

The Company recognizes the fees payable to ICANN for each annual term of domain name registrations and renewals, as an asset which is amortized on a straight-line basis over the related registration term. These assets are included in Other current assets and Other long-term assets.

#### *Income Taxes*

Verisign uses the asset and liability method to account for income taxes. Deferred tax assets and liabilities are recognized for the future tax consequences attributable to differences between the financial statement carrying amounts of existing assets and liabilities and their respective tax bases and net operating loss carryforwards. Deferred tax assets and liabilities are measured using enacted tax rates expected to apply to taxable income in the years in which those temporary differences are expected to be recovered or settled. The Company records a valuation allowance to reduce deferred tax assets to an amount whose realization is more likely than not. For every tax-paying component and within each tax jurisdiction, all deferred tax liabilities and assets are offset and presented as a single net noncurrent asset or liability.

The Company recognizes the U.S. income tax effect of future global intangible low-taxed income inclusions in the period in which they arise.

The Company's income taxes payable is reduced by the tax benefits from restricted stock unit ("RSU") vestings equal to the fair market value of the stock at the vesting date. If the income tax benefit at the vesting date differs from the income tax benefit recorded based on the grant date fair value of the RSUs, the excess or shortfall of the tax benefit is recognized within income tax expense.

Verisign operates in multiple tax jurisdictions in the United States and internationally. Tax laws and regulations in these jurisdictions are complex, interrelated, and periodically changing. Significant judgment or interpretation of these laws and regulations is often required in determining the Company's worldwide provision for income taxes, including, for example, the calculations of taxable income in each jurisdiction, deferred taxes, and the availability and amount of deductions and tax credits. The final taxes payable are dependent upon many factors, including negotiations with taxing authorities in various jurisdictions and resolution of disputes arising from various tax examinations. The Company only recognizes tax positions taken or expected to be taken on its tax returns that are more likely than not to be sustained upon examination, and records a tax benefit amount that is more likely than not to be realized upon ultimate settlement with the taxing authority. The Company adjusts its estimate of unrecognized tax benefits in light of changing facts and circumstances; however, due to the complexity of some of these uncertainties, the ultimate resolution may result in an outcome that is materially different from the estimate. See Note 10, "Income Taxes," for details of the changes to the Company's unrecognized tax benefits for the periods presented.

#### *Stock-based Compensation*

The Company's stock-based compensation consists of RSUs granted to employees and the employee stock purchase plan ("ESPP"). Stock-based compensation expense is typically recognized ratably over the requisite service period. Forfeitures of stock-based awards are recognized as they occur. As substantially all of the RSUs granted by the Company are routine annual grants, none of the awards are designed to be spring-loaded, and as such, the Company does not adjust the market price of its common stock when estimating the grant-date fair value of these awards. The Company also grants RSUs which include performance conditions, and in some cases market conditions, to certain executives. The expense for these performance-based RSUs is recognized based on the probable outcome of the performance conditions. The expense recognized for awards with market conditions is based on the grant date fair value of the awards including the impact of the market conditions, using a Monte Carlo simulation model. The Company uses the Black-Scholes option pricing model to determine the fair value of its ESPP offerings. The determination of the fair value of stock-based payment awards using the Monte Carlo simulation model or the Black-Scholes option-pricing model is affected by the Company's stock price as well as assumptions regarding a number of complex and subjective variables.

#### *Earnings per Share*

The Company computes basic earnings per share by dividing net income by the weighted-average number of common shares outstanding during the period. Diluted earnings per share gives effect to dilutive potential common shares, including unvested RSUs and ESPP offerings, using the treasury stock method.

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

*Fair Value of Financial Instruments*

The Company applies the following fair value hierarchy, which prioritizes the inputs used to measure fair value into three levels and bases the categorization within the hierarchy upon the lowest level of input that is available and significant to the fair value measurement:

- Level 1: Observable inputs that reflect quoted prices (unadjusted) for identical assets or liabilities in active markets.
- Level 2: Inputs reflect quoted prices for identical assets or liabilities in markets that are not active; quoted prices for similar assets or liabilities in active markets; inputs other than quoted prices that are observable for the assets or liabilities; or inputs that are derived principally from or corroborated by observable market data by correlation or other means.
- Level 3: Unobservable inputs reflecting the Company's own assumptions incorporated in valuation techniques used to determine fair value. These assumptions are required to be consistent with market participant assumptions that are reasonably available.

*Legal Proceedings*

Verisign is involved in various investigations, claims and lawsuits arising in the normal conduct of its business, none of which, in its opinion, will have a material adverse effect on its financial condition, results of operations, or cash flows. The Company can provide no assurance that it will prevail in any litigation. Regardless of the outcome, any litigation may require the Company to incur significant litigation expense and may result in significant diversion of management attention.

While certain legal proceedings and related indemnification obligations to which the Company is a party specify the amounts claimed, such claims may not represent reasonably possible losses. Given the inherent uncertainties of the litigation, the ultimate outcome of these matters cannot be predicted at this time, nor can the amount of possible loss or range of loss, if any, be reasonably estimated, except in circumstances where an aggregate litigation accrual has been recorded for probable and reasonably estimable loss contingencies. A determination of the amount of accrual required, if any, for these contingencies is made after careful analysis of each matter. The required accrual may change in the future due to new developments in each matter or changes in approach such as a change in settlement strategy in dealing with these matters. The Company does not believe that any such matter currently being reviewed will have a material adverse effect on its financial condition, results of operations, or cash flows.

**Note 2. Financial Instruments**

*Cash, Cash Equivalents, and Marketable Securities*

The following table summarizes the Company's cash, cash equivalents, and marketable securities and the fair value categorization of the financial instruments measured at fair value on a recurring basis:

	As of December 31,	
	2022	2021
	(In millions)	
Cash	\$ 27.0	\$ 25.8
Time deposits	4.1	3.7
Money market funds (Level 1)	178.6	165.6
Debt securities issued by the U.S. Treasury (Level 1)	776.1	1,016.0
Total	\$ 985.8	\$ 1,211.1
Cash and cash equivalents	\$ 373.6	\$ 223.5
Restricted cash (included in Other long-term assets)	5.4	5.3
Total Cash, cash equivalents, and restricted cash	379.0	228.8
Marketable securities	606.8	982.3
Total	\$ 985.8	\$ 1,211.1

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

The gross and net unrealized gains and losses included in the fair value of the debt securities were not significant for the periods presented. All of the debt securities held as of December 31, 2022 have contractual maturities of less than one year.

*Fair Value Measurements*

The fair value of the Company's investments in money market funds approximates their face value. Such instruments are classified as Level 1 and are included in Cash and cash equivalents. The fair value of the debt securities consisting of U.S. Treasury bills is based on their quoted market prices and are classified as Level 1.

As of December 31, 2022, the Company's other financial instruments include cash, accounts receivable, restricted cash, and accounts payable whose carrying values approximated their fair values. The aggregate fair value of the Company's senior notes is \$1.65 billion and \$1.88 billion as of December 31, 2022 and December 31, 2021, respectively. The fair values of these debt instruments are based on available market information from public data sources and are classified as Level 2.

**Note 3. Selected Balance Sheet Items**

*Other Current Assets*

Other current assets consist of the following:

	As of December 31,	
	2022	2021
	(In millions)	
Prepaid expenses	\$ 24.5	\$ 24.8
Prepaid registry fees	24.3	24.2
Accounts receivable, net	6.2	5.3
Taxes receivable	1.9	7.7
Other	1.4	0.9
Total other current assets	<u>\$ 58.3</u>	<u>\$ 62.9</u>

*Property and Equipment, Net*

The following table presents the detail of property and equipment, net:

	As of December 31,	
	2022	2021
	(In millions)	
Computer equipment and software	\$ 402.7	\$ 400.6
Buildings and building improvements	257.5	254.5
Land	31.1	31.1
Office equipment and furniture	10.4	10.1
Capital work in progress	3.6	3.1
Leasehold improvements	1.5	1.5
Total cost	<u>706.8</u>	<u>700.9</u>
Less: accumulated depreciation	<u>(474.8)</u>	<u>(449.7)</u>
Total property and equipment, net	<u>\$ 232.0</u>	<u>\$ 251.2</u>

Substantially all of the Company's property and equipment were held in the U.S. for both periods presented.

VERISIGN, INC.  
NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)  
DECEMBER 31, 2022, 2021 AND 2020

*Goodwill*

The following table presents the detail of goodwill:

	As of December 31,	
	2022	2021
	(In millions)	
Goodwill, gross	\$ 1,537.8	\$ 1,537.8
Accumulated goodwill impairment	(1,485.3)	(1,485.3)
Total goodwill	<u>\$ 52.5</u>	<u>\$ 52.5</u>

There was no impairment of goodwill or other long-lived assets recognized in any of the periods presented.

*Deposits to Acquire Intangible Assets*

The Company's Deposit to acquire intangible assets represents the \$145.0 million paid for the future assignment to the Company of contractual rights to the .web gTLD, pending resolution of objections by other applicants, and approval from ICANN. Upon assignment of the contractual rights, the Company will record the total investment as an indefinite-lived intangible asset.

*Other Long-Term Assets*

Other long-term assets consist of the following:

	As of December 31,	
	2022	2021
	(In millions)	
Long-term prepaid registry fees	\$ 9.1	\$ 8.7
Operating lease right-of-use asset	7.2	8.4
Long-term prepaid expenses	6.6	11.0
Restricted cash	5.4	5.3
Other	2.3	2.3
Total other long-term assets	<u>\$ 30.6</u>	<u>\$ 35.7</u>

The prepaid registry fees in the tables above relate to the fees the Company pays to ICANN for each annual term of .com domain name registrations and renewals which are deferred and amortized over the domain name registration term. The amount of prepaid registry fees as of December 31, 2022 reflects amortization of \$39.5 million during 2022 which was recorded in Cost of Revenues.

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

*Accounts Payable and Accrued Liabilities*

Accounts payable and accrued liabilities consist of the following:

	As of December 31,	
	2022	2021
	(In millions)	
Accounts payable and accrued expenses	\$ 9.8	\$ 9.0
Customer deposits	72.0	77.3
Accrued employee compensation	59.0	58.5
Taxes payable	37.4	26.8
Interest payable	19.5	19.5
Accrued registry fees	12.7	12.9
Customer incentives payable	7.1	13.3
Other accrued liabilities	9.0	9.3
<b>Total accounts payable and accrued liabilities</b>	<b>\$ 226.5</b>	<b>\$ 226.6</b>

*Long-term Tax and Other Liabilities*

Long-term tax and other liabilities consist of the following:

	As of December 31,	
	2022	2021
	(In millions)	
Long-term tax liabilities	\$ 60.5	\$ 76.1
Long-term operating lease liabilities	1.6	2.5
<b>Long-term tax and other liabilities</b>	<b>\$ 62.1</b>	<b>\$ 78.6</b>

Long-term tax liabilities include accruals for unrecognized tax benefits and the long-term portion of the U.S. income taxes payable on the Company's accumulated foreign earnings ("Transition Tax") resulting from the 2017 Tax Cuts and Jobs Act.

**Note 4. Debt**

*Senior Notes*

The following table summarizes information related to our Senior notes:

	Issuance Date	Maturity Date	Interest Rate	Principal	
				2022	2021
	As of December 31,				
	(in millions except interest rates)				
Senior notes due 2025	March 27, 2015	April 1, 2025	5.25 %	\$ 500.0	\$ 500.0
Senior notes due 2027	July 5, 2017	July 15, 2027	4.75 %	550.0	550.0
Senior notes due 2031	June 8, 2021	June 15, 2031	2.70 %	750.0	750.0
Principal amount of senior notes				1,800.0	1,800.0
Less: unamortized issuance costs				(12.1)	(14.3)
<b>Total Senior notes</b>				<b>\$ 1,787.9</b>	<b>\$ 1,785.7</b>

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

The 2031 Notes were issued at 99.712% of par value. The 2025 and 2027 notes were issued at par and all outstanding senior notes are senior unsecured obligations of the Company. Interest is payable on each of the senior notes semi-annually. Each of the senior notes issuances is redeemable, in whole or in part, at the Company's option at times and redemption prices specified in the indentures.

*2019 Credit Facility*

On December 12, 2019, the Company entered into a credit agreement for a \$200.0 million committed unsecured revolving credit facility (the "2019 Credit Facility"). The 2019 Credit Facility includes a financial covenant requiring that the Company's leverage ratio not exceed 4.0 to 1.0. As of December 31, 2022, there were no borrowings outstanding under the 2019 Credit Facility and the Company was in compliance with the financial covenants. The 2019 Credit Facility was amended in December 2021 to address the LIBOR transition. The 2019 Credit Facility expires on December 12, 2024 at which time any outstanding borrowings are due. Verisign may from time to time request lenders to agree on a discretionary basis to increase the commitment amount by up to an aggregate of \$150.0 million.

**Note 5. Stockholders' Deficit**

*Treasury Stock*

Treasury stock is accounted for under the cost method. Treasury stock includes shares repurchased under stock repurchase programs and shares withheld in lieu of the tax withholding due upon vesting of RSUs.

Effective February 10, 2022, the Company's Board of Directors ("Board") authorized the repurchase of its common stock in the amount of approximately \$705.4 million, in addition to the \$294.6 million that remained available for repurchases under the share repurchase program. Effective October 27, 2022, our Board of Directors authorized the repurchase of our common stock in the amount of \$803.0 million, in addition to the \$197.0 million that remained available for repurchases under the share repurchase program, for a total repurchase authorization of up to \$1.00 billion under the program. The program has no expiration date. Purchases made under the program could be effected through open market transactions, block purchases, accelerated share repurchase agreements or other negotiated transactions. As of December 31, 2022 there was approximately \$858.8 million remaining available for repurchases under the program.

The summary of the Company's common stock repurchases for 2022, 2021 and 2020 are as follows:

	2022		2021		2020	
	Shares	Average Price	Shares	Average Price	Shares	Average Price
(In millions, except average price amounts)						
Total repurchases under the repurchase plans	5.5	\$ 187.07	3.3	\$ 215.16	3.7	\$ 200.06
Total repurchases for tax withholdings	0.1	\$ 202.21	0.1	\$ 209.40	0.2	\$ 208.92
Total repurchases	5.6	\$ 187.28	3.4	\$ 214.97	3.9	\$ 200.48
Total costs		\$ 1,048.1		\$ 722.6		\$ 777.5

Since inception, the Company has repurchased 249.3 million shares of its common stock for an aggregate cost of \$12.75 billion, which is recorded as a reduction of Additional paid-in capital.

*Accumulated Other Comprehensive Loss*

The Accumulated other comprehensive loss balances as of December 31, 2022 and 2021 primarily consists of foreign currency translation adjustment losses. There were no significant changes to accumulated other comprehensive loss balances for the periods presented.

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

**Note 6. Calculation of Earnings per Share**

The following table presents the computation of weighted-average shares used in the calculation of basic and diluted earnings per share:

	Year Ended December 31,		
	2022	2021	2020
	(In millions)		
Weighted-average shares of common stock outstanding	107.9	112.0	115.1
Weighted-average potential shares of common stock outstanding:			
Unvested RSUs and ESPP	0.1	0.2	0.2
Shares used to compute diluted earnings per share	<u>108.0</u>	<u>112.2</u>	<u>115.3</u>

The calculation of diluted weighted average shares outstanding excludes performance-based RSUs granted by the Company for which the relevant performance criteria have not been achieved. The number of potential shares excluded from the calculation was not significant in any period presented.

**Note 7. Revenues**

The Company generates revenues in the U.S.; Europe, the Middle East and Africa (“EMEA”); China; and certain other countries, including, but not limited to Canada, Japan and Singapore. The following table presents our revenues disaggregated by geography, based on the billing addresses of our customers:

	Year Ended December 31,		
	2022	2021	2020
	(In millions)		
U.S	\$ 937.6	\$ 851.3	\$ 804.7
EMEA	226.0	231.7	214.2
China	106.0	101.7	113.7
Other	155.3	142.9	132.5
Total revenues	<u>\$ 1,424.9</u>	<u>\$ 1,327.6</u>	<u>\$ 1,265.1</u>

Revenues in the table above are attributed to the country of domicile and the respective regions in which registrars are located; however, this may differ from the regions where the registrars operate or where registrants are located. Revenues for each region may be impacted by registrars reincorporating, relocating, or from acquisitions or changes in affiliations of resellers. Revenues for each region may also be impacted by registrars domiciled in one region, registering domain names in another region.

*Major Customers*

Our largest customer accounted for approximately 32%, 33%, and 34% of revenues in 2022, 2021, and 2020, respectively. The Company does not believe that the loss of this customer would have a material adverse effect on the Company’s business because, in that event, end-users of this customer would transfer to the Company’s other existing customers.

*Deferred Revenues*

As payment for domain name registrations and renewals are due in advance of our performance, we record these amounts as deferred revenues. The increase in the deferred revenues balance in 2022 is primarily driven by amounts billed in 2022 for domain name registrations and renewals to be recognized as revenues in future periods, offset by refunds for domain name renewals deleted during the 45-day grace period, and \$818.4 million of revenues recognized that were included in the deferred revenues balance at December 31, 2021. The balance of deferred revenues as of December 31, 2022 represents our aggregate remaining performance obligations. Amounts included in current deferred revenues are all expected to be recognized in revenues within 12 months, except for a portion of deferred revenues that relates to domain name renewals that are deleted in the 45-day grace period following the transaction. The long-term deferred revenues amounts will be recognized in revenues over several years and in some cases up to ten years. The Company transitioned the operation of the .tv registry to a new operator in November 2022. Upon completion of the transition, the Company had no remaining performance obligations related

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

to the .tv ccTLD. As a result, the Company recognized the remaining \$8.4 million of deferred revenues in the fourth quarter of 2022.

**Note 8. Employee Benefits and Stock-based Compensation**

*401(k) Plan*

The Company maintains a defined contribution 401(k) plan (the “401(k) Plan”) for substantially all of its U.S. employees. Under the 401(k) Plan, eligible employees may contribute up to 50% of their pre-tax salary, subject to the Internal Revenue Service (“IRS”) annual contribution limits. The Company matches 50% of up to the first 8% of the employee’s annual salary contributed to the plan. The Company contributed \$5.5 million in 2022, \$5.2 million in 2021, and \$5.0 million in 2020 under the 401(k) Plan. The Company can terminate matching contributions at its discretion at any time.

*Equity Incentive Plan*

The majority of Verisign’s stock-based compensation relates to RSUs granted under the 2006 Equity Incentive Plan (the “2006 Plan”). As of December 31, 2022, a total of 7.8 million shares of common stock remain reserved for issuance upon the vesting of RSUs and for the future grant of equity awards. The 2006 Plan authorizes the award of incentive stock options to employees and non-qualified stock options, restricted stock awards, RSUs, stock bonus awards, stock appreciation rights and performance shares to eligible employees, officers, directors, consultants, independent contractors and advisers. The 2006 Plan is administered by the Compensation Committee which may delegate to a committee of one or more members of the Board or Verisign’s officers the ability to grant certain awards and take certain other actions with respect to participants who are not executive officers or non-employee directors. RSUs are awards covering a specified number of shares of Verisign common stock that may be settled by issuance of those shares (which may be restricted shares). RSUs generally vest over four years. Certain RSUs with performance and market conditions (“PSUs”), granted to the Company’s executives, generally vest over a three year term. Additionally, the Company has granted fully vested RSUs to members of its Board in each of the last three years. The Compensation Committee may authorize grants with a different vesting schedule in the future.

*2007 Employee Stock Purchase Plan*

Eligible employees of the Company may purchase common stock under the 2007 Employee Stock Purchase Plan through payroll deductions by electing to have between 2% and 25% of their compensation withheld to cover the purchase price. Each participant is granted an option to purchase common stock. This option is automatically exercised on the last day of each six-month purchase period during the offering period. The purchase price for the common stock under the ESPP is 85% of the lesser of the fair market value of the common stock on the first day of the applicable offering period or the last day of the applicable purchase period. Offering periods begin on the first business day of February and August of each year. As of December 31, 2022, 2.9 million shares of the Company’s common stock remain reserved for future issuance under this plan.

*Stock-based Compensation*

Stock-based compensation is classified in the Consolidated Statements of Comprehensive Income in the same expense line items as cash compensation. The following table presents the classification of stock-based compensation:

	Year Ended December 31,		
	2022	2021	2020
	(In millions)		
Cost of revenues	\$ 7.2	\$ 6.5	\$ 6.3
Research and development	9.5	8.3	7.1
Selling, general and administrative	41.9	38.6	34.8
Stock-based compensation expense	58.6	53.4	48.2
Capitalization (included in Property and equipment, net)	1.6	1.7	1.8
Total stock-based compensation	<u>\$ 60.2</u>	<u>\$ 55.1</u>	<u>\$ 50.0</u>

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

The following table presents the nature of the Company's total stock-based compensation:

	Year Ended December 31,		
	2022	2021	2020
	(In millions)		
RSUs	\$ 43.8	\$ 41.5	\$ 38.2
PSUs	12.1	9.3	7.4
ESPP	4.3	4.3	4.4
Total stock-based compensation	<u>\$ 60.2</u>	<u>\$ 55.1</u>	<u>\$ 50.0</u>

The income tax benefit that was included within Income tax (expense) benefit related to these stock-based compensation expenses for 2022, 2021, and 2020 was \$13.8 million, \$12.4 million, and \$11.0 million, respectively.

*RSUs Information*

The following table summarizes unvested RSUs activity for the year ended December 31, 2022:

	Shares	Weighted-Average Grant-Date Fair Value
	(Shares in millions)	
Unvested at beginning of period	0.6	\$ 192.88
Granted	0.3	\$ 210.94
Vested and settled	<u>(0.3)</u>	<u>\$ 184.74</u>
	<u>0.6</u>	<u>\$ 206.32</u>

The RSUs in the table above include PSUs. The unvested RSUs as of December 31, 2022 include 0.2 million PSUs. The number of shares received upon vesting of these PSUs may range from less than 0.1 million to 0.4 million depending on the level of performance achieved and whether any market conditions are satisfied.

The closing price of Verisign's stock was \$205.44 on December 31, 2022. As of December 31, 2022, the aggregate market value of unvested RSUs was \$129.0 million. The fair values of RSUs that vested during 2022, 2021, and 2020 were \$51.4 million, \$70.3 million, and \$115.0 million, respectively. The weighted-average grant-date fair value of RSUs granted during the years ended December 31, 2021 and 2020, was \$200.64 and \$205.61, respectively. As of December 31, 2022, total unrecognized compensation cost related to unvested RSUs was \$91.4 million which is expected to be recognized over a weighted-average period of 2.4 years.

**Note 9. Non-operating Income (Loss), Net**

The following table presents the components of Non-operating income (loss), net:

	Year Ended December 31,		
	2022	2021	2020
	(In millions)		
Interest income	\$ 14.9	\$ 0.6	\$ 7.8
Loss on extinguishment of debt	—	(2.1)	—
Gain on sale of business	—	—	6.4
Transition services income	—	—	2.1
Other, net	(2.5)	0.2	(0.1)
Total non-operating income (loss), net	<u>\$ 12.4</u>	<u>\$ (1.3)</u>	<u>\$ 16.2</u>

Interest income is earned principally from the Company's surplus cash balances and marketable securities. The increase in interest income in 2022 reflects higher interest rates on our investments in debt securities. The redemption of the 2023 senior notes in 2021 resulted in a loss on debt extinguishment of \$2.1 million related to the unamortized debt issuance costs on the notes. Gain on sale of business and transition services income in 2020 relates to the sale of the Company's security services customer contracts. Other, net in 2022 includes primarily foreign currency related losses.

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

**Note 10. Income Taxes**

Income before income taxes is categorized geographically as follows:

	Year Ended December 31,		
	2022	2021	2020
	(In millions)		
United States	\$ 558.5	\$ 489.4	\$ 457.8
Foreign	321.7	292.8	292.4
Total income before income taxes	<u>\$ 880.2</u>	<u>\$ 782.2</u>	<u>\$ 750.2</u>

The provision for income taxes consisted of the following:

	Year Ended December 31,		
	2022	2021	2020
	(In millions)		
Current expense (benefit):			
Federal	\$ 145.1	\$ 97.5	\$ (124.0)
State	41.7	32.2	10.5
Foreign, including withholding tax	26.3	29.8	29.2
	<u>213.1</u>	<u>159.5</u>	<u>(84.3)</u>
Deferred expense (benefit):			
Federal	(18.0)	3.9	4.3
State	(4.8)	(0.2)	17.4
Foreign	16.1	(165.8)	(2.1)
	<u>(6.7)</u>	<u>(162.1)</u>	<u>19.6</u>
Total income tax expense (benefit)	<u>\$ 206.4</u>	<u>\$ (2.6)</u>	<u>\$ (64.7)</u>

The difference between income tax expense (benefit) and the amount resulting from applying the federal statutory rate of 21% to Income before income taxes is attributable to the following:

	Year Ended December 31,		
	2022	2021	2020
	(In millions)		
Income tax expense at federal statutory rate	\$ 184.8	\$ 164.3	\$ 157.6
State taxes, net of federal benefit	29.2	25.5	23.2
Effect of non-U.S. operations	(9.5)	(23.3)	(27.7)
Stock-based compensation	4.7	1.3	(8.6)
Remeasurement of unrecognized tax benefits	(1.5)	(5.1)	(204.7)
Intercompany non-U.S. intellectual property transfer	—	(165.5)	—
Other	(1.3)	0.2	(4.5)
Total income tax expense (benefit)	<u>\$ 206.4</u>	<u>\$ (2.6)</u>	<u>\$ (64.7)</u>

During the fourth quarter of 2021, as part of a legal entity reorganization, the Company completed an internal transfer of certain of its non-U.S. intellectual property which had no book value. This transfer created amortizable tax basis for the receiving entity based on the \$1.20 billion fair value of the intellectual property, which resulted in the recognition of a \$165.5 million deferred tax asset and a corresponding income tax benefit. During 2020, the Company recognized an income tax benefit as a result of the remeasurement of certain previously unrecognized income tax benefits. The majority of these income tax benefits related to the worthless stock deduction taken in 2013. These remeasurements were based on written confirmations from the IRS, indicating no examination adjustments would be proposed related to the worthless stock deduction or certain

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

other matters reviewed as part of the audit of the Company's federal income tax returns for 2010 through 2014, and the lapse of statutes of limitations related to other unrecognized income tax benefits.

The tax effects of temporary differences that give rise to significant portions of the Company's deferred tax assets and liabilities are as follows:

	As of December 31,	
	2022	2021
(In millions)		
<b>Deferred tax assets:</b>		
Intellectual property	\$ 147.0	\$ 165.5
Deferred revenues, accruals and reserves	73.7	68.6
Research and development costs	12.0	—
Tax credit carryforwards	3.8	3.5
Net operating loss carryforwards	3.4	4.7
Other	1.8	1.7
Total deferred tax assets	241.7	244.0
Valuation allowance	(5.5)	(5.5)
Net deferred tax assets	236.2	238.5
<b>Deferred tax liabilities:</b>		
Property and equipment	(0.5)	(6.6)
Other	(1.1)	(1.2)
Total deferred tax liabilities	(1.6)	(7.8)
Total net deferred tax assets	\$ 234.6	\$ 230.7

With the exception of deferred tax assets related to certain state and foreign net operating loss and foreign tax credit carryforwards, management believes it is more likely than not that the tax effects of the deferred tax liabilities together with future taxable income, will be sufficient to fully recover the remaining deferred tax assets.

As part of the Tax Cuts and Jobs Act of 2017, domestic and foreign research and development expenses, including costs related to internally developed software, are required to be amortized for income tax purposes, over five and fifteen years, respectively, beginning with our 2022 tax year. As a result, the Company recognized a deferred tax asset of \$12.0 million in 2022.

As of December 31, 2022, the Company's deferred tax assets included \$55.9 million of state net operating loss carryforwards, before applying tax rates for the respective jurisdictions. The tax credit carryforwards as of December 31, 2022 consisted primarily of foreign tax credit carryforwards. The state net operating loss carryforwards expire in various years from 2023 through 2034. The foreign tax credits will expire in 2028.

A reconciliation of the beginning and ending balances of the total amounts of gross unrecognized tax benefits is as follows:

	As of December 31,	
	2022	2021
(In millions)		
Beginning balance	\$ 16.0	\$ 23.7
Increases in tax positions for prior years	0.1	0.1
Decreases in tax positions for prior years	—	(1.3)
Increases in tax positions for current year	1.4	1.1
Decreases in tax positions due to settlement with taxing authorities	—	(1.2)
Lapse in statute of limitations	(2.4)	(6.4)
Ending balance	\$ 15.1	\$ 16.0

**VERISIGN, INC.**  
**NOTES TO CONSOLIDATED FINANCIAL STATEMENTS - (Continued)**  
**DECEMBER 31, 2022, 2021 AND 2020**

As of December 31, 2022, approximately \$14.8 million of unrecognized tax benefits, including penalties and interest, could affect the Company's tax provision and effective tax rate. The Company does not expect the balance of unrecognized tax benefits to change materially during the next twelve months.

In accordance with its accounting policy, the Company recognizes accrued interest and penalties related to unrecognized tax benefits as a component of tax expense. These accruals were not material in any period presented.

The Company's major taxing jurisdictions are the U.S., the Commonwealth of Virginia, and Switzerland. The Company's U.S. federal income tax returns are currently under examination by the IRS for 2010 through 2013. The Company's U.S. federal tax returns for 2019, and the years thereafter, also remain subject to examination. The Company's other material tax returns are not currently under examination by their respective taxing jurisdictions. Because the Company has previously used net operating loss carryforwards and other tax attributes to offset its taxable income in income tax returns for the U.S. and Virginia, such attributes can be adjusted by these taxing authorities until the statute of limitations closes on the year in which such attributes were utilized. The open years for examination in Switzerland are the 2012 tax year and forward.

**Note 11. Commitments and Contingencies**

The following table represents the minimum payments required by Verisign under certain purchase obligations, certain U.S. income tax obligations, leases, and the interest payments and principal on the Senior Notes:

	Purchase Obligations	Transition Tax	Operating Leases	Senior Notes	Total
	(In millions)				
2023	\$ 43.0	\$ 14.6	\$ 5.6	\$ 72.6	\$ 135.8
2024	9.7	19.4	1.5	72.6	103.2
2025	5.0	24.3	0.1	559.5	588.9
2026	—	—	—	46.4	46.4
2027	—	—	—	596.4	596.4
Thereafter	—	—	—	820.9	820.9
<b>Total</b>	<b>\$ 57.7</b>	<b>\$ 58.3</b>	<b>\$ 7.2</b>	<b>\$ 2,168.4</b>	<b>\$ 2,291.6</b>

The amounts in the table above exclude \$14.8 million of unrecognized tax benefits, as the Company is unable to reasonably estimate the ultimate amount or time of settlement of those liabilities.

Verisign enters into certain purchase obligations with various vendors. The Company's significant purchase obligations include firm commitments with telecommunication carriers, other service providers and the fixed portion of registry fees related to the operation of certain top-level domains. Registry fees for top-level domains that we operate where the amounts are variable or passed-through to registrars have been excluded from the table above. The Company does not have any significant purchase obligations beyond 2025.

The Company has an agreement with Internet Corporation for Assigned Names and Numbers ("ICANN") to be the sole registry operator for domain names in the .com registry through November 30, 2024. Under this agreement, the Company pays ICANN on a quarterly basis, \$0.25 for each annual term of a domain name registered or renewed during such quarter. The Company incurred registry fees for the .com registry of \$39.9 million in 2022, \$40.6 million in 2021, and \$36.3 million in 2020.

In connection with the .com Registry Agreement with ICANN, the Company is required to make annual payments of \$4.0 million to ICANN through 2025 to support efforts to maintain the security and stability of the DNS. The payments for 2023 through 2025 are included in Purchase obligations in the table above.

The Transition Tax amounts in the table above are the remaining installments of U.S. income taxes payable on our accumulated foreign earnings pursuant to the 2017 Tax Cuts and Jobs Act.

Verisign leases a small portion of its office space and a portion of its data center facilities under operating leases, the longest of which extends into 2025. Rental expenses under operating leases were not material in any period presented.

**ITEM 9. CHANGES IN AND DISAGREEMENTS WITH ACCOUNTANTS ON ACCOUNTING AND FINANCIAL DISCLOSURE**

Not applicable.

**ITEM 9A. CONTROLS AND PROCEDURES**

**a. Evaluation of Disclosure Controls and Procedures**

Based on our management's evaluation, with the participation of our Chief Executive Officer (our principal executive officer) and our Chief Financial Officer (our principal financial officer), as of December 31, 2022, our principal executive officer and principal financial officer have concluded that our disclosure controls and procedures (as defined in Rules 13a-15(e) and 15d-15(e) under the Exchange Act) are effective to ensure that information required to be disclosed by us in reports that we file or submit under the Exchange Act is recorded, processed, summarized and reported within the time periods specified in SEC rules and forms and is accumulated and communicated to our management, including our principal executive officer and principal financial officer, as appropriate to allow timely decisions regarding required disclosure.

**b. Management's Report on Internal Control over Financial Reporting**

Our management is responsible for establishing and maintaining adequate internal control over financial reporting as defined in Rules 13a-15(f) and 15d-15(f) under the Exchange Act. Under the supervision and with the participation of our management, including our Chief Executive Officer and Chief Financial Officer, we conducted an evaluation of the effectiveness of our internal control over financial reporting as of December 31, 2022 using the criteria established in *Internal Control-Integrated Framework* (2013 Framework) issued by the Committee of Sponsoring Organizations of the Treadway Commission ("COSO").

Based on our evaluation under the COSO framework, management has concluded that our internal control over financial reporting is effective to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles.

KPMG LLP, an independent registered public accounting firm, has issued a report concerning the effectiveness of our internal control over financial reporting as of December 31, 2022. See "Report of Independent Registered Public Accounting Firm" in Item 8 of this Form 10-K.

**c. Changes in Internal Control over Financial Reporting**

There was no change in our internal control over financial reporting (as such term is defined in Rules 13a-15(f) and 15d-15(f) under the Exchange Act) during the three months ended December 31, 2022 that has materially affected, or is reasonably likely to materially affect, the Company's internal control over financial reporting.

**d. Inherent Limitations of Disclosure Controls and Internal Control over Financial Reporting**

Because of their inherent limitations, our disclosure controls and procedures and our internal control over financial reporting may not prevent material errors or fraud. A control system, no matter how well conceived and operated, can provide only reasonable, not absolute, assurance that the objectives of the control system are met. The effectiveness of our disclosure controls and procedures and our internal control over financial reporting is subject to risks, including that the controls may become inadequate because of changes in conditions or that the degree of compliance with our policies or procedures may deteriorate.

**ITEM 9B. OTHER INFORMATION**

None.

**Item 9C. DISCLOSURE REGARDING FOREIGN JURISDICTIONS THAT PREVENT INSPECTIONS.**

None.

## PART III

### ITEM 10. DIRECTORS, EXECUTIVE OFFICERS AND CORPORATE GOVERNANCE

The information required by this item regarding our directors and nominees, Audit Committee, Corporate Governance and Nominating Committee, and Compensation Committee will be included under the captions “Proposal No. 1—Election of Directors,” “Security Ownership of Certain Beneficial Owners” and “Corporate Governance” in our Proxy Statement related to the 2023 Annual Meeting of Stockholders and is incorporated herein by reference (our “2023 Proxy Statement”).

Pursuant to General Instruction G(3) of Form 10-K, the information required by this item relating to our executive officers is included under the caption “Information About Our Executive Officers” in Part I of this Form 10-K.

We have adopted a written Code of Conduct, which is posted on our Investor Relations website under “Ethics and Business Conduct” at <https://investor.verisign.com/corporate-governance>. The Code of Conduct applies to all of our directors, officers, and employees, including our principal executive officer, principal financial officer, and other senior accounting officers. We have also adopted the “Corporate Governance Principles for the Board of Directors,” which provide guidance to our directors on corporate practices that serve the best interests of our company and our stockholders.

We intend to satisfy any disclosure requirement under Item 5.05 of Form 8-K regarding an amendment to, or waiver from, a provision of the Code of Conduct, to the extent applicable to the principal executive officer, principal financial officer, or other senior accounting officers, by posting such information on our website, on the web page found by clicking through to “Ethics and Business Conduct” as specified above.

### ITEM 11. EXECUTIVE COMPENSATION

Information required by this item is incorporated herein by reference to our 2023 Proxy Statement from the discussions under the captions “Compensation of Directors,” “Non-Employee Director Retainer Fees and Equity Compensation Information” and “Non-Employee Director Compensation Table for 2022,” and “Executive Compensation.”

### ITEM 12. SECURITY OWNERSHIP OF CERTAIN BENEFICIAL OWNERS AND MANAGEMENT AND RELATED STOCKHOLDER MATTERS

Information required by this item is incorporated herein by reference from the discussions under the captions “Security Ownership of Certain Beneficial Owners and Management” and “Equity Compensation Plan Information” in our 2023 Proxy Statement.

### ITEM 13. CERTAIN RELATIONSHIPS AND RELATED TRANSACTIONS, AND DIRECTOR INDEPENDENCE

Information required by this item is incorporated herein by reference to our 2023 Proxy Statement from the discussions under the captions “Policies and Procedures with Respect to Transactions with Related Persons,” “Certain Relationships and Related Transactions” and “Independence of Directors.”

### ITEM 14. PRINCIPAL ACCOUNTANT FEES AND SERVICES

Our independent registered public accounting firm is KPMG LLP, McLean, VA, Auditor Firm ID: 185.

Information required by this item is incorporated herein by reference to our 2023 Proxy Statement from the discussions under the captions “Principal Accountant Fees and Services” and “Policy on Audit Committee Pre-Approval of Audit and Permissible Non-Audit Services of Independent Auditors.”

**PART IV****ITEM 15. EXHIBITS, FINANCIAL STATEMENT SCHEDULES**

Financial statement schedules are omitted because the information called for is not material or is shown either in the consolidated financial statements or the notes thereto.

## 3. Exhibits

*(a) Index to Exhibits*

Pursuant to the rules and regulations of the SEC, the Company has filed certain agreements as exhibits to this Form 10-K. These agreements may contain representations and warranties by the parties thereto. These representations and warranties have been made solely for the benefit of the other party or parties to such agreements and (1) may be intended not as statements of fact, but rather as a way of allocating the risk to one of the parties to such agreements if those statements prove to be inaccurate, (2) may have been qualified by disclosures that were made to such other party or parties and that either have been reflected in the Company's filings or are not required to be disclosed in those filings, (3) may apply materiality standards different from what may be viewed as material to investors and (4) were made only as of the date of such agreements or such other date(s) as may be specified in such agreements and are subject to more recent developments. Accordingly, these representations and warranties may not describe the Company's actual state of affairs at the date hereof or at any other time.

# Ethos Capital to Acquire Public Interest Registry from the Internet Society

*Public Interest Registry Will Continue Management and Mission of .ORG Under New Ownership*

**Reston, VA (November 13, 2019)** – The Internet Society and Public Interest Registry (PIR) today announced that they have reached an agreement with Ethos Capital, under which Ethos Capital will acquire PIR and all of its assets from the Internet Society. The transaction is expected to close during the first quarter of next year.

“This is an important and exciting development for both the Internet Society and Public Interest Registry,” said Andrew Sullivan, President and Chief Executive Officer of the Internet Society, the organization that established Public Interest Registry. “This transaction will provide the Internet Society with an endowment of sustainable funding and the resources to advance our mission on a broader scale as we continue our work to make the Internet more open, accessible and secure – for everyone. It also aligns Public Interest Registry with Ethos Capital, a strong strategic partner that understands the intricacies of the domain industry and has the expertise, experience and shared values to further advance the goals of .ORG into the future.”

“Since the inception of Public Interest Registry, our mission has been to enable the .ORG Community to use the Internet more effectively and change the world for the better,” stated Jon Nevett, CEO of Public Interest Registry. “That will not change. We have enjoyed a long and successful relationship with the Internet Society, and are thrilled that we will be able to continue – and expand – our important work with Ethos Capital while sustaining our commitment to the .ORG Community going forward.”

Following the close of the transaction, PIR will continue to meet the highest standards of public transparency, accountability, and social performance in line with its longstanding purpose-driven mission, and will consider seeking B Corporation certification. All of PIR’s domain operations and educational initiatives will continue, and there will be no disruption of service or support to the .ORG Community or other generic top-level domains operated by the organization.

establishing a Stewardship Council that will serve to uphold PIR's core founding values and provide support through a variety of community programs."

Mr. Brooks added: "Importantly, throughout the transition and beyond, we are committed to ensuring complete continuity of PIR's operations and enhancing the relationships PIR has established over the years. We look forward to continuing PIR's longstanding partnerships and vendor affiliations to ensure domain operations run smoothly and without interruption."

Vint Cerf, former Chairman of the Board of ICANN and founding President of the Internet Society, said: "When the Internet Society won the bid to operate the .ORG registry, it enabled a productive and sustainable future for the organization. Public Interest Registry exercised its stewardship to the benefit of the registrants and the Internet Society's mission. I am looking forward to supporting Ethos Capital and PIR in any way I can as they continue to expand the utility of the .ORG top-level domain in creative and socially responsible ways."

PIR was established by the Internet Society in 2002 to manage and operate the .ORG domain. Since then, .ORG has risen to become the largest purpose-driven domain used by millions of organizations and others to achieve their online goals.

Goldman Sachs & Co LLC is serving as financial advisor to both the Internet Society and PIR. Morgan, Lewis & Bockius LLP and Proskauer Rose LLP are serving as legal advisors to the Internet Society and PIR, respectively. Macquarie Capital is serving as financial advisor and Morrison & Foerster LLP is serving as legal advisor to Ethos Capital.

## **About Public Interest Registry**

Public Interest Registry (PIR) is a nonprofit corporation that operates the .ORG top-level domain—one of the world's largest generic top-level domains with more than 10 million domain names registered worldwide. As an advocate for collaboration, safety, and security on the Internet, PIR's mission is to serve as an exemplary registry and to provide a trusted digital identity. PIR strives to educate the global community to use the Internet more safely and effectively while taking a leadership position among Internet stakeholders on policy and other issues relating to the domain naming system. PIR was founded by the Internet Society (<https://www.internetsociety.org>) in 2002 and is based in Reston, Virginia, USA. Visit Public Interest Registry at <https://pir.org>.

## **About .ORG**

.ORG is the original purpose-driven "generic" top-level domain (gTLD) with more than 10 million domain names registered worldwide. .ORG is open to everyone, providing a global platform for organizations, associations, clubs, businesses and individuals to bring their ideas to life. For more than

## About the Internet Society

Founded by Internet pioneers, the Internet Society (ISOC) is a non-profit organization dedicated to ensuring the open development, evolution and use of the Internet. Working through a global community of chapters and members, the Internet Society collaborates with a broad range of groups to promote technologies that keep the Internet safe and secure, and to advocate for policies and infrastructure that enable universal access. The Internet Society also provides a corporate home for the administrative entity that supports the Internet Engineering Task Force (IETF). For additional information, visit <https://www.internetsociety.org/>.

## About Ethos Capital

Ethos Capital is a specialized investment firm that helps transform and grow established companies in today's rapidly evolving digital economy. Ethos Capital's Founder and CEO, Erik Brooks, has deep expertise and relationships across the business, technical, and social communities that protect and promote the Internet's core founding values. As a mission-driven firm, Ethos Capital is committed to setting the gold standard of ethics and social responsibility for registry operations and supporting a globally connected and resilient Internet. For more information, please visit <https://ethoscapital.com/>.

## PRIVATE EQUITY

# Ethos Capital Defends Deal to Take Private the Group That Registers Nonprofits' Websites

By Lina Saigol and Selin Bucak Feb. 11, 2020 10:38 am ET

Participants at an Icann meeting.  
Getty Images

The planned \$1.1 billion sale of the Public Interest Registry to Ethos Capital has attracted a deluge of criticism from international bodies over fear the deal, currently under investigation by California, could harm the independence and accessibility of the internet. The private-equity firm hasn't managed to quiet the chorus of

concern just yet, but its chief addressed the issues in an interview with *Barron's* and a sister publication, *Private Equity News*.

**The back story.** PIR, which manages the rights of the .org domain, is used by some of the world's most high-profile not-for-profit groups, including Greenpeace, Human Rights Watch, and Amnesty International.

Ethos Capital, a newly created buyout firm headed by Erik Brooks, announced the [acquisition of the registrar from the Internet Society](#) in November. Within days, the deal became the subject of debate among several international organizations that depend on PIR for the registration of their websites.

At the [heart of their concerns](#) was that transferring the nonprofit to private-equity ownership could potentially lead to censorship and a damaging increase in prices. Last year, the Internet Corporation for Assigned Names and Numbers, or Icann—a nonprofit in charge of the domain-name system—removed a price cap that banned PIR from charging more than \$8.25 per domain.

The organization also gave permission to PIR to create “protections for the rights of third parties,” raising concerns that some companies and governments will be allowed to demand censorship in the name of protection.

**What's new.** In the interview, Brooks sought to allay concerns, saying he won't increase the price of the .org domain by more than 10% a year on average.

Brooks also said Ethos will set up a stewardship council, comprising members from the not-for-profit world, some of which he hopes to announce in the coming weeks.

PIR generated \$92 million in net revenue in 2018, but suffered a loss of \$3.2 million because it spent nearly \$49 million on funding Internet Society programs and education, according to its annual report. The Internet Society is PIR's parent organization.

Brooks says he is now looking to invest in a number of areas to build up the business, including expanding the customer base both in the U.S. and globally, increasing marketing spending, and introducing new products and services.

Brooks believes the first wave of opposition against the deal came from people who buy and sell domain names, who he says encouraged the not-for-profit groups to speak out.

"This whole narrative was established early on and very vocally initiated by a community of individuals called domainers," Brooks said. "They are professional investors who buy thousands of domain names at a time and sit on them."

The domainers, he argued, are focused only on the prices of domains, he said. "It was a very convenient narrative to push it out into the world that a for-profit company would increase prices."

**Looking ahead.** The Internet Society will invest the sale proceeds into an endowment and use the earnings to fund its work. It has said that the funding it will receive from the endowment will be broadly equivalent to the annual earnings it currently receives from PIR.

Despite such assurances, questions around the sale still remain.

Last week, the attorney general of California, who supervises charitable organizations in the state, where Ican is based, requested a delay to the transaction to have time to investigate it.

The internet Society, Ethos Capital and PIR have agreed to a delay until Feb. 29. Brooks said he is confident that both Ican and the attorney general will greenlight the deal.

Cooperative Agreement Between NSI and U.S.  
Government

Effective: 1 January 1993

**Network Information Services Manager(s) for NSFNET and the NREN:  
INTERNIC Registration Services  
COOPERATIVE AGREEMENT NO. NCR-9218742**

**Parties:**

National Science Foundation  
1800 G Street, N.W.  
Washington, D.C. 20550

and

Network Solutions, Incorporated  
505 Huntmar Park Drive  
Herndon, VA 20170

**COOPERATIVE AGREEMENT NO. NCR-9218742**

**Parties:**

National Science Foundation

and

Network Solutions, Incorporated

**Title:**

Network Information Services Manager(s) for NSFNET and the NREN: INTERNIC Registration Services

**Type of Award:**

Cost-Plus-Fixed-Fee Cooperative Agreement

**Estimated Total Amount:**

\$4,219,339

**Effective Date:**

January 1, 1993

**Expiration Date:**

September 30, 1998

**Authority:**

This agreement is awarded under the authority of the National Science Foundation Act (R@ U.S.C. 186 et seq.) and the Federal Grant and Cooperative Agreement Act (31 U.S.C. 6301 et

seq.)

This agreement is entered into between the United States of America, Hereinafter called the Government, represented by the National Science Foundation, hereinafter called the Foundation or NSF, and Network Solutions, Incorporated, hereinafter called the Awardee.

**NSF Program Official:**

Donald R. Mitchell  
Telephone : 202-357-9717  
e-mail: dmitcheff@nsf.gov

**NSF Administrative Official:**

Altie H. Metcalf  
Telephone: 202-357-9843  
e-mail: ametcalf@nsf.gov

IN WITNESS WHEREOF, the parties have executed Cooperative Agreement No. NCR-9218742, Network Information Services Manager(s) for NSFNET and the NREN: INTERNIC Registration Services.

---

**ARTICLE 1. BACKGROUND AND PURPOSE OF AGREEMENT**

During the past two decades computer networks have facilitated collaboration among members of many research and education communities and provided them with remote access to information and computing resources. These networks have continued to grow both in the number of users connected and in the capabilities provided to the individual users. It is anticipated that such networks will become essential to research and education during this decade. In particular, the collection of interconnected networks known as the Internet has become important for many research communities. It is also of increasing importance for education.

Today more than 5,000 networks comprise the Internet. These networks link together hundreds of thousands of computers and millions of users throughout the world. The domestic, non-military portion of the Internet includes NSFNET. It also includes other federally sponsored networks such as NASA Science Internet (NSI) and Energy Sciences Network (Esnet). NSFNET, NSI, and Esnet, as well as some other networks of the Internet, are related to the National Research and Education Network (NREN) which was defined in the President's Fiscal 1992 budget and which has been authorized by the passage in December, 1991, of the High Performance Computing and Communications Act, Public Law 102-194.

The NREN is projected to evolve from a part of the Internet containing portions of NSFNET, NSI, and Esnet. This evolution will reflect the legal and technical requirements of the various sponsoring agencies. For example, NASA and DOE are mission agencies whose networks' traffic must relate to the agencies' missions. NSF, on the other hand, is chartered to support science and engineering research and education; hence NSFNET can carry all traffic contemplated for the NREN and may in fact support additional traffic as well.

Because of the breadth of the charter of the NSFNET, it is projected that it will continue to serve an expanding base of research and education users. The provision of enhanced network information services for NSFNET will be an important part of the expansion in user base.

In cooperation with the Internet community, the National Science Foundation developed and released, in the spring of 1992, Project Solicitation NSF92-24 for one or more Network Information Services Managers (NIS Manager(s)) to provide and/or coordinate (i) Registration Services, (ii) Directory and Database Services, and (iii) Information Services for the NSFNET. As a result of this solicitation, three separate organizations were selected to receive cooperative agreements in the areas of (i) Registration Services, (ii) Directory and Database Services, and (iii) Information Services. Together, these three awards constitute the NIS Manager(s) Project.

It is essential that the three project participants selected work closely together to provide a seamless interface for users in need of services. For this reason, the three awardees, at the request of the Foundation, have developed a detailed concept and plan to provide this seamless interface called the "INTERNIC," have revised their proposals to reflect the implementation of the "INTERNIC" concept, and have agreed to the structuring of their three (separate) awards as one collaborative project. This Cooperative Agreement for Registration Services is one of the three (3) collaborative awards resulting from the NIC Manager(s) Project solicitation.

It is anticipated that all registration services required during the period of this Agreement will be obtained and furnished under the terms of this Agreement and that the definition and providing of these services will help facilitate the evolution of the NSFNET and the development of the NREN. References to NSFNET in this Agreement should in general be understood to include the NREN as well.

## **ARTICLE 2. SPECIAL REQUIREMENTS**

### **A. Collaborative Proposals and Effort(s)**

1. An important aspect of the Awardee's work is coordination with the Network Information Services Managers for (i) Database and Directory Services (AT&T under Cooperative Agreement NCR-9218179) and (ii) Information Services (General Atomics under Cooperative Agreement NCR-9218749) to provide a "seamless interface" for internet users in accordance with the "INTERNIC" concept explicated in the Awardee's revised proposal dated October 19, 1992. Hereafter in this agreement, Awardee's two collaborating partners, General Atomics and AT&T, shall be referred to as

Collaborators and Awardee shall coordinate its performance hereunder with the efforts of its Collaborators in accordance with the "INTERNIC" concept explicated in the Awardee's revised proposal dated October 19, 1992. The NSF Program Official reserves the authority to resolve technical, managerial, or scheduling disputes.

2. This requirement for close collaboration and coordination among the three aspects of the Network Information Services Management Project shall be stated in each of the three awards. Such collateral agreements and fund transfers consistent with the currently approved Program Plan (see Article 9) as may be necessary to effect the coordination, collaboration and seamless interface to users called for by the "INTERNIC" concept or improve the overall integration of the NIS Manager(s) Project may be entered into by, between and among the Awardee and its Collaborators without further Foundation approvals. Absent a specific inclusion in the approved Program Plan, Awardee fund transfers made pursuant to this Article may not exceed \$50,000 in any Program Year.

#### B. Directed Activities

At the request of the NSF Program Director, as set forth in article 13 (below), the Awardee shall attend such meetings, seminars, conference and planning and other events and shall provide such related supplies and services as necessary to promulgate information regarding registration activity to the worldwide internet community and to facilitate the most effective, efficient and ubiquitous registration services possible.

### ARTICLE 3. STATEMENT OF WORK

A. The Awardee shall provide to non-military internet users and networks all necessary registration services (which were) previously provided by the Defense Information Systems Agency Network Information Center (the DISA NIC).

B. The work will be performed in general accordance with NSF Project Solicitation NSF 92-24 for Network Information Services Manager(s) for the NSFNET and the NREN, the Awardee's proposal No. NCR-9218742, dated September 23, 1992, amended by Awardee's supplemental proposal addressing collaborative INTERNIC activity, dated October 19, 1992, hereinafter referred to cumulatively as Awardee's Proposal, and in conformance with the technical and/or performance requirements contained therein and set forth below.

C. The Awardee shall provide registration services in accordance with the provisions of RFC 1174. As stated in RFC 1174:

[T]he Internet system has employed a central Internet Assigned Numbers Authority (IANA) for the allocation and assignment of various numeric identifiers needed for the operation of the Internet. The IANA function is currently performed by the University of Southern California's Information Sciences Institute. The IANA has the discretionary authority to delegate portions of this responsibility and, with respect to numeric network and autonomous system identifiers, has lodged this responsibility with an Internet Registry (IR).

D. Moreover, in cooperation with the IANA, the IR may create delegate registries to carry out registration services for specified domains.

E. The Awardee shall work with the DISA NIC to design and implement a transition plan, as outlined in Awardee's Proposal, that will minimize inconvenience to the networking community during and after the transition.

F. The Non-military internet registration services to be provided under this agreement will initially include, but not be limited to, the following:

1. Domain name registration
2. Domain name server registration

3. Network number assignment
4. Autonomous system number assignment

G. Possible future changes in the registration services provided under this Agreement may include, but shall not be limited to, the use of alternate registration/numbering systems or schemes and the imposition of a user based fee structure. However, in no case shall any user based fee structure be imposed or changed without the express direction/approval of the NSF Program Official.

#### **ARTICLE 4. TURNAROUND AND PERFORMANCE MEASURES**

A. The following describes the required turnaround and availability of Registration data:

1. 3 working days/Class C
2. 5 working days/Class B
3. 22 working days/Class A

B. Turnaround is the time from receipt of a completed template, and any information pertaining to network topology and usage of previously assigned address space as may be specifically requested in individual cases, to the assignment of a number. Availability is the provision of the registration data to the INTERNIC Database and Directory Services Awardee.

C. The quality of Awardee's registration services will be measured in accordance with the formulae contained in Section J of Awardee's revised proposal of September 23, 1992 and in light of the turnaround times specified above.

#### **ARTICLE 5. ESTIMATED REQUIREMENTS AND REVIEW**

A. Estimated Requirements

The registration services currently required for the performance of this Cooperative Agreement are described above. The registration services described above are only an estimate of the immediate and long-term requirements of the scientific research and education community and are furnished for planning purposes only. Since the future needs of the scientific research and education community are unknown at this time, the Foundation reserves the right to increase, decrease or modify the quantity, quality, content or nature of the registration services to be provided hereunder. Should the Foundation exercise the right to increase, decrease or modify the quantity, quality, content or nature of the registration services provided hereunder, appropriate change to estimated costs, fees, and funding schedules shall be negotiated and incorporated into the Agreement.

B. Performance Review

By December 31, 1994, the Foundation will review the project to determine whether to continue funding and to provide general direction as to the continuation and contemplated level of future support to be provided for the remainder of the agreement.

#### **ARTICLE 6. RESPONSIBILITIES**

A. Awardee

The Awardee has primary responsibility for ensuring the quality, timeliness and effective management of the registration services provided under this agreement. To the extent that NSF does not reserve specific responsibility for accomplishing the purposes of this Agreement, by either special condition or general condition of the Agreement, all such responsibilities remain with the Awardee.

B. National Science Foundation

1. General

NSF has responsibility for registration services support, support planning, oversight, monitoring, and evaluation. NSF will make approvals required under the General Conditions and, where necessary and appropriate, NSF will contact and negotiate with Federal agencies and other national and International members of the Internet community to further the efforts of this project.

## 2. Technical

### a. Program Officer Authority

Performance of work under this Cooperative Agreement shall be subject to the general oversight and monitoring of the NSF Program Officer. This involvement may include, but is not limited to:

- (1) Review of the Quarterly and Annual Reports, Program Plans and Budget.
- (2) Participation in resolution of technical, managerial and scheduling concerns; review and, where required by the Agreement, approval of technical reports and information to be delivered by Awardee.

### b. Limitations

NSF technical involvement will be consistent with the general statement of work as stated in this Agreement. The Program Officer does not have the authority to and may not:

- (1) request additional work outside the Statement of Work;
- (2) issue instructions which constitute a change as defined in Article 8 of GC-1(10/91);
- (3) require an increase in the Agreement's estimated cost or extension to the Agreement's period of performance, or;
- (4) change any of the expressed terms, conditions or specifications of the Agreement.

### c. Awardee Notifications

If, in the opinion of the Awardee, any instructions or requests issued by the Program Officer are within one of the categories as defined in (1) through (4) in the above paragraph, the Awardee shall not proceed but shall notify the NSF Grants and Contracts Officer and shall request, if appropriate, amendment of the Agreement in accordance with Article 37, "Changes -- Limitations of Funds," of the Attached Cooperative Agreement General Conditions.

## 3. Approvals

Unless stated otherwise, all NSF approvals, authorizations, notifications and instructions required pursuant to the terms of this agreement must be set forth in writing by the NSF Grants and Contracts Officer.

## **ARTICLE 7. PERIOD OF PERFORMANCE**

This Agreement, effective January 1, 1993, shall include a three month phase-in period, a five (5) year period of operational support (commencing April 1, 1993), and a six month (no additional cost) flexibility period and shall continue through September 30, 1998.

## **ARTICLE 8. FUNDING**

### A. Agreement Amount

The current total estimated amount of this Cooperative Agreement, exclusive of such amounts as may be provided in connection with Directed Activities provided pursuant to Article 11 (below) is \$5,219,339 of which [ Proprietary Figures Omitted ]

#### B. Allotted Amount(s)

1. There is currently allotted and available for expenditure for provision of registration services under this agreement, exclusive of amounts allotted for Directed Activities(as shown in paragraph 3, below), \$1,162,245, of which [ Proprietary Figures Omitted ]
2. Amounts anticipated to be needed for reimbursement of costs incurred in connection with Directed Activities as provided pursuant to Article 11 (below) are not included in the allotted amount(s) shown in paragraph 8.C, below. Amounts for directed activities may be allotted from time to time throughout the period of this agreement.
3. There is currently allotted and available for expenditure in connection with reimbursement for directed activities under this agreement \$0.

#### C. Obligation

For purposes of payment of the Foundation's portion of all allowable costs (including those incurred in connection with the performance of Directed Activities in accordance with Article 11 below) pursuant to the terms outlined in this Agreement, the total amount currently allotted by the Government to this Cooperative Agreement is \$1,162,245. This allotment covers performance through March 31, 1994.

#### D. Limitation of Funds

1. The parties estimate that performance of this Cooperative Agreement will not cost the Government more than the estimated amount specified in Article 8.A, Agreement Amount, above. The Awardee shall use its best efforts to perform the work specified in Article 3 and all obligations under this award within the allotted funds.
2. Paragraph C of this Article specifies the cumulative amount presently available for payment by the Government and allotted to this award. The parties contemplate that the Government will allot additional funds incrementally to the award up to the full estimate specified in Article 8.A, Agreement Amount, above.
3. The Awardee shall notify the NSF Grants and Contracts Officer in writing whenever it has reason to believe that the costs it expects to incur under this Agreement in the next 60 days, when added to all costs previously incurred, will exceed 85% of the total amount so far allotted to the Agreement by the Government.
4. When and to the extent that the amount allotted by the Government is increased, any costs the Awardee incurs before the increase that are in excess of the amount previously allotted by the Government, shall be allowable to the same extent as if incurred afterward.

#### E. Compensation and Expenditures

1. As compensation for its performance under this agreement, Awardee shall be compensated for its direct and indirect costs (see Article 8.E.3) and shall be paid a fixed fee as provided in this agreement.
2. The Awardee shall also be reimbursed for such travel and related costs as may be specifically required and approved by the NSF Program Director pursuant to Article 11 (below). Expenditures under this agreement must be in accordance with a current Budget or Program Plan which has been approved by the NSF Grants Officer and no reallocation of funds in excess of \$10,000 between budget line items is permitted without prior written (or e-mail) approval of the NSF Program Official.

3. The amount currently allotted includes an indirect cost allowance at the following maximum provisional rates, subject to downward adjustment only:

Internet Services [ Proprietary Figure Omitted ]  
 Material Burden [ Proprietary Figure Omitted ]  
 G&A [ Proprietary Figure Omitted]

#### F. Future Allotments

The actual level of continued NSF support for future years will be negotiated annually with the Awardee and will depend upon annual review of progress, the proposed Program Plan and the availability of funds. The actual funding of such allotments may be provided unilaterally by NSF on an incremental basis.

### ARTICLE 9. ANNUAL REPORT, PROGRAM PLAN AND BUDGET

By December 31 each year, the Awardee shall submit both electronically and in 10 hard copies an Annual Report, Program Plan and Budget to the Foundation for approval. These Program Plans and Budgets shall be submitted in a format and level of detail approved by the Foundation but shall, as a minimum, contain project goals and objectives specified with sufficient technical criteria, milestones, and timetables to measure the progress of the effort toward the attainment of objectives during the time period for which it is being submitted. This Program Plan will be the basis for the performance goals and funding for succeeding twelve month operational period beginning April 1. Each submission should contain narrative information indicating (for the past year's activities) by functional area and overall; any goals accomplished, exceeded, or missed and explaining any significant deviations from the previous year's plan; any educational achievements; patents, copyrights, or other innovations resulting from the activities; industrial and other funding, income and contributions. Each annual submission should also contain information on actual line charges and expenditures (both annual and cumulative) by functional area and overall, in the same level of detail for which it projects the succeeding year's costs, and a summary budget in accordance with NSF Form 1030. The Awardee will receive formal approval of the Program Plan from the NSF Grants Officer. The Foundation accepts (i) the Awardee's proposal as the Program Plan covering the period April 1, 1993, through May 31, 1994; and (ii) the budgets dated October 19, 1992, as the approved budgets for the period January 1, 1993, through May 31, 1994.

### ARTICLE 10. OTHER REPORTING REQUIREMENTS

#### A. Timely Notification of Significant Problems

The Awardee shall inform the NSF Program Official (either by e-mail or in writing) in a timely manner of any significant problems or events that could affect the overall schedule or progress in the program.

#### B. Verbal Reports, Collaboration Briefings and Liaison

1. The Awardee shall meet on an informal basis, as necessary or requested, with the NSF Program Director to review progress to date and to exchange views, ideas, and information concerning the program. During the initial three (3) month phase in period, and thereafter until notified by the NSF Program Director, a weekly status review meeting shall be held to discuss the progress of the transition/phase in, including any problems or delays encountered and changes occasioned by same. (Such weekly status review meetings may be held by telephone and the substance thereof confirmed via e-mail when agreed.

2. The Awardee and Collaborators shall jointly meet, as requested, with the NSF Program Director to detail the progress and discuss the status of the collaboration effort and any difficulties being encountered in providing to the Internet community the seamless interface service envisioned by their collaborative proposal and called for in Article 2 in (above). It is currently contemplated that, at least during the first twelve

(12) months of the award, such meetings shall be held quarterly at either NSF, the Awardee's or Collaborator's facilities.

3. When requested by the NSF Program Director, Awardee shall arrange to have its subawardees in attendance at meetings which deal with their areas of activity. In addition, at the request of the NSF Program Director, the Awardee shall arrange on-site meetings for the Program Officer, other Federal staff and/or representatives of the world-wide Internet community and the Awardee's professional personnel, and/or those of its subawardees.

#### C. Monthly Letter Progress Reports

Monthly letter progress reports may be submitted electronically to the NSF Program Official and NSF Administrative Official at the address shown on the cover page. These (monthly letter progress) reports shall be submitted in such detail and format as required by the Foundation's Program Director and shall contain statistical and narrative information on the performance of the Awardee during the preceding month.

#### D. Quarterly Status Report

1. Awardee shall prepare and furnish electronically and in four hard (4) copies quarterly letter status reports; the first quarterly status report will be for the period from January 1, 1993, through March 31, 1993. These reports shall show the status of all major events and summaries and major work performed during the quarter, including technical status, accomplishments, problems, collaboration activities, changes in future plans, and any pending requests for NSF approval and should be fully reconciled with the information, goals and projections contained in the Annual Report and Program Plan. The report shall also include a summary of award expenditures and line charges both cumulative and for the current quarter.

2. The report shall be prepared on a quarterly basis and shall be submitted within (30) days after the reporting period ends. No quarterly report need be submitted for the quarter in which the Annual Reports are submitted, but, Awardee must insure that any germane information for the quarter not contained in the Annual Report (i.e., list of pending requests for NSF approval) and submitted by separate letter.

#### E. Final Report

The Awardee shall submit electronically and in ten hard (10) copies a final report to NSF at the conclusion of the Cooperative Agreement. The final report shall contain a description of all work performed and problems encountered (and if requested a copy and documentation of any and all software and data generated) in such form and sufficient detail as to permit replication of the work by a reasonably knowledgeable party or organization.

#### F. Submission of Reports

All reports and Program Plans are to be forwarded to the Foundation electronically. Hard copies of reports are indicated to be forwarded in the specified number of copies to the following destinations:

No. of Copies	Addressee
1	National Science Foundation e-mail: awilson@nsf.gov ATTN: Alfred W. Wilson Division of Grants and Agreements, Room 495 Arlington, VA 22230 [Amend 01]
Remainder	National Science Foundation e-mail: dmitchel@nsf.gov ATTN: Donald Mitchell Division of Networking and Communications Research and Infrastructure, Room 1175 Arlington, VA 22230 [Amend 01]

## ARTICLE 11. DIRECTED ACTIVITIES

From time to time the NSF Program Director may require the Awardee to attend such meetings, seminars, conferences and planning and other events and/or to provide related supplies and services as necessary to disseminate information regarding registration services activity to the worldwide Internet community and/or to facilitate the most effective, efficient and ubiquitous registration services possible on an expedited basis. In such a case, the following procedures will be followed;

- A. The NSF Program Director shall request, by e-mail, the Awardee's attendance or special services required and an estimate by the Awardee of any reimbursable costs involved;
- B. Awardee shall submit to the NSF Program director, by e-mail, its estimate of any such reimbursable costs involved; and
- C. the NSF Program Director shall forward to the Awardee a letter directive requesting that the travel be performed and/or the special services be provided and specifying the maximum amount that Awardee will be reimbursed for its efforts pursuant to the letter directive.
- D. Pursuant to such a letter directive, Awardee may incur costs against the "Directed Activities" amounts included in the approved budget provided (i) that the costs so incurred do not exceed the maximum amount specified in the letter directive and (ii) provided also that the awardee may not incur costs under a letter directive if such costs, when combined with costs incurred under other letter directives will exceed the amount allotted for directed activities as set forth in Article 8.B.2 (above).

## ARTICLE 12. KEY PERSONNEL

- A. The following individuals are considered key personnel and essential to the work:

Alan S. Williamson  
John Zabluski

- B. Any changes in the individual (s) or significant changes in their proposed level of effort as set forth in the approved Program Plan for any period requires the prior written approval of the NSF Grants and Contracts Officer.

## ARTICLE 13. ORDER OF PRECEDENCE

Any inconsistency in this Cooperative Agreement shall be resolved by giving precedence in the following order (a) the Special Provisions; and (b) Grant General Conditions (5/94) and Cooperative Agreement General Conditions (5/94). [Amend 01]

## ARTICLE 14 PUBLICITY, PUBLIC INFORMATION, AND PUBLICATIONS

A. All news releases, public information brochures, publications and other similar items (not limited to printed media, and including video, etc., prepared by Awardee, subawardees, and/or their employees or contractors which describe activities or results under this Registration Services Agreement shall:

1. acknowledge the sponsorship of NSF:
2. be sent to NSF in reasonable quantities for project and related NSF distribution before being distributed or shown to the public; and
3. in the case of news releases or public information, be coordinated with and have the approval of the NSF Program Official before release.

B. An acknowledgment of NSF support must appear in any publication of any material, whether copyrighted or not, based upon or developed under this project, in substantially the following terms:

The material is based on work sponsored by the National Science Foundation under Cooperative Agreement No. NCR-9218742. The Government has certain rights in this material.

C. All writings such as reports, books, journal articles, software, data bases, sound recordings, video tapes and video discs, except scientific articles or papers published in scientific, technical or professional journals, must also contain the following disclaimer:

Any opinions, findings and conclusions or recommendations expressed in this publication are those of the author(s) and do not necessarily reflect the views of the National Science Foundation.

#### **ARTICLE 15. PROJECT INCOME FROM REGISTRATION FEES**

A. If, and to the extent that Awardee is authorized and/or directed to charge and collect user fees for the Registration Services provided hereunder, any user fees so collected shall be placed in an interest bearing account, and shall be used to defray the Awardee's and the Foundation's Project expenses in the following descending order of priority:

1. Project expenses incurred by Awardee as a result of the imposition of such fees.
2. Project expenses of the Awardee charged to the Foundation under this award. (Program Plans and future year funding requests should reflect any such Income.
3. Project expenses of Awardee's Collaborators charged to the Foundation under their respective Awards. (Program Plans and future year funding requests should reflect any such inform and project fund transfers.
4. The provisions of this Article shall apply only to any Project Income which is generated from the imposition of user based fees on registration services. Article 19, Project Income, of the General Conditions shall apply to project related revenue from any other source [Amend 01].

## Amendment 4 to Cooperative Agreement Between NSI and U.S. Government

13 September 1995

---

NATIONAL SCIENCE FOUNDATION  
4201 WILSON BOULEVARD  
ARLINGTON, VIRGINIA 22230

September 13, 1995

Mr. Dave M. Graves  
Contracts Administrator  
Network Solutions, Inc.  
505 Huntmar Park Drive  
Herndon, VA 22070

Cooperative Agreement No. NCR-9218742  
Amendment No. 04  
Proposal No. NCR-9544193

Dear Mr. Graves:

The purpose of this amendment is to modify the agreement to allow for the collection of user fees for registration services and establish the provisions for the use, disbursement and accountability of Program Income generated by such fees.

The Foundation and the Awardee hereby agree that the imposition of user fees for registration services will be carried out in accordance with the following general guidelines:

1. NSI will provide Registration and information Services as outlined in your approved Year 3 Program Plan.
2. Effective 12:00 A.M. EDT, September 14, 1995, Awardee is authorized to impose an annual fee of \$50/year per 2nd level domain name in .gov, .edu, .com, .net, and .org to pay for the services provided. NSF will pay the annual fee for domain name holders in .edu and .gov on a temporary basis. (The specifics of the imposition include an initial charge of \$100 for two years for new registrants and \$50/year payable on the anniversary date of the original registration

for every year thereafter. Existing domain name holders will be charged the \$50/year on their anniversary date.)

3. The funds collected by reason of the fee imposition will be treated as "Program Income" under the terms of the agreement. Of those funds:

a. 70% will be available to Awardee as consideration for the services provided.

b. the remaining 30% will be placed into an interest-bearing account which will be used for the preservation and enhancement of the "Intellectual Infrastructure" of the Internet in general conformance with approved Program Plans. Awardee will develop and implement mechanisms to insure the involvement of the Internet communities in determining and overseeing disbursements from this account. Awardee will also establish and maintain publically available records of all deposits to and disbursements from the account.

4. Any changes in the fee structure or amount will require approval (as set forth in Article 3.G of the agreement).

5. Awardee will continue to submit a Program Plan for approval by NSF in advance of each Program Year, to submit monthly, quarterly, and annual reports and attend/host quarterly InterNIC reviews as requested by the NSF Program Official.

The specific details of the implementation of user fees will be as set forth in Awardees letter of September 13, 1995 (including all attachments) which is incorporated herein by reference.

The Agreement, as amended, is hereby further amended as follows:

1. In Article 2.A.1, effective with this amendment, the reference to "General Atomics under Cooperative Agreement NCR-9218179" is hereby deleted, (reflecting the recent termination of that agreement).

2. To Article 4, the following section D is added:

"D. Beginning in November 1995, the Awardee shall make available on rs.internic.net performance measures for registration services and turnaround times, as well as Awardee's performance against those measures and turnaround times for public review and comment."

3. To Article 5, the following section C is added:

"C. The report generated by the performance review required by paragraph B. above will be available at ds.internic.net for public review."

4. In Article 8:

a. In section C. delete the date "September 30, 1995" and substitute in lieu thereof the date "September 13, 1995", and;

b. Add the following section G:

Article 8. Funding contained in the original cooperative agreement, and as amended by Amendments No. 1, 2 and 3 and above shall apply for the period January 1, 1993 through September 13, 1995).

Effective September 14, 1995, the following shall apply:

Compensation:

In consideration of all work performed under this agreement after September 13, 1995, Awardee shall impose a user fee of \$50/year per second level domain name in .gov, .edu, .com, .net, and .org to pay for the services provided as detailed in Awardees proposal of September 13, 1995. (The specifics of the imposition include an initial charge of \$100 for two years for new registrants and \$50/year payable on the anniversary date of the original registration for every year thereafter. Existing domain name holders will be charged the \$50/year on their anniversary date.) Implementation of the user fee imposition shall be in general accordance with Awardees proposal of September 13, 1995.

NSF shall pay the fees for the second level domain name registrations in the .edu domain for the period of this agreement, and shall on an interim basis support the fees for second level domain name registrations in the .gov domain. Notwithstanding the foregoing, Awardee will defer invoicing of fees for registrations in the .edu and .gov domains until

a further amendment is added explicating the provisions for the invoicing and payment of these fees.

The funds collected by reason of the user fee imposition will be considered "Program Income" under the terms of the agreement. Of these funds:

- a. 70 % will be available to NSI as consideration for the services provided.
- b. the remaining 30% will be placed into an interest-bearing account which will be used for the preservation and enhancement of the "Intellectual Infrastructure" of the Internet. Awardee will develop and implement mechanisms to insure the involvement of the Internet communities in determining and overseeing disbursements from this account. Awardee will also establish and maintain publically available records of all deposits to and disbursements from the account.

5. Effective October 1, 1995, Article 9, Annual Report, Program Plan and Budget, (effective for the period January 1, 1993 through September 30, 1995) is hereby superseded and replaced by the following Article 9. Annual Report, Program Plan and Budget:

#### **ARTICLE 9. Annual Report, Program Plan and Budget**

By January 31 each year, Awardee shall submit both electronically and in 10 hard copies an Annual Report, Program Plan and Budget to the Foundation for approval. These documents shall be submitted in a format and level of detail approved by the Foundation but shall, as a minimum, contain project goals and objectives specified with sufficient technical criteria, milestones, and objectives to measure the progress of the effort toward attainment of objectives during the time period for which it is being submitted. The Program Plan will be the basis for performance goals, areas of emphasis and any adjustments in the user fee charged for registration

services (or the distribution of revenues from those fees in the succeeding 12 month period). Each submission should contain narrative information indicating (for the past years' activities) by functional area and overall: any goals accomplished, exceeded or missed and explaining any significant deviations from the previous year's plan; any educational achievements; patents, copyrights or other innovations resulting from the activities. Each annual submission shall also contain information on projected revenues and expenditures for the upcoming year and actual projected revenues and expenditures for the reporting period.

The Awardee will receive a formal approval of the Program Plan from the Foundation.

6. Effective September 14, 1995, Article 15. Project Income from Registration Fees is superseded and replaced in its entirety by the following:

**Article 15. Revenues from Registration Fees**

All income generated by the imposition of user fees charged for registration services shall be considered "Project Income" within the agreement. Distribution and use of these funds shall be made in accordance with the provisions of Article 8. (as amended above) and Awardee's proposal of September 13, 1995.

Please indicate your acceptance of this amendment by having it signed by an authorized official of your organization and returning one copy to me as soon as possible.

Sincerely,

Karen L. Sandberg

### A Brief History of NSF and the Internet

*August 2003*

**Early Years: 1960s-1994.** The Internet that many of us take for granted today arose from a series of government-funded computer networking efforts. In 1969, the precursor to the Internet began with the U.S. Defense Department's ARPAnet. ARPA-funded researchers developed many of the protocols still used for most Internet communication. Several other agencies also developed networks so their researchers could communicate and share data. In 1981, for example, the National Science Foundation (NSF) provided a grant to establish the Computer Science Network (CSNET) to provide networking services to all university computer scientists.

In 1985, NSF considered how it could provide greater access to the high-end computing resources at its recently established supercomputer centers. Because NSF intended the supercomputers to be shared by scientists and engineers around the country, any viable solution had to link many research universities to the centers.

NSFNET went online in 1986 and connected the supercomputer centers at 56,000 bits per second—the speed of a typical computer modem today. In a short time, the network became congested and, by 1988, its links were upgraded to 1.5 megabits per second. A variety of regional research and education networks, supported in part by NSF, were connected to the NSFNET backbone, thus extending the Internet's reach throughout the United States.

Creation of NSFNET was an intellectual leap. It was the first large-scale implementation of Internet technologies in a complex environment of many independently operated networks. NSFNET forced the Internet community to iron out technical issues arising from the rapidly increasing number of computers and address many practical details of operations, management and conformance.

Throughout its existence, NSFNET carried, at no cost to institutions, any U.S. research and education traffic that could reach it. At the same time,

the number of Internet-connected computers grew from 2,000 in 1985 to more than 2 million in 1993. To handle the increasing data traffic, the NSFNET backbone became the first national 45-megabits-per-second Internet network in 1991.

The history of NSFNET and NSF's supercomputing centers also overlapped with the rise of personal computers and the launch of the World Wide Web in 1991 by Tim Berners-Lee and colleagues at CERN, the European Organisation for Nuclear Research, in Geneva, Switzerland. The NSF centers developed many tools for organizing, locating and navigating through information, including one of the first widely used Web server applications. But perhaps the most spectacular success was Mosaic, the first freely available Web browser to allow Web pages to include both graphics and text, which was developed in 1993 by students and staff working at the NSF-supported National Center for Supercomputing Applications (NCSA) at the University of Illinois, Urbana-Champaign. In less than 18 months, NCSA Mosaic became the Web "browser of choice" for more than a million users and set off an exponential growth in the number of Web servers as well as Web surfers. Mosaic was the progenitor of modern browsers such as Microsoft Internet Explorer and Netscape Navigator.

**Privatization: 1993-1998.** Commercial firms noted the popularity and effectiveness of the growing Internet and built their own networks. The proliferation of private suppliers led to an NSF solicitation in 1993 that outlined a new Internet architecture that largely remains in place today.

From that solicitation, NSF awarded contracts in 1995 for three network access points, to provide connection points between commercial networks, and one routing arbiter, to ensure an orderly exchange of traffic across the Internet. In addition, NSF signed a cooperative agreement to establish the next-generation very-high-performance Backbone Network Service. A more prominent milestone was the decommissioning of the NSFNET backbone in April 1995.

In the years following NSFNET, NSF helped navigate the road to a self-governing and commercially viable Internet during a period of remarkable growth. The most visible, and most contentious, component of the Internet transition was the registration of domain names. Domain name registration associates a human-readable character string (such as `nsf.gov`) with Internet Protocol (IP) addresses, which computers use to locate one another.

The Department of Defense funded early registration efforts because most registrants were military users and awardees. By the early 1990s, academic institutions comprised the majority of new registrations, so the Federal Networking Council (a group of government agencies involved in networking) asked NSF to assume responsibility for non-military Internet registration. When NSF awarded a five-year agreement for this service to Network Solutions, Inc. (NSI), in 1993, there were 7,500 domain names.

In September 1995, as the demand for Internet registration became largely commercial (97 percent) and grew by orders of magnitude, the NSF authorized NSI to charge a fee for domain name registration. Previously, NSF had subsidized the cost of registering all domain names. At that time,

there were 120,000 registered domain names. In September 1998, when NSF's agreement with NSI expired, the number of registered domain names had passed 2 million.

The year 1998 marked the end of NSF's direct role in the Internet. That year, the network access points and routing arbiter functions were transferred to the commercial sector. And after much debate, the Department of Commerce's National Telecommunications and Information Administration formalized an agreement with the non-profit Internet Corporation for Assigned Numbers and Names (ICANN) for oversight of domain name registration. Today, anyone can register a domain name through a number of ICANN-accredited registrars.

**NSF after NSFNET.** The decommissioning of NSFNET and privatization of the Internet did not mark the end of NSF's involvement in networking. NSF continues to support many research projects to develop new networking tools, educational uses of the Internet and network-based applications.

Through its programs, NSF helps research and education institutions—including those serving underrepresented minorities, rural areas, and Native American reservations—make and enhance their connections to the Internet. NSF has also been instrumental in providing international connections services that have bridged the U.S. network infrastructure with countries and regions including Europe, Mongolia, Africa, Latin America, Russia and the Pacific Rim. In addition, NSF has continued to extend the reach of the highest-performance U.S. research and education networks by supporting connectivity and collaborations with their counterparts in Canada, Europe and Asia.

### **NSF Internet Experts**

Thomas Greene, senior program director in the CISE Advanced Networking Infrastructure and Research division, oversees a number of NSF's post-NSFNET Internet efforts, including national and international connections programs. [tgreene@nsf.gov](mailto:tgreene@nsf.gov), 703-292-8948.

Larry Landweber, CISE senior advisor on networking, proposed the CSNET concept in 1979 and organized the workshops that led to its creation in 1981. He was an advisor to NSF during the development of NSFNET and helped establish the first Internet gateways between the United States and countries in Europe, Asia and Latin America. [llandweb@nsf.gov](mailto:llandweb@nsf.gov), 703-292-8900.

George Strawn, currently NSF's Chief Information Officer, was the NSFNET program director from 1991 to 1993. From 1993 to 1995, he was involved with defining and deploying the privatized Internet architecture, and from 1995 to 1998 as networking division director, he led NSF's efforts in the Next Generation Internet Initiative. *The paper set forth below, concerning ways to improve technical management of the Internet Domain Name System, is a proposed rule of the Department of Commerce. This same document will be published in the Federal Register in the near future. While the Department will accept comments on the paper starting today, the Federal Register publication will establish the official deadline for the acceptance of public comment on this proposed rule. Comments may be mailed to U.S. Department of Commerce, NTIA/OIA, 14th and Constitution Avenue, N.W., Washington, D.C. 20230 or sent via electronic mail to [dns@ntia.doc.gov](mailto:dns@ntia.doc.gov). Though it is not intended or expected, should any discrepancy occur between the document set forth below and that published in the Federal Register, the Federal Register publication controls. All comments received will be considered exclusively in the context of issuing a final rule. The paper is being made available through the Internet solely as a means to facilitate the public's access to this document and to provide an additional means of notifying the public of the solicitation of public comment on the proposed rule.*

**A PROPOSAL TO IMPROVE TECHNICAL MANAGEMENT OF  
INTERNET NAMES AND ADDRESSES  
DISCUSSION DRAFT 1/30/98**

Domain names are the familiar and easy-to-remember names for Internet computers (e.g. "www.ecommerce.gov"). They map to unique Internet Protocol (IP) numbers (e.g. 98.37.241.30) that serve as routing addresses on the Internet. The domain name system (DNS) translates Internet names into the IP numbers needed for transmission of information across the network.

### ***History***

Today's Internet is an outgrowth of U.S. government investments in packet-switching technology and communications networks carried out under agreements with the Defense Advanced Research Projects Agency (DARPA), the National Science Foundation (NSF) and other U.S. research agencies. The government encouraged bottom-up development of networking technologies through work at NSF, which established the NSFNET as a network for research and education. The NSFNET fostered a wide range of applications, and in 1992 the U.S. Congress gave the National Science Foundation statutory authority to commercialize the NSFNET, which formed the basis for today's Internet.

As a legacy, major components of the domain name system are still performed by or subject to agreements with agencies of the U.S. government.

### **1) Assignment of numerical addresses to Internet users.**

Every Internet computer has a unique IP number. The Internet Assigned Numbers Authority (IANA), headed by Dr. Jon Postel of the Information Sciences Institute (ISI) at the University of Southern California, coordinates this system by allocating blocks of numerical addresses to regional IP registries (ARIN in North America, RIPE in Europe, and APNIC in the Asia/Pacific region), under contract with DARPA. In turn, larger Internet service providers

apply to the regional IP registries for blocks of IP addresses. The recipients of those address blocks then reassign addresses to smaller Internet service providers and to end users.

## **2) Management of the system of registering names for Internet users.**

The domain name space is constructed as a hierarchy. It is divided into top-level domains (TLDs), with each TLD then divided into second-level domains (SLDs), and so on. More than 200 national, or country-code, TLDs (ccTLDs) are administered by their corresponding governments or by private entities with the appropriate national government's acquiescence. A small set of generic top-level domains (gTLDs) do not carry any national identifier, but denote the intended function of that portion of the domain space. For example, .com was established for commercial users, .org for not-for-profit organizations, and .net for network service providers. The registration and propagation of these key gTLDs are performed by Network Solutions, Inc. (NSI), a Virginia-based company, under a five-year cooperative agreement with NSF. This agreement includes an optional ramp-down period that expires on September 30, 1998.

## **3) Operation of the root server system.**

The root server system contains authoritative databases listing the TLDs so that an Internet message can be routed to its destination. Currently, NSI operates the "A" root server, which maintains the authoritative root database and replicates changes to the other root servers on a daily basis. Different organizations, including NSI, operate the other 12 root servers. In total, the U.S. government plays a direct role in the operation of half of the world's root servers. Universal connectivity on the Internet cannot be guaranteed without a set of authoritative and consistent roots.

## **4) Protocol Assignment.**

The Internet protocol suite, as defined by the Internet Engineering Task Force (IETF), contains many technical parameters, including protocol numbers, port numbers, autonomous system numbers, management information base object identifiers and others. The common use of these protocols by the Internet community requires that the particular values used in these fields be assigned uniquely. Currently, IANA, under contract with DARPA, makes these assignments and maintains a registry of the assigned values.

### ***The Need for Change***

From its origins as a U.S.-based research vehicle, the Internet is rapidly becoming an international medium for commerce, education and communication. The traditional means of organizing its technical functions need to evolve as well. The pressures for change are coming from many different quarters:

- There is widespread dissatisfaction about the absence of competition in domain name registration.
- Mechanisms for resolving conflict between trademark holders and domain name holders are expensive and cumbersome.

-Without changes, a proliferation of lawsuits could lead to chaos as tribunals around the world apply the antitrust law and intellectual property law of their jurisdictions to the Internet.

-Many commercial interests, staking their future on the successful growth of the Internet, are calling for a more formal and robust management structure.

-An increasing percentage of Internet users reside outside of the U.S., and those stakeholders want a larger voice in Internet coordination.

-As Internet names increasingly have commercial value, the decision to add new top-level domains cannot continue to be made on an ad hoc basis by entities or individuals that are not formally accountable to the Internet community.

-As the Internet becomes commercial, it becomes inappropriate for U.S. research agencies (NSF and DARPA) to participate in and fund these functions.

### ***The Future Role of the U.S. Government in the DNS***

On July 1, 1997, as part of the Clinton Administration's *Framework for Global Electronic Commerce*, the President directed the Secretary of Commerce to privatize, increase competition in, and promote international participation in the domain name system.

Accordingly, on July 2, 1997, the Department of Commerce issued a Request for Comments (RFC) on DNS administration, on behalf of an inter-agency working group previously formed to explore the appropriate future role of the U.S. government in the DNS. The RFC solicited public input on issues relating to the overall framework of the DNS system, the creation of new top-level domains, policies for registrars, and trademark issues. During the comment period, over 430 comments were received, amounting to some 1500 pages.<sup>(1)</sup>

This discussion draft, shaped by the public input described above, provides notice and seeks public comment on a proposal to improve the technical management of Internet names and addresses. It does not propose a monolithic structure for Internet governance. We doubt that the Internet should be governed by one plan or one body or even by a series of plans and bodies. Rather, we seek to create mechanisms to solve a few, primarily technical (albeit critical) questions about administration of Internet names and numbers.

### **PRINCIPLES FOR A NEW SYSTEM**

Our consultations have revealed substantial differences among Internet stakeholders on how the domain name system should evolve. Since the Internet is changing so rapidly, no one entity or individual can claim to know what is best for the Internet. We certainly do not believe that our views are uniquely prescient. Nevertheless, shared principles have emerged from our discussions with Internet stakeholders.

#### **1. Stability.**

The U.S. government should end its role in the Internet number and name address systems in a responsible manner. This means, above all else, ensuring the stability of the

Internet. The Internet functions well today, but its current technical management is probably not viable over the long term. We should not wait for it to break down before acting. Yet, we should not move so quickly, or depart so radically from the existing structures, that we disrupt the functioning of the Internet. The introduction of a new system should not disrupt current operations, or create competing root systems.

## 2. Competition.

The Internet succeeds in great measure because it is a decentralized system that encourages innovation and maximizes individual freedom. Where possible, market mechanisms that support competition and consumer choice should drive the technical management of the Internet because they will promote innovation, preserve diversity, and enhance user choice and satisfaction.

## 3. Private, Bottom-Up Coordination.

Certain technical management functions require coordination. In these cases, responsible, private-sector action is preferable to government control. A private coordinating process is likely to be more flexible than government and to move rapidly enough to meet the changing needs of the Internet and of Internet users. The private process should, as far as possible, reflect the bottom-up governance that has characterized development of the Internet to date.

## 4. Representation.

Technical management of the Internet should reflect the diversity of its users and their needs. Mechanisms should be established to ensure international input in decision making.

In keeping with these principles, we divide the name and number functions into two groups, those that can be moved to a competitive system and those that should be coordinated. We then suggest the creation of a representative, not-for-profit corporation to manage the coordinated functions according to widely accepted objective criteria. We then suggest the steps necessary to move to competitive markets in those areas that can be market driven. Finally, we suggest a transition plan to ensure that these changes occur in an orderly fashion that preserves the stability of the Internet.

## **THE PROPOSAL**

### ***The Coordinated Functions***

Management of number addresses is best done on a coordinated basis. As technology evolves, changes may be needed in the number allocation system. These changes should also be undertaken in a coordinated fashion.

Similarly, coordination of the root server network is necessary if the whole system is to work smoothly. While day-to-day operational tasks, such as the actual operation and maintenance of

the Internet root servers, can be contracted out, overall policy guidance and control of the TLDs and the Internet root server system should be vested in a single organization that is representative of Internet users.

Finally, coordinated maintenance and dissemination of the protocol parameters for Internet addressing will best preserve the stability and interconnectivity of the Internet.

We propose the creation of a private, not-for-profit corporation (the new corporation) to manage the coordinated functions in a stable and open institutional framework. The new corporation should operate as a private entity for the benefit of the Internet as a whole. The new corporation would have the following authority:

1. to set policy for and direct the allocation of number blocks to regional number registries for the assignment of Internet addresses;
2. to oversee the operation of an authoritative root server system;
3. to oversee policy for determining, based on objective criteria clearly established in the new organization's charter, the circumstances under which new top-level domains are added to the root system; and
4. to coordinate the development of other technical protocol parameters as needed to maintain universal connectivity on the Internet.

The U.S. government would gradually transfer existing IANA functions, the root system and the appropriate databases to this new not-for-profit corporation. This transition would commence as soon as possible, with operational responsibility moved to the new entity by September 30, 1998. The U.S. government would participate in policy oversight to assure stability until the new corporation is established and stable, phasing out as soon as possible and in no event later than September 30, 2000. The U.S. Department of Commerce will coordinate the U.S. government policy role. In proposing these dates, we are trying to balance concerns about a premature U.S. government exit that turns the domain name system over to a new and untested entity against the concern that the U.S. government will never relinquish its current management role.

The new corporation will be funded by domain name registries and regional IP registries. Initially, current IANA staff will move to this new organization to provide continuity and expertise throughout the period of time it takes to establish the new corporation. The new corporation should hire a chief executive officer with a background in the corporate sector to bring a more rigorous management to the organization than was possible or necessary when the Internet was primarily a research medium. As these functions are now performed in the United States, the new corporation will be headquartered in the United States, and incorporated under U.S. law as a not-for-profit corporation. It will, however, have and report to a board of directors from around the world.

It is probably impossible to establish and maintain a perfectly representative board for this new organization. The Internet community is already extraordinarily diverse and likely to become more so over time. Nonetheless, the organization and its board must derive legitimacy from the participation of key stakeholders. Since the organization will be concerned mainly

with numbers, names and protocols, its board should represent membership organizations in each of these areas, as well as the direct interests of Internet users.

The board of directors for the new corporation should be balanced to equitably represent the interests of IP number registries, domain name registries, domain name registrars, the technical community, and Internet users (commercial, not-for-profit, and individuals). Officials of governments or intergovernmental organizations should not serve on the board of the new corporation. Seats on the initial board might be allocated as follows:

1. -three directors from a membership association of regional number registries, representing three different regions of the world. Today this would mean one each from ARIN, APNIC and RIPE. As additional regional number registries are added, board members could be designated on a rotating basis or elected by a membership organization made up of regional registries. ARIN, RIPE and APNIC are open membership organizations that represent entities with large blocks of numbers. They have the greatest stake in and knowledge of the number address system. They are also representative internationally.
2. -two members designated by the Internet Architecture Board (IAB), an international membership board that represents the technical community of the Internet.
3. -two members designated by a membership association (to be created) representing domain name registries and registrars.
4. -seven members designated by a membership association (to be created) representing Internet users. At least one of those board seats could be designated for an individual or entity engaged in non-commercial, not-for-profit use of the Internet, and one for individual end users. The remaining seats could be filled by commercial users, including trademark holders.
5. -the CEO of the new corporation would serve on the board of directors.

The new corporation's processes should be fair, open and pro-competitive, protecting against capture by a narrow group of stakeholders. Its decision-making processes should be sound and transparent; the bases for its decisions should be recorded and made publicly available. Super-majority or even consensus requirements may be useful to protect against capture by a self-interested faction. The new corporation's charter should provide a mechanism whereby its governing body will evolve to reflect changes in the constituency of Internet stakeholders. The new corporation should establish an open process for the presentation of petitions to expand board representation.

In performing the functions listed above, the new corporation will act much like a standard-setting body. To the extent that the new corporation operates in an open and pro-competitive manner, its actions will withstand antitrust scrutiny. Its standards should be reasonably based on, and no broader than necessary to promote its legitimate coordinating objectives. Under U.S. law, a standard-setting body can face antitrust liability if it is dominated by an economically interested entity, or if standards are set in secret by a few leading competitors. But appropriate processes and structure will minimize the possibility that the body's actions will be, or will appear to a court to be, anticompetitive.

### ***The Competitive Functions***

The system for registering second-level domain names and the management of the TLD registries should become competitive and market-driven.

In this connection, we distinguish between registries and registrars. A "registry," as we use the term, is responsible for maintaining a TLD's zone files, which contain the name of each SLD in that TLD and each SLD's corresponding IP number. Under the current structure of the Internet, a given TLD can have no more than one registry. A "registrar" acts as an interface between domain-name holders and the registry, providing registration and value-added services. It submits to the registry zone file information and other data (including contact information) for each of its customers in a single TLD. Currently, NSI acts as both the exclusive registry and as the exclusive registrar for .com, .net, .org, and .edu.

Both registry and registrar functions could be operated on a competitive basis. Just as NSI acts as the registry for .com, .net, and .org, other companies could manage registries with different TLDs such as .vend or .store. Registrars could provide the service of obtaining domain names for customers in any gTLD. Companies that design Web sites for customers might, for example, provide registration as an adjunct to other services. Other companies may perform this function as a stand-alone business.

There appears to be strong consensus that, at least at this time, domain name registration - the registrar function - should be competitive. There is disagreement, however, over the wisdom of promoting competition at the registry level.

Some have made a strong case for establishing a market-driven registry system. Competition among registries would allow registrants to choose among TLDs rather than face a single option. Competing TLDs would seek to heighten their efficiency, lower their prices, and provide additional value-added services. Investments in registries could be recouped through branding and marketing. The efficiency, convenience, and service levels associated with the assignment of names could ultimately differ from one TLD registry to another. Without these types of market pressures, they argue, registries will have very little incentive to innovate.

Others feel strongly, however, that if multiple registries are to exist, they should be undertaken on a not-for-profit basis. They argue that lack of portability among registries (that is, the fact that users cannot change registries without adjusting at least part of their domain name string) could create lock-in problems and harm consumers. For example, a registry could induce users to register in a top-level domain by charging very low prices initially and then raise prices dramatically, knowing that name holders will be reluctant to risk established business by moving to a different top-level domain.

We concede that switching costs and lock-in could produce the scenario described above. On the other hand, we believe that market mechanisms may well discourage this type of behavior. On balance, we believe that consumers will benefit from competition among market oriented registries, and we thus support limited experimentation with competing registries during the transition to private sector administration of the domain name system.

### ***The Creation of New gTLDs***

Internet stakeholders disagree about who should decide when a new top-level domain can be added and how that decision should be made. Some believe that anyone should be allowed to create a top-level domain registry. They argue that the market will decide which will succeed and which will not. Others believe that such a system would be too chaotic and would dramatically increase customer confusion. They argue that it would be far more complex technically, because the root server system would have to point to a large number of top-level domains that were changing with great frequency. They also point out that it would be much more difficult for trademark holders to protect their trademarks if they had to police a large number of top-level domains.

All these arguments have merit, but they all depend on facts that only further experience will reveal. At least in the short run, a prudent concern for the stability of the system requires that expansion of gTLDs proceed at a deliberate and controlled pace to allow for evaluation of the impact of the new gTLDs and well-reasoned evolution of the domain space. The number of new top-level domains should be large enough to create competition among registries and to enable the new corporation to evaluate the functioning, in the new environment, of the root server system and the software systems that enable shared registration. At the same time, it should not be so large as to destabilize the Internet.

We believe that during the transition to private management of the DNS, the addition of up to five new registries would be consistent with these goals. At the outset, we propose that each new registry be limited to a single top-level domain. During this period, the new corporation should evaluate the effects that the addition of new gTLDs have on the operation of the Internet, on users, and on trademark holders. After this transition, the new corporation will be in a better position to decide whether or when the introduction of additional gTLDs is desirable.

Individual companies and consortia alike may seek to operate specific generic top-level domains. Competition will take place on two levels. First, there will be competition among different generic top-level domains. Second, registrars will compete to register clients into these generic top-level domains. By contrast, existing national registries will continue to administer country-code top-level domains if these national governments seek to assert those rights. Changes in the registration process for these domains are up to the registries administering them and their respective national governments.

Some have called for the creation of a more descriptive system of top-level domains based on industrial classifications or some other easy to understand schema. They suggest that having multiple top-level domains is already confusing and that the addition of new generic TLDs will make it more difficult for users to find the companies they are seeking.

Market driven systems result in innovation and greater consumer choice and satisfaction in the long run. We expect that in the future, directory services of various sorts will make it easy for users to find the sites they seek regardless of the number of top-level domains. Attempts to impose too much central order risk stifling a medium like the Internet that is decentralized by nature and thrives on freedom and innovation.

### ***The Trademark Dilemma***

It is important to keep in mind that trademark/domain name disputes arise very rarely on the Internet today. NSI, for example, has registered millions of domain names, only a tiny fraction of which have been challenged by a trademark owner. But where a trademark is unlawfully used as a domain name, consumers may be misled about the source of the product or service offered on the Internet, and trademark owners may not be able to protect their rights without very expensive litigation.

For cyberspace to function as an effective commercial market, businesses must have confidence that their trademarks can be protected. On the other hand, management of the Internet must respond to the needs of the Internet community as a whole, and not trademark owners exclusively. The balance we strike is to provide trademark holders with the same rights they have in the physical world, to ensure transparency, to guarantee a dispute resolution mechanism with resort to a court system, and to add new top-level domains carefully during the transition to private sector coordination of the domain name system.

There are certain steps that could be taken in the application process that would not be difficult for an applicant, but that would make the trademark owner's job easier. For instance, gTLD registrants could supply basic information -- including the applicant's name and sufficient contact information to be able to locate the applicant or its representative. To deter the pirating of domain names, the registry could also require applicants to certify that it knows of no entity with superior rights in the domain name it seeks to register.

The job of policing trademarks could be considerably easier if domain name databases were readily searchable through a common interface to determine what names are registered, who holds those domain names, and how to contact a domain name holder. Many trademark holders find the current registration search tool, Whois, too limited in its functioning to be effective for this purpose. A more robust and flexible search tool, which features multiple field or string searching and retrieves similar names, could be employed or developed to meet the needs of trademark holders. The databases also could be kept up to date by a requirement that domain name registrants maintain up-to-date contact information.

Mechanisms that allow for on-line dispute resolution could provide an inexpensive and efficient alternative to litigation for resolving disputes between trademark owners and domain name registrants. A swift dispute resolution process could provide for the temporary suspension of a domain name registration if an adversely affected trademark holder objects within a short time, e.g. 30 days, of the initial registration. We seek comment on whether registries should be required to resolve disputes within a specified period of time after an opposition is filed, and if so, how long that period should be.

Trademark holders have expressed concern that domain name registrants in faraway places may be able to infringe their rights with no convenient jurisdiction available in which the trademark owner could file suit to protect those rights. At the time of registration, registrants could agree that, in the event of a trademark dispute involving the name registered, jurisdiction would lie where the registry is domiciled, where the registry database is maintained, or where the "A" root server is maintained. We seek comment on this proposal, as well as suggestions for how such jurisdictional provisions could be implemented.

Trademark holders have also called for the creation of some mechanism for "clearing" trademarks, especially famous marks, across a range of gTLDs. Such mechanisms could reduce trademark conflict associated with the addition of new gTLDs. Again, we seek comment on this proposal, and suggested mechanisms for trademark clearance processes.

We stop short of proposals that could significantly limit the flexibility of the Internet, such as waiting periods or not allowing any new top-level domains.

We also do not propose to establish a monolithic trademark dispute resolution process at this time, because it is unclear what system would work best. Even trademark holders we have consulted are divided on this question. Therefore, we propose that each name registry must establish minimum dispute resolution and other procedures related to trademark considerations. Those minimum procedures are spelled out in [Appendix 2](#). Beyond those minimums, registries would be permitted to establish additional trademark protection and trademark dispute resolution mechanisms.

We also propose that shortly after their introduction into the root, a study be undertaken on the effects of adding new gTLDs and related dispute resolution procedures on trademark and intellectual property right holders. This study should be conducted under the auspices of a body that is internationally recognized in the area of dispute resolution procedures, with input from trademark and domain name holders and registries. The findings of this study should be submitted to the board of the new corporation and considered when it makes decisions on the creation and introduction of new gTLDs. Information on the strengths and weaknesses of different dispute resolution procedures should also give the new corporation guidance for deciding whether the established minimum criteria for dispute resolution should be amended or maintained. Such a study could also provide valuable input with respect to trademark harmonization generally.

U.S. trademark law imposes no general duty on a registrar to investigate the propriety of any given registration.<sup>(2)</sup> Under existing law, a trademark holder can properly file a lawsuit against a domain name holder that is infringing or diluting the trademark holder's mark. But the law provides no basis for holding that a registrar's mere registration of a domain name, at the behest of an applicant with which it has an arm's-length relationship, should expose it to liability.<sup>(3)</sup> Infringers, rather than registrars, registries, and technical management bodies, should be liable for trademark infringement. Until case law is fully settled, however, registries can expect to incur legal expenses in connection with trademark disputes as a cost of doing business. These costs should not be borne by the new not-for-profit corporation, and therefore registries should be required to indemnify the new corporation for costs incurred in connection with trademark disputes. The evolution of litigation will be one of the factors to be studied by the group tasked to review Internet trademark issues as the new structure evolves.

### ***The Intellectual Infrastructure Fund***

In 1995, NSF authorized NSI to assess new domain name registrants a \$50 fee per year for the first two years, 30 percent of which was to be deposited in a fund for the preservation and enhancement of the intellectual infrastructure of the Internet (the "Intellectual Infrastructure Fund")

In excess of \$46 Million has been collected to date. In 1997, Congress authorized the crediting of \$23 Million of the funds collected to the Research and Related Activities Appropriation of the National Science Foundation to support the development of the Next Generation Internet. The establishment of the Intellectual Infrastructure Fund currently is the subject of litigation in the U.S. District Court for the District of Columbia.

As the U.S. government is seeking to end its role in the domain name system, we believe the provision in the cooperative agreement regarding allocation of a portion of the registration fee to the Internet Intellectual Infrastructure Fund should terminate on April 1, 1998, the beginning of the ramp-down period of the cooperative agreement.

## **THE TRANSITION**

A number of steps must be taken to create the system envisioned in this paper.

1. The new not-for-profit organization must be established and its board chosen.
2. The membership associations representing 1) registries and registrars, and 2) Internet users, must be formed.
3. An agreement must be reached between the U.S. government and the current IANA on the transfer of IANA functions to the new organization.
4. NSI and the U.S. government must reach agreement on the terms and conditions of NSI's evolution into one competitor among many in the registrar and registry marketplaces. A level playing field for competition must be established.
5. The new corporation must establish processes for determining whether an organization meets the transition period criteria for prospective registries and registrars.
6. A process must be laid out for making the management of the root server system more robust and secure, and, for transitioning that management from U.S. government auspices to those of the new corporation.

### ***The NSI Agreement***

The U.S. government will ramp down the NSI cooperative agreement and phase it out by the end of September 1998. The ramp down agreement with NSI should reflect the following terms and conditions designed to promote competition in the domain name space.

1. NSI will effectively separate and maintain a clear division between its current registry business and its current registrar business. NSI will continue to operate .com, .net and .org but on a fully shared-registry basis; it will shift operation of .edu to a not-for-profit entity. The registry will treat all registrars on a nondiscriminatory basis and will price registry services according to an agreed upon formula for a period of time.
2. As part of the transition to a fully shared-registry system, NSI will develop (or license) and implement the technical capability to share the registration of its top-level domains with any registrar so that any registrar can register domain names there in as soon as possible, by a date certain to be agreed upon.

3. NSI will give the U.S. government a copy and documentation of all the data, software, and appropriate licenses to other intellectual property generated under the cooperative agreement, for use by the new corporation for the benefit of the Internet.
4. NSI will turn over control of the "A" root server and the management of the root server system when instructed to do so by the U.S. government.
5. NSI will agree to meet the requirements for registries and registrars set out in [Appendix 1](#).

### ***Competitive Registries, Registrars, and the Addition of New gTLDs***

Over the past few years, several groups have expressed a desire to enter the registry or registrar business. Ideally, the U.S. government would stay its hand, deferring the creation of a specific plan to introduce competition into the domain name system until such time as the new corporation has been organized and given an opportunity to study the questions that such proposals raise. Should the transition plan outlined below, or some other proposal, fail to achieve substantial consensus, that course may well need to be taken.

Realistically, however, the new corporation cannot be established overnight. Before operating procedures can be established, a board of directors and a CEO must be selected. Under a best case scenario, it is unlikely that the new corporation can be fully operational before September 30, 1998. It is our view, based on widespread public input, that competition should be introduced into the DNS system more quickly.

We therefore set out below a proposal to introduce competition into the domain name system during the transition from the existing U.S. government authority to a fully functioning coordinating body. This proposal is designed only for the transition period. Once the new corporation is formed, it will assume authority over the terms and conditions for the admission of new top-level domains.

#### ***Registries and new gTLDs***

This proposal calls for the creation of up to five new registries, each of which would be initially permitted to operate one new gTLD. As discussed above, that number is large enough to provide valuable information about the effects of adding new gTLDs and introducing competition at the registry level, but not so large as to threaten the stability of the Internet during this transition period. In order to designate the new registries and gTLDs, IANA must establish equitable, objective criteria and processes for selecting among a large number of individuals and entities that want to provide registry services. Unsuccessful applicants will be disappointed.

We have examined a number of options for recognizing the development work already underway in the private sector. For example, some argue for the provision of a "pioneer preference" or other grandfathering mechanism to limit the pool of would-be registrants to those who, in response to previous IANA requests, have already invested in developing registry businesses. While this has significant appeal and we do not rule it out, it is not an easy matter to determine who should be in that pool. IANA would be exposed to considerable liability for such determinations, and required to defend against charges that it acted in an

arbitrary or inequitable manner. We welcome suggestions as to whether the pool of applicants should be limited, and if so, on what basis.

We propose, that during the transition, the first five entities (whether from a limited or unlimited pool) to meet the technical, managerial, and site requirements described in Appendix 1 will be allowed to establish a domain name registry. The IANA will engage neutral accounting and technical consultancy firms to evaluate a proposed registry under these criteria and certify an applicant as qualified. These registries may either select, in order of their qualification, from a list of available gTLDs or propose another gTLD to IANA. (We welcome suggestions on the gTLDs that should be immediately available and would propose a list based on that input, as well as any market data currently available that indicates consumer interest in particular gTLDs.)

The registry will be permitted to provide and charge for value-added services, over and above the basic services provided to registrars. At least at this time, the registry must, however, operate on a shared registry basis, treating all registrars on a nondiscriminatory basis, with respect to pricing, access and rules. Each TLD's registry should be equally accessible to any qualified registrar, so that registrants may choose their registrars competitively on the basis of price and service. The registry will also have to agree to modify its technical capabilities based on protocol changes that occur in Internet technology so that interoperability can be preserved. At some point in the future, the new organization may consider the desirability of allowing the introduction of non-shared registries.

### ***Registrars***

Any entity will be permitted to provide registrar services as long as it meets the basic technical, managerial, and site requirements as described in [Appendix 1](#) of this paper. Registrars will be allowed to register clients into any top-level domain for which the client satisfies the eligibility rules, if any.

### ***The Root Server System***

IANA and the U.S. government, in cooperation with NSI, the IAB, and other relevant organizations will undertake a review of the root server system to recommend means to increase the security and professional management of the system. The recommendations of the study should be implemented as part of the transition process to the new corporation.

### ***The .us Domain***

At present, the IANA administers .us as a locality based hierarchy in which second-level domain space is allocated to states and US territories.<sup>(4)</sup> This name space is further subdivided into localities. General registration under localities is performed on an exclusive basis by private firms that have requested delegation from IANA. The .us name space has typically been used by branches of state and local governments, although some commercial names have been assigned. Where registration for a locality has not been delegated, the IANA itself serves as the registrar.

Some in the Internet community have suggested that the pressure for unique identifiers in the .com gTLD could be relieved if commercial use of the .us space was encouraged. Commercial users and trademark holders, however, find the current locality-based system too cumbersome and complicated for commercial use. Expanded use of the .us TLD could alleviate some of the pressure for new generic TLDs and reduce conflicts between American companies and others vying for the same domain name.

Clearly, there is much opportunity for enhancing the .us domain space, and the .us domain could be expanded in many ways without displacing the current geopolitical structure. Over the next few months, the U.S. government will work with the private sector and state and local governments to determine how best to make the .us domain more attractive to commercial users. It may also be appropriate to move the gTLDs traditionally reserved for U.S. government use (i.e. .gov and .mil), into a reformulated .us ccTLD.

The U.S. government will further explore and seek public input on these issues through a separate Request for Comment on the evolution of the .us name space. However, we welcome any preliminary comments at this time.

### ***The Process***

The U.S. government recognizes that its unique role in the Internet domain name system should end as soon as is practical. We also recognize an obligation to end this involvement in a responsible manner that preserves the stability of the Internet. We cannot cede authority to any particular commercial interest or any specific coalition of interest groups. We also have a responsibility to oppose any efforts to fragment the Internet, as this would destroy one of the key factors - interoperability - that has made the Internet so successful.

Our goal is to seek as strong a consensus as possible so that a new, open, and accountable system can emerge that is legitimate in the eyes of all Internet stakeholders. It is in this spirit that we present this paper for discussion.

---

## **Appendix 1**

### ***Recommended Registry and Registrar Requirements***

In order to ensure the stability of the Internet's domain name system, protect consumers, and preserve the intellectual property rights of trademark owners, all registries of generic top-level domain names must meet the set of technical, managerial, and site requirements outlined below. Only prospective registries that meet these criteria will be allowed by IANA to register their gTLD in the "A" server. If, after it begins operations, a registry no longer meets these requirements, IANA may transfer management of the domain names under that registry's gTLD to another organization.

Independent testing, reviewing, and inspection called for in the requirements for registries should be done by appropriate certifying organizations or testing laboratories rather than IANA itself, although IANA will define the requirements and the procedures for tests and audits.

These requirements apply only to generic TLDs. They will apply to both existing gTLDs (e.g., .com, .edu., .net, .org) and new gTLDs. Although they are not required to, we expect many ccTLD registries and registrars may wish to assure their customers that they meet these requirements or similar ones.

Registries will be separate from registrars and have only registrars as their customers. If a registry wishes to act both as registry and registrar for the same TLD, it must do so through separate subsidiaries. Appropriate accounting and confidentiality safeguards shall be used to ensure that the registry subsidiary's business is not utilized in any manner to benefit the registrar subsidiary to the detriment of any other registrar.

Each top-level domain (TLD) database will be maintained by only one registry and, at least initially, each new registry can host only one TLD.

### **Registry requirements:**

1. An independently-tested, functioning DATABASE AND COMMUNICATIONS SYSTEM that:

- a. Allows multiple competing registrars to have secure access (with encryption and authentication) to the database on an equal (first-come, first-served) basis.
- b. Is both robust (24 hours per day, 365 days per year) and scalable (i.e., capable of handling high volumes of entries and inquiries).
- c. Has multiple high-throughput (i.e., at least T1) connections to the Internet via at least two separate Internet Service Providers.
- d. Includes a daily data backup and archiving system.
- e. Incorporates a record management system that maintains copies of all transactions, correspondence, and communications with registrars for at least the length of a registration contract.
- f. Features a searchable, on-line database meeting the requirements of Appendix 2.
- g. Provides free access to the software and customer interface that a registrar would need to register new second-level domain names.
- h. An adequate number (perhaps two or three) of globally-positioned zone-file servers connected to the Internet for each TLD.

2. Independently-reviewed MANAGEMENT POLICIES, PROCEDURES, AND PERSONNEL including:

- a. Alternate (i.e., non-litigation) dispute resolution providing a timely and inexpensive forum for trademark-related complaints. (These procedures should be consistent with applicable national laws and compatible with any available judicial or administrative remedies.)

b. A plan to ensure that the registry's obligations to its customers will be fulfilled in the event that the registry goes out of business. This plan must indicate how the registry would ensure that domain name holders will continue to have use of their domain name and that operation of the Internet will not be adversely affected.

c. Procedures for assuring and maintaining the expertise and experience of technical staff.

d. Commonly-accepted procedures for information systems security to prevent malicious hackers and others from disrupting operations of the registry.

3. Independently inspected PHYSICAL SITES that feature:

a. A backup power system including a multi-day power source.

b. A high level of security due to twenty-four-hour guards and appropriate physical safeguards against intruders.

c. A remotely-located, fully redundant and staffed twin facility with "hot switchover" capability in the event of a main facility failure caused by either a natural disaster (e.g., earthquake or tornado) or an accidental (fire, burst pipe) or deliberate (arson, bomb) man-made event. (This might be provided at, or jointly supported with, another registry, which would encourage compatibility of hardware and commonality of interfaces.)

### **Registrar requirements**

Registries will set standards for registrars with which they wish to do business. The following are the minimal qualifications that IANA should mandate that each registry impose and test or inspect before allowing a registrar to access its database(s). Any additional requirements imposed by registries on registrars must be approved by IANA and should not affect the stability of the Internet or substantially reduce competition in the registrar business. Registries may refuse to accept registrations from registrars that fail to meet these requirements and may remove domain names from the registries if at a later time the registrar which registered them no longer meets the requirements for registrars.

1. A functioning DATABASE AND COMMUNICATIONS SYSTEM that supports:

a. Secure access (with encryption and authentication) to the registry.

b. Robust and scalable operations capable of handling moderate volumes.

c. Multiple connections to the Internet via at least two Internet Service Providers.

d. A daily data backup and archival system.

e. A record management system that maintains copies of all transactions, correspondence, and communications with all registries for at least the length of a registration contract.

## 2. MANAGEMENT POLICIES, PROCEDURES, AND PERSONNEL including:

- a. A plan to ensure that the registrar's obligations to its customers and to the registries will be fulfilled in the event that the registrar goes out of business. This plan must indicate how the registrar would ensure that domain name holders will continue to have use of their domain name and that operation of the Internet will not be adversely affected.
- b. Commonly-accepted procedures for information systems security to prevent malicious hackers and others from disrupting operations.

## 3. Independently inspected PHYSICAL SITES that features:

- a. A backup power system.
- b. A high level of security due to twenty-four-hour guards and appropriate physical safeguards against intruders.
- c. Remotely-stored backup files to permit recreation of customer records.

---

## Appendix 2

### *Minimum Dispute Resolution and Other Procedures related to Trademarks*

#### 1. Minimum Application Requirements:

- a. Sufficient owner and contact information (e.g., names, mail address for service of process, e-mail address, telephone and fax numbers, etc.) to enable an interested party to contact either the owner/applicant or its designated representative; and a
- b. Certification statement by the applicant that:
  - it is entitled to register the domain name for which it is applying and knows of no entity with superior rights in the domain name; and
  - it intends to use the domain name.

#### 2. Searchable Database Requirements:

Utilizing a simple, easy-to-use, standardized search interface that features multiple field or string searching and the retrieval of similar names, the following information must be included in all registry databases, and available to anyone with access to the Internet:

- up-to-date ownership and contact information;
- up-to-date and historical chain of title information for the domain name;

- a mail address for service of process;
- the date of the domain name registration; and
- the date an objection to registration of the domain name was filed.

### 3. Updated Ownership, Contact and Use Information

a. At any time there is a change in ownership, the domain name owner must submit the following information:

- up-to-date contact and ownership information and
- a description of how the owner is using the domain name, or, if the domain name is not in use, a statement to that effect.

### 4. Alternative Dispute Resolution of Domain Name Conflicts:

1. There must be a readily available and convenient dispute resolution process that requires no involvement by registrars.
2. Registries/Registrars will abide by the decisions resulting from an agreed upon dispute resolution process or by the decision of a court of competent jurisdiction.
3. If an objection to registration is raised within 30 days after registration of the domain name, a brief period of suspension during the pendency of the dispute will be provided by the registries.

---

## DEPARTMENT OF COMMERCE

### National Telecommunications and Information Administration

[Docket Number: 980212036-8146-02]

#### Management of Internet Names and Addresses

**AGENCY:** National Telecommunications and Information Administration, Commerce.

**ACTION:** Statement of policy.

**SUMMARY:** On July 1, 1997, as part of the Clinton Administration's *Framework for Global Electronic Commerce*,<sup>1</sup> the President directed the Secretary of Commerce to privatize the domain name system (DNS) in a manner that increases competition and facilitates international participation in its management.

Accordingly, on July 2, 1997, the Department of Commerce issued a Request for Comments (RFC) on DNS administration. The RFC solicited public input on issues relating to the overall framework of the DNS administration, the creation of new top-level domains, policies for domain name registrars, and trademark issues. During the comment period, more than 430 comments were received, amounting to some 1500 pages.<sup>2</sup>

On January 30, 1998, the National Telecommunications and Information Administration (NTIA), an agency of the Department of Commerce, issued for comment, *A Proposal to Improve the Technical Management of Internet Names and Addresses*. The proposed

rulemaking, or "Green Paper," was published in the **Federal Register** on February 20, 1998, providing opportunity for public comment. NTIA received more than 650 comments, as of March 23, 1998, when the comment period closed.<sup>3</sup>

The Green Paper proposed certain actions designed to privatize the management of Internet names and addresses in a manner that allows for the development of robust competition and facilitates global participation in Internet management. The Green Paper proposed for discussion a variety of issues relating to DNS management including private sector creation of a new not-for-profit corporation (the "new corporation") managed by a globally and functionally representative Board of Directors.

**EFFECTIVE DATE:** This general statement of policy is not subject to the delay in effective date required of substantive rules under 5 U.S.C. § 553(d). It does not contain mandatory provisions and does not itself have the force and effect of law.<sup>4</sup> Therefore, the effective date of this policy statement is June 10, 1998.

**FOR FURTHER INFORMATION CONTACT:** Karen Rose, Office of International Affairs (OIA), Rm 4701, National Telecommunications and Information Administration (NTIA), U.S. Department of Commerce, 14<sup>th</sup> and Constitution Ave., NW, Washington, DC., 20230. Telephone: (202) 482-0365. E-mail: [dnspolicy@ntia.doc.gov](mailto:dnspolicy@ntia.doc.gov)

**Authority:** 15 U.S.C. 1512; 15 U.S.C. 1525; 47 U.S.C. 902(b)(2)(H); 47 U.S.C. 902(b)(2)(I); 47 U.S.C. 902(b)(2)(M); 47 U.S.C. 904(c)(1).

#### SUPPLEMENTARY INFORMATION:

##### Background

Domain names are the familiar and easy-to-remember names for Internet computers (e.g., "www.ecommerce.gov"). They map to unique Internet Protocol (IP) numbers (e.g., 98.37.241.30) that serve as routing addresses on the Internet. The domain name system (DNS) translates Internet names into the IP numbers needed for transmission of information across the network.

<sup>3</sup>The RFC, the Green Paper, and comments received in response to both documents are available on the Internet at the following address: <http://www.ntia.doc.gov>. Additional comments were submitted after March 23, 1998. These comments have been considered and treated as part of the official record and have been separately posted at the same site, although the comments were not received by the deadline established in the February 20, 1998 **Federal Register** Notice.

<sup>4</sup>See Administrative Law Requirements at p. 19.

#### U.S. Role in DNS Development

More than 25 years ago, the U.S. Government began funding research necessary to develop packet-switching technology and communications networks, starting with the "ARPANET" network established by the Department of Defense's Advanced Research Projects Agency (DARPA) in the 1960s. ARPANET was later linked to other networks established by other government agencies, universities and research facilities. During the 1970s, DARPA also funded the development of a "network of networks;" this became known as the Internet, and the protocols that allowed the networks to intercommunicate became known as Internet protocols (IP).

As part of the ARPANET development work contracted to the University of California at Los Angeles (UCLA), Dr. Jon Postel, then a graduate student at the university, undertook the maintenance of a list of host names and addresses and also a list of documents prepared by ARPANET researchers, called Requests for Comments (RFCs). The lists and the RFCs were made available to the network community through the auspices of SRI International, under contract to DARPA and later the Defense Communication Agency (DCA) (now the Defense Information Systems Agency (DISA)) for performing the functions of the Network Information Center (the NIC).

After Dr. Postel moved from UCLA to the Information Sciences Institute (ISI) at the University of Southern California (USC), he continued to maintain the list of assigned Internet numbers and names under contracts with DARPA. SRI International continued to publish the lists. As the lists grew, DARPA permitted Dr. Postel to delegate additional administrative aspects of the list maintenance to SRI, under continuing technical oversight. Dr. Postel, under the DARPA contracts, also published a list of technical parameters that had been assigned for use by protocol developers. Eventually these functions collectively became known as the Internet Assigned Numbers Authority (IANA).

Until the early 1980s, the Internet was managed by DARPA, and used primarily for research purposes. Nonetheless, the task of maintaining the name list became onerous, and the Domain Name System (DNS) was developed to improve the process. Dr. Postel and SRI participated in DARPA's development and establishment of the technology and practices used by the DNS. By 1990, ARPANET was completely phased out.

The National Science Foundation (NSF) has statutory authority for supporting and strengthening basic scientific research, engineering, and educational activities in the United States, including the maintenance of computer networks to connect research and educational institutions. Beginning in 1987, IBM, MCI and Merit developed NSFNET, a national high-speed network based on Internet protocols, under an award from NSF. NSFNET, the largest of the governmental networks, provided a "backbone" to connect other networks serving more than 4,000 research and educational institutions throughout the country. The National Aeronautics and Space Administration (NASA) and the U.S. Department of Energy also contributed backbone facilities.

In 1991-92, NSF assumed responsibility for coordinating and funding the management of the non-military portion of the Internet infrastructure. NSF solicited competitive proposals to provide a variety of infrastructure services, including domain name registration services. On December 31, 1992, NSF entered into a cooperative agreement with Network Solutions, Inc. (NSI) for some of these services, including the domain name registration services. Since that time, NSI has managed key registration, coordination, and maintenance functions of the Internet domain name system. NSI registers domain names in the generic top level domains (gTLDs) on a first come, first served basis and also maintains a directory linking domain names with the IP numbers of domain name servers. NSI also currently maintains the authoritative database of Internet registrations.

In 1992, the U.S. Congress gave NSF statutory authority to allow commercial activity on the NSFNET.<sup>5</sup> This facilitated connections between NSFNET and newly forming commercial network service providers, paving the way for today's Internet. Thus, the U.S. Government has played a pivotal role in creating the Internet as we know it today. The U.S. Government consistently encouraged bottom-up development of networking technologies, and throughout the course of its development, computer scientists from around the world have enriched the Internet and facilitated exploitation of its true potential. For example, scientists at CERN, in Switzerland, developed software, protocols and conventions that formed the basis of

today's vibrant World Wide Web. This type of pioneering Internet research and development continues in cooperative organizations and consortia throughout the world.

#### *DNS Management Today*

In recent years, commercial use of the Internet has expanded rapidly. As a legacy, however, major components of the domain name system are still performed by, or subject to, agreements with agencies of the U.S. Government.

(1) Assignment of numerical addresses to Internet users.

Every Internet computer has a unique IP number. IANA, headed by Dr. Jon Postel, coordinates this system by allocating blocks of numerical addresses to regional IP registries (ARIN in North America, RIPE in Europe, and APNIC in the Asia/Pacific region), under contract with DARPA. In turn, larger Internet service providers apply to the regional IP registries for blocks of IP addresses. The recipients of those address blocks then reassign addresses to smaller Internet service providers and to end users.

(2) Management of the system of registering names for Internet users.

The domain name space is constructed as a hierarchy. It is divided into top-level domains (TLDs), with each TLD then divided into second-level domains (SLDs), and so on. More than 200 national, or country-code, TLDs (ccTLDs) are administered by their corresponding governments or by private entities with the appropriate national government's acquiescence. A small set of gTLDs do not carry any national identifier, but denote the intended function of that portion of the domain space. For example, .com was established for commercial users, .org for not-for-profit organizations, and .net for network service providers. The registration and propagation of these key gTLDs are performed by NSI, under a five-year cooperative agreement with NSF. This agreement expires on September 30, 1998.

(3) Operation of the root server system.

The root server system is a set of thirteen file servers, which together contain authoritative databases listing all TLDs. Currently, NSI operates the "A" root server, which maintains the authoritative root database and replicates changes to the other root servers on a daily basis.

Different organizations, including NSI, operate the other 12 root servers.<sup>6</sup>

The U.S. Government plays a role in the operation of about half of the Internet's root servers. Universal name consistency on the Internet cannot be guaranteed without a set of authoritative and consistent roots. Without such consistency messages could not be routed with any certainty to the intended addresses.

(4) Protocol Assignment.

The Internet protocol suite, as defined by the Internet Engineering Task Force (IETF), contains many technical parameters, including protocol numbers, port numbers, autonomous system numbers, management information base object identifiers and others. The common use of these protocols by the Internet community requires that the particular values used in these fields be assigned uniquely. Currently, IANA, under contract with DARPA, makes these assignments and maintains a registry of the assigned values.

#### *The Need for Change*

From its origins as a U.S.-based research vehicle, the Internet is rapidly becoming an international medium for commerce, education and communication. The traditional means of organizing its technical functions need to evolve as well. The pressures for change are coming from many different quarters:

- There is widespread dissatisfaction about the absence of competition in domain name registration.
- Conflicts between trademark holders and domain name holders are becoming more common. Mechanisms for resolving these conflicts are expensive and cumbersome.
- Many commercial interests, staking their future on the successful growth of the Internet, are calling for a more formal and robust management structure.
- An increasing percentage of Internet users reside outside of the U.S., and those stakeholders want to participate in Internet coordination.
- As Internet names increasingly have commercial value, the decision to add new top-level domains cannot be made on an *ad hoc* basis by entities or individuals that are not formally accountable to the Internet community.
- As the Internet becomes commercial, it becomes less appropriate for U.S. research agencies to direct and fund these functions.

The Internet technical community has been actively debating DNS

<sup>5</sup> See Scientific and Advanced-Technology Act of 1992; Pub. L. 102-476 section 4(9), 106 Stat. 2297, 2300 (codified at 42 U.S.C. 1862 (a)).

<sup>6</sup> An unofficial diagram of the general geographic location and institutional affiliations of the 13 Internet root servers, prepared by Anthony

Rutkowski, is available at <<http://www.wia.org/pub/rooterv.html>>.

management policy for several years. Experimental registry systems offering name registration services in an alternative set of exclusive domains developed as early as January 1996. Although visible to only a fraction of Internet users, alternative systems such as the name.space, AlterNIC, and eDNS affiliated registries<sup>7</sup> contributed to the community's dialogue on the evolution of DNS administration.

In May of 1996, Dr. Postel proposed the creation of multiple, exclusive, competing top-level domain name registries. This proposal called for the introduction of up to 50 new competing domain name registries, each with the exclusive right to register names in up to three new top-level domains, for a total of 150 new TLDs. While some supported the proposal, the plan drew much criticism from the Internet technical community.<sup>8</sup> The paper was revised and reissued.<sup>9</sup> The Internet Society's (ISOC) board of trustees endorsed, in principle, the slightly revised but substantively similar version of the draft in June of 1996.

After considerable debate and redrafting failed to produce a consensus on DNS change, IANA and the Internet Society (ISOC) organized the International Ad Hoc Committee<sup>10</sup> (IAHC or the Ad Hoc Committee) in September 1996, to resolve DNS management issues. The World Intellectual Property Organization (WIPO) and the International Telecommunications Union (ITU) participated in the IAHC. The Federal Networking Council (FNC) participated in the early deliberations of the Ad Hoc Committee.

The IAHC issued a draft plan in December 1996 that introduced unique and thoughtful concepts for the evolution of DNS administration.<sup>11</sup> The final report proposed a memorandum of understanding (MoU) that would have established, initially, seven new gTLDs

<sup>7</sup> For further information about these systems see: name.space: <<http://namespace.pgmedia.net>>; AlterNIC: <<http://www.alternic.net>>; eDNS: <<http://www.edns.net>>. Reference to these organizations does not constitute an endorsement of their commercial activities.

<sup>8</sup> Lengthy discussions by the Internet technical community on DNS issues generally and on the Postel DNS proposal took place on the *newdom*, *com-priv*, *ietf* and *domain-policy* Internet mailing lists.

<sup>9</sup> See *draft-Postel-iana-itld-admin-01.txt*; available at <<http://www.newdom.com/archive>>.

<sup>10</sup> For further information about the IAHC see: <<http://www.iahc.org>> and related links. Reference to this organization does not constitute an endorsement of the commercial activities of its related organizations.

<sup>11</sup> December 1996 draft: *draft-iahc-gtldspec-00.txt*; available at <<http://info.internet.isi.edu:80/in-drafts/files>>.

to be operated on a nonexclusive basis by a consortium of new private domain name registrars called the Council of Registrars (CORE).<sup>12</sup> Policy oversight would have been undertaken in a separate council called the Policy Oversight Committee (POC) with seats allocated to specified stakeholder groups. Further, the plan formally introduced mechanisms for resolving trademark/domain name disputes. Under the MoU, registrants for second-level domains would have been required to submit to mediation and arbitration, facilitated by WIPO, in the event of conflict with trademark holders.

Although the IAHC proposal gained support in many quarters of the Internet community, the IAHC process was criticized for its aggressive technology development and implementation schedule, for being dominated by the Internet engineering community, and for lacking participation by and input from business interests and others in the Internet community.<sup>13</sup> Others criticized the plan for failing to solve the competitive problems that were such a source of dissatisfaction among Internet users and for imposing unnecessary burdens on trademark holders. Although the POC responded by revising the original plan, demonstrating a commendable degree of flexibility, the proposal was not able to overcome initial criticism of both the plan and the process by which the plan was developed.<sup>14</sup> Important segments of the Internet community remained outside the IAHC process, criticizing it as insufficiently representative.<sup>15</sup>

As a result of the pressure to change DNS management, and in order to facilitate its withdrawal from DNS management, the U.S. Government, through the Department of Commerce and NTIA, sought public comment on the direction of U.S. policy with respect to DNS, issuing the Green Paper on January 30, 1998.<sup>16</sup> The approach outlined in the Green Paper adopted elements of other proposals, such as the

early Postel drafts and the IAHC gTLD-MoU.

*Comments and Response:* The following are summaries of and responses to the major comments that were received in response to NTIA's issuance of *A Proposal to Improve the Technical Management of Internet Names and Addresses*. As used herein, quantitative terms such as "some," "many," and "the majority of," reflect, roughly speaking, the proportion of comments addressing a particular issue but are not intended to summarize all comments received or the complete substance of all such comments.

#### 1. Principles for a New System

The Green Paper set out four principles to guide the evolution of the domain name system: stability, competition, private bottom-up coordination, and representation.

*Comments:* In general, commenters supported these principles, in some cases highlighting the importance of one or more of the principles. For example, a number of commenters emphasized the importance of establishing a body that fully reflects the broad diversity of the Internet community. Others stressed the need to preserve the bottom-up tradition of Internet governance. A limited number of commenters proposed additional principles for the new system, including principles related to the protection of human rights, free speech, open communication, and the preservation of the Internet as a public trust. Finally, some commenters who agreed that Internet stability is an important principle, nonetheless objected to the U.S. Government's assertion of any participatory role in ensuring such stability.

*Response:* The U.S. Government policy applies only to management of Internet names and addresses and does not set out a system of Internet "governance." Existing human rights and free speech protections will not be disturbed and, therefore, need not be specifically included in the core principles for DNS management. In addition, this policy is not intended to displace other legal regimes (international law, competition law, tax law and principles of international taxation, intellectual property law, etc.) that may already apply. The continued applicability of these systems as well as the principle of representation should ensure that DNS management proceeds in the interest of the Internet community as a whole. Finally, the U.S. Government believes that it would be irresponsible to withdraw from its existing management role without

taking steps to ensure the stability of the Internet during its transition to private sector management. On balance, the comments did not present any consensus for amending the principles outlined in the Green Paper.

## 2. The Coordinated Functions

The Green Paper identified four DNS functions to be performed on a coordinated, centralized basis in order to ensure that the Internet runs smoothly:

1. To set policy for and direct the allocation of IP number blocks;
2. To oversee the operation of the Internet root server system;
3. To oversee policy for determining the circumstances under which new top level domains would be added to the root system; and
4. To coordinate the development of other technical protocol parameters as needed to maintain universal connectivity on the Internet.

*Comments:* Most commenters agreed that these functions should be coordinated centrally, although a few argued that a system of authoritative roots is not technically necessary to ensure DNS stability. A number of commenters, however, noted that the fourth function, as delineated in the Green Paper, overstated the functions currently performed by IANA, attributing to it central management over an expanded set of functions, some of which are now carried out by the IETF.

*Response:* In order to preserve universal connectivity and the smooth operation of the Internet, the U.S. Government continues to believe, along with most commenters, that these four functions should be coordinated. In the absence of an authoritative root system, the potential for name collisions among competing sources for the same domain name could undermine the smooth functioning and stability of the Internet.

The Green Paper was not, however, intended to expand the responsibilities associated with Internet protocols beyond those currently performed by IANA. Specifically, management of DNS by the new corporation does not encompass the development of Internet technical parameters for other purposes by other organizations such as IETF. The fourth function should be restated accordingly:

- To coordinate the assignment of other Internet technical parameters as needed to maintain universal connectivity on the Internet.

## 3. Separation of Name and Number Authority

*Comments:* A number of commenters suggested that management of the domain name system should be separated from management of the IP number system. These commenters expressed the view that the numbering system is relatively technical and straightforward. They feared that tight linkage of domain name and IP number policy development would embroil the IP numbering system in the kind of controversy that has surrounded domain name issuance in recent months. These commenters also expressed concern that the development of alternative name and number systems could be inhibited by this controversy or delayed by those with vested interests in the existing system.

*Response:* The concerns expressed by the commenters are legitimate, but domain names and IP numbers must ultimately be coordinated to preserve universal connectivity on the Internet. Also, there are significant costs associated with establishing and operating two separate management entities.

However, there are organizational structures that could minimize the risks identified by commenters. For example, separate name and number councils could be formed within a single organization. Policy could be determined within the appropriate council that would submit its recommendations to the new corporation's Board of Directors for ratification.

## 4. Creation of the New Corporation and Management of the DNS

The Green Paper called for the creation of a new private, not-for-profit corporation<sup>17</sup> responsible for coordinating specific DNS functions for the benefit of the Internet as a whole. Under the Green Paper proposal, the U.S. Government<sup>18</sup> would gradually transfer these functions to the new corporation beginning as soon as possible, with the goal of having the new corporation carry out operational responsibility by October 1998. Under the Green Paper proposal, the U.S. Government would continue to

<sup>17</sup> As used herein, the term "new corporation" is intended to refer to an entity formally organized under well recognized and established business law standards.

<sup>18</sup> As noted in the Summary, the President directed the Secretary of Commerce to privatize DNS in a manner that increases competition and facilitates international participation in its management. Accordingly, the Department of Commerce will lead the coordination of the U.S. government's role in this transition.

participate in policy oversight until such time as the new corporation was established and stable, phasing out as soon as possible, but in no event later than September 30, 2000. The Green Paper suggested that the new corporation be incorporated in the United States in order to promote stability and facilitate the continued reliance on technical expertise residing in the United States, including IANA staff at USC/ISI.

*Comments:* Almost all commenters supported the creation of a new, private not-for-profit corporation to manage DNS. Many suggested that IANA should evolve into the new corporation. A small number of commenters asserted that the U.S. Government should continue to manage Internet names and addresses. Another small number of commenters suggested that DNS should be managed by international governmental institutions such as the United Nations or the International Telecommunications Union. Many commenters urged the U.S. Government to commit to a more aggressive timeline for the new corporation's assumption of management responsibility. Some commenters also suggested that the proposal to headquarter the new corporation in the United States represented an inappropriate attempt to impose U.S. law on the Internet as a whole.

*Response:* The U.S. Government is committed to a transition that will allow the private sector to take leadership for DNS management. Most commenters shared this goal. While international organizations may provide specific expertise or act as advisors to the new corporation, the U.S. continues to believe, as do most commenters, that neither national governments acting as sovereigns nor intergovernmental organizations acting as representatives of governments should participate in management of Internet names and addresses. Of course, national governments now have, and will continue to have, authority to manage or establish policy for their own ccTLDs.

The U.S. Government would prefer that this transition be complete before the year 2000. To the extent that the new corporation is established and operationally stable, September 30, 2000 is intended to be, and remains, an "outside" date.

IANA has functioned as a government contractor, albeit with considerable latitude, for some time now. Moreover, IANA is not formally organized or constituted. It describes a function more than an entity, and as such does not currently provide a legal foundation for the new corporation. This is not to say,

however, that IANA could not be reconstituted by a broad-based, representative group of Internet stakeholders or that individuals associated with IANA should not themselves play important foundation roles in the formation of the new corporation. We believe, and many commenters also suggested, that the private sector organizers will want Dr. Postel and other IANA staff to be involved in the creation of the new corporation.

Because of the significant U.S.-based DNS expertise and in order to preserve stability, it makes sense to headquarter the new corporation in the United States. Further, the mere fact that the new corporation would be incorporated in the United States would not remove it from the jurisdiction of other nations. Finally, we note that the new corporation must be headquartered somewhere, and similar objections would inevitably arise if it were incorporated in another location.

#### 5. Structure of the New Corporation

The Green Paper proposed a 15-member Board, consisting of three representatives of regional number registries, two members designated by the Internet Architecture Board (IAB), two members representing domain name registries and domain name registrars, seven members representing Internet users, and the Chief Executive Officer of the new corporation.

*Comments:* Commenters expressed a variety of positions on the composition of the Board of Directors for the new corporation. In general, however, most commenters supported the establishment of a Board of Directors that would be representative of the functional and geographic diversity of the Internet. For the most part, commenters agreed that the groups listed in the Green Paper included individuals and entities likely to be materially affected by changes in DNS. Most of those who criticized the proposed allocation of Board seats called for increased representation of their particular interest group on the Board of Directors. Specifically, a number of commenters suggested that the allocation set forth in the Green Paper did not adequately reflect the special interests of (1) trademark holders, (2) Internet service providers, or (3) the not-for-profit community. Others commented that the Green Paper did not adequately ensure that the Board would be globally representative.

*Response:* The Green Paper attempted to describe a manageably sized Board of Directors that reflected the diversity of the Internet. It is probably impossible to

allocate Board seats in a way that satisfies all parties concerned. On balance, we believe the concerns raised about the representation of specific groups are best addressed by a thoughtful allocation of the "user" seats as determined by the organizers of the new corporation and its Board of Directors, as discussed below.

The Green Paper identified several international membership associations and organizations to designate Board members such as APNIC, ARIN, RIPE, and the Internet Architecture Board. We continue to believe that as use of the Internet expands outside the United States, it is increasingly likely that a properly open and transparent DNS management entity will have board members from around the world. Although we do not set any mandatory minimums for global representation, this policy statement is designed to identify global representativeness as an important priority.

#### 6. Registrars and Registries

The Green Paper proposed moving the system for registering second level domains and the management of generic top-level domains into a competitive environment by creating two market-driven businesses, registration of second level domain names and the management of gTLD registries.

##### a. Competitive Registrars

*Comments:* Commenters strongly supported establishment of a competitive registrar system whereby registrars would obtain domain names for customers in any gTLD. Few disagreed with this position. The Green Paper proposed a set of requirements to be imposed by the new corporation on all would-be registrars. Commenters for the most part did not take exception to the proposed criteria, but a number of commenters suggested that it was inappropriate for the United States government to establish them.

*Response:* In response to the comments received, the U.S. Government believes that the new corporation, rather than the U.S. Government, should establish minimum criteria for registrars that are pro-competitive and provide some measure of stability for Internet users without being so onerous as to prevent entry by would-be domain name registrars from around the world. Accordingly, the proposed criteria are not part of this policy statement.

##### b. Competitive Registries

*Comments:* Many commenters voiced strong opposition to the idea of competitive and/or for-profit domain

name registries, citing one of several concerns. Some suggested that top level domain names are not, by nature, ever truly generic. As such, they will tend to function as "natural monopolies" and should be regulated as a public trust and operated for the benefit of the Internet community as a whole. Others suggested that even if competition initially exists among various domain name registries, lack of portability in the naming systems would create lock-in and switching costs, making competition unsustainable in the long run. Finally, other commenters suggested that no new registry could compete meaningfully with NSI unless all domain name registries were not-for-profit and/or noncompeting.

Some commenters asserted that an experiment involving the creation of additional for-profit registries would be too risky, and irreversible once undertaken. A related concern raised by commenters addressed the rights that for-profit operators might assert with respect to the information contained in registries they operate. These commenters argued that registries would have inadequate incentives to abide by DNS policies and procedures unless the new corporation could terminate a particular entity's license to operate a registry. For-profit operators, under this line of reasoning, would be more likely to disrupt the Internet by resisting license terminations.

Commenters who supported competitive registries conceded that, in the absence of domain name portability, domain name registries could impose switching costs on users who change domain name registries. They cautioned, however, that it would be premature to conclude that switching costs provide a sufficient basis for precluding the proposed move to competitive domain name registries and cited a number of factors that could protect against registry opportunism. These commenters concluded that the potential benefits to customers from enhanced competition outweighed the risk of such opportunism. The responses to the Green Paper also included public comments on the proposed criteria for registries.

*Response:* Both sides of this argument have considerable merit. It is possible that additional discussion and information will shed light on this issue, and therefore, as discussed below, the U.S. Government has concluded that the issue should be left for further consideration and final action by the new corporation. The U.S. Government is of the view, however, that competitive systems generally result in greater innovation, consumer choice,

and satisfaction in the long run. Moreover, the pressure of competition is likely to be the most effective means of discouraging registries from acting monopolistically. Further, in response to the comments received, the U.S. government believes that new corporation should establish and implement appropriate criteria for gTLD registries. Accordingly, the proposed criteria are not part of this policy statement.

#### 7. The Creation of New gTLDs

The Green Paper suggested that during the period of transition to the new corporation, the U.S. Government, in cooperation with IANA, would undertake a process to add up to five new gTLDs to the authoritative root. Noting that formation of the new corporation would involve some delay, the Green Paper contemplated new gTLDs in the short term to enhance competition and provide information to the technical community and to policy makers, while offering entities that wished to enter into the registry business an opportunity to begin offering service to customers. The Green Paper, however, noted that ideally the addition of new TLDs would be left to the new corporation.

*Comments:* The comments evidenced very strong support for limiting government involvement during the transition period on the matter of adding new gTLDs. Specifically, most commenters—both U.S. and non-U.S.—suggested that it would be more appropriate for the new, globally representative, corporation to decide these issues once it is up and running. Few believed that speed should outweigh process considerations in this matter. Others warned, however, that relegating this contentious decision to a new and untested entity early in its development could fracture the organization. Others argued that the market for a large or unlimited number of new gTLDs should be opened immediately. They asserted that there are no technical impediments to the addition of a host of gTLDs, and the market will decide which TLDs succeed and which do not. Further, they pointed out that there are no artificial or arbitrary limits in other media on the number of places in which trademark holders must defend against dilution.

*Response:* The challenge of deciding policy for the addition of new domains will be formidable. We agree with the many commenters who said that the new corporation would be the most appropriate body to make these decisions based on global input. Accordingly, as supported by the

preponderance of comments, the U.S. Government will not implement new gTLDs at this time.

At least in the short run, a prudent concern for the stability of the system suggests that expansion of gTLDs proceed at a deliberate and controlled pace to allow for evaluation of the impact of the new gTLDs and well-reasoned evolution of the domain space. New top level domains could be created to enhance competition and to enable the new corporation to evaluate the functioning, in the new environment, of the root server system and the software systems that enable shared registration.

#### 8. The Trademark Dilemma

When a trademark is used as a domain name without the trademark owner's consent, consumers may be misled about the source of the product or service offered on the Internet, and trademark owners may not be able to protect their rights without very expensive litigation. For cyberspace to function as an effective commercial market, businesses must have confidence that their trademarks can be protected. On the other hand, management of the Internet must respond to the needs of the Internet community as a whole, and not trademark owners exclusively. The Green Paper proposed a number of steps to balance the needs of domain name holders with the legitimate concerns of trademark owners in the interest of the Internet community as a whole. The proposals were designed to provide trademark holders with the same rights they have in the physical world, to ensure transparency, and to guarantee a dispute resolution mechanism with resort to a court system.

The Green Paper also noted that trademark holders have expressed concern that domain name registrants in faraway places may be able to infringe their rights with no convenient jurisdiction available in which the trademark owner could enforce a judgment protecting those rights. The Green Paper solicited comments on an arrangement whereby, at the time of registration, registrants would agree to submit a contested domain name to the jurisdiction of the courts where the registry is domiciled, where the registry database is maintained, or where the "A" root server is maintained.

*Comments:* Commenters largely agreed that domain name registries should maintain up-to-date, readily searchable domain name databases that contain the information necessary to locate a domain name holder. In general commenters did not take specific issue with the database specifications

proposed in Appendix 2 of the Green Paper, although some commenters proposed additional requirements. A few commenters noted, however, that privacy issues should be considered in this context.

A number of commenters objected to NSI's current business practice of allowing registrants to use domain names before they have actually paid any registration fees. These commenters pointed out that this practice has encouraged cybersquatters and increased the number of conflicts between domain name holders and trademark holders. They suggested that domain name applicants should be required to pay before a desired domain name becomes available for use.

Most commenters also favored creation of an on-line dispute resolution mechanism to provide inexpensive and efficient alternatives to litigation for resolving disputes between trademark owners and domain name registrants. The Green Paper contemplated that each registry would establish specified minimum dispute resolution procedures, but remain free to establish additional trademark protection and dispute resolution mechanisms. Most commenters did not agree with this approach, favoring instead a uniform approach to resolving trademark/domain name disputes.

Some commenters noted that temporary suspension of a domain name in the event of an objection by a trademark holder within a specified period of time after registration would significantly extend trademark holders' rights beyond what is accorded in the real world. They argued that such a provision would create a *de facto* waiting period for name use, as holders would need to suspend the use of their name until after the objection window had passed to forestall an interruption in service. Further, they argue that such a system could be used anti-competitively to stall a competitor's entry into the marketplace.

The suggestion that domain name registrants be required to agree at the time of registration to submit disputed domain names to the jurisdiction of specified courts was supported by U.S. trademark holders but drew strong protest from trademark holders and domain name registrants outside the United States. A number of commenters characterized this as an inappropriate attempt to establish U.S. trademark law as the law of the Internet. Others suggested that existing jurisdictional arrangements are satisfactory. They argue that establishing a mechanism whereby the judgment of a court can be enforced absent personal jurisdiction

over the infringer would upset the balance between the interests of trademark holders and those of other members of the Internet community.

*Response:* The U.S. Government will seek international support to call upon the World Intellectual Property Organization (WIPO) to initiate a balanced and transparent process, which includes the participation of trademark holders and members of the Internet community who are not trademark holders, to (1) develop recommendations for a uniform approach to resolving trademark/domain name disputes involving cybersquatting (as opposed to conflicts between trademark holders with legitimate competing rights), (2) recommend a process for protecting famous trademarks in the generic top level domains, and (3) evaluate the effects, based on studies conducted by independent organizations, such as the National Research Council of the National Academy of Sciences, of adding new gTLDs and related dispute resolution procedures on trademark and intellectual property holders. These findings and recommendations could be submitted to the board of the new corporation for its consideration in conjunction with its development of registry and registrar policy and the creation and introduction of new gTLDs.

In trademark/domain name conflicts, there are issues of jurisdiction over the domain name in controversy and jurisdiction over the legal persons (the trademark holder and the domain name holder). This document does not attempt to resolve questions of personal jurisdiction in trademark/domain name conflicts. The legal issues are numerous, involving contract, conflict of laws, trademark, and other questions. In addition, determining how these various legal principles will be applied to the borderless Internet with an unlimited possibility of factual scenarios will require a great deal of thought and deliberation. Obtaining agreement by the parties that jurisdiction over the domain name will be exercised by an alternative dispute resolution body is likely to be at least somewhat less controversial than agreement that the parties will subject themselves to the personal jurisdiction of a particular national court. Thus, the references to jurisdiction in this policy statement are limited to jurisdiction over the domain name in dispute, and not to the domain name holder.

In order to strike a balance between those commenters who thought that registrars and registries should not themselves be engaged in disputes between trademark owners and domain

name holders and those commenters who thought that trademark owners should have access to a reliable and up-to-date database, we believe that a database should be maintained that permits trademark owners to obtain the contact information necessary to protect their trademarks.

Further, it should be clear that whatever dispute resolution mechanism is put in place by the new corporation, that mechanism should be directed toward disputes about cybersquatting and cybersquatting and not to settling the disputes between two parties with legitimate competing interests in a particular mark. Where legitimate competing rights are concerned, disputes are rightly settled in an appropriate court.

Under the revised plan, we recommend that domain name holders agree to submit infringing domain names to the jurisdiction of a court where the "A" root server is maintained, where the registry is domiciled, where the registrar database is maintained, or where the registrar is domiciled. We believe that allowing trademark infringement suits to be brought wherever registrars and registries are located will help ensure that all trademark holders "both U.S. and non-U.S." have the opportunity to bring suits in a convenient jurisdiction and enforce the judgments of those courts.

Under the revised plan, we also recommend that, whatever options are chosen by the new corporation, each registrar should insist that payment be made for the domain name before it becomes available to the applicant. The failure to make a domain name applicant pay for its use of a domain name has encouraged cybersquatters and is a practice that should end as soon as possible.

#### 9. Competition Concerns

*Comments:* Several commenters suggested that the U.S. Government should provide full antitrust immunity or indemnification for the new corporation. Others noted that potential antitrust liability would provide an important safeguard against institutional inflexibility and abuses of power.

*Response:* Applicable antitrust law will provide accountability to and protection for the international Internet community. Legal challenges and lawsuits can be expected within the normal course of business for any enterprise and the new corporation should anticipate this reality.

The Green Paper envisioned the new corporation as operating on principles similar to those of a standard-setting

body. Under this model, due process requirements and other appropriate processes that ensure transparency, equity and fair play in the development of policies or practices would need to be included in the new corporation's originating documents. For example, the new corporation's activities would need to be open to all persons who are directly affected by the entity, with no undue financial barriers to participation or unreasonable restrictions on participation based on technical or other such requirements. Entities and individuals would need to be able to participate by expressing a position and its basis, having that position considered, and appealing if adversely affected. Further, the decision making process would need to reflect a balance of interests and should not be dominated by any single interest category. If the new corporation behaves this way, it should be less vulnerable to antitrust challenges.

#### 10. The NSI Agreement

*Comments:* Many commenters expressed concern about continued administration of key gTLDs by NSI. They argued that this would give NSI an unfair advantage in the marketplace and allow NSI to leverage economies of scale across their gTLD operations. Some commenters also believe the Green Paper approach would have entrenched and institutionalized NSI's dominant market position over the key domain name going forward. Further, many commenters expressed doubt that a level playing field between NSI and the new registry market entrants could emerge if NSI retained control over .com, .net, and .org.

*Response:* The cooperative agreement between NSI and the U.S. Government is currently in its ramp down period. The U.S. Government and NSI will shortly commence discussions about the terms and conditions governing the ramp-down of the cooperative agreement. Through these discussions, the U.S. Government expects NSI to agree to take specific actions, including commitments as to pricing and equal access, designed to permit the development of competition in domain name registration and to approximate what would be expected in the presence of marketplace competition. The U.S. Government expects NSI to agree to act in a manner consistent with this policy statement, including recognizing the role of the new corporation to establish and implement DNS policy and to establish terms (including licensing terms) applicable to new and existing gTLD registries under which registries, registrars and gTLDs are permitted to

operate. Further, the U.S. Government expects NSI to agree to make available on an ongoing basis appropriate databases, software, documentation thereof, technical expertise, and other intellectual property for DNS management and shared registration of domain names.

#### 11. A Global Perspective

*Comments:* A number of commenters expressed concern that the Green Paper did not go far enough in globalizing the administration of the domain name system. Some believed that international organizations should have a role in administering the DNS. Others complained that incorporating the new corporation in the United States would entrench control over the Internet with the U.S. Government. Still others believed that the awarding by the U.S. Government of up to five new gTLDs would enforce the existing dominance of U.S. entities over the gTLD system.

*Response:* The U.S. Government believes that the Internet is a global medium and that its technical management should fully reflect the global diversity of Internet users. We recognize the need for and fully support mechanisms that would ensure international input into the management of the domain name system. In withdrawing the U.S. Government from DNS management and promoting the establishment of a new, non-governmental entity to manage Internet names and addresses, a key U.S. Government objective has been to ensure that the increasingly global Internet user community has a voice in decisions affecting the Internet's technical management.

We believe this process has reflected our commitment. Many of the comments on the Green Paper were filed by foreign entities, including governments. Our dialogue has been open to all Internet users—foreign and domestic, government and private—during this process, and we will continue to consult with the international community as we begin to implement the transition plan outlined in this paper.

#### 12. The Intellectual Infrastructure Fund

In 1995, NSF authorized NSI to assess domain name registrants a \$50 fee per year for the first two years, 30 percent of which was to be deposited in the Intellectual Infrastructure Fund (IIF), a fund to be used for the preservation and enhancement of the intellectual infrastructure of the Internet.

*Comments:* Very few comments referenced the IIF. In general, the comments received on the issue

supported either refunding the IIF portion of the domain name registration fee to domain registrants from whom it had been collected or applying the funds toward Internet infrastructure development projects generally, including funding the establishment of the new corporation.

*Response:* As proposed in the Green Paper, allocation of a portion of domain name registration fees to this fund terminated as of March 31, 1998. NSI has reduced its registration fees accordingly. The IIF remains the subject of litigation. The U.S. Government takes the position that its collection has recently been ratified by the U.S. Congress,<sup>19</sup> and has moved to dismiss the claim that it was unlawfully collected. This matter has not been finally resolved, however.

#### 13. The .us Domain

At present, the IANA administers .us as a locality-based hierarchy in which second-level domain space is allocated to states and U.S. territories.<sup>20</sup> This name space is further subdivided into localities. General registration under localities is performed on an exclusive basis by private firms that have requested delegation from IANA. The .us name space has typically been used by branches of state and local governments, although some commercial names have been assigned. Where registration for a locality has not been delegated, the IANA itself serves as the registrar.

*Comments:* Many commenters suggested that the pressure for unique identifiers in the .com gTLD could be relieved if commercial use of the .us space was encouraged. Commercial users and trademark holders, however, find the current locality-based system too cumbersome and complicated for commercial use. They called for expanded use of the .us TLD to alleviate some of the pressure for new generic TLDs and reduce conflicts between American companies and others vying for the same domain name. Most commenters support an evolution of the .us domain designed to make this name space more attractive to commercial users.

*Response:* Clearly, there is much opportunity for enhancing the .us domain space, and .us could be expanded in many ways without displacing the current structure. Over the next few months, the U.S. Government will work with the private

sector and state and local governments to determine how best to make the .us domain more attractive to commercial users. Accordingly, the Department of Commerce will seek public input on this important issue.

#### Administrative Law Requirements

On February 20, 1998, NTIA published for public comment a proposed rule regarding the domain name registration system. That proposed rule sought comment on substantive regulatory provisions, including but not limited to a variety of specific requirements for the membership of the new corporation, the creation during a transition period of a specified number of new generic top level domains and minimum dispute resolution and other procedures related to trademarks. As discussed elsewhere in this document, in response to public comment these aspects of the original proposal have been eliminated. In light of the public comment and the changes to the proposal made as a result, as well as the continued rapid technological development of the Internet, the Department of Commerce has determined that it should issue a general statement of policy, rather than define or impose a substantive regulatory regime for the domain name system. As such, this policy statement is not a substantive rule, does not contain mandatory provisions and does not itself have the force and effect of law.

The Assistant General Counsel for Legislation and Regulation, Department of Commerce, certified to the Chief Counsel for Advocacy, Small Business Administration, that, for purposes of the Regulatory Flexibility Act, 5 U.S.C. 601 *et seq.*, the proposed rule on this matter, if adopted, would not have a significant economic impact on a substantial number of small entities. The factual basis for this certification was published along with the proposed rule. No comments were received regarding this certification. As such, and because this final rule is a general statement of policy, no final regulatory flexibility analysis has been prepared.

This general statement of policy does not contain any reporting or record keeping requirements subject to the Paperwork Reduction Act, 44 U.S.C. ch. 35 (PRA). However, at the time the U.S. Government might seek to enter into agreements as described in this policy statement, a determination will be made as to whether any reporting or record keeping requirements subject to the PRA are being implemented. If so, the NTIA will, at that time, seek approval under the PRA for such requirement(s) from the Office of Management and Budget.

<sup>19</sup> 1998 Supplemental Appropriations and Rescissions Act; Pub. L. 105-174; 112 Stat. 58.

<sup>20</sup> Management principles for the .us domain space are set forth in Internet RFC 1480, (<http://www.isi.edu/in-notes/rfc1480.txt>).

This statement has been determined to be not significant for purposes of Office of Management and Budget review under Executive Order 12866, entitled Regulatory Planning and Review.

### Revised Policy Statement

This document provides the U.S. Government's policy regarding the privatization of the domain name system in a manner that allows for the development of robust competition and that facilitates global participation in the management of Internet names and addresses.

The policy that follows does not propose a monolithic structure for Internet governance. We doubt that the Internet should be governed by one plan or one body or even by a series of plans and bodies. Rather, we seek a stable process to address the narrow issues of management and administration of Internet names and numbers on an ongoing basis.

As set out below, the U.S. Government is prepared to recognize, by entering into agreement with, and to seek international support for, a new, not-for-profit corporation formed by private sector Internet stakeholders to administer policy for the Internet name and address system. Under such agreement(s) or understanding(s), the new corporation would undertake various responsibilities for the administration of the domain name system now performed by or on behalf of the U.S. Government or by third parties under arrangements or agreements with the U.S. Government. The U.S. Government would also ensure that the new corporation has appropriate access to needed databases and software developed under those agreements.

### The Coordinated Functions

Management of number addresses is best done on a coordinated basis. Internet numbers are a unique, and at least currently, a limited resource. As technology evolves, changes may be needed in the number allocation system. These changes should also be coordinated.

Similarly, coordination of the root server network is necessary if the whole system is to work smoothly. While day-to-day operational tasks, such as the actual operation and maintenance of the Internet root servers, can be dispersed, overall policy guidance and control of the TLDs and the Internet root server system should be vested in a single organization that is representative of Internet users around the globe.

Further, changes made in the administration or the number of gTLDs contained in the authoritative root system will have considerable impact on Internet users throughout the world. In order to promote continuity and reasonable predictability in functions related to the root zone, the development of policies for the addition, allocation, and management of gTLDs and the establishment of domain name registries and domain name registrars to host gTLDs should be coordinated.

Finally, coordinated maintenance and dissemination of the protocol parameters for Internet addressing will best preserve the stability and interconnectivity of the Internet. We are not, however, proposing to expand the functional responsibilities of the new corporation beyond those exercised by IANA currently.

In order to facilitate the needed coordination, Internet stakeholders are invited to work together to form a new, private, not-for-profit corporation to manage DNS functions. The following discussion reflects current U.S. Government views of the characteristics of an appropriate management entity. What follows is designed to describe the characteristics of an appropriate entity generally.

### Principles for a New System

In making a decision to enter into an agreement to establish a process to transfer current U.S. Government management of DNS to such a new entity, the U.S. will be guided by, and consider the proposed entity's commitment to, the following principles:

1. *Stability.* The U.S. Government should end its role in the Internet number and name address system in a manner that ensures the stability of the Internet. The introduction of a new management system should not disrupt current operations or create competing root systems. During the transition and thereafter, the stability of the Internet should be the first priority of any DNS management system. Security and reliability of the DNS are important aspects of stability, and as a new DNS management system is introduced, a comprehensive security strategy should be developed.

2. *Competition.* The Internet succeeds in great measure because it is a decentralized system that encourages innovation and maximizes individual freedom. Where possible, market mechanisms that support competition and consumer choice should drive the management of the Internet because they will lower costs, promote

innovation, encourage diversity, and enhance user choice and satisfaction.

3. *Private, Bottom-Up Coordination.* Certain management functions require coordination. In these cases, responsible, private-sector action is preferable to government control. A private coordinating process is likely to be more flexible than government and to move rapidly enough to meet the changing needs of the Internet and of Internet users. The private process should, as far as possible, reflect the bottom-up governance that has characterized development of the Internet to date.

4. *Representation.* The new corporation should operate as a private entity for the benefit of the Internet community as a whole. The development of sound, fair, and widely accepted policies for the management of DNS will depend on input from the broad and growing community of Internet users. Management structures should reflect the functional and geographic diversity of the Internet and its users. Mechanisms should be established to ensure international participation in decision making.

*Purpose.* The new corporation ultimately should have the authority to manage and perform a specific set of functions related to coordination of the domain name system, including the authority necessary to:

- (1) Set policy for and direct allocation of IP number blocks to regional Internet number registries;
- (2) Oversee operation of the authoritative Internet root server system;
- (3) Oversee policy for determining the circumstances under which new TLDs are added to the root system; and
- (4) Coordinate the assignment of other Internet technical parameters as needed to maintain universal connectivity on the Internet.

*Funding.* Once established, the new corporation could be funded by domain name registries, regional IP registries, or other entities identified by the Board.

*Staff.* We anticipate that the new corporation would want to make arrangements with current IANA staff to provide continuity and expertise over the course of transition. The new corporation should secure necessary expertise to bring rigorous management to the organization.

*Incorporation.* We anticipate that the new corporation's organizers will include representatives of regional Internet number registries, Internet engineers and computer scientists, domain name registries, domain name registrars, commercial and noncommercial users, Internet service providers, international trademark

holders and Internet experts highly respected throughout the international Internet community. These incorporators should include substantial representation from around the world.

As these functions are now performed in the United States, by U.S. residents, and to ensure stability, the new corporation should be headquartered in the United States, and incorporated in the U.S. as a not-for-profit corporation. It should, however, have a board of directors from around the world. Moreover, incorporation in the United States is not intended to supplant or displace the laws of other countries where applicable.

**Structure.** The Internet community is already global and diverse and likely to become more so over time. The organization and its board should derive legitimacy from the participation of key stakeholders. Since the organization will be concerned mainly with numbers, names and protocols, its board should represent membership organizations in each of these areas, as well as the direct interests of Internet users.

The Board of Directors for the new corporation should be balanced to equitably represent the interests of IP number registries, domain name registries, domain name registrars, the technical community, Internet service providers (ISPs), and Internet users (commercial, not-for-profit, and individuals) from around the world. Since these constituencies are international, we would expect the board of directors to be broadly representative of the global Internet community.

As outlined in appropriate organizational documents, (Charter, Bylaws, etc.) the new corporation should:

(1) Appoint, on an interim basis, an initial Board of Directors (an Interim Board) consisting of individuals representing the functional and geographic diversity of the Internet community. The Interim Board would likely need access to legal counsel with expertise in corporate law, competition law, intellectual property law, and emerging Internet law. The Interim Board could serve for a fixed period, until the Board of Directors is elected and installed, and we anticipate that members of the Interim Board would not themselves serve on the Board of Directors of the new corporation for a fixed period thereafter.

(2) Direct the Interim Board to establish a system for electing a Board of Directors for the new corporation that insures that the new corporation's Board of Directors reflects the geographical and functional diversity of the Internet,

and is sufficiently flexible to permit evolution to reflect changes in the constituency of Internet stakeholders. Nominations to the Board of Directors should preserve, as much as possible, the tradition of bottom-up governance of the Internet, and Board Members should be elected from membership or other associations open to all or through other mechanisms that ensure broad representation and participation in the election process.

(3) Direct the Interim Board to develop policies for the addition of TLDs, and establish the qualifications for domain name registries and domain name registrars within the system.

(4) Restrict official government representation on the Board of Directors without precluding governments and intergovernmental organizations from participating as Internet users or in a non-voting advisory capacity.

**Governance.** The organizing documents (Charter, Bylaws, etc.) should provide that the new corporation is governed on the basis of a sound and transparent decision-making process, which protects against capture by a self-interested faction, and which provides for robust, professional management of the new corporation. The new corporation could rely on separate, diverse, and robust name and number councils responsible for developing, reviewing, and recommending for the board's approval policy related to matters within each council's competence. Such councils, if developed, should also abide by rules and decision-making processes that are sound, transparent, protect against capture by a self-interested party and provide an open process for the presentation of petitions for consideration. The elected Board of Directors, however, should have final authority to approve or reject policies recommended by the councils.

**Operations.** The new corporation's processes should be fair, open and pro-competitive, protecting against capture by a narrow group of stakeholders. Typically this means that decision-making processes should be sound and transparent; the basis for corporate decisions should be recorded and made publicly available. Super-majority or even consensus requirements may be useful to protect against capture by a self-interested faction. The new corporation does not need any special grant of immunity from the antitrust laws so long as its policies and practices are reasonably based on, and no broader than necessary to promote the legitimate coordinating objectives of the new corporation. Finally, the commercial importance of the Internet necessitates

that the operation of the DNS system, and the operation of the authoritative root server system should be secure, stable, and robust.

The new corporation's charter should provide a mechanism whereby its governing body will evolve to reflect changes in the constituency of Internet stakeholders. The new corporation could, for example, establish an open process for the presentation of petitions to expand board representation.

**Trademark Issues.** Trademark holders and domain name registrants and others should have access to searchable databases of registered domain names that provide information necessary to contact a domain name registrant when a conflict arises between a trademark holder and a domain name holder.<sup>21</sup> To this end, we anticipate that the policies established by the new corporation would provide that following information would be included in all registry databases and available to anyone with access to the Internet:

- Up-to-date registration and contact information;
- Up-to-date and historical chain of registration information for the domain name;
- A mail address for service of process;
- The date of domain name registration;
- The date that any objection to the registration of the domain name is filed; and
- Any other information determined by the new corporation to be reasonably necessary to resolve disputes between domain name registrants and trademark holders expeditiously.

Further, the U.S. Government recommends that the new corporation adopt policies whereby:

(1) Domain registrants pay registration fees at the time of registration or renewal and agree to submit infringing domain names to the authority of a court of law in the jurisdiction in which the registry, registry database, registrar, or the "A" root servers are located.

(2) Domain name registrants would agree, at the time of registration or renewal, that in cases involving cybersquatting or cybersquatting (as opposed to conflicts between legitimate competing rights holders), they would submit to and be bound by alternative dispute resolution systems identified by the new corporation for the purpose of resolving those conflicts. Registries and Registrars should be required to abide by decisions of the ADR system.

<sup>21</sup> These databases would also benefit domain name holders by making it less expensive for new registrants and registries to identify potential customers, enhancing competition and lowering prices.

(3) Domain name registrants would agree, at the time of registration or renewal, to abide by processes adopted by the new corporation that exclude, either pro-actively or retroactively, certain famous trademarks from being used as domain names (in one or more TLDs) except by the designated trademark holder.

(4) Nothing in the domain name registration agreement or in the operation of the new corporation should limit the rights that can be asserted by a domain name registrant or trademark owner under national laws.

### The Transition

Based on the processes described above, the U.S. Government believes that certain actions should be taken to accomplish the objectives set forth above. Some of these steps must be taken by the government itself, while others will need to be taken by the private sector. For example, a new not-for-profit organization must be established by the private sector and its Interim Board chosen. Agreement must be reached between the U.S. Government and the new corporation relating to transfer of the functions currently performed by IANA. NSI and the U.S. Government must reach agreement on the terms and conditions of NSI's evolution into one competitor among many in the registrar and registry marketplaces. A process must be laid out for making the management of the root server system more robust and secure. A relationship between the U.S. Government and the new corporation must be developed to transition DNS management to the private sector and to transfer management functions.

During the transition the U.S. Government expects to:

(1) Ramp down the cooperative agreement with NSI with the objective of introducing competition into the domain name space. Under the ramp down agreement NSI will agree to (a) take specific actions, including commitments as to pricing and equal access, designed to permit the development of competition in domain name registration and to approximate what would be expected in the presence of marketplace competition, (b) recognize the role of the new corporation to establish and implement DNS policy and to establish terms (including licensing terms) applicable to new and existing gTLDs and registries under which registries, registrars and gTLDs are permitted to operate, (c) make available on an ongoing basis appropriate databases, software, documentation thereof, technical expertise, and other intellectual

property for DNS management and shared registration of domain names;

(2) Enter into agreement with the new corporation under which it assumes responsibility for management of the domain name space;

(3) Ask WIPO to convene an international process including individuals from the private sector and government to develop a set of recommendations for trademark/domain name dispute resolutions and other issues to be presented to the Interim Board for its consideration as soon as possible;

(4) Consult with the international community, including other interested governments as it makes decisions on the transfer; and

(5) Undertake, in cooperation with IANA, NSI, the IAB, and other relevant organizations from the public and private sector, a review of the root server system to recommend means to increase the security and professional management of the system. The recommendations of the study should be implemented as part of the transition process; and the new corporation should develop a comprehensive security strategy for DNS management and operations.

Dated: June 4, 1998.

## COMMISSION OF FINE ARTS

### Notice of Meeting

The next meeting of the Commission of Fine Arts is scheduled for June 18, 1998 at 10:00 a.m. in the Commission's offices at the National Building Museum (Pension Building), Suite 312, Judiciary Square, 441 F Street, N.W., Washington, D.C. 20001. The meeting will focus on a variety of projects affecting the appearance of the city.

Inquiries regarding the agenda and requests to submit written or oral statements should be addressed to Charles H. Atherton, Secretary, Commission of Fine Arts, at the above address or call 202-504-2200. Individuals requiring sign language interpretation for the hearing impaired should contact the Secretary at least 10 days before the meeting date.

Dated in Washington, D.C., June 2, 1998.

**Charles H. Atherton,**

*Secretary.*

[FR Doc. 98-15372 Filed 6-9-98; 8:45 am]

BILLING CODE 6330-01-M

## COMMITTEE FOR THE IMPLEMENTATION OF TEXTILE AGREEMENTS

### Adjustment of Import Limits for Certain Cotton, Wool and Man-Made Fiber Textile Products and Silk Blend and Other Vegetable Fiber Apparel Produced or Manufactured in the Philippines

June 5, 1998.

**AGENCY:** Committee for the Implementation of Textile Agreements (CITA).

**ACTION:** Issuing a directive to the Commissioner of Customs adjusting limits.

**EFFECTIVE DATE:** June 10, 1998.

**FOR FURTHER INFORMATION CONTACT:** Janet Heinzen, International Trade Specialist, Office of Textiles and Apparel, U.S. Department of Commerce, (202) 482-4212. For information on the quota status of these limits, refer to the Quota Status Reports posted on the bulletin boards of each Customs port or call (202) 927-5850. For information on embargoes and quota re-openings, call (202) 482-3715.

### SUPPLEMENTARY INFORMATION:

**Authority:** Section 204 of the Agricultural Act of 1956, as amended (7 U.S.C. 1854); Executive Order 11651 of March 3, 1972, as amended.

The current limits for certain categories are being adjusted, variously, for special shift and carryover.

A description of the textile and apparel categories in terms of HTS numbers is available in the CORRELATION: Textile and Apparel Categories with the Harmonized Tariff Schedule of the United States (see **Federal Register** notice 62 FR 66057, published on December 17, 1997). Also see 62 FR 64361, published on December 5, 1997.

**Troy H. Cribb,**

*Chairman, Committee for the Implementation of Textile Agreements.*

### Committee for the Implementation of Textile Agreements

June 5, 1998.

Commissioner of Customs,  
*Department of the Treasury, Washington, DC 20229.*

Dear Commissioner: This directive amends, but does not cancel, the directive issued to you on December 1, 1997, by the Chairman, Committee for the Implementation of Textile Agreements. That directive concerns imports of certain cotton, wool and man-made fiber textiles and textile products and silk blend and other vegetable fiber apparel, produced or manufactured in the Philippines and exported during the twelve-

**EXHIBIT JJN-17**

**JOINT PROJECT AGREEMENT BETWEEN  
THE U.S. DEPARTMENT OF COMMERCE AND  
THE INTERNET CORPORATION FOR ASSIGNED NAMES AND NUMBERS**

**PREAMBLE**

The U.S. Department of Commerce (Department) has an agreement (the Joint Project Agreement) with the Internet Corporation for Assigned Names and Numbers (ICANN) for the purpose of the joint development of the mechanisms, methods, and procedures necessary to effect the transition of Internet domain name and addressing system (DNS) to the private sector.

The Department continues to support private sector leadership in the innovation and investment that has characterized the development and expansion of the Internet around the globe. Furthermore, the Department continues to support the work of ICANN as the coordinator for the technical functions related to the management of the Internet DNS. Both Parties agree that preserving the security and stability of the Internet DNS is a priority, with ICANN's focus on DNS security matters being critical to this effort.

**AGREEMENT BETWEEN THE PARTIES**

In recognition of the Parties' desire to institutionalize the private sector technical coordination and management of the Internet DNS to the private sector, the Parties hereby agree as follows:

**I. To strike Section V.B. from the Joint Project Agreement in its entirety and to substitute the following:**

B. Department. The Department reaffirms its policy goal of transitioning the technical coordination of the DNS to the private sector in a manner that promotes stability and security, competition, bottom-up coordination, and representation. Consistent with this objective, the Department agrees to perform the following activities:

1. *Transparency and Accountability:* Continue to provide expertise and advice on methods and administrative procedures to encourage greater transparency, accountability, and openness in the consideration and adoption of policies related to the technical coordination of the Internet DNS;
2. *Root Server Security:* Continue to consult with the managers of root name servers operated by the U.S. Government and with other responsible U.S. Government agencies with respect to operational and security matters, both physical and network, of such root name servers and recommendations for improvements in those matters;
3. *Governmental Advisory Committee:* Participate in the Governmental Advisory Committee so as to facilitate effective consideration by ICANN of GAC advice on the public policy aspects of the technical coordination of the Internet DNS; and

4. *Monitoring:* Continue to monitor the performance of the activities conducted pursuant to this Agreement.

**II. To strike Section V.C. from the Joint Project Agreement in its entirety and to substitute the following:**

C. ICANN. ICANN reaffirms its commitment to maintaining security and stability in the coordination of the technical functions related to the management of the DNS and to perform as an organization founded on the principles of stability and security, competition, bottom-up coordination, and representation. In conformity with the ICANN Board-approved mission and core values, ICANN agrees to perform the following activities:

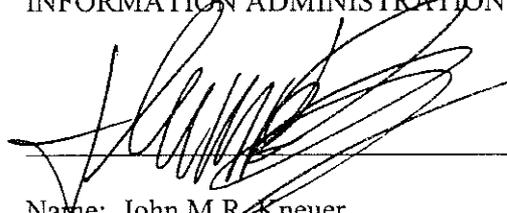

1. *Accountability:* To take action on the Responsibilities set out in the Affirmation of Responsibilities established by the ICANN Board in ICANN Board Resolution 06.71, dated September 25, 2006, (Responsibilities) and attached hereto as Annex A; and
2. *Reporting:* To publish, on or before December 31st of each year, an ICANN Annual Report that sets out ICANN's progress against the following:
  - a. ICANN Bylaws;
  - b. ICANN's Responsibilities; and
  - c. ICANN's Strategic and Operating Plans.

**III. Strike Section VII from the Joint Project Agreement in its entirety and to replace it with:**

- A. This Agreement will become effective upon signature of ICANN and the Department. This Agreement will terminate on September 30, 2009.
- B. In furtherance of the objective of this Agreement, and to support the completion of the transition of DNS management to the private sector, the Department will hold regular meetings with ICANN senior management and leadership to assess progress. In addition, the Department will conduct a midterm review of progress achieved on each activity and Responsibility that will include consultation with interested stakeholders.
- C. This Agreement may not be amended except upon the mutual written agreement of the Parties. Either Party may terminate this Agreement by providing one hundred twenty (120) days written notice to the other Party. If this Agreement is terminated, each Party shall be solely responsible for the payment of any expenses it has incurred. This Agreement is subject to the availability of funds.

**IV. Except as specifically modified by this document, the terms and conditions of the Joint Project Agreement remain unchanged.**

Communications and Information

Date: September 29, 2006

FOR THE INTERNET CORPORATION  
FOR ASSIGNED NAMES AND  
NUMBERS:

Name: Dr. Paul Twomey

Title: President and CEO

Date: September 29, 2006

## ANNEX A

AFFIRMATION OF RESPONSIBILITIES  
for  
ICANN's Private Sector Management

Approved by the  
ICANN Board of Directors  
25 September 2006

ICANN shall continue in its commitment to the private sector management of the Internet DNS, by promoting the security and stability of the global Internet, while maintaining and promoting competition through its multi-stakeholder model.

ICANN hereby affirms and agrees to be guided by the following responsibilities:

- 1) **Security and Stability:** ICANN shall coordinate, at the overall level, the global Internet's systems of unique identifiers, and in particular to ensure the stable and secure operation of the Internet's unique identifier systems.
- 2) **Transparency:** ICANN shall continue to develop, test and improve processes and procedures to encourage improved transparency, accessibility, efficiency, and timeliness in the consideration and adoption of policies related to technical coordination of the Internet DNS, and funding for ICANN operations. ICANN will innovate and aspire to be a leader in the area of transparency for organizations involved in private sector management.
- 3) **Accountability:** ICANN shall continue to develop, test, maintain, and improve on accountability mechanisms to be responsive to global Internet stakeholders in the consideration and adoption of policies related to the technical coordination of the Internet DNS, including continuing to improve openness and accessibility for enhanced participation in ICANN's bottom-up participatory policy development processes.
- 4) **Root Server Security and Relationships:** ICANN shall continue to coordinate with the operators of root name servers and other appropriate experts with respect to the operational and security matters, both physical and network, relating to the secure and stable coordination of the root zone; ensure appropriate contingency planning; maintain clear processes in root zone changes. ICANN will work to formalize relationships with root name server operators.
- 5) **TLD Management:** ICANN shall maintain and build on processes to ensure that competition, consumer interests, and Internet DNS stability and security issues

are identified and considered in TLD management decisions, including the consideration and implementation of new TLDs and the introduction of IDNs. ICANN will continue to develop its policy development processes, and will further develop processes for taking into account recommendations from ICANN's advisory committees and supporting organizations and other relevant expert advisory panels and organizations. ICANN shall continue to enforce existing policy relating to WHOIS, such existing policy requires that ICANN implement measures to maintain timely, unrestricted and public access to accurate and complete WHOIS information, including registrant, technical, billing and administrative contact information. ICANN shall continue its efforts to achieve stable agreements with country-code top-level domain (ccTLD) operators.

- 6) Multi-stakeholder Model: ICANN shall maintain and improve multi-stakeholder model and the global participation of all stakeholders, including conducting reviews of its existing advisory committees and supporting organizations, and will continue to further the effectiveness of the bottom-up policy development processes. ICANN will strive to increase engagement with the Private Sector by developing additional mechanisms for involvement of those affected by the ICANN policies.
- 7) Role of Governments: ICANN shall work with the Government Advisory Committee Members to review the GAC's role within ICANN so as to facilitate effective consideration of GAC advice on the public policy aspects of the technical coordination of the Internet.
- 8) IP Addressing: ICANN shall continue to work collaboratively on a global and regional level so as to incorporate Regional Internet Registries' policy-making activities into the ICANN processes while allowing them to continue their technical work. ICANN shall continue to maintain legal agreements with the RIRs (and such other appropriate organizations) reflecting this work.
- 9) Corporate Responsibility: ICANN shall maintain excellence and efficiency in operations, including good governance, organizational measures to maintain stable, international private sector organization, and shall maintain relevant technical and business experience for members of the Board of Directors, executive management, and staff. ICANN will implement appropriate mechanisms that foster participation in ICANN by global Internet stakeholders, such as providing educational services and fostering information sharing for constituents and promoting best practices among industry segments.
- 10) Corporate Administrative Structure: ICANN shall conduct a review of, and shall make necessary changes in, corporate administrative structure to ensure stability, including devoting adequate resources to contract enforcement, taking into account organizational and corporate governance "best practices."

**EXHIBIT JJN-18**

**AFFIRMATION OF COMMITMENTS BY THE UNITED STATES  
DEPARTMENT OF COMMERCE AND THE INTERNET CORPORATION FOR  
ASSIGNED NAMES AND NUMBERS**

1. This document constitutes an Affirmation of Commitments (Affirmation) by the United States Department of Commerce (“DOC”) and the Internet Corporation for Assigned Names and Numbers (“ICANN”), a not-for-profit corporation. In recognition of the conclusion of the Joint Project Agreement and to institutionalize and memorialize the technical coordination of the Internet’s domain name and addressing system (DNS)<sup>1</sup>, globally by a private sector led organization, the parties agree as follows:
  
2. The Internet is a transformative technology that will continue to empower people around the globe, spur innovation, facilitate trade and commerce, and enable the free and unfettered flow of information. One of the elements of the Internet’s success is a highly decentralized network that enables and encourages decision-making at a local level. Notwithstanding this decentralization, global technical coordination of the Internet’s underlying infrastructure - the DNS - is required to ensure interoperability.
  
3. This document affirms key commitments by DOC and ICANN, including commitments to: (a) ensure that decisions made related to the global technical coordination of the DNS are made in the public interest and are accountable and transparent; (b) preserve the security, stability and resiliency of the DNS; (c) promote competition, consumer trust, and consumer choice in the DNS marketplace; and (d) facilitate international participation in DNS technical coordination.
  
4. DOC affirms its commitment to a multi-stakeholder, private sector led, bottom-up policy development model for DNS technical coordination that acts for the benefit of global Internet users. A private coordinating process, the outcomes of which reflect the public interest, is best able to flexibly meet the changing needs of the Internet and of Internet users. ICANN and DOC recognize that there is a group of participants that engage in ICANN’s processes to a greater extent than Internet users generally. To ensure that its decisions are in the public interest, and not just the interests of a particular set of stakeholders, ICANN commits to perform and publish analyses of the positive and negative effects of its decisions on the public, including any financial impact on the public, and the positive or negative impact (if any) on the systemic security, stability and resiliency of the DNS.
  
5. DOC recognizes the importance of global Internet users being able to use the Internet in their local languages and character sets, and endorses the rapid introduction of internationalized country code top level domain names (ccTLDs), provided related security, stability and resiliency issues are first addressed. Nothing in this document is an expression of support by DOC of any specific plan or proposal for the implementation of

---

<sup>1</sup> For the purposes of this Affirmation the Internet’s domain name and addressing system (DNS) is defined as: domain names; Internet protocol addresses and autonomous system numbers; protocol port and parameter numbers. ICANN coordinates these identifiers at the overall level, consistent with its mission.

new generic top level domain names (gTLDs) or is an expression by DOC of a view that the potential consumer benefits of new gTLDs outweigh the potential costs.

6. DOC also affirms the United States Government's commitment to ongoing participation in ICANN's Governmental Advisory Committee (GAC). DOC recognizes the important role of the GAC with respect to ICANN decision-making and execution of tasks and of the effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the Internet DNS.

7. ICANN commits to adhere to transparent and accountable budgeting processes, fact-based policy development, cross-community deliberations, and responsive consultation procedures that provide detailed explanations of the basis for decisions, including how comments have influenced the development of policy consideration, and to publish each year an annual report that sets out ICANN's progress against ICANN's bylaws, responsibilities, and strategic and operating plans. In addition, ICANN commits to provide a thorough and reasoned explanation of decisions taken, the rationale thereof and the sources of data and information on which ICANN relied.

8. ICANN affirms its commitments to: (a) maintain the capacity and ability to coordinate the Internet DNS at the overall level and to work for the maintenance of a single, interoperable Internet; (b) remain a not for profit corporation, headquartered in the United States of America with offices around the world to meet the needs of a global community; and (c) to operate as a multi-stakeholder, private sector led organization with input from the public, for whose benefit ICANN shall in all events act. ICANN is a private organization and nothing in this Affirmation should be construed as control by any one entity.

9. Recognizing that ICANN will evolve and adapt to fulfill its limited, but important technical mission of coordinating the DNS, ICANN further commits to take the following specific actions together with ongoing commitment reviews specified below:

9.1 Ensuring accountability, transparency and the interests of global Internet users:

ICANN commits to maintain and improve robust mechanisms for public input, accountability, and transparency so as to ensure that the outcomes of its decision-making will reflect the public interest and be accountable to all stakeholders by: (a) continually assessing and improving ICANN Board of Directors (Board) governance which shall include an ongoing evaluation of Board performance, the Board selection process, the extent to which Board composition meets ICANN's present and future needs, and the consideration of an appeal mechanism for Board decisions; (b) assessing the role and effectiveness of the GAC and its interaction with the Board and making recommendations for improvement to ensure effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the DNS; (c) continually assessing and improving the processes by which ICANN receives public input (including adequate explanation of decisions taken and the rationale thereof); (d) continually assessing the extent to which ICANN's decisions are embraced, supported and accepted by the public and the Internet community; and

(e) assessing the policy development process to facilitate enhanced cross community deliberations, and effective and timely policy development. ICANN will organize a review of its execution of the above commitments no less frequently than every three years, with the first such review concluding no later than December 31, 2010. The review will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the Chair of the Board of ICANN, the Assistant Secretary for Communications and Information of the DOC, representatives of the relevant ICANN Advisory Committees and Supporting Organizations and independent experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the Chair of the Board of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations. Each of the foregoing reviews shall consider the extent to which the assessments and actions undertaken by ICANN have been successful in ensuring that ICANN is acting transparently, is accountable for its decision-making, and acts in the public interest. Integral to the foregoing reviews will be assessments of the extent to which the Board and staff have implemented the recommendations arising out of the other commitment reviews enumerated below.

9.2 Preserving security, stability and resiliency: ICANN has developed a plan to enhance the operational stability, reliability, resiliency, security, and global interoperability of the DNS, which will be regularly updated by ICANN to reflect emerging threats to the DNS. ICANN will organize a review of its execution of the above commitments no less frequently than every three years. The first such review shall commence one year from the effective date of this Affirmation. Particular attention will be paid to: (a) security, stability and resiliency matters, both physical and network, relating to the secure and stable coordination of the Internet DNS; (b) ensuring appropriate contingency planning; and (c) maintaining clear processes. Each of the reviews conducted under this section will assess the extent to which ICANN has successfully implemented the security plan, the effectiveness of the plan to deal with actual and potential challenges and threats, and the extent to which the security plan is sufficiently robust to meet future challenges and threats to the security, stability and resiliency of the Internet DNS, consistent with ICANN's limited technical mission. The review will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, and independent experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the CEO of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations.

9.3 Promoting competition, consumer trust, and consumer choice: ICANN will ensure that as it contemplates expanding the top-level domain space, the various issues that are involved (including competition, consumer protection, security, stability and resiliency, malicious abuse issues, sovereignty concerns, and rights protection) will be adequately addressed prior to implementation. If and when new gTLDs (whether in ASCII or other language character sets) have been in operation for one year, ICANN will organize a review that will examine the extent to which the introduction or expansion of gTLDs has promoted competition, consumer trust and consumer choice, as well as effectiveness of (a) the application and evaluation process, and (b) safeguards put in place to mitigate issues involved in the introduction or expansion. ICANN will organize a further review of its execution of the above commitments two years after the first review, and then no less frequently than every four years. The reviews will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, and independent experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the CEO of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations.

9.3.1 ICANN additionally commits to enforcing its existing policy relating to WHOIS, subject to applicable laws. Such existing policy requires that ICANN implement measures to maintain timely, unrestricted and public access to accurate and complete WHOIS information, including registrant, technical, billing, and administrative contact information. One year from the effective date of this document and then no less frequently than every three years thereafter, ICANN will organize a review of WHOIS policy and its implementation to assess the extent to which WHOIS policy is effective and its implementation meets the legitimate needs of law enforcement and promotes consumer trust. The review will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, as well as experts, and representatives of the global law enforcement community, and global privacy experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the CEO of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations.

10. To facilitate transparency and openness in ICANN's deliberations and operations, the terms and output of each of the reviews will be published for public comment. Each review team will consider such public comment and amend the review as it deems appropriate before it issues its final report to the Board.

11. The DOC enters into this Affirmation of Commitments pursuant to its authority under 15 U.S.C. 1512 and 47 U.S.C. 902. ICANN commits to this Affirmation according to its Articles of Incorporation and its Bylaws. This agreement will become effective October 1, 2009. The agreement is intended to be long-standing, but may be amended at any time by mutual consent of the parties. Any party may terminate this Affirmation of Commitments by providing 120 days written notice to the other party. This Affirmation contemplates no transfer of funds between the parties. In the event this Affirmation of Commitments is terminated, each party shall be solely responsible for the payment of any expenses it has incurred. All obligations of the DOC under this Affirmation of Commitments are subject to the availability of funds.

# IANA Functions Contract

---

Critical to the DNS is the continued performance of the Internet Assigned Numbers Authority (IANA) functions. The IANA functions have historically included: (1) the coordination of the assignment of technical Internet protocol parameters; (2) the administration of certain responsibilities associated with Internet DNS root zone management; (3) the allocation of Internet numbering resources; and (4) other services related to the management of the .ARPA and .INT top-level domains. The Internet Corporation for Assigned Names and Numbers (ICANN) performed the

IANA functions, on behalf of the United States Government, through a contract with NTIA.

---

## 2012 Contract

- [Contract Close-out](#) (October 21, 2016)
- [Amendment Modification No. 0005](#) (February 2, 2016)
- [Amendment Modification No. 0004](#) (September 17, 2015)
- [Amendment Modification No. 0003](#) (August 4, 2015)
- [Amendment Modification No. 0002](#) (April 30, 2013)
- [Amendment Modification No. 0001](#) (October 1, 2012)
- [Commerce Department Awards Contract for Management of Key Internet Functions to ICANN](#) (July 2, 2012)
- [Award IANA Functions Contract](#) (July 2, 2012) (858 KB pdf); [ICANN proposal](#) (incorporated by reference)  
RFP SA1301-12-RP-0043 was awarded on July 2, 2012 to Internet Corporation for Assigned Numbers (ICANN).
- [Amendment 001](#) Internet Assigned Numbers Authority (IANA)  
Solicitation Number: SA1301-12-RP-0043 (May 17, 2012)  
The purpose of this amendment is to post all [questions and answers](#) submitted in response to this RFP and amend sections E, F, H, I, L, M and the [SF33 to the original RFP](#) (05/17/2012).
- [Request for Proposal](#) – Internet Assigned Numbers Authority (IANA)  
Solicitation Number: SA1301-12-RP-0043(April 16, 2012)  
On April 16, 2012, the Department of Commerce [re-issued](#) the Request for Proposal (RFP) SA1301-12-RP-0043 for a new Internet

Assigned Numbers Authority (IANA) functions contract. The continued performance of these functions is critical to preserving the stability and security of the Internet's Domain Name System.

- **Notice** – Cancelled [Internet Assigned Numbers Authority \(IANA\) Functions - Request for Proposal \(RFP\) SA1301-12-RP-IANA](#) (March 10, 2012)
- **Notice** – [Extension of the Internet Assigned Numbers Authority \(IANA\) Functions Contract](#) (March 10, 2012)
- [Amendment 003](#) Internet Assigned Numbers Authority (IANA) Solicitation Number: SA1301-12-RP-IANA (March 9, 2012)  
Request for Proposal (RFP) SA1301-12-RP-IANA is hereby cancelled. The Department of Commerce intends to reissue the RFP at a future date, date to be determined (TBD).
- [Amendment 002](#) Internet Assigned Numbers Authority (IANA) Solicitation Number: SA1301-12-RP-IANA (December 2, 2011)  
The purpose of this amendment is to post all questions and answers submitted in response to this RFP and change the "Note" found on page 82.
- [Amendment 001](#) Internet Assigned Numbers Authority (IANA) Solicitation Number: SA1301-12-RP-IANA (November 17, 2011)  
This amendment revises Section I.
- [Internet Assigned Numbers Authority \(IANA\) Solicitation](#) Number: SA1301-12-RP-IANA (November 10, 2011)
- [Pre-solicitation Notice](#) Operation of the Internet Assigned Numbers Authority (IANA) Functions (October 21, 2011)  
The U.S. Department of Commerce (DOC), Office of the Secretary (OS) intends to issue a solicitation (Request for Proposal) on behalf of

DOC, National Telecommunications and Information Administration (NTIA) for services to maintain the continuity and stability of services related to certain interdependent Internet technical management functions, known collectively as the Internet Assigned Numbers Authority (IANA).

- [Internet Assigned Numbers Authority \(IANA\) Functions Further Notice of Inquiry](#) with Public Comments (June 14, 2011)
  - [Request for Comments on the Internet Assigned Numbers Authority \(IANA\) Functions](#) (February 25, 2011)

1. **ATTACHMENTS**

The following documentation submitted by the Internet Corporation for Assigned Names and Numbers (ICANN) is hereby incorporated by reference:

- a. ICANN quotation dated February 2, 2000 signed by Michael M. Roberts.
- b. USC/ICANN Transition Agreement by and between the University of Southern California and the Internet Corporation for Assigned Names and Numbers (Transition Agreement).

2. **SCHEDULE OF SERVICES**

The Contractor shall provide services to perform the operation of the Internet Assigned Numbers Authority (IANA) in accordance with the Statement of Work, Section 12 of this purchase order.

3. **COMPENSATION**

Contractor shall perform under this purchase order without any cost to the United States Government.

At the effective date of this purchase order, the Contractor shall not impose or collect any fees for performing the IANA functions under this purchase order. After the effective date of this purchase order, ICANN may establish and collect fees from third parties (i.e. other than the United States Government) for the functions performed under this purchase order, provided the fee levels are approved by the Contracting Officer before going into effect, which approval shall not be withheld unreasonably provided the fee levels are fair and equitable and provided the aggregate fees charged during the term of this purchase order do not exceed the cost of providing the functions.

4. **APPROVALS AND ADHERANCE TO CONFIDENTIALITY OBLIGATIONS**

- (a) As contemplated by Section 5.4 of the Transition Agreement, the United States Government hereby gives approval of the transfer of functions and responsibilities contemplated in Section 1 of the Transition Agreement.
- (b) As contemplated by Section 2.6 of the Transition Agreement, the United States Government hereby approves the acquisition by ICANN of USC's entire right, title and interest in and to the Licensed IP Rights as defined in the Transition Agreement.

- (c) The Government acknowledges that data submitted by applicants in connection with the IANA function is Confidential Information. To the extent permitted by law, the Government shall accord any data submitted by applicants in connection with the IANA function with the same degree of care as it uses to protect its own confidential information, but not less than reasonable care, to prevent the unauthorized use, disclosure or publication of confidential information. In providing data to the United States Government that is subject to such a confidentiality obligation, the Contractor shall advise the United States Government of that obligation.

5. ESTIMATED PURCHASE ORDER VALUE

At the time of purchase order award, the estimated value of this purchase order is under \$10,000.

6. PERIOD OF PERFORMANCE

The period of performance of this purchase order is from the date of award through September 30, 2000.

7. KEY PERSONNEL

- (a) The Contractor shall assign to this purchase order, the following key personnel:

1. Michael M. Roberts
2. Louis Touton
3. Joyce K. Reynolds
4. Suzanne Woolf

- (b) During the first ninety (90) days of performance, the Contractor shall make no substitutions of key personnel unless the substitution is necessitated by illness, death, or termination of employment. The Contractor shall notify the Contracting Officer within 15 calendar days after the occurrence of any of these events and provide the information required by paragraph (c) below. After the initial 90-day period, the Contracting Officer shall submit the information required by paragraph (c) to the Contracting Officer at least 15 days prior to making any permanent substitutions.
- (c) The Contractor shall provide a detailed explanation of the circumstances necessitating the proposed substitutions, complete resumes for the proposed substitutes, and any additional information requested by the Contracting Officer. Proposed substitutes should have comparable qualifications to those of the persons being replaced. The Contracting Officer will notify the Contractor within 15 calendar days after receipt of all required information of

the decision on substitutions. The purchase order will be modified to reflect any approved changes of personnel.

8. **Organizational Conflict Of Interest**

- (a) The Contractor warrants that, to the best of the Contractor's knowledge and belief, there are no relevant facts or circumstances which could give rise to an organizational conflict of interest, as defined in FAR Subpart 9.5, or that the Contractor has disclosed all such relevant information.
- (b) The Contractor agrees that if an actual or potential organizational conflict of interest is discovered after award, the Contractor will make a full disclosure in writing to the Contracting Officer. This disclosure shall include a description of actions which the Contractor has taken or proposes to take, after consultation with the Contracting Officer, to avoid, mitigate, or neutralize the actual or potential conflict.
- (c) Remedies – The Contracting Officer may terminate this purchase order for convenience, in whole or in part, if it deems such termination necessary to avoid an organizational conflict of interest. If the Contractor was aware of a potential organizational conflict of interest prior to award or discovered an actual or potential conflict after award and did not disclose or misrepresented relevant information to the Contracting Officer, the Government may terminate the purchase order for default, debar the Contractor from Government contracting, or pursue such other remedies as may be permitted by law or this purchase order.
- (d) The Contractor further agrees to insert provisions which shall conform substantially to the language of this clause, including paragraph (d), in any subcontract or consultant agreement hereunder.

9. **For administrative information pertaining to this purchase order contact:**

Teresa A. Reeve  
Contracting Officer  
National Institute of Standards and Technology  
Building 301, Room B117  
100 Bureau Drive, Stop 3572  
Gaithersburg, Maryland 20899-3572  
Phone No. (301) 975-6364  
Teresa.reefe@nist.gov

10. **Contracting Officer's Authority**

The Contracting Officer (CO) is the only person authorized to make or approve any changes in any of the requirements of this purchase order and notwithstanding any provisions contained elsewhere in this purchase order, the said authority remains solely in the CO. In the event that the Contractor makes any changes at the direction of any person other than the CO, the change will be considered to have been without authority and no adjustment will be made in the purchase order prices to cover any increase in costs incurred as a result thereof.

11. **The Contracting Officer's Technical Representative** pertaining to this purchase order is:

Karen Rose  
U.S. Department of Commerce  
1401 Constitution Avenue, NW  
Room 4701  
Washington, DC 20230  
(202) 482-1866

12. **DESCRIPTION/SPECIFICATIONS/WORK STATEMENT**

**12.1 STATEMENT OF WORK/SPECIFICATIONS**

The contractor shall furnish the necessary personnel, material, equipment, services and facilities (except as otherwise specified), to perform the following Statement of Work/Specifications.

**12.2 BACKGROUND**

The Department of Commerce (DOC) has initiated an effort to transition the technical management of Internet Names and Addresses from the United States Government to the private sector. In June, 1998, DOC issued its Statement of Policy "Management of Internet Names and Addresses," 63 Fed. Reg. 31741 (1998) (Statement of Policy) that sets forth the transition process. The Statement of Policy indicates that in order to maintain the stability and continuity of services, the United States Government will continue to participate in oversight Internet technical management functions during the transition.

Part of the transition process relates to the performance of certain Internet technical management functions collectively known as the Internet Assigned Numbers Authority (IANA). The IANA functions are currently performed by the Information Sciences Institute at the University of Southern California (USC) pursuant to a contract with the Department of Defense's Advanced Research Project Agency (DARPA).

The portion of the IANA functions related to the DARPA/USC contract is nearing completion. However, the continued performance of these technical functions is vital to the stability and smooth functioning of the Internet. The National Telecommunications and Information Administration (NTIA), an agency of DOC, has initiated this purchase order action to fulfill its need for stability and continuity of services in the performance of the IANA technical functions during the transition period described in the Statement of Policy, and other related activities.

### 12.3 CONTRACTOR REQUIREMENTS

NTIA has a requirement for a contractor to maintain the smooth operation of the Internet by performing the technical functions collectively known as the Internet Assigned Numbers Authority (IANA). The IANA technical functions are currently operated by the Information Sciences Institute at the University of Southern California pursuant to a contract with the Department of Defense's Advanced Research Projects Agency. In performance of this purchase order, the contractor shall perform the following IANA functions:

- Coordination of the assignment of technical protocol parameters. This involves the review and assignment of unique values to various parameters (e.g., operation codes, port numbers, object identifiers, protocol numbers) used in various Internet protocols. This function also includes the dissemination of the listings of assigned parameters through various means (including on-line publication) and the review of technical documents for consistency with assigned values.
- Administrative functions associated with root management. This function involves facilitation and coordination of the root zone of the domain name system. It includes receiving requests for and making routine updates of ccTLD contact and nameserver information. It also includes receiving delegation and redelegation requests, investigating the circumstances pertinent to those requests, and reporting on the requests. This function, however, does not include authorizing modifications, additions, or deletions to the root zone file or associated information that constitute delegation or redelegation of top-level domains. The purchase order award will not alter root system responsibilities defined in Amendment 11 of the Cooperative Agreement.
- Allocation of IP address blocks. This involves overall responsibility for the allocation of IPv4 and IPv6 address space. It includes delegations of IP address blocks to regional registries for routine allocation, typically through downstream providers, to Internet end-users within the regions served by those registries. It also includes reservation and direct allocation of space for special purposes, such as multicast addressing, cable blocks, addresses for private networks as described in RFC 1918, and globally specified applications.
- Other services. The contractor will perform other IANA functions as needed upon request of DOC. These functions may include the performance of periodic functions or supplemental

functions identified by the contractor as part of the three (3) month performance progress report.

#### 12.4 REPORTING REQUIREMENTS

Performance Reporting. The contractor shall prepare a final report regarding the performance of the IANA technical functions that shall include a description of the techniques, methods, software, and tools employed in the performance of the functions. The purpose of the report is to document standard operating procedures that may be readily adopted by other organizations. Further, the contractor shall submit a performance progress report every three (3) months that documents the performance of the functions. The contractor, therefore, shall:

- Prepare and submit a final report on the performance of the IANA functions that documents standard operating procedures (including a description of all techniques, methods, software, and tools.)
- Prepare and submit a performance progress report every three (3) months that contains statistical and narrative information on the performance of the functions during the previous three (3) months. The report shall include a summary of the major work performed for each of the functions during the previous three (3) months, including technical status, major events, problems encountered, and any projected significant changes related to performance of the functions.

#### 12.5 PERFORMANCE EXCLUSIONS

- The performance of administrative functions associated with root management does not include authorizing modifications, additions, or deletions to the root zone file or associated information that constitute delegation or redelegation of top-level domains. The **purchase order** award will not alter root system responsibilities defined in Amendment 11 of the Cooperative Agreement.
- This purchase order, in itself, does not authorize the contractor to make substantive changes in established policy associated with the performance of the IANA functions. Procedures for policy development will remain the subject of a Joint Project Agreement (JPA) between DOC and ICANN. The JPA contemplates that the policy-development procedures developed under the JPA may result in adoption of new or changed policies concerning Internet technical management functions. To the extent those policies require alterations in the manner in which the IANA functions are performed, those alterations may be implemented upon mutual agreement of the parties.

#### 13. CONTRACT CLAUSES

**52.213-4 Terms and Conditions--Simplified Acquisitions (Other Than Commercial Items) (June 1999)**

(a) The Contractor shall comply with the following Federal Acquisition Regulation (FAR) clauses that are incorporated by reference:

- (1) The clauses listed below implement provisions of law or Executive order:
  - (i) 52.222-3, Convict Labor (Aug 1996) (E.O. 11755).
  - (ii) 52.233-3, Protest After Award (Aug 1996) (31 U.S.C. 3553).
- (2) Listed below are additional clauses that apply:
  - (i) 52.225-11, Restrictions on Certain Foreign Purchases (Aug 1998).
  - (ii) 52.232-1, Payments (Apr 1984).
  - (iii) 52.232-8, Discounts for Prompt Payment (May 1997).
  - (iv) 52.232-11, Extras (Apr 1984).
  - (v) 52.232-25, Prompt Payment (Jun 1997).
  - (vi) 52.233-1, Disputes (Dec 1998).
  - (vii) 52.244-6, Subcontracts for Commercial Items and Commercial Components (Oct 1998).
  - (viii) 52.253-1, Computer Generated Forms (Jan 1991).

(b) The Contractor shall comply with the following FAR clauses, incorporated by reference, unless the circumstances do not apply:

- (1) The clauses listed below implement provisions of law or Executive order:
  - (i) 52.222-20, Walsh-Healey Public Contracts Act (Dec 1996) (41 U.S.C. 35-45) (Applies to supply contracts over \$10,000 in the United States).
  - (ii) 52.222-26, Equal Opportunity (Feb 1999) (E.O. 11246) (Applies to contracts over \$10,000).
  - (iii) 52.222-35, Affirmative Action for Disabled Veterans and Veterans of the Vietnam Era (Apr 1998) (38 U.S.C. 4212) (Applies to contracts over \$10,000).
  - (iv) 52.222-36, Affirmative Action for Workers with Disabilities (Jun 1998) (29 U.S.C. 793) (Applies to contracts over \$10,000).
  - (v) 52.222-37, Employment Reports on Disabled Veterans and Veterans of the Vietnam Era (Jan 1999) (38 U.S.C. 4212) (Applies to contracts over \$10,000).
  - (vi) 52.222-41, Service Contract Act of 1965, As Amended (May 1989) (41 U.S.C. 351, et seq.) (Applies to service contracts over \$2,500).
  - (vii) 52.223-5, Pollution Prevention and Right-to-Know Information (Apr 1998) (E.O. 12856) (Applies to services performed on Federal facilities).
  - (viii) 52.225-3, Buy American Act--Supplies (Jan 1994) (41 U.S.C. 10) (Applies to supplies, and to services involving the furnishing of supplies, if the contract was--
    - (A) Under \$25,000; or
    - (B) Set aside for small business concerns, regardless of dollar value).

- (1) Within a reasonable period of time after the defect was discovered or should have been discovered; and
- (2) Before any substantial change occurs in the condition of the item, unless the change is due to the defect in the item.

(e) Excusable delays. The Contractor shall be liable for default unless nonperformance is caused by an occurrence beyond the reasonable control of the Contractor and without its fault or negligence, such as acts of God or the public enemy, acts of the Government in either its sovereign or contractual capacity, fires, floods, epidemics, quarantine restrictions, strikes, unusually severe weather, and delays of common carriers. The Contractor shall notify the Contracting Officer in writing as soon as it is reasonably possible after the commencement of any excusable delay, setting forth the full particulars in connection therewith, shall remedy such occurrence with all reasonable dispatch, and shall promptly give written notice to the Contracting Officer of the cessation of such occurrence.

(f) Termination for the Government's convenience. The Government reserves the right to terminate this contract, or any part hereof, for its sole convenience. In the event of such termination, the Contractor shall immediately stop all work hereunder and shall immediately cause any and all of its suppliers and subcontractors to cease work. Subject to the terms of this contract, the Contractor shall be paid a percentage of the contract price reflecting the percentage of the work performed prior to the notice of termination, plus reasonable charges that the Contractor can demonstrate to the satisfaction of the Government, using its standard record keeping system, have resulted from the termination. The Contractor shall not be required to comply with the cost accounting standards or contract cost principles for this purpose. This paragraph does not give the Government any right to audit the Contractor's records. The Contractor shall not be paid for any work performed or costs incurred that reasonably could have been avoided.

(g) Termination for cause. The Government may terminate this contract, or any part hereof, for cause in the event of any default by the Contractor, or if the Contractor fails to comply with any contract terms and conditions, or fails to provide the Government, upon request, with adequate assurances of future performance. In the event of termination for cause, the Government shall not be liable to the Contractor for any amount for supplies or services not accepted, and the Contractor shall be liable to the Government for any and all rights and remedies provided by law. If it is determined that the Government improperly terminated this contract for default, such termination shall be deemed a termination for convenience.

(h) Warranty. The Contractor warrants and implies that the items delivered hereunder are merchantable and fit for use for the particular purpose described in this contract.

(ix) 52.232-33, Payment by Electronic Funds Transfer--Central Contractor Registration (May 1999). (Applies when the payment will be made by electronic funds transfer (EFT) and the payment office uses the Central Contractor Registration (CCR) database as its source of EFT information.)

(x) 52.232-34, Payment by Electronic Funds Transfer--Other than Central Contractor Registration (May 1999). (Applies when the payment will be made by EFT and the payment office does not use the CCR database as its source of EFT information.)

(2) Listed below are additional clauses that may apply:

(i) 52.209-6, Protecting the Government's Interest When Subcontracting with Contractors Debarred, Suspended, or Proposed for Debarment (July 1995)

(Applies to contracts over \$25,000).

(ii) 52.211-17, Delivery of Excess Quantities (Sept 1989) (Applies to fixed-price supplies).

(iii) 52.247-29, F.o.b. Origin (Jun 1988) (Applies to supplies if delivery is f.o.b. origin).

(iv) 52.247-34, F.o.b. Destination (Nov 1991) (Applies to supplies if delivery is f.o.b. destination).

(c) FAR 52.252-2, Clauses Incorporated by Reference (Feb 1998). This contract incorporates one or more clauses by reference, with the same force and effect as if they were given in full text. Upon request, the Contracting Officer will make their full text available. Also, the full text of a clause may be accessed electronically at this/these address(es): **WWW.ARNET.GOV/FAR**

52.227-1 AUTHORIZATION AND CONSENT (JUL 1995)

52.227-2 NOTICE AND ASSISTANCE REGARDING PATENT AND COPYRIGHT INFRINGEMENT (DEC 1998)

52.227-11 PATENT RIGHTS -- RETENTION BY THE CONTRACTOR (SHORT FORM) (JUN 1997)

52.227-14 RIGHTS IN DATA -- GENERAL Alternate I (JUN 1987)

52.227-14 RIGHTS IN DATA -- GENERAL Alternate II (JUN 1987)

52.227-14 RIGHTS IN DATA -- GENERAL Alternate III (JUN 1987)

52.227-14 RIGHTS IN DATA -- GENERAL Alternate V (JUN 1987)

52.227-16 ADDITIONAL DATA REQUIREMENTS (JUN 1987)

(d) Inspection/Acceptance. The Contractor shall tender for acceptance only those items that conform to the requirements of this contract. The Government reserves the right to inspect or test any supplies or services that have been tendered for acceptance. The Government may require repair or replacement of nonconforming supplies or reperformance of nonconforming services at no increase in contract price. The Government must exercise its postacceptance rights--

- (1) Within a reasonable period of time after the defect was discovered or should have been discovered; and
- (2) Before any substantial change occurs in the condition of the item, unless the change is due to the defect in the item.

(e) Excusable delays. The Contractor shall be liable for default unless nonperformance is caused by an occurrence beyond the reasonable control of the Contractor and without its fault or negligence, such as acts of God or the public enemy, acts of the Government in either its sovereign or contractual capacity, fires, floods, epidemics, quarantine restrictions, strikes, unusually severe weather, and delays of common carriers. The Contractor shall notify the Contracting Officer in writing as soon as it is reasonably possible after the commencement of any excusable delay, setting forth the full particulars in connection therewith, shall remedy such occurrence with all reasonable dispatch, and shall promptly give written notice to the Contracting Officer of the cessation of such occurrence.

(f) Termination for the Government's convenience. The Government reserves the right to terminate this contract, or any part hereof, for its sole convenience. In the event of such termination, the Contractor shall immediately stop all work hereunder and shall immediately cause any and all of its suppliers and subcontractors to cease work. Subject to the terms of this contract, the Contractor shall be paid a percentage of the contract price reflecting the percentage of the work performed prior to the notice of termination, plus reasonable charges that the Contractor can demonstrate to the satisfaction of the Government, using its standard record keeping system, have resulted from the termination. The Contractor shall not be required to comply with the cost accounting standards or contract cost principles for this purpose. This paragraph does not give the Government any right to audit the Contractor's records. The Contractor shall not be paid for any work performed or costs incurred that reasonably could have been avoided.

(g) Termination for cause. The Government may terminate this contract, or any part hereof, for cause in the event of any default by the Contractor, or if the Contractor fails to comply with any contract terms and conditions, or fails to provide the Government, upon request, with adequate assurances of future performance. In the event of termination for cause, the Government shall not be liable to the Contractor for any amount for supplies or services not accepted, and the Contractor shall be liable to the Government for any and all rights and remedies provided by law. If it is determined that the Government improperly terminated this contract for default, such termination shall be deemed a termination for convenience.

(h) Warranty. The Contractor warrants and implies that the items delivered hereunder are merchantable and fit for use for the particular purpose described in this contract.

# NTIA Announces Intent to Transition Key Internet Domain Name Functions

---

**FOR IMMEDIATE RELEASE**

March 14, 2014

**News Media Contact**

## NTIA, Office of Public Affairs

WASHINGTON – To support and enhance the multistakeholder model of Internet policymaking and governance, the U.S. Commerce Department’s National Telecommunications and Information Administration (NTIA) today announces its intent to transition key Internet domain name functions to the global multistakeholder community. As the first step, NTIA is asking the Internet Corporation for Assigned Names and Numbers (ICANN) to convene global stakeholders to develop a proposal to transition the current role played by NTIA in the coordination of the Internet’s domain name system (DNS).

NTIA’s responsibility includes the procedural role of administering changes to the authoritative root zone file – the database containing the lists of names and addresses of all top-level domains – as well as serving as the historic steward of the DNS. NTIA currently contracts with ICANN to carry out the Internet Assigned Numbers Authority (IANA) functions and has a Cooperative Agreement with Verisign under which it performs related root zone management functions. Transitioning NTIA out of its role marks the final phase of the privatization of the DNS as outlined by the U.S. Government in 1997.

“The timing is right to start the transition process,” said Assistant Secretary of Commerce for Communications and Information Lawrence E. Strickling. “We look forward to ICANN convening stakeholders across the global Internet community to craft an appropriate transition plan.”

ICANN is uniquely positioned, as both the current IANA functions contractor and the global coordinator for the DNS, as the appropriate party to convene the multistakeholder process to develop the transition

plan. NTIA has informed ICANN that it expects that in the development of the proposal, ICANN will work collaboratively with the directly affected parties, including the Internet Engineering Task Force (IETF), the Internet Architecture Board (IAB), the Internet Society (ISOC), the Regional Internet Registries (RIRs), top level domain name operators, VeriSign, and other interested global stakeholders.

NTIA has communicated to ICANN that the transition proposal must have broad community support and address the following four principles:

- Support and enhance the multistakeholder model;
- Maintain the security, stability, and resiliency of the Internet DNS;
- Meet the needs and expectation of the global customers and partners of the IANA services; and,
- Maintain the openness of the Internet.

Consistent with the clear policy expressed in bipartisan resolutions of the U.S. Senate and House of Representatives (S.Con.Res.50 and H.Con.Res.127), which affirmed the United States support for the multistakeholder model of Internet governance, NTIA will not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution.

From the inception of ICANN, the U.S. Government and Internet stakeholders envisioned that the U.S. role in the IANA functions would be temporary. The Commerce Department's June 10, 1998 [Statement of Policy](#) stated that the U.S. Government "is committed to a transition that will allow the private sector to take leadership for DNS management." ICANN as an organization has matured and taken steps in recent years to improve its accountability and transparency and its technical

competence. At the same time, international support continues to grow for the multistakeholder model of Internet governance as evidenced by the continued success of the Internet Governance Forum and the resilient stewardship of the various Internet institutions.

While stakeholders work through the ICANN-convened process to develop a transition proposal, NTIA's current role will remain unchanged. The current IANA functions contract expires September 30, 2015.

**LIST OF ANNEXES & APPENDICES .....51**

# Summary

---

- 01 Since December 2014, a working group of ICANN community members has developed a set of proposed enhancements to ICANN's accountability to the global Internet community. This document is being distributed for the consideration and approval of the working group's 6 Chartering Organizations.
- 02 This effort is integral to the transition of the United States' stewardship of the IANA functions to the global Internet community, reflecting the ICANN community's conclusion that improvements to ICANN's accountability were necessary in the absence of the accountability backstop that the historical contractual relationship with the United States government provided. The accountability improvements set out in this document are not designed to change ICANN's multistakeholder model, the bottom-up nature of policy development, or significantly alter ICANN's day-to-day operations.
- 03 The main elements of the proposal are outlined below, supported by additional annexes and appendices. Together with ICANN's existing structures and groups, these accountability enhancements will ensure ICANN remains accountable to the global Internet community.
- **A revised Mission Statement** for the ICANN Bylaws that sets out what ICANN does. This Mission Statement clarifies but does not change ICANN's historic mission.
  - An enhanced **Independent Review Process** and redress process with a broader scope and the power to ensure ICANN stays within its Mission.
  - New specific **powers** for the ICANN community that can be enforced when the usual methods of discussion and dialogue have not effectively built consensus, including the powers to:
    - Reject ICANN Budgets, IANA Budgets or Strategic/Operating Plans.
    - Reject changes to ICANN's Standard Bylaws.
    - Approve changes to new Fundamental Bylaws, Articles of Incorporation and ICANN's sale or other disposition of all or substantially all of ICANN's assets.
    - Remove an individual ICANN Board Director.
    - Recall the entire ICANN Board.
    - Initiate a binding Independent Review Process (where a panel decision is enforceable in any court recognizing international arbitration results).
    - Reject ICANN Board decisions relating to reviews of the IANA functions, including the triggering of Post-Transition IANA separation.
    - The rights of inspection and investigation
  - A community Independent Review Process as an enforcement mechanism further to a Board action or inaction.
- 04 All of these community powers can only be exercised after extensive community discussions and debates through processes of **engagement and escalation**. The process of escalation provides many opportunities for the resolution of disagreements between parties before formal action is required.
- 05 The accountability elements outlined above will be supported through:
- Additions to the ICANN Bylaws to create an **Empowered Community** that is based on a simple legal vehicle designed to act on the instructions of ICANN stakeholder groups when

needed to exercise the Community Powers. The Empowered Community is granted the status of a Designator (a recognized role in law) and has the standing to enforce the Community Powers if needed.

- Core elements of ICANN's governing documents, including the Articles of Incorporation and **Fundamental Bylaws** that can only be changed with agreement between the ICANN community and the ICANN Board.

06 In addition, further proposed changes include:

- Recognition of **ICANN's respect for Human Rights** into the Bylaws.
- Incorporation of ICANN's commitments under the 2009 **Affirmation of Commitments** with the United States Department of Commerce into the Bylaws, where appropriate.
- Improved accountability and diversity standards for ICANN's **Supporting Organizations and Advisory Committees**.
- A commitment to discuss additional accountability improvements and broader accountability enhancements in 2016 that do not need to be in place or committed to prior to the IANA Stewardship Transition. These include:
  - Considering improvements to ICANN's standards for diversity at all levels.
  - Further enhancements to the accountability of ICANN's Supporting Organizations and Advisory Committees, as well as ICANN staff.
  - Improving ICANN's transparency relating to ICANN's Documentary Information Disclosure Policy (DIDP), interactions with governments, whistleblower policy and Board deliberations.
  - Developing and clarifying a Framework of Interpretation for ICANN's Human Rights commitment in the Bylaws.
  - Addressing questions focused on jurisdiction of contracts and dispute settlements.
  - Considering enhancements to the role and function of the ICANN Ombudsman.

07 To develop these recommendations to improve ICANN's accountability, the working group:

- Relied on suggestions and proposals generated inside the working group and by the broader Internet multistakeholder community.
- Conducted three public comment periods to gather feedback on earlier drafts and discussed iterations of its recommendations across the world at ICANN meetings and through online webinars.
- Rigorously "stress tested" ICANN's current and proposed accountability mechanisms to assess their strength against problematic scenarios the organization could potentially face.
- Engaged two external law firms to ensure the legal reliability of the proposed accountability enhancements.
- Made the minimum enhancements to ICANN's accountability necessary to meet the baseline requirements of the community, as required for the IANA Stewardship Transition.
- Met the requirements of the group that developed the IANA Stewardship Transition proposal for the Domain Names community.
- Met the requirements of the U.S. National Telecommunications and Information Agency for the IANA Stewardship Transition.

- 08 Each of the twelve recommendations has a corresponding annex with additional details including a summary, CCWG-Accountability<sup>1</sup> Recommendations, Detailed Explanation of Recommendations, Changes from the 'Third Draft Proposal on Work Stream 1 Recommendations,' Stress Tests Related to this Recommendation, how the recommendation meets the CWG-Stewardship<sup>2</sup> Requirements, and how the recommendation addresses NTIA Criteria.
- 09 **Note:** Minority statements can be found in Appendix A: Documenting Consensus (Including Minority Views)

---

<sup>1</sup> Cross Community Working Group on Enhancing ICANN Accountability

<sup>2</sup> Cross Community Working Group to Develop an IANA Stewardship Transition Proposal on Naming Related Functions

# Background

---

- 10 On 14 March 2014, the U.S. National Telecommunications and Information Administration (NTIA) announced its intent to transition its stewardship of the [Internet Assigned Numbers Authority \(IANA\) Functions](#) to the global multistakeholder community. NTIA asked ICANN to convene an inclusive, global discussion to determine a process for transitioning the stewardship of these functions to the Internet community.
- 11 During initial discussions on how to proceed with the transition process, the ICANN multistakeholder community, recognizing the safety net that the NTIA provides as part of its stewardship role of the IANA Functions, raised concerns about the impact of the transition on ICANN's accountability.
- 12 To address these concerns, the ICANN community requested that ICANN's existing accountability mechanisms be reviewed and enhanced as a key part of the transition process. As a result, the Cross Community Working Group on Enhancing ICANN Accountability (CCWG-Accountability) was convened. The CCWG-Accountability's work consists of two tracks:

13 **Work Stream 1:** Focused on mechanisms enhancing ICANN accountability that must be in place or committed to within the time frame of the IANA Stewardship Transition.

14 **Work Stream 2:** Focused on addressing accountability topics for which a timeline for developing solutions and full implementation may extend beyond the IANA Stewardship Transition.

- 15 Any other consensus items that are not required to be in place within the IANA Stewardship Transition timeframe can be addressed in Work Stream 2. There are mechanisms in Work Stream 1 to adequately enforce implementation of Work Stream 2 items, even if they were to encounter resistance from ICANN Management or others.
- 16 The work documented in this Draft Proposal focuses on Work Stream 1, with some references to related activities that are part of Work Stream 2's remit.

# Requirements

---

17 This section provides an overview of the requirements the CCWG-Accountability has to fulfill in developing its recommendations

## 18 **NTIA Requirements**

19 NTIA [has requested](#) that ICANN “convene a multistakeholder process to develop a plan to transition the U.S. Government stewardship role” with regard to the IANA Functions and related Root Zone management. In making its announcement, the NTIA specified that the transition Proposal must have broad community support and meet the following principles:

- Support and enhance the multistakeholder model.
- Maintain the security, stability, and resiliency of the Internet DNS.
- Meet the needs and expectations of the global customers and partners of the IANA services.
- Maintain the openness of the Internet.

20 NTIA also specified that it would not accept a Proposal that replaces its role with a government-led or an intergovernmental organization solution.

21 Additionally, NTIA also requires that the CCWG-Accountability Proposal clearly document how it worked with the multistakeholder community, which options it considered in developing its Proposal, and how it tested these.

22 Please Refer to Annex 14: NTIA Requirements for the details of how the CCWG-Accountability meets these requirements.

## 23 **CWG-Stewardship Requirements**

24 In the transmittal letter for the CWG-Stewardship transition plan to the IANA Stewardship Transition Coordination Group (ICG), the CWG-Stewardship noted the following regarding its dependencies on the CCWG-Accountability work in response to an earlier version of this document:

25 “The CWG-Stewardship is significantly dependent and expressly conditioned on the implementation of ICANN-level accountability mechanisms proposed by the Cross Community Working Group on Enhancing ICANN Accountability (CCWG-Accountability). The co-Chairs of the CWG-Stewardship and the CCWG-Accountability have coordinated their efforts and the CWG-Stewardship is confident that the CCWG-Accountability Work Stream 1 recommendations, if implemented as expected, will meet the requirements that the CWG-Stewardship has previously communicated to the CCWG-Accountability. If any element of these level accountability mechanisms is not implemented as contemplated by the CWG-Stewardship, this will require revision.”

26 The CWG-Stewardship requirements of the CCWG-Accountability are detailed on pages 20 – 21 of the CWG-Stewardship Proposal transmitted on 25 June 2015. The Work Stream 1 Proposals from the CCWG-Accountability address all of these conditions.

27 These requirements are:

1. ICANN Budget
  2. ICANN Board and Community Empowerment Mechanisms
  3. IANA Function Review and Separation Process
  4. Customer Standing Committee
  5. Appeals Mechanism
  6. Post-Transition IANA (PTI) Governance
  7. Fundamental Bylaws
- 28 Please refer to Annex 13: CWG-Stewardship Requirements for details on how the CCWG-Accountability meets these requirements.

# The CCWG-Accountability's Findings and Recommendations

---

29 This section provides an overview of the CCWG-Accountability's findings and recommendations regarding Work Stream 1:

---

30 **Recommendation #1:** Establishing an Empowered Community for Enforcing Community Powers

31 **Recommendation #2:** Empowering the Community through Consensus: Engagement, Escalation, and Enforcement

32 **Recommendation #3:** Standard Bylaws, Fundamental Bylaws and Articles of Incorporation

33 **Recommendation #4:** Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers

34 **Recommendation #5:** Changing Aspects of ICANN's Mission, Commitments, and Core Values

35 **Recommendation #6:** Reaffirming ICANN's Commitment to Respect Internationally Recognized Human Rights as it Carries out its Mission

36 **Recommendation #7:** Strengthening ICANN's Independent Review Process

37 **Recommendation #8:** Improving ICANN's Request for Reconsideration Process

38 **Recommendation #9:** Incorporating the Affirmation of Commitments in ICANN's Bylaws

39 **Recommendation #10:** Enhancing the Accountability of Supporting Organizations and Advisory Committees

40 **Recommendation #11:** Board Obligations with Regard to Governmental Advisory Committee Advice (Stress Test 18)

41 **Recommendation #12:** Committing to Further Accountability Work in Work Stream 2

---

42 Note:
----------

- The language in the Summary, CCWG-Accountability Recommendations, and Changes from the “Third Draft Proposal on Work Stream 1 Recommendations” sections of the Recommendations is copied from the matching Annexes which were approved as consensus positions by the CCWG-Accountability. Only the formatting has been modified to accommodate the structure of the main report.
- The language proposed in recommendations for ICANN Bylaw revisions are conceptual at this stage. The CCWG-Accountability’s external legal counsel and the ICANN legal team will draft final language for these revisions to the Articles of Incorporation and Bylaws (Fundamental and Standard Bylaws).

## Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers

### 43 Summary

44 Under California law and the current Bylaws of the Internet Corporation for Assigned Names and Numbers (ICANN), the ICANN Board of Directors has the final responsibility for the activities and affairs of ICANN.

45 With removal of the U.S. National Telecommunications and Information Administration (NTIA) as a perceived enforcement body over ICANN, the CCWG-Accountability requires a method to ensure that decisions produced by community accountability mechanisms can be enforced, including in situations where the ICANN Board may object to the results.

46 The CCWG-Accountability recommends creating a new entity that will act at the direction of the multistakeholder community to exercise and enforce Community Powers. The entity will take the form of a California unincorporated association and be given the role of "Sole Designator" of ICANN Board Directors and will have the ability to directly or indirectly the Community Powers. The entity will be referred to as the "Empowered Community."

47 As permitted under California law, the Empowered Community will have the statutory power to appoint and, with that, the statutory power to remove ICANN Board Directors (whether an individual Director or the entire Board). Other powers, such as the power to approve or reject amendments to the Articles of Incorporation and Bylaws, may be provided to the Empowered Community.

48 The CCWG-Accountability accepts that its statutory power will be limited as described above, and that this is sufficient given:

- The creation of "Fundamental Bylaws" that can only be modified jointly by the ICANN Board and Empowered Community.
- All recommended Work Stream 1 accountability mechanisms are constituted as Fundamental Bylaws.
- The right of inspection is granted to "Decisional Participants" in the Empowered Community.
- The right of investigation is granted to the Decisional Participants in the Empowered Community.

49 The process for the Empowered Community to use a Community Power is outlined in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement.

### 50 CCWG-Accountability Recommendations

51 The CCWG-Accountability recommends creating an entity that will act at the direction of the community to exercise and enforce Community Powers:

- This entity will take the form of a California unincorporated association and be given the role of Sole Designator of ICANN Board Directors and will have the ability to directly or indirectly enforce the Community Powers. This entity will be referred to as the Empowered Community.

- The Empowered Community will act as directed by participating Supporting Organizations (SOs) and Advisory Committees (ACs), which will be referred to as the Decisional Participants in the Empowered Community.
- The Empowered Community, and the rules by which it is governed, will be constituted in ICANN's Fundamental Bylaws, along with provisions to ensure the Empowered Community cannot be changed or eliminated without its own consent (see Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation).
- The Articles of Incorporation will be amended to clarify that the global public interest will be determined through a bottom-up, multistakeholder process.

52 Additionally, the CCWG-Accountability recommends including in the ICANN Bylaws:

- The right for Decisional Participants in the Empowered Community to inspection as outlined in California Corporations Code 6333, although this specific code reference would not be mentioned in the Bylaws.
- The right of investigation, which includes the adoption of the following audit process: upon three Decisional Participants in the Empowered Community coming together to identify a perceived issue with fraud or gross mismanagement of ICANN resources, ICANN will retain a third-party, independent firm to undertake a specific audit to investigate that issue. The audit report will be made public, and the ICANN Board will be required to consider the recommendations and findings of that report.
- The following limitation associated with the Governmental Advisory Committee (GAC) acting as a Decisional Participant: If the GAC chooses to participate as a Decisional Participant in the Empowered Community, it may not participate as a decision-maker in the Empowered Community's exercise of a Community Power to challenge the ICANN Board's implementation of GAC consensus advice (referred to as the "GAC carve-out").

In such cases, the GAC will still be entitled to participate in the Empowered Community in an advisory capacity in all other aspects of the escalation process, but its views will not count towards or against the thresholds needed to initiate a conference call, convene a Community Forum or exercise the Community Power.

The GAC carve-out preserves the ICANN Board's unique obligation to work with the GAC to try to find a mutually acceptable solution to the implementation of GAC advice supported by consensus – as defined in Recommendation #11: Board Obligations with Regard to Governmental Advisory Committee Advice (Stress Test 18) – while protecting the Empowered Community's power to challenge such Board decisions.

53 **Changes from the "Third Draft Proposal on Work Stream 1 Recommendations"**

- Scope and limitations with respect to the right to inspect accounting books and records of ICANN confirmed, emphasizing the difference between DIDP and inspection rights.
- Added inspection rights for accounting books and records and minutes based on a one Decisional Participant threshold.
- Introduced additional suggestion by the ICANN Board regarding investigation right (audits), based on three Decisional Participants in the Empowered Community threshold.

- Confirmed direction for implementation to avoid abusive claims.
- Compromise on Recommendation #11 required the creation of the “GAC carve-out.”

- Annex 03 – Details on Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation
- Annex 04 – Details on Recommendation #4: Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers

## **Recommendation #2: Empowering the Community Through Consensus: Engagement, Escalation, and Enforcement**

#### 55 **Summary**

#### 56 **Engagement**

57 Today, the Internet Corporation for Assigned Names and Numbers (ICANN) Board of Directors voluntarily consults with the multistakeholder community on a variety of decisions, including the Annual Budget and changes to the ICANN Bylaws. To gather feedback, the ICANN Board uses mechanisms such as public consultations and information sessions to gauge community support and/or identify issues on the topic. These consultation mechanisms are referred to as an “engagement process.”

58 The CCWG-Accountability is recommending that engagement processes for specific ICANN Board actions be constituted in the Fundamental Bylaws. Although the ICANN Board engages voluntarily in these processes today, this recommendation would formally require the ICANN Board to undertake an extensive engagement process (including, at a minimum, a full public consultation process that complies with ICANN rules for public consultations) before taking action on any of the following:

- Approving ICANN’s Five-Year Strategic Plan.
- Approving ICANN’s Five-Year Operating Plan.
- Approving ICANN’s Annual Operating Plan & Budget.
- Approving the Internet Assigned Numbers Authority (IANA) Functions Budget.
- Approving any modifications to Standard or Fundamental Bylaws or the Articles of Incorporation, or approving ICANN’s sale or other disposition of all or substantially all of ICANN’s assets.
- Making ICANN Board decisions relating to reviews of IANA functions, including the triggering of any Post-Transition IANA (PTI) separation process.

59 If it is determined that there is divergence between the ICANN Board and the community after the engagement process, the Empowered Community (as defined in Recommendation #1:

Establishing an Empowered Community for Enforcing Community Powers) may decide to use a Community Power after the appropriate “escalation process” has been satisfied.

60 The Empowered Community may begin an escalation process to:

- Reject a Five-Year Strategic Plan, Five-Year Operating Plan, Annual Operating Plan & Budget, or the IANA Functions Budget.
- Reject a change to ICANN Standard Bylaws.
- Approve changes to Fundamental Bylaws and/or Articles of Incorporation, and/or approve ICANN’s sale or other disposition of all or substantially all of ICANN’s assets.
- Remove an individual ICANN Board Director.
- Recall the entire ICANN Board.
- Initiate a binding community Independent Review Process (IRP), where a panel decision is enforceable in any court recognizing international arbitration results, or a non-binding Request for Reconsideration, where the ICANN Board of Directors is obliged to reconsider a recent decision or action/inaction by ICANN’s Board or staff.

61 Reject an ICANN Board decision relating to reviews of IANA functions, including the triggering of any PTI separation process.

## 62 **Escalation**

63 The escalation process can differ, sometimes significantly, from one Community Power to another.

64 One of the most standardized versions of the escalation process is required for all Community Powers to “reject,” remove individual Nominating Committee-nominated Board Directors, or recall the entire Board.

- **This escalation process comprises the following steps:**

1. An individual starts a petition in a Supporting Organization (SO) or Advisory Committee (AC) that is a Decisional Participant in the Empowered Community (see Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers).
  - If the petition is approved by that SO or AC, it proceeds to the next step.
  - If the petition is not approved by that SO or AC, the escalation process is terminated.
2. The SO or AC that approved the petition contacts the other Decisional Participants to ask them to support the petition.
  - At least one additional SO and/or AC must support the petition (for a minimum of two or, for Board recall, three) for a Community Forum to be organized to discuss the issue.
    - If the threshold is not met, the escalation process is terminated.
    - If the threshold is met, a Community Forum is organized to discuss the petition.
3. An open Community Forum of one or two days is organized for any interested stakeholder in the community to participate.
  - The petitioning SO and/or AC will:

- Circulate a detailed rationale for proposing to use the Community Power to all Decisional Participants.
  - Designate a representative(s) to liaise with SOs/ACs to answer questions from the SOs/ACs.
  - If desired, optionally, request that ICANN organize a conference call prior to the Community Forum for the community to discuss the issue.
  - If the ICANN Board and the Empowered Community can resolve their issues before or in the Community Forum, the escalation process is terminated.
  - Otherwise, the Empowered Community must decide if it wishes to use its Community Power.
4. The Empowered Community considers use of a Community Power.
- If the threshold to use a Community Power is not met, or there is more than one objection, then the escalation process is terminated.
  - If the threshold is met for using the Community Power, and there is no more than one objection, the Empowered Community advises the ICANN Board of the decision and directs it to comply with the decision (as outlined in the Fundamental Bylaws for this Community Power).
5. The Empowered Community advises the ICANN Board.
- If the Empowered Community has decided to use its power, it will advise the ICANN Board of the decision and direct the Board to take any necessary action to comply with the decision.

65 **Enforcement**

66 If the ICANN Board refuses or fails to comply with a decision of the Empowered Community using a Community Power (other than a decision to remove an individual Director or the entire ICANN Board pursuant to the Empowered Community's statutory power, as discussed below), the Empowered Community must decide if it wishes to begin the enforcement process.

67 The enforcement process can proceed in one of two ways:

- The Empowered Community may initiate mediation and community IRP procedures.
- The Empowered Community may initiate an escalation process to recall the entire ICANN Board.

68 The enforcement process may result in a resolution of the issue. Otherwise, if needed, the result of the enforcement process is enforceable in court.

69 If the ICANN Board refuses or fails to comply with a decision of the Empowered Community to use the statutory power to remove an individual ICANN Director or recall the entire ICANN Board (or with the Empowered Community's appointment of a Director), the Empowered Community could address that refusal by bringing a claim in a court that has jurisdiction; there is no need for the Empowered Community to initiate or undertake other enforcement processes such as mediation or an IRP to enforce the power.

70 **CCWG-Accountability Recommendations**

- 71 Establish a Fundamental Bylaw that requires the ICANN Board to undertake an extensive engagement process (including, at a minimum, a full public consultation process that complies with ICANN rules for public consultations) before taking action on any of the following:
- Approving ICANN’s Five-Year Strategic Plan.
  - Approving ICANN’s Five-Year Operating Plan.
  - Approving ICANN’s Annual Operating Plan & Budget.
  - Approving the IANA Functions Budget.
  - Approving any modification to Standard or Fundamental Bylaws or the Articles of Incorporation, or approving ICANN’s sale or other disposition of all or substantially all of ICANN’s assets.
  - Making any ICANN Board decision relating to reviews of IANA functions, including the triggering of any PTI separation process.
- 72 Include the engagement, escalation and enforcement processes in the Fundamental Bylaws.
- Note: The escalation processes for each Community Power are outlined in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers.

73 **Table: Required Thresholds for the Various Escalation and Enforcement Processes (Based on a Minimum of Five Decisional Participants in the Empowered Community)**

Required Community Powers?	Petition Threshold to convene a Community Forum	Is there consensus support to exercise a Community Power?
74 1. Reject a proposed Operating Plan/Strategic Plan/Budget	75 Two SOs/ACs	76 Four support rejection, and no more than one objection
77 2. Approve a change to Fundamental Bylaws and Articles of Incorporation, and approve ICANN’s sale or other disposition of all or substantially all of ICANN’s assets	78 N/A	79 Three support approval, and no more than one objection
80 3. Reject changes to Standard Bylaws	81 Two SOs/ACs, including the SO that led the PDP that requires the Bylaw change (if any)	82 Three support rejection, including the SO that led the PDP that requires the Bylaw change (if any), and no more than one objection

<b>Required Community Powers?</b>	<b>Petition Threshold to convene a Community Forum</b>	<b>Is there consensus support to exercise a Community Power?</b>
83 4a. Remove an individual Board Director nominated by an SO or AC (and appointed by the Empowered Community)	84 Majority within nominating SO/AC	85 Invite and consider comments from all SOs/ACs. 3/4 majority within the nominating SO/AC to remove their director
86 4b. Remove an individual Board Director nominated by the Nominating Committee (and appointed by the Empowered Community)	87 Two SOs/ACs	88 Three support, and no more than one objection
89 5. Recall the entire Board of Directors	90 Three SOs/ACs	91 Four support, and no more than one objection <sup>3</sup>
92 6. Initiate a binding IRP or a Request for Reconsideration	93 Two SOs/ACs	94 Three support, including the SO(s) that approved the policy recommendations from the PDP which result is being challenged through the IRP (if any), and no more than one objection 95 Require mediation before IRP begins
96 7. Reject an ICANN Board decision relating to reviews of IANA functions, including the triggering of any PTI separation process	97 Two SOs/ACs	98 Four support, and no more than one objection

99 Implementation of the Empowered Community currently anticipates that all of ICANN's SOs, the ALAC and GAC (if the GAC chooses to participate) would participate in the Empowered Community – that is, they will be listed in the Bylaws as the five Decisional Participants.

100 The thresholds presented in this document were determined based on this assessment. If fewer than five of ICANN's SOs and ACs agree to be Decisional Participants, these thresholds for consensus support may be adjusted. Thresholds may also have to be adjusted if ICANN changes to have more SOs or ACs.

101 In the event of the creation (or removal) of SOs/ACs, the corresponding percentage could be used as useful guidelines in refining the thresholds. There would, however, need to be a conscious decision, depending on the circumstances, regarding these adjustments. If such a change were to affect the list of Decisional Participants in the Empowered Community, the

<sup>3</sup> A minority of CCWG-Accountability participants prefer to require five SOs and ACs, or allow one objection to block consensus.

change would follow the Fundamental Bylaw change process, which enables such a conscious decision to be undertaken.

102 The CCWG-Accountability also recommends that in a situation where the GAC may not participate as a Decisional Participant because the Community Power is proposed to be used to challenge the Board's implementation of GAC consensus advice and the threshold is set at four in support, the power will still be validly exercised if three are in support and no more than one objects, with the following exception:

- Where the power to be exercised is recalling the entire Board for implementing GAC advice, the reduced threshold would apply only after an IRP has found that, in implementing GAC advice, the Board acted inconsistently with the ICANN Bylaws. If the Empowered Community has brought such an IRP and does not prevail, the Empowered Community may not exercise its power to recall the entire the Board solely on the basis of the matter decided by the IRP. It may, however, exercise that power based on other grounds.

### 103 **Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”**

- Extended time for certain escalation steps in response to comments. Kept overall timeline similar by combining and removing some steps (mandatory conference call).
- Made it mandatory for petitioning party to reach out to SOs/ACs to socialize relevant information before Community Forum.
- Acknowledged comments regarding the thresholds adjustment in case the number of Decisional Participants is lower (page 12, paragraph 60 of the Third Draft Proposal), by removing this option and replacing it with a lower threshold for approving changes to Fundamental Bylaws. Since the Fundamental Bylaw change process is a requirement for “approval” and not a “rejection” option, this would preserve the requirement for stronger protection of Fundamental Bylaws.
- Determined that the use of the corresponding percentage for thresholds as recommended by the Board can be suggested as a guideline in the event of the creation of new SOs/ACs, but there would need to be a conscious decision, depending on the circumstances. If such a new SO/AC were to become a Decisional Participant in the Empowered Community, this change would require a change to the Fundamental Bylaws and would therefore require approval by the Empowered Community.
- Implemented the compromise for Recommendation #11: Board Obligations with Regard to Governmental Advisory Committee Advice (Stress Test 18) that the threshold requirements would be modified if the GAC was a Decisional Participant.

### 104 **Relevant Annexes**

- 105 Annex 02 – Details on Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, and Enforcement
- 106 Annex 03 – Details on Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation
- 107 Annex 04 – Details on Recommendation #4: Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers

## Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation

### 108 **Summary**

109 Currently, the Bylaws of the Internet Corporation for Assigned Names and Numbers (ICANN) have a single mechanism for amendment.

- Any provision of the ICANN Bylaws can be changed by a 2/3 vote of all the Directors on the ICANN Board.
- The ICANN Board is not required to consult the multistakeholder community or the wider public before amending the Bylaws, but has voluntarily done so up to this point.

110 The CCWG-Accountability recommends classifying each ICANN Bylaw as either a “Fundamental Bylaw” or a “Standard Bylaw,” with Fundamental Bylaws being more difficult to change.

111 Specifically, the CCWG-Accountability recommends that:

- Public consultations be required on all changes to ICANN Bylaws, both Fundamental and Standard.
- The requirement for public consultations to be added to the ICANN Bylaws as a Fundamental Bylaw to ensure that ICANN must continue to engage with the community in the future.
- Any changes to Fundamental Bylaws require approval from both the ICANN Board and Empowered Community, as outlined in the respective Community Power (as described in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers).
- The threshold for ICANN Board approval for changing a Fundamental Bylaw is raised from 2/3 to 3/4.
- Approval for changes to the Articles of Incorporation use the same process required for approving changes to Fundamental Bylaws, including public consultations.

112 Why is the CCWG-Accountability recommending this?

- The CCWG-Accountability felt that it was critical to ensure that the ICANN Bylaws that embody the purpose of the organization (Mission, Commitments and Core Values) and are meant to ensure the accountability of the ICANN Board, cannot be changed by the ICANN Board acting alone.

### 113 **CCWG-Accountability Recommendations**

114 The CCWG-Accountability recommends:

- Classifying each ICANN Bylaw as either a Fundamental Bylaw or a Standard Bylaw.
- Making the following CCWG-Accountability and CWG-Stewardship Recommendations Fundamental Bylaws:

- The Empowered Community for enforcing Community Powers, including the role of Sole Designator of ICANN's Directors, as described in Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers.
- The escalation and enforcement mechanisms as described in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement.
- The process for amending Fundamental Bylaws and/or Articles of Incorporation, and for approving ICANN's sale or other disposition of all or substantially all of ICANN's assets as described in Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation.
- The seven Community Powers as described in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers.
- The Mission, Commitments and Core Values as described in Recommendation #5: Changing Aspects of ICANN's Mission, Commitments and Core Values.
- The framework for the Independent Review Process (IRP) as described in Recommendation #7: Strengthening ICANN's Independent Review Process.
- The IANA Function Review, Special IANA Function Review and the Separation Process, accountability mechanisms for the IANA naming functions that are required under the CWG-Stewardship Proposal.
- The PTI Governance and Customer Standing Committee (CSC) structures, also required by the CWG-Stewardship Proposal.
- The rights of investigation and inspection as described in Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers.
- Requiring ICANN to conduct public consultations on any proposed changes to Standard Bylaws, Fundamental Bylaws or the Articles of Incorporation.
- Requiring approval for any changes to Fundamental Bylaws and the Articles of Incorporation from both the ICANN Board and the Empowered Community as outlined in the Community Power as described in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers.
- Raising the threshold for ICANN Board approval for changing a Fundamental Bylaw or the Articles of Incorporation from 2/3 to 3/4 of all the Directors on the ICANN Board.

115

### **Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”**

- Clarified that IANA Function Review (IFR) provisions apply only to the IANA naming functions (CWG-Stewardship requirement).
- Clarified the process for changes of Articles of Incorporation to be similar to process for changes to Fundamental Bylaws, as well as the process for approving ICANN's sale or other disposition of all or substantially all of ICANN's assets.
- Added a specific recommendation that the current Articles of Incorporation be modified to remove the notion of members and reflect the need for an affirmative vote of at least 3/4 of all the Directors on the ICANN Board, as well as approval by the Empowered Community.

116 **Relevant Annexes**

117 Annex 03 – Details on Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation

118 Annex 04 – Details on Recommendation #4: Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers

## Recommendation #4: Ensuring Community Engagement in ICANN Decision-making: Seven New Community Powers

 <p><b>REJECT BUDGET OR STRATEGIC/ OPERATING PLAN</b></p>	 <p><b>REJECT CHANGES TO ICANN STANDARD BYLAWS</b></p>	 <p><b>APPROVE CHANGES TO FUNDAMENTAL BYLAWS OR ARTICLES, OR CERTAIN ASSET SALES</b></p>	
 <p><b>REMOVE INDIVIDUAL ICANN BOARD DIRECTORS</b></p>	 <p><b>RECALL ENTIRE ICANN BOARD</b></p>	 <p><b>LAUNCH COMMUNITY INDEPENDENT REVIEW PROCESS OR REQUEST FOR RECONSIDERATION</b></p>	 <p><b>REJECT ICANN BOARD DECISIONS RELATING TO IANA FUNCTIONS REVIEWS</b></p>

119 **Summary**

120 The CCWG-Accountability has recommended seven powers for the community that should be in place to improve ICANN's accountability and ensure community engagement.

121 These "Community Powers" are:

1. Reject a Five-Year Strategic Plan, Five-Year Operating Plan, Annual Operating Plan & Budget or IANA Functions Budget.

2. Reject a change to ICANN Standard Bylaws.
3. Approve a change to Fundamental Bylaws and/or Articles of Incorporation, and/or approve ICANN's sale or other disposition of all or substantially all of ICANN's assets.
4. Remove an individual ICANN Board Director.
5. Recall the entire ICANN Board.
6. Initiate a binding Independent Review Process (IRP) (where a panel decision is enforceable in any court recognizing international arbitration results) or a non-binding Request for Reconsideration (where the ICANN Board of Directors is obliged to reconsider a recent decision or action/inaction by ICANN's Board or staff).
7. Reject an ICANN Board decision relating to reviews of IANA functions, including the triggering of any Post-Transition IANA (PTI) separation process for the IANA naming functions.

122 The Community Powers and associated processes were designed to ensure that no stakeholder can singlehandedly exercise any power, and that under no circumstances, would any individual segment of the community be able to block the use of a power.

## 123 **CCWG-Accountability Recommendations**

124 The CCWG-Accountability recommends:

- Defining the following Community Powers as Fundamental Bylaws:
  1. Reject a Five-Year Strategic Plan, Five-Year Operating Plan, Annual Operating Plan & Budget or IANA Functions Budget.
  2. Reject a change to ICANN Standard Bylaws.
  3. Approve a change to Fundamental Bylaws and/or Articles of Incorporation, and/or approve ICANN's sale or other disposition of all or substantially all of ICANN's assets.
  4. Remove an individual ICANN Board Director.
  5. Recall the entire ICANN Board.
  6. Initiate a binding IRP (where a panel decision is enforceable in any court recognizing international arbitration results) or a non-binding Request for Reconsideration (where the ICANN Board of Directors is obliged to reconsider a recent decision or action/inaction by ICANN's Board or staff).
  7. Reject ICANN Board decisions relating to reviews of IANA functions, including the triggering of any PTI separation process for the IANA naming functions.
- Adding an ICANN Bylaw that states that if the entire ICANN Board is removed, an Interim Board will be established only as long as is required for the selection/election process for the Replacement Board to take place. Supporting Organizations (SOs), Advisory Committees (ACs), and the Nominating Committee (NOMCOM) will develop replacement processes that ensure the Interim Board will not be in place for more than 120 days. The Interim Board will have the same powers and duties as the Board it replaces. Having a Board in place at all times is critical to the operational continuity of ICANN and is a legal requirement.

- The ICANN Bylaws will state that, except in circumstances in which urgent decisions are needed to protect the security, stability and resilience of the DNS, the Interim Board will consult with the community through the SO and AC leaderships before making major decisions. Where relevant, the Interim Board will also consult through the ICANN Community Forum before taking any action that would mean a material change in ICANN's strategy, policies or management, including replacement of the serving President and CEO.
- Note: Details on what the powers do is presented in greater detail in the following section and the details of how these can be used can be found in Annex 2.
- That there be an exception to rejecting Standard Bylaws in cases where the Standard Bylaw change is the result of a Policy Development Process. The exception would be as follows:
  - Fundamental Bylaws would require that the ICANN Board not combine the approval of ICANN Bylaw changes that are the result of a Policy Development Process with any other Bylaw changes.
  - Fundamental Bylaws would require the ICANN Board to clearly indicate if an ICANN Bylaw change is the result of a Policy Development Process when the Board approves it.
  - Fundamental Bylaws would require that if the change to the ICANN Bylaws is the result of a Policy Development Process, the SO that led the Policy Development Process must formally support holding a Community Forum and exercise the power to reject the Bylaw change. If the SO that led the Policy Development Process that requires the Bylaw change does not support holding a Community Forum or exercising the power to reject the Bylaw, then the Community Power to reject the Bylaw cannot be used.

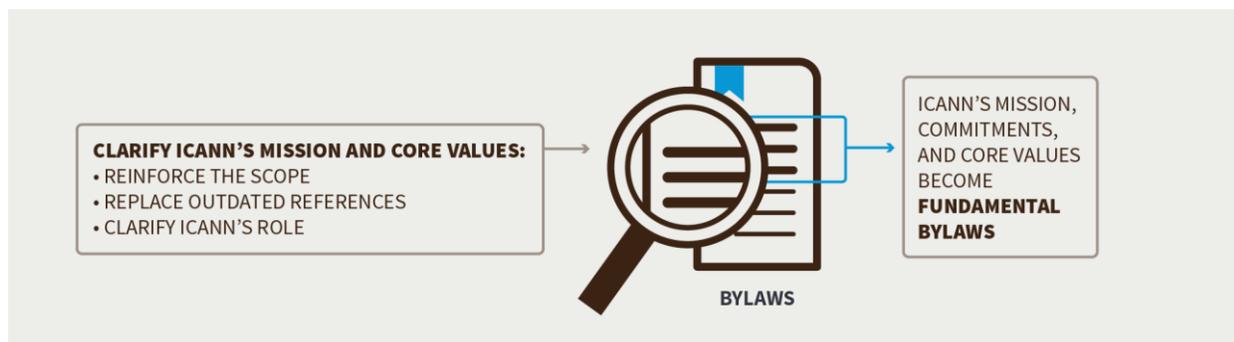

125 **Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”**

- Budget rejection for PTI significantly updated.
- Caretaker budget expanded.
- Indemnification for removal of an ICANN Board Director greatly expanded.
- Escalation steps amended to match process in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, and Enforcement.
- Scope of community IRP modified to match Recommendation #7: Strengthening ICANN's Independent Review Process.
- “The Power to Approve Changes to Fundamental Bylaws and/or Articles of Incorporation” is now: “The Power to Approve Changes to Fundamental Bylaws and/or Articles of Incorporation and/or Approve ICANN's Sale or Other Disposition of All or Substantially All of ICANN's Assets.”
- “The Power to Initiate a Binding IRP (Where a Panel Decision is Enforceable in any Court Recognizing International Arbitration Results)” now includes the possibility for the Empowered Community to file a Request for Reconsideration.

126 **Relevant Annexes**

- 127 Annex 02 – Details on Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement
- 128 Annex 03 – Details on Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation
- 129 Annex 04 – Details on Recommendation #4: Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers

## Recommendation #5: Changing Aspects of ICANN's Mission, Commitments, and Core Values

### 130 Summary

131 The CCWG-Accountability is recommending changes to the ICANN Bylaws to assure that the Bylaws reflect the CCWG-Accountability recommendations.

- Note: The language proposed in this recommendation for ICANN Bylaw revisions is conceptual in nature at this stage. External legal counsel and the ICANN legal team will draft final language for these revisions to the Articles of Incorporation and Bylaws.

### 132 Mission Statement

133 The CCWG-Accountability recommends the following changes to ICANN's "Mission Statement," (Bylaws, Article I, Section 1):

- Clarify that ICANN's Mission is limited to coordinating the development and implementation of policies that are designed to ensure the stable and secure operation of the Domain Name System and are reasonably necessary to facilitate its openness, interoperability, resilience, and/or stability.
- Clarify that ICANN's Mission does not include the regulation of services that use the Domain Name System or the regulation of the content these services carry or provide.
- Clarify that ICANN's powers are "enumerated." Simply, this means that anything that is not articulated in the Bylaws is outside the scope of ICANN's authority.
  - Note: This does not mean ICANN's powers can never evolve. However, it ensures that any changes will be deliberate and supported by the community.

134 **Core Values**

01 The CCWG-Accountability recommends the following changes to ICANN's "Core Values" (Bylaws, Article I, Section 2 and Article II, Section 3):

- Divide ICANN's existing Core Values provisions into "Commitments" and "Core Values."
  - Incorporate ICANN's obligation to "operate for the benefit of the Internet community as a whole, and to carry out its activities in accordance with applicable law and international law and conventions through open and transparent processes that enable competition" into the Bylaws.
  - Note: These obligations are currently contained in ICANN's Articles of Incorporation.
- Designate certain Core Values as "Commitments." ICANN's Commitments will include the values that are fundamental to ICANN's operation, and are intended to apply consistently and comprehensively.

Commitments will include ICANN's obligations to:

- Preserve and enhance the stability, reliability, security, global interoperability, resilience, and openness of the DNS and the Internet.
  - Limit its activities to those within ICANN's Mission that require, or significantly benefit from, global coordination.
  - Employ open, transparent, bottom-up, multistakeholder processes.
  - Apply policies consistently, neutrally, objectively and fairly, without singling any party out for discriminatory treatment.
- Slightly modify the remaining Core Values to:
    - Reflect various provisions in the Affirmation of Commitments, such as efficiency, operational excellence, and fiscal responsibility.
    - Add an obligation to avoid capture.

135 Although previous CCWG-Accountability draft proposals proposed to modify existing Core Value 5 ("Where feasible and appropriate, depending on market mechanisms to promote and sustain a competitive environment") to drop the phrase "where feasible and appropriate," the CCWG-Accountability has reconsidered this recommendation. While acknowledging that ICANN is not an antitrust authority, on balance the CCWG-Accountability elected to retain the introductory language to ensure that ICANN continues to have the authority, for example, to refer competition-related questions regarding new registry services to competent authorities under the RSEP program and to establish bottom-up policies for allocating top-level domains (e.g., community preference).

136 **Balancing or Reconciliation Test**

137 The CCWG-Accountability recommends modification to the "balancing" language in the ICANN Bylaws to clarify the manner in which this balancing or reconciliation takes place. Specifically:

*These Commitments and Core Values are intended to apply in the broadest possible range of circumstances. The Commitments reflect ICANN's fundamental compact with*

*the global Internet community and are intended to apply consistently and comprehensively to ICANN's activities. The specific way in which Core Values apply, individually and collectively, to each new situation may depend on many factors that cannot be fully anticipated or enumerated. Situations may arise in which perfect fidelity to all Core Values simultaneously is not possible. In any situation where one Core Value must be reconciled with another, potentially competing Core Value, the balancing must further an important public interest goal within ICANN's Mission that is identified through the bottom-up, multistakeholder process.*

138 **Fundamental Bylaws Provisions**

139 The CCWG-Accountability recommends that the revised Mission Statement, Commitments and Core Values be constituted as Fundamental Bylaws. See Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation.

140 **CCWG-Accountability Recommendations**

141 Modify ICANN's Fundamental Bylaws to implement the following:

142 **Mission**

143 The Mission of the Internet Corporation for Assigned Names and Numbers ("ICANN") is to ensure the stable and secure operation of the Internet's unique identifier systems as described below. Specifically, ICANN:

1. Coordinates the allocation and assignment of names in the root zone of the Domain Name System ("DNS"). In this role, ICANN's scope is to coordinate the development and implementation of policies:
  - For which uniform or coordinated resolution is reasonably necessary to facilitate the openness, interoperability, resilience, security and/or stability of the DNS; and
  - That are developed through a bottom-up, consensus-based multistakeholder process and designed to ensure the stable and secure operation of the Internet's unique names systems.
2. Facilitates coordination of the operation and evolution of the DNS root name server system.
3. Coordinates the allocation and assignment of the top-most level of Internet Protocol ("IP") and Autonomous System ("AS") numbers. In this role, ICANN provides registration services and open access for global number registries as requested by the Internet Engineering Task Force and the Regional Internet Registries and facilitates the development of related global number registry policies by the affected community as agreed with the RIRs.
4. Collaborates with other bodies as appropriate to publish core registries needed for the functioning of the Internet. In this role, with respect to protocol ports and parameters, ICANN's scope is to provide registration services and open access for registries in the public domain requested by Internet protocol development organizations.

144 ICANN shall act strictly in accordance with, and only as reasonably appropriate, to achieve its Mission.

145 ICANN shall not impose regulations on services that use the Internet's unique identifiers, or the content that such services carry or provide.

146 ICANN shall have the ability to negotiate, enter into and enforce agreements, including Public Interest Commitments ("PICs"), with contracted parties in service of its Mission.

147 Note to drafters: In crafting proposed Bylaws language to reflect this Mission Statement, the CCWG wishes the drafters to note the following:

1. The prohibition on the regulation of "content" is not intended to prevent ICANN policies from taking into account the use of domain names as identifiers in various natural languages.
2. The issues identified in Specification 1 to the Registry Agreement and Specification 4 to the Registrar Accreditation Agreement (the so-called "Picket Fence") are intended and understood to be within the scope of ICANN's Mission. A side-by-side comparison of the formulation of the Picket Fence in the respective agreements is included for reference at the end of this Annex.
3. For the avoidance of uncertainty only, the language of existing registry agreements and registrar accreditation agreements (including PICs and as-yet unsigned new gTLD Registry Agreements for applicants in the new gTLD round that commenced in 2013) should be grandfathered to the extent that such terms and conditions might otherwise be considered to violate ICANN's Bylaws or exceed the scope of its Mission. This means that the parties who entered/enter into existing contracts intended (and intend) to be bound by those agreements. It means that until the expiration date of any such contract following ICANN's approval of a new/substitute form of Registry Agreement or Registrar Accreditation Agreement, neither a contracting party nor anyone else should be able to bring a case alleging that any provisions of such agreements on their face are ultra vires. It does not, however, modify any contracting party's right to challenge the other party's interpretation of that language. It does not modify the right of any person or entity materially affected (as defined in the Bylaws) by an action or inaction in violation ICANN's Bylaws to seek redress through an IRP. Nor does it modify the scope of ICANN's Mission.
4. The CCWG-Accountability anticipates that the drafters may need to modify provisions of the Articles of Incorporation to align with the revised Bylaws.

## 148 **Section 2. Commitments & Core Values**

149 In carrying out its Mission, ICANN will act in a manner that complies with and reflects ICANN's Commitments and respects ICANN's Core Values, both described below.

### 150 **Commitments**

151 In performing its Mission, ICANN must operate in a manner consistent with its Bylaws for the benefit of the Internet community as a whole, carrying out its activities in conformity with relevant principles of international law and international conventions, and applicable local law and through open and transparent processes that enable competition and open entry in Internet-related markets. Specifically, ICANN's action must:

1. Preserve and enhance its neutral and judgment-free administration of the DNS, and the operational stability, reliability, security, global interoperability, resilience, and openness of the DNS and the Internet.
2. Maintain the capacity and ability to coordinate the DNS at the overall level and to work for the maintenance of a single, interoperable Internet.

3. Respect the creativity, innovation, and flow of information made possible by the Internet by limiting ICANN's activities to matters that are within ICANN's Mission and require or significantly benefit from global coordination.
4. Employ open, transparent and bottom-up, multistakeholder policy development processes, led by the private sector, including business stakeholders, civil society, the technical community, academia, and end users, while duly taking into account the public policy advice of governments and public authorities that (1) seek input from the public, for whose benefit ICANN shall in all events act, (2) promote well-informed decisions based on expert advice, and (3) ensure that those entities most affected can assist in the policy development process.
5. Make decisions by applying documented policies consistently, neutrally, objectively, and fairly, without singling out any particular party for discriminatory treatment.
6. Remain accountable to the Internet Community through mechanisms defined in the Bylaws that enhance ICANN's effectiveness.

152 **Core Values**

153 In performing its Mission, the following Core Values should also guide the decisions and actions of ICANN:

1. To the extent feasible and appropriate, delegating coordination functions to or recognizing the policy role of other responsible entities that reflect the interests of affected parties and the roles of both ICANN's internal bodies and external expert bodies.
2. Seeking and supporting broad, informed participation reflecting the functional, geographic, and cultural diversity of the Internet at all levels of policy development and decision-making to ensure that the bottom-up, multistakeholder policy development process is used to ascertain the global public interest and that those processes are accountable and transparent.
3. Where feasible and appropriate, depending on market mechanisms to promote and sustain a healthy competitive environment in the DNS market.
4. Introducing and promoting competition in the registration of domain names where practicable and beneficial in the public interest as identified through the bottom-up, multistakeholder policy development process.
  - a. Operating with efficiency and excellence, in a fiscally responsible and accountable manner and at a speed that is responsive to the needs of the global Internet community.
5. While remaining rooted in the private sector, including business stakeholders, civil society, the technical community, academia, and end users, recognizing that governments and public authorities are responsible for public policy and duly taking into account the public policy advice of governments and public authorities.
6. Striving to achieve a reasonable balance between the interests of different stakeholders.

154 These Commitments and Core Values are intended to apply in the broadest possible range of circumstances. The Commitments reflect ICANN's fundamental compact with the global Internet community and are intended to apply consistently and comprehensively to ICANN's activities.

155 The specific way in which Core Values apply, individually and collectively, to each new situation may depend on many factors that cannot be fully anticipated or enumerated. Situations may arise in which perfect fidelity to all Core Values simultaneously is not possible.

156 In any situation where one Core Value must be reconciled with another, potentially competing Core Value, the balancing must further an important public interest goal within ICANN's Mission that is identified through the bottom-up, multistakeholder process.

157 Note: Specific recommendations on how to implement these modifications can be found at the end of the next section.

## 158 **Changes from the 'Third Draft Proposal on Work Stream 1 Recommendations'**

159 For space considerations the list of changes is not included here. Please consult Annex 5 - Recommendation #5: Changing Aspects of ICANN's Mission, Commitments and Core Values for a detailed list of modifications.

## 160 **Relevant Annexes**

161 Annex 05 – Details on Recommendation #5: Changing Aspects of ICANN's Mission, Commitments, and Core Values

# **Recommendation #6: Reaffirming ICANN's Commitment to Respect Internationally Recognized Human Rights as it Carries Out its Mission**

## 162 **Summary**

163 The subject of including a commitment to respect Human Rights in the ICANN Bylaws has been extensively discussed by the CCWG-Accountability.

164 The CCWG-Accountability sought legal advice on whether, upon the termination of the IANA Functions Contract between ICANN and the U.S. National Telecommunications and Information Administration (NTIA), ICANN's specific Human Rights obligations could be called into question. It was found that, upon termination of the contract, there would be no significant impact on ICANN's Human Rights obligations. However, the CCWG-Accountability reasoned that a commitment to respect Human Rights should be included in ICANN's Bylaws in order to comply with the NTIA criteria to maintain the openness of the Internet.

165 This proposed draft Bylaw on Human Rights would reaffirm ICANN's existing obligations within its Core Values, and would clarify ICANN's commitment to respect Human Rights.

166 Amendments to the proposed draft Bylaw text since the Second Draft Proposal aimed to prevent Mission expansion or "Mission creep," and under the proposed draft Bylaw, ICANN commits to respect internationally recognized Human Rights "within its Core Values."

167 The proposed draft Bylaw does not impose any enforcement duty on ICANN, or any obligation on ICANN to take action in furtherance of the Bylaw.

168 The proposed draft Bylaw also clarifies that no IRP challenges can be made on the grounds of this Bylaw until a Framework of Interpretation on Human Rights (FOI-HR) is developed and approved as part of Work Stream 2 activities. It further clarifies that acceptance of the FOI-HR

will require the same process as for Work Stream 1 recommendations (as agreed for all Work Stream 2 recommendations).

- 169 Additionally, the CCWG-Accountability has identified several work areas that need to be undertaken as part of Work Stream 2 in order to fully operationalize ICANN's commitment to respect Human Rights.

170 **CCWG-Accountability Recommendations**

- Include a Bylaw with the following intent in Work Stream 1 recommendations:

“Within its Core Values, ICANN will commit to respect internationally recognized Human Rights as required by applicable law. This provision does not create any additional obligation for ICANN to respond to or consider any complaint, request, or demand seeking the enforcement of Human Rights by ICANN. This Bylaw provision will not enter into force until (1) a Framework of Interpretation for Human Rights (FOI-HR) is developed by the CCWG-Accountability as a consensus recommendation in Work Stream 2 (including Chartering Organizations’ approval) and (2) the FOI-HR is approved by the ICANN Board using the same process and criteria it has committed to use to consider the Work Stream 1 recommendations.”

- Note: This proposed draft Bylaw will be reviewed by both CCWG-Accountability’s lawyers and ICANN’s legal department and then submitted to the CCWG-Accountability for approval before its submission to the Board for approval.
- Include the following in Work Stream 2 activities:
  - Develop an FOI-HR for the Human Rights Bylaw.
  - Consider which specific Human Rights conventions or other instruments, if any, should be used by ICANN in interpreting and implementing the Human Rights Bylaw.
  - Consider the policies and frameworks, if any, that ICANN needs to develop or enhance in order to fulfill its commitment to respect Human Rights.
  - Consistent with ICANN’s existing processes and protocols, consider how these new frameworks should be discussed and drafted to ensure broad multistakeholder involvement in the process.

- Consider what effect, if any, this Bylaw will have on ICANN's consideration of advice given by the Governmental Advisory Committee (GAC).
- Consider how, if at all, this Bylaw will affect how ICANN's operations are carried out.
- Consider how the interpretation and implementation of this Bylaw will interact with existing and future ICANN policies and procedures.

171 **Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”**

- The CCWG-Accountability considered comments received during the third public comment period, which were overall in favor of including Human Rights language with a few exceptions which included the ICANN Board.
- The CCWG-Accountability engaged with the ICANN Board to specifically address its concerns through discussion and debate in three plenary calls. Additionally, ICANN's legal team and CCWG-Accountability's legal advisors discussed the concerns raised by ICANN legal regarding the possibility of having a significant number of IRP challenges initiated on the grounds of Human Rights claims and the problems this could create without having a Framework of Interpretation in place to properly implement the proposed Bylaw provision.
- The CCWG-Accountability developed compromise text based on a proposal by its legal advisors, which it believed addressed these concerns. The ICANN Board maintained that this compromise text did not address its concerns, but did not provide any specific examples of its concerns regarding the alleged unintended consequences.
- The ICANN Board responded with proposed changes to the draft Bylaw text, which reflected a compromise position and included a commitment to respect Human Rights within ICANN's Core Values, which were accepted by the CCWG-Accountability.

172 **Relevant Annexes**

- 173 Annex 06 – Details on Recommendation #6: Reaffirming ICANN's Commitment to Respect Internationally Recognized Human Rights as it Carries Out its Mission

## **Recommendation #7: Strengthening ICANN's Independent Review Process**

- 174 The purpose of the Independent Review Process (IRP) is to ensure that ICANN does not exceed the scope of its limited technical Mission and complies with its Articles of Incorporation and Bylaws.
- 175 A consultation process undertaken by ICANN produced numerous comments calling for overhaul and reform of ICANN's existing IRP. Commenters called for ICANN to be held to a substantive standard of behavior rather than just an evaluation of whether or not its action was taken in good faith.

176 The CCWG-Accountability therefore proposes several enhancements to the IRP to ensure that the process is:

- Transparent, efficient and accessible (both financially and from a standing perspective).
- Designed to produce consistent and coherent results that will serve as a guide for future actions.

177 The CCWG-Accountability also proposes that the IRP:

- Hear and resolve claims that ICANN, through its Board of Directors or staff, has acted (or has failed to act) in violation of its Articles of Incorporation or Bylaws – including any violation of the Bylaws resulting from action taken in response to advice/input from any Supporting Organization (SO) or Advisory Committee (AC).
- Hear and resolve claims that Post-Transition IANA (PTI), through its Board of Directors or staff, has acted (or has failed to act) in violation of its contract with ICANN and the CWG-Stewardship requirements for issues related to the IANA naming functions.
- Hear and resolve claims that expert panel decisions are inconsistent with the ICANN Bylaws.
- Hear and resolve claims that DIDP decisions by ICANN are inconsistent with the ICANN Bylaws.
- Hear and resolve claims initiated by the Empowered Community with respect to matters reserved to the Empowered Community in the Articles of Incorporation or Bylaws. In such cases, ICANN will bear the costs associated with the Standing Panel, as well as the Empowered Community's legal expenses.
- Be subject to certain exclusions relating to the results of an SO's policy development process, country code top-level domain delegations/redelegations, numbering resources, and protocols parameters.

178 **CCWG-Accountability Recommendations**

- Modifying the Fundamental Bylaws to implement the modifications associated with this recommendation on the IRP which include:
  - Hear and resolve claims that ICANN through its Board of Directors or staff has acted (or has failed to act) in violation of its Articles of Incorporation or Bylaws (including any violation of the Bylaws resulting from action taken in response to advice/input from any AC or SO).
  - Hear and resolve claims that PTI through its Board of Directors or staff has acted (or has failed to act) in violation of its contract with ICANN and the CWG-Stewardship requirements for issues related to the IANA naming functions.
  - Hear and resolve claims that expert panel decisions are inconsistent with ICANN's Bylaws.
  - Hear and resolve claims that DIDP decisions by ICANN are inconsistent with ICANN's Bylaws.
  - Hear and resolve claims initiated by the Empowered Community with respect to matters reserved to the Empowered Community in the Articles of Incorporation or Bylaws.

- A standing judicial/arbitral panel: The IRP should have a standing judicial/arbitral panel tasked with reviewing and acting on complaints brought by individuals, entities, and/or the community who have been materially affected by ICANN's action or inaction in violation of the Articles of Incorporation and/or Bylaws.
  - Composition of Panel and Expertise: Significant legal expertise, particularly international law, corporate governance, and judicial systems/dispute resolution/arbitration is necessary.
  - Diversity: English will be the primary working language with provision of translation services for claimants as needed. Reasonable efforts will be taken to achieve cultural, linguistic, gender, and legal diversity, with an aspirational cap on number of panelists from any single region (based on the number of members of the Standing Panel as a whole).
  - Size of Panel:
    - Standing Panel: Minimum of seven panelists.
    - Decisional Panel: Three panelists.
  - Independence: Panel members must be independent of ICANN, including ICANN SOs and ACs.
  - Recall: Appointments shall be made for a fixed term of five years with no removal except for specified cause (corruption, misuse of position for personal use, etc.). The recall process will be developed by way of the IRP subgroup.
- Initiation of the Independent Review Process: An aggrieved party would trigger the IRP by filing a complaint with the panel alleging that a specified action or inaction is in violation of ICANN's Articles of Incorporation and/or Bylaws, or otherwise within the scope of IRP jurisdiction. The Empowered Community could initiate an IRP with respect to matters reserved to the Empowered Community in the Articles of Incorporation or Bylaws.
- Standing: Any person/group/entity "materially affected" by an ICANN action or inaction in violation of ICANN's Articles of Incorporation and/or Bylaws shall have the right to file a complaint under the IRP and seek redress. The Board's failure to fully implement an Empowered Community decision will be sufficient for the Empowered Community to be materially affected.
- Community Independent Review Process: The CCWG-Accountability recommends giving the Empowered Community the right to present arguments on behalf of the Empowered Community to the IRP Panel. In such cases, ICANN will bear the costs associated with the Standing Panel, as well as the Empowered Community's legal expenses.
- Standard of Review: The IRP Panel, with respect to a particular IRP, shall decide the issue(s) presented based on its own independent interpretation of the ICANN Articles of Incorporation and Bylaws in the context of applicable governing law and prior IRP decisions.
- Accessibility and Cost: The CCWG-Accountability recommends that ICANN bear all the administrative costs of maintaining the system (including panelist salaries), while each party should bear the costs of their own legal advice, except that the legal expenses of the Empowered Community associated with a community IRP will be borne by ICANN. The panel may provide for loser pays/fee shifting in the event it identifies a challenge or defense as frivolous or abusive. ICANN should seek to establish access – for example

access to pro bono representation for community, non-profit complainants and other complainants that would otherwise be excluded from utilizing the process.

- **Implementation:** The CCWG-Accountability proposes that the revised IRP provisions be adopted as Fundamental Bylaws. Implementation of these enhancements will necessarily require additional detailed work. Detailed rules for the implementation of the IRP (such as rules of procedure) are to be created by the ICANN community through a CCWG (assisted by counsel, appropriate experts, and the Standing Panel when confirmed), and approved by the Board, such approval not to be unreasonably withheld. The functional processes by which the Empowered Community will act, such as through a council of the chairs of the ACs and SOs, should also be developed. These processes may be updated in the light of further experience by the same process, if required. In addition, to ensure that the IRP functions as intended, the CCWG-Accountability proposes to subject the IRP to periodic community review.
- **Transparency:** The community has expressed concerns regarding the ICANN document/information access policy and implementation. Free access to relevant information is an essential element of a robust IRP, and as such, the CCWG-Accountability recommends reviewing and enhancing ICANN's Documentary Information Disclosure Policy as part of the accountability enhancements in Work Stream 2.

179

### **Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”**

- The scope of the IRP will be restricted to the IANA naming functions for claims that PTI through its Board of Directors or staff has acted (or has failed to act) in violation of its contract with ICANN.
- The scope of the IRP will include actions and inactions of PTI by way of the PTI Board being bound to ensure that PTI complies with its contractual obligations with ICANN in the Bylaws. ICANN's failure to enforce material obligations will be appealable by way of the IRP as a Bylaws violation.
- The scope of the IRP will include claims that DIDP decisions by ICANN are inconsistent with ICANN's Bylaws.
- Clarified that ICANN must modify Registry Agreements with gTLD Operators to expand scope of arbitration available thereunder to cover PTI service complaints.
- **Exclusion:** The IRP will not be applicable to protocols parameters.
- **Exclusion:** An IRP cannot be launched that challenges the result(s) of an SO's policy development process (PDP) without the support of the SO that developed such PDP or, in the case of joint PDPs, without the support of all of the SOs that developed such PDP.
- **Limitation:** An IRP challenge of expert panel decisions is limited to a challenge of whether the panel decision is consistent with ICANN's Bylaws.
- The legal expenses of the Empowered Community associated with a community IRP will be borne by ICANN.

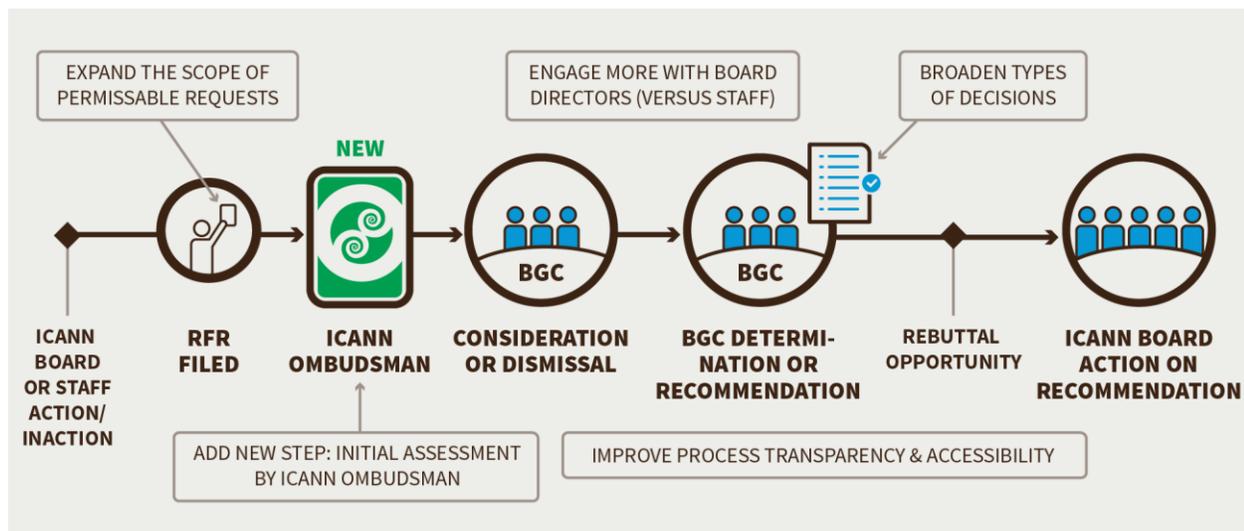

180

### **Relevant Annexes**

181

Annex 07 – Details on Recommendation #7: Strengthening ICANN's Independent Review Process

## Recommendation #8: Improving ICANN's Request for Reconsideration Process

### 182 Summary

183 Currently, any person or entity may submit a Request for Reconsideration or review of an ICANN action or inaction as provided for in [Article IV, Section 2 of ICANN's Bylaws](#).

184 The CCWG-Accountability proposes a number of key reforms to ICANN's Request for Reconsideration process, including:

- Expanding the scope of permissible requests.
- Extending the time period for filing a Request for Reconsideration from 15 to 30 days.
- Narrowing the grounds for summary dismissal.
- Making the ICANN Board of Directors responsible for determinations on all requests (rather than a committee handling staff issues).
- Making ICANN's Ombudsman responsible for initial substantive evaluation of the requests.

185 The CCWG-Accountability also proposes several enhancements to transparency requirements and firm deadlines in issuing of determinations, including:

- Recordings/transcripts of Board discussion should be posted at the option of the requestor.
- An opportunity to rebut the Board Governance Committee's (BGC's) final recommendation before a final decision by the ICANN Board should be provided.
- Adding hard deadlines to the process, including an affirmative goal that final determinations of the Board be issued within 75 days from request filing wherever possible, and in no case more than 135 days from the date of the request.

186 ICANN's Document and Information Disclosure Policy (DIDP) will be addressed in Work Stream 2. The CCWG-Accountability recommends that the policy should be improved to accommodate the legitimate need for requestors to obtain internal ICANN documents that are relevant to their requests.

## 187 **CCWG-Accountability Recommendations**

188 Modify [Article IV, Section 2 of ICANN's Bylaws](#) to reflect the following changes:

- Expanding the scope of permissible requests.
- Extending the time period for filing a Request for Reconsideration from 15 to 30 days.
- Narrowing the grounds for summary dismissal.
- Requiring determinations on all requests to be made by the ICANN Board of Directors (rather than a committee handling staff issues).
- Requiring ICANN's Ombudsman to make the initial substantive evaluation of the requests.
- Requiring recordings/transcripts of Board discussion to be posted at the option of the requestor.
- Providing a rebuttal opportunity to the BGC's final recommendation before a final decision by the ICANN Board.
- Adding hard deadlines to the process, including an affirmative goal that final determinations of the Board be issued within 75 days from request filing wherever possible, and in no case more than 135 days from the date of the request.

## 189 **Changes from the "Third Draft Proposal on Work Stream 1 Recommendations"**

- Conflicts in timing for Board approval addressed by changing 60 days to 75 days and the total of 120 days to 135 days.

## 190 **Relevant Annexes**

191 Annex 08 – Details on Recommendation #8: Improving ICANN's Request for Reconsideration Process

## Recommendation #9: Incorporating the Affirmation of Commitments in ICANN's Bylaws

### 192 Summary

193 Based on stress test analysis, the CCWG-Accountability recommends incorporating the reviews specified in the Affirmation of Commitments, a 2009 bilateral agreement between ICANN and the U.S. National Telecommunications and Information Administration (NTIA), into the ICANN Bylaws. This will ensure that community reviews remain a central aspect of ICANN's accountability and transparency framework.

194 Specifically, the CCWG-Accountability proposes to:

- Add the relevant ICANN Commitments from the Affirmation of Commitments into the ICANN Bylaws.
- Add the four review processes specified in the Affirmation of Commitments to the ICANN Bylaws, including:
  - Ensuring accountability, transparency, and the interests of global Internet users.
  - Enforcing ICANN's existing policy relating to WHOIS, subject to applicable laws.
  - Preserving security, stability, and resiliency of the Domain Name System (DNS).
  - Promoting competition, consumer trust, and consumer choice.

195 In addition, to support the common goal of improving the efficiency and effectiveness of reviews, ICANN will publish operational standards to be used as guidance by the community, ICANN staff and the Board in conducting future reviews. The community will review these operational standards on an ongoing basis to ensure that they continue to meet the community's needs.

### 196 CCWG-Accountability Recommendations

197 The CCWG-Accountability evaluated the contingency of ICANN or NTIA unilaterally withdrawing from the Affirmation of Commitments (see information about Stress Test #14 in the “Detailed Explanation of Recommendations” section, below).

198 To ensure continuity of these key commitments, the CCWG-Accountability proposes the following two accountability measures:

- Preserve in the ICANN Bylaws any Relevant ICANN Commitments from the Affirmation of Commitments<sup>4</sup>
  - This includes Sections 3, 4, 7, and 8 of the Affirmation of Commitments. Sections 3, 4, 8a, and 8c would be included in the Core Values section of the ICANN Bylaws.
  - Part of the content of Section 8b of the Affirmation of Commitments (the part relating to the location of ICANN’s principal office), is already covered by ICANN Bylaws Article XVIII. Article XVIII is to be classified as a Standard Bylaw and is not to be moved into the Core Values section with material derived from Affirmation of Commitments Sections 8a and 8c.
  - Section 7 of the Affirmation of Commitments would be inserted as a new Section 8 in Article III, Transparency, of the ICANN Bylaws.
- Bring the Four Affirmation of Commitments Review Processes into the ICANN Bylaws
  - The following four reviews will be preserved in the reviews section of the Bylaws:
    - Ensuring accountability, transparency, and the interests of global Internet users.
    - Enforcing ICANN’s existing policy relating to WHOIS, subject to applicable laws.
    - Preserving security, stability, and resiliency of the DNS.
    - Promoting competition, consumer trust, and consumer choice.

199 After these elements of the Affirmation of Commitments are adopted in the ICANN Bylaws, the following should take place:

- ICANN and NTIA should mutually agree to terminate the Affirmation of Commitments.

<sup>4</sup> Sections 3, 4, 7, and 8 of the Affirmation of Commitments contain relevant ICANN commitments. The remaining sections in the Affirmation of Commitments are preamble text and commitments of the U.S. Government. As such, they do not contain commitments by ICANN, and cannot usefully be incorporated in the Bylaws.

- New review rules will prevail as soon as the Bylaws have been changed, but care should be taken when terminating the Affirmation of Commitments to not disrupt any Affirmation of Commitments reviews that may be in process at that time. Any in-progress reviews will adopt the new rules to the extent practical. Any planned Affirmation of Commitments review should not be deferred simply because the new rules allow up to five years between review cycles. If the community prefers to do a review sooner than five years from the previous review, that is allowed under the new rules.
- Through its Work Party IRP Implementation Oversight Team (WP-IRP IOT), the CCWG-Accountability will examine the suggestion to include a mid-term review of the Independent Review Process (IRP).
- To support the common goal of improving the efficiency and effectiveness of reviews, ICANN will publish operational standards to be used as guidance by the community, ICANN staff, and the Board in conducting future reviews. The community will review these operational standards on an ongoing basis to ensure that they continue to meet the community's needs.
- These operational standards should include issues such as: composition of Review Teams, Review Team working methods (meeting protocol, document access, role of observers, budgets, decision making methods, etc.), and methods of access to experts. These standards should be developed with the community and should require community input and review to be changed. The standards are expected to reflect levels of detail that are generally not appropriate for governance documents, and should not require a change to the Bylaws to modify. This is an implementation issue aligned with the need for review of the proposed Bylaws text developed by the CCWG-Accountability that has been provided as guidance to legal counsel.

200 A section related to the IANA Function Review and Special IANA Function Review will fit into these new sections of the Bylaws and will be classified as Fundamental Bylaws. Specifications will be based on the requirements detailed by the CWG-Stewardship. It is anticipated that the Bylaw drafting process will include the CWG-Stewardship.

201 **Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”**

- The AoC text for Competition, Consumer Trust & Consumer Choice review is reintroduced.
- All AoC reviews (and the IFR and Special IFR) should be incorporated into the Bylaws.
- The WP-IRP IOT will examine the suggestion to include a mid-term review of the IRP. The ATRT scope will be expanded to suggest a review of the IRP (paragraph 89).
- The representation and number of seats on Review Teams that relate to gTLD reviews will remain unchanged from the Third Draft Proposal (paragraph 54).
- The Board amendment on WHOIS/future Registration Directory Services policy (paragraph 127) should be included.
- The ICANN Articles of Incorporation address ICANN's state of incorporation (or corporate domicile), and the ICANN Bylaws (Article XVIII) address the separate issue of the location of ICANN's principal office. Article XVIII of the ICANN Bylaws will be classified as a Standard Bylaw (see paragraph 5).

- The Board suggestion regarding AoC reviews operational standards to be developed as part of implementation should be included on the understanding that Recommendation #9 would be respected and that this text would address implementation details only (see paragraph 8).
- CCWG-Accountability lawyers advised clarifying “diversity” in paragraph 54 regarding composition of AoC Review Teams. CCWG-Accountability notes that “diversity” considerations could include geography, skills, gender, etc., and that chairs of participating ACs and SOs should have flexibility in their consideration of factors in selecting Review Team members.
- CCWG-Accountability lawyers suggested “the group of chairs can solicit additional nominees or appoint less than 21 members to avoid potential overrepresentation of particular ACs or SOs if some nominate less than 3 members.” The CCWG-Accountability proposed “up to 21”, so it is not actually proposing a fixed number of Review Team members. “Fixed” has been replaced with “limited” in paragraph 54. CCWG-Accountability purposely allowed AC/SO chairs to select additional Review Team members from ACs/SOs that had offered more than 3 candidates. This is to accommodate ACs/SOs that had greater interest in a review, such as the GNSO, which would be the most concerned with reviews of new gTLDs and WHOIS/Directory Services. Therefore, the representation and number of seats on the Review Team will remain unchanged from the Third Draft Proposal.
- Replaced “participants” with “observers” in paragraph 54.

## Relevant Annexes

- 202 Annex 09 – Details on Recommendation #9: Incorporating the Affirmation of Commitments Reviews in ICANN’s Bylaws

## Recommendation #10: Enhancing the Accountability of Supporting Organizations and Advisory Committees

### 203 Summary

204 The CCWG-Accountability recommends addressing the accountability of Supporting Organizations (SOs) and Advisory Committees (ACs) in a two-stage approach:

- In Work Stream 1: Include the review of SO and AC accountability mechanisms in the independent structural reviews performed on a regular basis.
- In Work Stream 2: Include the subject of SO and AC accountability as part of the work on the Accountability and Transparency Review process.

### 205 CCWG-Accountability Recommendations

206 Having reviewed and inventoried the existing mechanisms related to SO and AC accountability, it is clear that the current mechanisms need to be enhanced in light of the new responsibilities associated with the Work Stream 1 recommendations.

207 The CCWG-Accountability recommends the following.

208 **Work Stream 1:**

209 Include the review of SO and AC accountability mechanisms in the independent periodical structural reviews that are performed on a regular basis.

- These reviews should include consideration of the mechanisms that each SO and AC has in place to be accountable to their respective Constituencies, Stakeholder Groups, Regional At-Large Organizations, etc.
- This recommendation can be implemented through an amendment of Section 4 of Article IV of the ICANN Bylaws, which currently describes the goal of these reviews as:

*The goal of the review, to be undertaken pursuant to such criteria and standards as the Board shall direct, shall be to determine (i) whether that organization has a continuing purpose in the ICANN structure, and (ii) if so, whether any change in structure or operations is desirable to improve its effectiveness.*

- The periodic review of ICANN Accountability and Transparency required under the Affirmation of Commitments is being incorporated into the ICANN Bylaws as part of Work Stream 1. In Recommendation #9: Incorporating the Affirmation of Commitments in ICANN's Bylaws, the Accountability and Transparency Review will include the following among the issues that merit attention in the review:

*assessing the role and effectiveness of GAC interaction with the Board and with the broader ICANN community, and making recommendations for improvement to ensure effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the DNS*

210 **Work Stream 2:**

211 Include the subject of SO and AC accountability as part of the Accountability and Transparency Review process.

- Evaluate the proposed "Mutual Accountability Roundtable" to assess its viability and, if viable, undertake the necessary actions to implement it.<sup>5</sup>

---

<sup>5</sup> CCWG-Accountability Advisor Willie Currie introduced a short description of the mutual accountability roundtable: *The idea of mutual accountability is that multiple actors are accountable to each other. How might this work in ICANN? It would be necessary to carve out a space within the various forms of accountability undertaken within ICANN that are of the principal-agent variety. So where the new Community Powers construct the community as a principal who calls the Board as agent to account, a line of mutual accountability would enable all ICANN structures to call one another to account. So one could imagine a Mutual Accountability Roundtable that meets at each ICANN meeting, perhaps replacing the current Public Forum. The form would be a roundtable of the Board, CEO, and all Supporting Organizations and Advisory Committees, represented by their chairpersons. The roundtable would designate a chairperson for the roundtable from year to year who would be responsible for facilitating each Mutual Accountability Roundtable. Each Roundtable may pick one or two key topics to examine. Each participant could give an account of how his or her constituency addressed the issue, indicating what worked and didn't work. This could be followed by a discussion on how to improve matters of performance. The purpose would be to create a space for mutual accountability as well as a learning space for improvement.*

- Develop a detailed working plan on enhancing SO and AC accountability taking into consideration the comments made during the public comment period on the Third Draft Proposal.

212 Assess whether the Independent Review Process (IRP) would also be applicable to SO and AC activities.

213 **Changes Made Since the Third Draft Proposal**

- Added: The periodic review of ICANN Accountability and Transparency required under the Affirmation of Commitments is being incorporated into the ICANN Bylaws as part of Work Stream 1. In Recommendation #9: Incorporating the Affirmation of Commitments in ICANN's Bylaws, the Accountability and Transparency Review will include the following among the issues that merit attention in the review:

*assessing the role and effectiveness of GAC interaction with the Board and with the broader ICANN community, and making recommendations for improvement to ensure effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the DNS*

- In Work Stream 2 recommendations, added: Develop a detailed working plan on enhancing SO and AC accountability taking into consideration the comments made during the public comment period on the Third Draft Proposal.

214 **Relevant Annexes**

215 Annex 10 – Details on Recommendation #10: Enhancing the Accountability of Supporting Organizations and Advisory Committees

## Recommendation #11: Board Obligations with Regard to Governmental Advisory Committee Advice (Stress Test 18)

### 216 Summary

217 Currently, Governmental Advisory Committee (GAC) advice to the ICANN Board has special status as described in the ICANN Bylaws Article XI, Section 2:

*j. The advice of the Governmental Advisory Committee on public policy matters shall be duly taken into account, both in the formulation and adoption of policies. In the event that the ICANN Board determines to take an action that is not consistent with the Governmental Advisory Committee advice, it shall so inform the Committee and state the reasons why it decided not to follow that advice. The Governmental Advisory Committee and the ICANN Board will then try, in good faith and in a timely and efficient manner, to find a mutually acceptable solution.*

218 Stress Test #18 considers a scenario where ICANN's GAC would amend its operating procedures to change from consensus decisions (no objections) to majority voting for advice to the ICANN Board. Since the Board must seek a mutually acceptable solution if it rejects GAC advice, concerns were raised that the ICANN Board could be forced to arbitrate among sovereign governments if they were divided in their support for the GAC advice on public policy matters.

219 In addition, if the GAC lowered its decision threshold while also participating in the new Empowered Community (if the GAC chooses to so participate), some stakeholders believe that this could increase government influence over ICANN.

220 In order to mitigate these concerns, the CCWG-Accountability is recommending changes be made to the ICANN Bylaws relating to GAC advice.

### 221 CCWG-Accountability Recommendations

222 The CCWG-Accountability recommends that the following changes be made to the ICANN Bylaws Article XI, Section 2 (emphasis added):

223 *j. The advice of the Governmental Advisory Committee on public policy matters shall be duly taken into account, both in the formulation and adoption of policies. In the event that the ICANN Board determines to take an action that is not consistent with the Governmental Advisory Committee advice, it shall so inform the Committee and state the reasons why it decided not to follow that advice. **Any Governmental Advisory Committee advice approved by a full Governmental Advisory Committee consensus, understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection, may only be rejected by a vote of 60% of the Board**, and the Governmental Advisory Committee and the ICANN Board will then try, in good faith and in a timely and efficient manner, to find a mutually acceptable solution.*

224 This recommendation is intended only to limit the conditions under which the ICANN Board and GAC must "try to find a mutually acceptable solution," as required in ICANN's current Bylaws. This recommendation shall not create any new obligations for the ICANN Board to

consider, vote upon, or to implement GAC advice, relative to the Bylaws in effect prior to the IANA Stewardship Transition. This recommendation does not create any presumption or modify the standard applied by the Board in reviewing GAC advice.

225 The GAC has the autonomy to refine its operating procedures to specify how objections are raised and considered (for example, disallowing a single country to continue an objection on the same issue if no other countries will join in an objection). When transmitting consensus advice to the ICANN Board for which the GAC seeks to receive special consideration, the GAC has the obligation to confirm the lack of any formal objection.

226 The CCWG-Accountability recommends inserting a requirement that all ACs provide a rationale for their advice. A rationale must be provided for formal advice provided by an Advisory Committee to the ICANN Board. The Board shall have the responsibility to determine whether the rationale provided is adequate to enable determination of whether following that advice would be consistent with ICANN's Bylaws.

227 To address concerns regarding GAC advice that is inconsistent with the ICANN Bylaws, the CCWG-Accountability recommends adding this clarification for legal counsel to consider when drafting Bylaws language:

*ICANN cannot take action - based on advice or otherwise – that is inconsistent with its Bylaws. While the GAC is not restricted as to the advice it can offer to ICANN, it is clear that ICANN may not take action that is inconsistent with its Bylaws. Any aggrieved party or the Empowered Community will have standing to bring claims through the IRP that the Board acted (or failed to act) in a manner inconsistent with the ICANN Articles of Incorporation or Bylaws, even if the Board acted on GAC advice.*

228 Note: The language proposed in recommendations for ICANN Bylaw revisions are conceptual in nature at this stage. The CCWG-Accountability's external legal counsel and the ICANN legal team will draft final language for these revisions to the Articles of Incorporation and Bylaws.

## 229 **Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”**

- Changed the 2/3rds threshold for the Board rejecting GAC consensus advice to 60%. As part of the compromise, this required changes in Recommendations #1 and #2 to implement a GAC “carve out.”

## 230 **Relevant Annexes**

231 Annex 11 – Details on Recommendation #11: Board Obligations with Regard to Governmental Advisory Committee Advice (Stress Test 18)

## Recommendation #12: Committing to Further Accountability Work in Work Stream 2

### 232 **Summary**

233 The CCWG-Accountability Work Stream 2 is focused on addressing those accountability topics for which a timeline for developing solutions may extend beyond the IANA Stewardship Transition.

234 As part of Work Stream 2, the CCWG-Accountability proposes that further enhancements be made to a number of designated mechanisms:

- Considering improvements to ICANN's standards for diversity at all levels.
- Staff accountability.
- Supporting Organizations and Advisory Committee accountability.
- Improving ICANN's transparency with a focus on:
  - Enhancements to ICANN's existing Documentary Information Disclosure Policy (DIDP).
  - Transparency of ICANN's interactions with governments.
  - Improvements to the existing whistleblower policy.
  - Transparency of Board deliberations.
- Developing and clarifying a Framework of Interpretation for ICANN's Human Rights commitment and proposed Draft Bylaw.
- Addressing jurisdiction-related questions, namely: "Can ICANN's accountability be enhanced depending on the laws applicable to its actions?" The CCWG-Accountability anticipates focusing on the question of applicable law for contracts and dispute settlements.
- Considering enhancements to the Ombudsman's role and function.

235 The CCWG-Accountability expects to begin refining the scope of Work Stream 2 during the upcoming [ICANN55 Meeting](#) in March 2016. It is intended that Work Stream 2 recommendations will be published for comments by the end of 2016.

236 The community raised concerns that after the IANA Stewardship Transition, there may be a lack of incentive for ICANN to implement the proposal arising out of Work Stream 2. To prevent this scenario, the CCWG-Accountability recommends that the ICANN Board adopt an Interim Bylaw that would commit ICANN to consider the CCWG-Accountability Work Stream 2 recommendations according to the same process and criteria it has committed to use to consider the Work Stream 1 recommendations. In a [letter](#) dated 13 November 2015, the ICANN Board confirmed its intent to work with the ICANN community and to provide adequate support for work on these issues.

### 237 **CCWG-Accountability Recommendations**

238 The CCWG-Accountability recommends that the Board adopt an Interim Bylaw that would commit ICANN to consider the CCWG-Accountability consensus recommendations according to the same process and criteria it has committed to use to consider the Work Stream 1

recommendations. The Bylaw would task the group with creating further enhancements to ICANN's accountability limited to the Work Stream 2 list of issues:

- Considering improvements to ICANN's standards for diversity at all levels.
- Staff accountability.
- Supporting Organizations and Advisory Committee accountability.
  - Include the subject of SO and AC accountability as part of the work on the Accountability and Transparency Review process.
  - Evaluate the proposed "Mutual Accountability Roundtable" to assess viability.
  - Propose a detailed working plan on enhancing SO and AC accountability as part of Work Stream 2.
  - Assess whether the IRP would also be applicable to SO and AC activities.
- Improving ICANN's transparency with a focus on:
  - Enhancements to ICANN's existing DIDP.
  - Transparency of ICANN's interactions with governments.
  - Improvements to the existing whistleblower policy.
  - Transparency of Board deliberations.
- Developing and clarifying a Framework of Interpretation for ICANN's Human Rights commitment and proposed Draft Bylaw.
- Addressing jurisdiction-related questions, namely: "Can ICANN's accountability be enhanced depending on the laws applicable to its actions?" The CCWG-Accountability anticipates focusing on the question of applicable law for contracts and dispute settlements.
- Considering enhancements to the Ombudsman's role and function.

239 The CCWG-Accountability notes that further enhancements to ICANN accountability can be accommodated through the accountability review process (see Recommendation #10: Enhancing the Accountability of Supporting Organizations and Advisory Committees) or through specific, ad hoc, cross community working group initiatives.

240 **Changes from the "Third Draft Proposal on Work Stream 1 Recommendations"**

- Interim Bylaws clarifications to address Board's concerns by highlighting that Work Stream 2 will be following similar rules as Work Stream 1: consensus recommendations, endorsement by Chartering Organizations, ability for the Board to engage in special dialogue, 2/3 threshold for such Board decision, etc.
- Edits to the documents will include focus on fact that Work Stream 2 deliberations will be open to all (similar to Work Stream 1).
- List of Work Stream 2 items is "limited to" instead of "related to." A note is added that clarifies that further items beyond this list can be accommodated through regular review cycles, or specific CCWG-Accountability.

- Timeframe discussion: target dates are needed, but hard deadlines would not be appropriate or helpful.
- Agreed to incorporate Public Experts Group (PEG) Advisor input to strengthen the diversity requirement.
- Enhancing the Ombudsman role and function is confirmed as a Work Stream 2 item.
- Re-inserted staff accountability requirement.

241 **Relevant Annexes**

242 Annex 12 – Details on Recommendation #12: Committing to Further Accountability Work in Work Stream 2

## Conclusion

---

- 243 The CCWG-Accountability believes that the set of accountability mechanisms it has proposed, outlined above, empowers the community through the use of the bottom-up, multistakeholder model by relying on of the stakeholders within ICANN's existing and tested community structures. Furthermore, the CCWG-Accountability believes that this community-driven model is appropriate for replacing the accountability inherent in ICANN's historical relationship with the U.S. Government.

### **Community Powers are an Effective Replacement of the Safety Net Provided by the U.S. Government's Current IANA Stewardship Role**

- 244 The CCWG-Accountability believes that the Seven Community Powers, as a package, can effectively replace the safety net that the U.S. Government has provided to date as part of its oversight role. It is recommended that these powers need to be enforced by a court of law only as a last resort. The CCWG-Accountability has based its recommendations on existing structures and recommends:
- Considering the entire community as ICANN's Empowered Community.
  - Ensuring no part of the community has more rights than another part, either by having the ability to push through its individual interests or by blocking community consensus. The CCWG-Accountability has ensured that no Community Powers or statutory rights can be exercised singlehandedly.
  - Ensuring the community can only jointly exercise its powers using a consensus-based model.

### **The CCWG-Accountability Believes that the Recommended Accountability Frameworks Provided in this Proposal Meet the Requirements of the Domain Names Community and the IANA Stewardship Transition Proposal**

- 245 The CCWG-Accountability will seek confirmation from the Cross Community Working Group that developed the IANA Stewardship Transition that this Proposal meets its requirements.
- 246 The CCWG-Accountability believes that its Proposal also meets the requirements NTIA published for the transition and will present its analysis of this in the full Proposal.

# Annex 01 – Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers

---

## 1. Summary

- 01 Under California law and the current Bylaws of the Internet Corporation for Assigned Names and Numbers (ICANN), the ICANN Board of Directors has the final responsibility for the activities and affairs of ICANN.
- 02 With removal of the U.S. National Telecommunications and Information Administration (NTIA) as a perceived enforcement body over ICANN, the CCWG-Accountability requires a method to ensure that decisions produced by community accountability mechanisms can be enforced, including in situations where the ICANN Board may object to the results.
- 03 The CCWG-Accountability recommends creating a new entity that will act at the direction of the multistakeholder community to exercise and enforce Community Powers. The entity will take the form of a California unincorporated association and be given the role of “Sole Designator” of ICANN Board Directors and will have the ability to directly or indirectly the Community Powers. The entity will be referred to as the “Empowered Community.”
- 04 As permitted under California law, the Empowered Community will have the statutory power to appoint and, with that, the statutory power to remove ICANN Board Directors (whether an individual Director or the entire Board). Other powers, such as the power to approve or reject amendments to the Articles of Incorporation and Bylaws, may be provided to the Empowered Community.
- 05 The CCWG-Accountability accepts that its statutory power will be limited as described above, and that this is sufficient given:
  - The creation of “Fundamental Bylaws” that can only be modified jointly by the ICANN Board and Empowered Community.
  - All recommended Work Stream 1 accountability mechanisms are constituted as Fundamental Bylaws.
  - The right of inspection is granted to “Decisional Participants” in the Empowered Community.
  - The right of investigation is granted to the Decisional Participants in the Empowered Community.
- 06 The process for the Empowered Community to use a Community Power is outlined in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement.

## 2. CCWG-Accountability Recommendations

- 07 The CCWG-Accountability recommends creating an entity that will act at the direction of the community to exercise and enforce Community Powers:
- This entity will take the form of a California unincorporated association and be given the role of Sole Designator of ICANN Board Directors and will have the ability to directly or indirectly enforce the Community Powers. This entity will be referred to as the Empowered Community.
  - The Empowered Community will act as directed by participating Supporting Organizations (SOs) and Advisory Committees (ACs), which will be referred to as the Decisional Participants in the Empowered Community.
  - The Empowered Community, and the rules by which it is governed, will be constituted in ICANN's Fundamental Bylaws, along with provisions to ensure the Empowered Community cannot be changed or eliminated without its own consent (see Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation).
  - The Articles of Incorporation will be amended to clarify that the global public interest will be determined through a bottom-up, multistakeholder process.
- 08 Additionally, the CCWG-Accountability recommends including in the ICANN Bylaws:
- The right for Decisional Participants in the Empowered Community to inspection as outlined in California Corporations Code 6333, although this specific code reference would not be mentioned in the Bylaws.
  - The right of investigation, which includes the adoption of the following audit process: upon three Decisional Participants in the Empowered Community coming together to identify a perceived issue with fraud or gross mismanagement of ICANN resources, ICANN will retain a third-party, independent firm to undertake a specific audit to investigate that issue. The audit report will be made public, and the ICANN Board will be required to consider the recommendations and findings of that report.
  - The following limitation associated with the Governmental Advisory Committee (GAC) acting as a Decisional Participant: If the GAC chooses to participate as a Decisional Participant in the Empowered Community, it may not participate as a decision-maker in the Empowered Community's exercise of a Community Power to challenge the ICANN Board's implementation of GAC consensus advice (referred to as the "GAC carve-out").
- In such cases, the GAC will still be entitled to participate in the Empowered Community in an advisory capacity in all other aspects of the escalation process, but its views will not count towards or against the thresholds needed to initiate a conference call, convene a Community Forum or exercise the Community Power.
- The GAC carve-out preserves the ICANN Board's unique obligation to work with the GAC to try to find a mutually acceptable solution to the implementation of GAC advice supported by consensus (as defined in Recommendation #11: Board Obligations with Regard to Governmental Advisory Committee Advice (Stress Test 18)) while protecting the Empowered Community's power to challenge such Board decisions.

## 3. Detailed Explanation of Recommendations

### 09 Background

- 10 With removal of NTIA as a perceived enforcement body over ICANN, the CCWG-Accountability requires a method to ensure that decisions produced by community accountability mechanisms can be enforced, including in situations where the Board may object to the results.

### 11 Objectives

- 12 In developing a mechanism to ensure the community can effectively enforce its decisions, the CCWG-Accountability agreed to:
- Minimize the degree of structural or organizational changes required in ICANN to create the mechanism for these powers.
  - Organize the mechanism in line and compatible with the current ICANN SO and AC structures (with flexibility to evolve these structures in the future).
  - Address the dependencies of the CWG-Stewardship.
  - Provide the following powers and rights that would be constituted in the Fundamental Bylaws and would also be legally enforceable:
    - The power to reject ICANN Budgets, IANA Budgets or Strategic/Operating Plans (CWG-Stewardship dependency).
    - The power to reject changes to ICANN Standard Bylaws.
    - The power to approve changes to Fundamental Bylaws (CWG-Stewardship dependency) and changes to the Articles of Incorporation, and to approve ICANN's sale or other disposition of all or substantially all of ICANN's assets.
    - The power to remove individual ICANN Board Directors (along with appointment, CWG-Stewardship dependency).
    - The power to recall the entire ICANN Board (CWG-Stewardship dependency).
    - The power to launch a community Independent Review Process (along with an appeal mechanism for issues relating to the IANA functions, CWG-Stewardship dependency) or Request for Reconsideration.
    - The power to reject ICANN Board decisions relating to reviews of the IANA functions, including the procedure to implement a separation process relating to Post-Transition IANA (CWG-Stewardship dependency).
    - The rights of inspection and investigation.

### 13 Why the Sole Designator Model?

#### Concerns with Supporting Organization/Advisory Committee Membership Model

- 14 The CCWG-Accountability's "[Initial Draft Proposal on Work Stream 1 Recommendations](#)" proposed a Supporting Organization/Advisory Committee Membership Model as the reference model for the community enforcement mechanism. However, in the Public Comment Period, 4

May – 3 June 2015, significant concerns were expressed and the CCWG-Accountability initiated work on alternative solutions.

15 A core concern of the Supporting Organization/Advisory Committee Membership Model was the ability of the ICANN community to fully participate in the new accountability framework, and was integral to the work in devising a new approach.

16 The CCWG-Accountability’s [“Second Draft Proposal on Work Stream 1 Recommendations”](#) proposed a “Sole Member” model instead of the Supporting Organization/Advisory Committee Membership Model.

### 17 **Concerns with a Sole Member Model**

18 In the Public Comment Period on the “Second Draft Proposal on Work Stream 1 Recommendations,” concerns were raised about the Sole Member model. Under California law, Members have certain statutory powers that cannot be waived. Commenters expressed concern that these rights, such as the ability to dissolve the corporation, could not be adequately constrained and might have unintended and unanticipated consequences.

### 19 **The Sole Designator Model**

20 To address the concerns described above, the CCWG-Accountability now recommends implementing a “Sole Designator” model. The Empowered Community will have the statutory power to appoint and, with that, the statutory power to remove individual ICANN Board Directors or the entire Board, which is a requirement of the CCWG-Accountability and the CWG-Stewardship.

21 This removes the concerns related to unintended and unanticipated consequences of the additional statutory powers associated with a Member. Other powers, such as the power to approve or reject amendments to the Articles of Incorporation and Bylaws, may be provided to the Empowered Community.

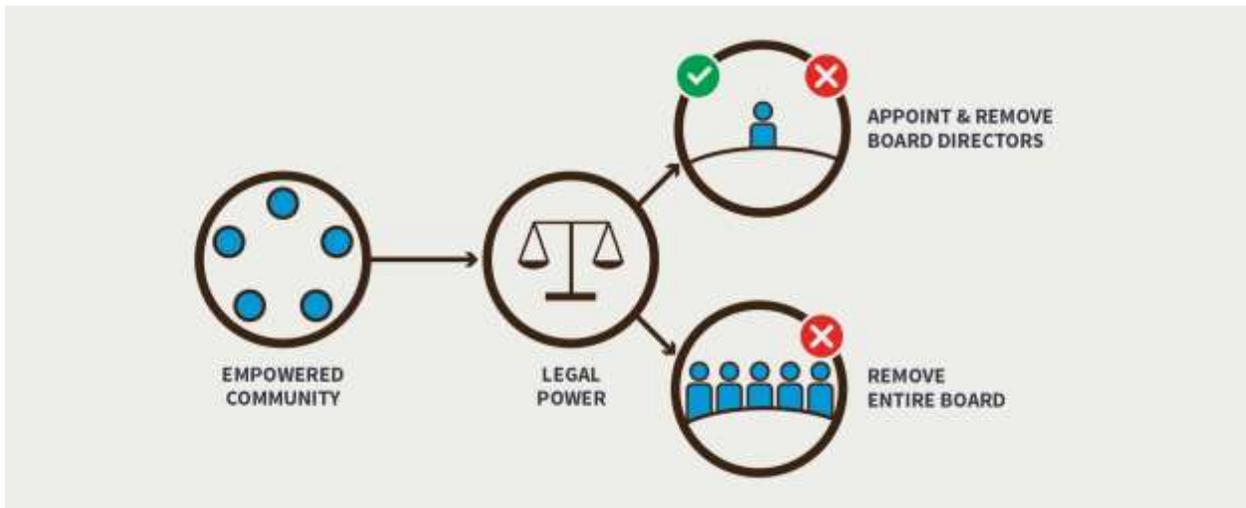

- Given that the right to inspect, as outlined in California Corporations Code 6333, is not a statutory right of a Sole Designator, and that the community felt this was a critical requirement, the CCWG-Accountability recommends this right be granted to Decisional Participants in the Empowered Community in the Fundamental Bylaws.

22 The CCWG-Accountability’s external legal counsel informed the group that adopting a Sole Designator model could effectively be implemented while meeting the community’s requirements and having minimal impact on the corporate structure of ICANN.

### 23 **Legal Advice on Implementing the Empowered Community**

24 To implement the Sole Designator model, ICANN’s SOs and ACs would create a unified entity to enforce their Community Powers. This unified entity will be referred to as the Empowered Community.

25 The Empowered Community will have the right to appoint and remove ICANN Board Directors, whether individually or in its entirety.

- 26 If the ICANN Board refused to comply with a decision by the Empowered Community to use the statutory rights, the refusal could be petitioned in a court that has jurisdiction to force the ICANN Board to comply with that decision.
- 27 The CCWG-Accountability accepts that its statutory power will be limited as described above and that this is sufficient given:

**1. All of the recommended Work Stream 1 accountability mechanisms are constituted as Fundamental Bylaws and protected from any changes without Empowered Community approval.**

- This includes the Independent Review Process (IRP), which issues binding decisions. This also includes the Empowered Community’s power to launch a community IRP challenge if it believes the ICANN Board is in breach of its Articles of Incorporation or Bylaws.<sup>1</sup>
- The ICANN Board would be in breach of its own Bylaws if it refused to comply with a decision by the Empowered Community with respect to an accountability mechanism defined in the Fundamental Bylaws.
- If a community IRP challenge with respect to such a decision is successful and the Board still refused to comply with the decision, the Empowered Community could petition a court that has jurisdiction to force the ICANN Board to comply with that decision.
- Alternatively, the Empowered Community could remove the Board with the expectation that the new Board would respect the decision.

---

<sup>1</sup> For example, if the Board were not to accept the decision of the Empowered Community to use one of its Community Powers. Community Powers are documented in Recommendation #4: Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers.

**2. The Empowered Community has legal standing as a California unincorporated association.**

- The Empowered Community will act as directed by participating SOs and ACs (the Decisional Participants in the Empowered Community).

**3. The Empowered Community and the rules by which it is governed will be constituted as a Fundamental Bylaw, along with provisions in the Articles of Incorporation and Bylaws to protect it from any changes without its own approval.**

**4. The Articles of Incorporation will be amended to clarify that the global public interest will be determined through a bottom-up, multistakeholder process.**

- Note: Legal counsel indicated that the Articles of Incorporation could be amended to ensure that the ICANN Board must consider the community’s interpretation of the “global public interest” as ICANN pursues the charitable and public purposes set forth in Article III. The CCWG-Accountability recommends this change as part of the shift from a Sole Member to a Sole Designator model. The Articles will be amended to clarify that the global public interest will be determined through a bottom-up, multistakeholder process.

28 **Additional Rights Granted by Inclusion in the ICANN Bylaws**

29 **Right to inspect accounting books and records of ICANN**

30 In addition to the statutory rights that the Empowered Community will have and the new Community Powers described in Recommendation #4: Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers, the CCWG-Accountability recommends including in the ICANN Fundamental Bylaws the right for Decisional Participants in the Empowered Community to inspect as outlined in California Corporations Code 6333, although this specific code reference would not be mentioned in the Bylaws.

31 This inspection right is distinct from the Document Information Disclosure Policy (DIDP). While any eligible party can file a request according to the DIDP, inspection rights are only accessible to Decisional Participants in the Empowered Community. The scopes are also different as explained below.

32 This inspection right would include the accounting books and records of ICANN, and the minutes of proceedings of the Board of Directors and committees of the Board of Directors, on the conditions discussed below. Since ICANN will not have statutory “members,” the right to inspect “member” meeting minutes would not apply.

33 Although the Corporations Code does not define “books and records of account,” the term is generally understood to refer to the journals and ledgers in which financial transactions are originally entered and recorded, and the statements compiled from them. The term generally does not extend to source documents on which books and records of account are based, such as canceled checks and invoices. Similarly, the term generally encompasses documents relevant to the operation of the corporation as a whole, and not to those relevant to only a small or isolated aspect of the corporation’s operations.

34 Authority under Section 6333 is sparse, but it is nonetheless clear that a “purpose reasonably related to [a] person’s interests as a member” does not include a member’s commercial or political interests, harassment, or massive and repeated inspection demands probing the

minutiae of financial records and details of management and administration. Similar limitations will be applied to rights of inspection provided by the Bylaws.

35 Unlike the exercise of the other Community Powers, which require community engagement and escalation before initiating a request for action by the Empowered Community, the CCWG-Accountability recommends that a petition for inspection be brought directly by a single Decisional Participant in the Empowered Community or by multiple Decisional Participants in the Empowered Community through making a written demand on ICANN for the requested materials. If the Board refuses or ignores the request, the petitioning Decisional Participant(s) could enforce its inspection right directly through the IRP or by petitioning the Empowered Community to initiate the escalation processes for a community IRP or for removing the Board.

### 36 **Investigation right**

37 There could be events where the community might wish to have additional power of transparency into investigations of potential fraud or financial mismanagement in ICANN.

38 To address these concerns, the CCWG-Accountability recommends the adoption of the following audit process: Upon three Decisional Participants in the Empowered Community coming together to identify a perceived issue with fraud or gross mismanagement of ICANN resources, ICANN will retain a third-party, independent firm to undertake a specific audit to investigate that issue. The audit report will be made public, and the ICANN Board will be required to consider the recommendations and findings of that report.

39 This right of investigation would be included in the ICANN Fundamental Bylaws.

### 40 **The Empowered Community**

41 Implementation of the Empowered Community currently anticipates that all of ICANN's SOs, the At-Large Advisory Committee (ALAC), and the GAC (if the GAC chooses to participate) would participate in the Empowered Community—that is, they will be listed in the Bylaws as the five Decisional Participants.

42 However, if the GAC chooses to participate as a Decisional Participant in the Empowered Community, it may not participate as a decision-maker in the Empowered Community's exercise of a Community Power to challenge the ICANN Board's implementation of GAC consensus advice (referred to as the "GAC carve-out"). In such cases, the GAC will still be entitled to participate in the Empowered Community in an advisory capacity in all other aspects of the escalation process, but its views will not count towards or against the thresholds needed to initiate a conference call, convene a Community Forum or exercise the Community Power.

43 The GAC carve-out preserves the ICANN Board's unique obligation to work with the GAC to try to find a mutually acceptable solution to the implementation of GAC advice supported by consensus (as defined in Recommendation #11: Board Obligations with Regard to Governmental Advisory Committee Advice [Stress Test 18]) while protecting the Empowered Community's power to challenge such Board decisions.

44 Clarifications relating to the GAC carve-out:

- The GAC carve-out will only apply to Empowered Community challenges to ICANN Board actions that were based on GAC consensus advice, meaning the GAC advice was "approved by general agreement in the absence of any formal objection." The GAC carve-out will not apply to Empowered Community challenges to Board decisions that were based on GAC advice that was not supported by consensus (i.e., not "approved by general agreement in the absence of any formal objection").

- Process for identifying GAC consensus advice, understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection, and applying the GAC carve-out:
  - GAC confirmation: When the GAC provides advice to the Board, the GAC will need to indicate whether the advice was approved by consensus, understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection.
  - Board confirmation: When the Board takes action that is based on GAC consensus advice, the Board will need to state in its resolution that its decision was based on GAC consensus advice.
  - GAC carve-out identified in petition to use Community Power: When a Board action that is based on GAC consensus advice is challenged, the petitioning SO or AC will need to indicate in the initial petition that the matter meets the requirements for the GAC carve-out and clearly identify the applicable Board action and GAC consensus advice at issue. The decision thresholds (as revised when the GAC carve-out is invoked in accordance in Annex 2) required for the escalation and enforcement processes will need to be met for the Community Power that is being exercised.
- Timing for invoking the GAC carve-out: The petitioning SO or AC will need to indicate in the initial petition to the Empowered Community that the matter meets the requirements for the GAC carve-out. Therefore, the timing restrictions for this aspect of the escalation process will apply (i.e., the petition must be brought within 21 days of a Board decision being published). While this addresses timing of the Board challenge, the Board decision that is being challenged could be based on standing GAC consensus advice that the GAC had provided at an earlier date.

<sup>45</sup> The thresholds presented in this document were determined based on five Decisional Participants. If fewer than five of ICANN's SOs and ACs agree to be Decisional Participants, these thresholds for consensus support may be adjusted. Thresholds may also have to be adjusted if ICANN changes to have more SOs or ACs.

## 4. Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”

- Scope and limitations with respect to the right to inspect accounting books and records of ICANN confirmed, emphasizing the difference between DIDP and inspection rights.
- Added inspection rights for accounting books and records and minutes based on a one Decisional Participant threshold.
- Introduced additional suggestion by the ICANN Board regarding investigation right (audits), based on three Decisional Participants in the Empowered Community threshold.
- Confirmed direction for implementation to avoid abusive claims.
- Compromise on Recommendation #11 required the creation of the “GAC carve-out.”

## 5. Stress Tests Related to this Recommendation

- ST5, 6, 7, 8, 9 10, 16, 24
- ST28
- ST31, 32, 36

## 6. How does this meet the CWG-Stewardship Requirements?

- 46 These recommendations meet the CWG-Stewardship requirement that the CCWG-Accountability recommend the creation of community rights regarding the ability to appoint/remove Directors of the ICANN Board and recall the entire ICANN Board.

## 7. How does this address NTIA Criteria?

47 **Support and enhance the multistakeholder model.**

- Decentralizing power within ICANN through an Empowered Community.
  - Providing a legal set of powers to the community while avoiding the risks of making changes to ICANN's organizational structure.
- 

48 **Maintain the security, stability, and resiliency of the Internet DNS.**

- Creates an effective system of checks and balances on the ICANN Board, which could affect the security, stability and resiliency of the Internet DNS.
- 

49 **Meet the needs and expectation of the global customers and partners of the IANA services.**

- Provides a clear set of mechanisms and processes for how the community can participate in and interact with the Empowered Community.
- 

50 **Maintain the openness of the Internet.**

- Preserving policies of open participation in ICANN's SOs and ACs.
  - Retaining decision-making based on consensus rather than voting.
- 

51 **NTIA will not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution.**

- To the extent the Government Advisory Committee (GAC) wishes to participate in decision-making by the Empowered Community, which the GAC has the flexibility to determine, it would be one of five Decisional Participants. In addition, the GAC will not participate as a decision-maker in community deliberations involving a challenge to the Board's implementation of GAC consensus advice. This "carve out," combined with the safeguards in Recommendation #11, leads the CCWG-Accountability to believe that this NTIA requirement is met, even when considering the increased threshold from 50 to 60% for the Board to reject GAC consensus advice.
-

# Annex 02 – Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement

---

## 1. Summary

### 01 Engagement

02 Today, the Internet Corporation for Assigned Names and Numbers (ICANN) Board of Directors voluntarily consults with the multistakeholder community on a variety of decisions, including the Annual Budget and changes to the ICANN Bylaws. To gather feedback, the ICANN Board uses mechanisms such as public consultations and information sessions to gauge community support and/or identify issues on the topic. These consultation mechanisms are referred to as an “engagement process.”

03 The CCWG-Accountability is recommending that engagement processes for specific ICANN Board actions be constituted in the Fundamental Bylaws. Although the ICANN Board engages voluntarily in these processes today, this recommendation would formally require the ICANN Board to undertake an extensive engagement process (including, at a minimum, a full public consultation process that complies with ICANN rules for public consultations) before taking action on any of the following:

- Approving ICANN’s Five-Year Strategic Plan.
- Approving ICANN’s Five-Year Operating Plan.
- Approving ICANN’s Annual Operating Plan & Budget.
- Approving the Internet Assigned Numbers Authority (IANA) Functions Budget.
- Approving any modifications to Standard or Fundamental Bylaws or the Articles of Incorporation, or approving ICANN’s sale or other disposition of all or substantially all of ICANN’s assets.
- Making ICANN Board decisions relating to reviews of IANA functions, including the triggering of any Post-Transition IANA (PTI) separation process.

04 If it is determined that there is divergence between the ICANN Board and the community after the engagement process, the Empowered Community (as defined in Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers) may decide to use a Community Power after the appropriate “escalation process” has been satisfied.

05 The Empowered Community may begin an escalation process to:

- Reject a Five-Year Strategic Plan, Five-Year Operating Plan, Annual Operating Plan & Budget, or the IANA Functions Budget.
- Reject a change to ICANN Standard Bylaws.

- Approve changes to Fundamental Bylaws and/or Articles of Incorporation, and/or approve ICANN's sale or other disposition of all or substantially all of ICANN's assets.
- Remove an individual ICANN Board Director.
- Recall the entire ICANN Board.
- Initiate a binding community Independent Review Process (IRP), where a panel decision is enforceable in any court recognizing international arbitration results, or a non-binding Request for Reconsideration, where the ICANN Board of Directors is obliged to reconsider a recent decision or action/inaction by ICANN's Board or staff.
- Reject an ICANN Board decision relating to reviews of IANA functions, including the triggering of any PTI separation process.

06 **Escalation**

07 The escalation process can differ, sometimes significantly, from one Community Power to another.

08 One of the most standardized versions of the escalation process is required for all Community Powers to “reject,” remove individual Nominating Committee-nominated Board Directors, or recall the entire Board.

09 **This escalation process comprises the following steps:**

1. An individual starts a petition in a Supporting Organization (SO) or Advisory Committee (AC) that is a Decisional Participant in the Empowered Community (see Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers).
  - If the petition is approved by that SO or AC, it proceeds to the next step.
  - If the petition is not approved by that SO or AC, the escalation process is terminated.
2. The SO or AC that approved the petition contacts the other Decisional Participants to ask them to support the petition.
  - At least one additional SO and/or AC must support the petition (for a minimum of two or, for Board recall, three) for a Community Forum to be organized to discuss the issue.
    - If the threshold is not met, the escalation process is terminated.
    - If the threshold is met, a Community Forum is organized to discuss the petition.
3. An open Community Forum of one or two days is organized for any interested stakeholder in the community to participate.
  - The petitioning SO and/or AC will:
    - Circulate a detailed rationale for proposing to use the Community Power to all Decisional Participants.
    - Designate a representative(s) to liaise with SOs/ACs to answer questions from the SOs/ACs.
    - If desired, optionally, request that ICANN organize a conference call prior to the Community Forum for the community to discuss the issue.

- If the ICANN Board and the Empowered Community can resolve their issues before or in the Community Forum, the escalation process is terminated.
  - Otherwise, the Empowered Community must decide if it wishes to use its Community Power.
4. The Empowered Community considers use of a Community Power.
    - If the threshold to use a Community Power is not met, or there is more than one objection, then the escalation process is terminated.
    - If the threshold is met for using the Community Power, and there is no more than one objection, the Empowered Community advises the ICANN Board of the decision and directs it to comply with the decision (as outlined in the Fundamental Bylaws for this Community Power).
  5. The Empowered Community advises the ICANN Board.
    - If the Empowered Community has decided to use its power, it will advise the ICANN Board of the decision and direct the Board to take any necessary action to comply with the decision.

## 10 **Enforcement**

- 11 If the ICANN Board refuses or fails to comply with a decision of the Empowered Community using a Community Power (other than a decision to remove an individual Director or the entire ICANN Board pursuant to the Empowered Community's statutory power, as discussed below), the Empowered Community must decide if it wishes to begin the enforcement process.
- 12 The enforcement process can proceed in one of two ways:
  - The Empowered Community may initiate mediation and community IRP procedures.
  - The Empowered Community may initiate an escalation process to recall the entire ICANN Board.
- 13 The enforcement process may result in a resolution of the issue. Otherwise, if needed, the result of the enforcement process is enforceable in court.
- 14 If the ICANN Board refuses or fails to comply with a decision of the Empowered Community to use the statutory power to remove an individual ICANN Director or recall the entire ICANN Board (or with the Empowered Community's appointment of a Director), the Empowered Community could address that refusal by bringing a claim in a court that has jurisdiction; there is no need for the Empowered Community to initiate or undertake other enforcement processes such as mediation or an IRP to enforce the power.

## **2. CCWG-Accountability Recommendations**

- 15 Establish a Fundamental Bylaw that requires the ICANN Board to undertake an extensive engagement process (including, at a minimum, a full public consultation process that complies with ICANN rules for public consultations) before taking action on any of the following:
  - Approving ICANN's Five-Year Strategic Plan.

- Approving ICANN's Five-Year Operating Plan.
  - Approving ICANN's Annual Operating Plan & Budget.
  - Approving the IANA Functions Budget.
  - Approving any modification to Standard or Fundamental Bylaws or the Articles of Incorporation, or approving ICANN's sale or other disposition of all or substantially all of ICANN's assets.
  - Making any ICANN Board decision relating to reviews of IANA functions, including the triggering of any PTI separation process.
- 16 Include the engagement, escalation and enforcement processes in the Fundamental Bylaws.
- Note: The escalation processes for each Community Power are outlined in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers.

### 3. Detailed Explanation of Recommendations

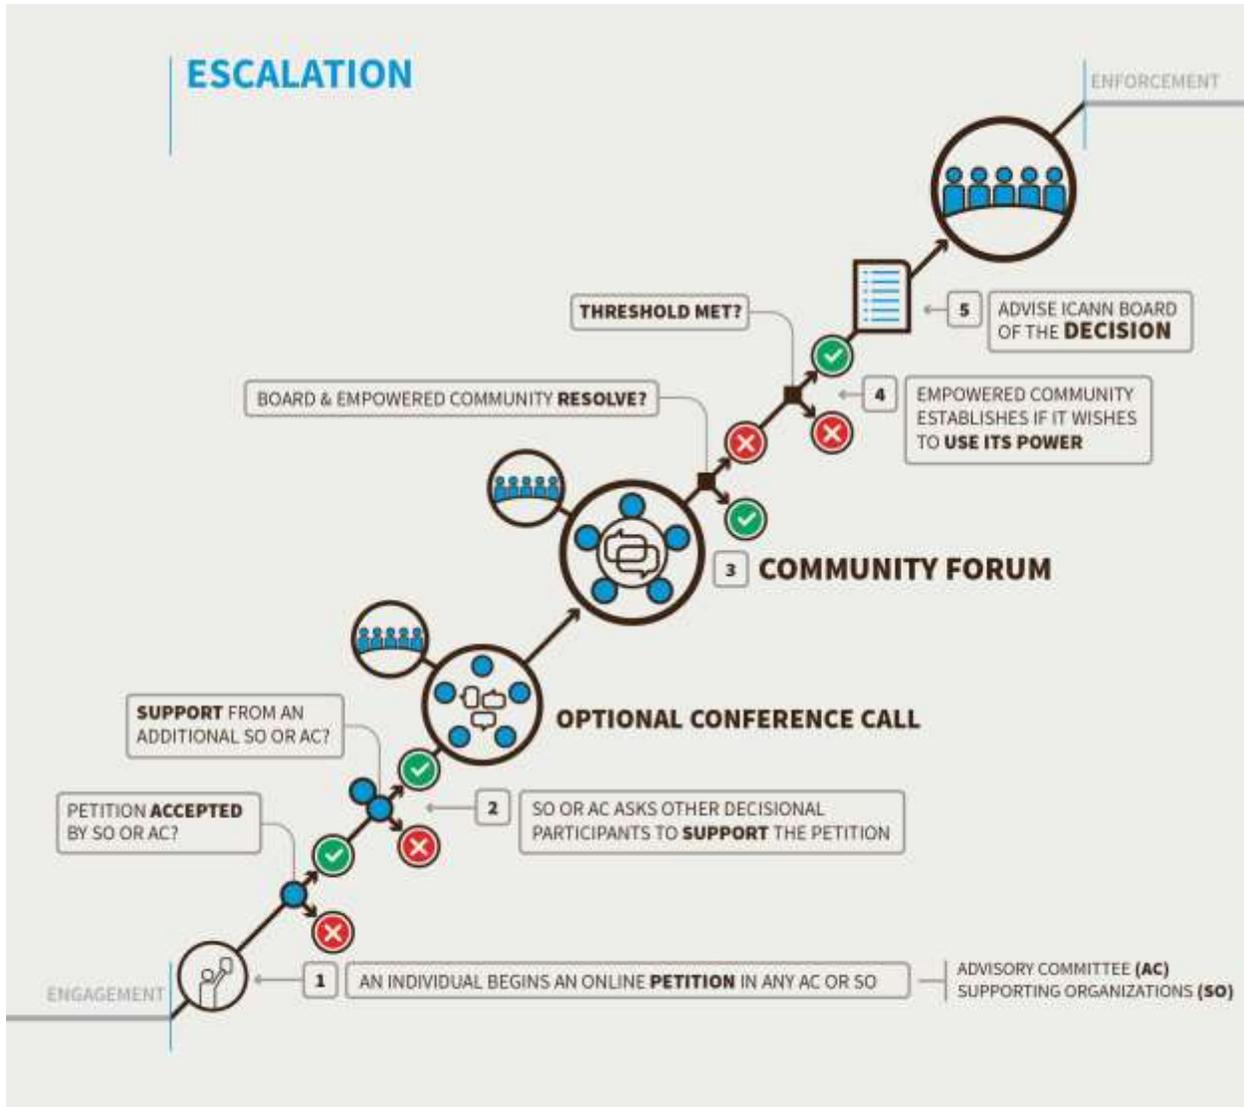

#### 17 Engagement

- 18 Today, the ICANN Board voluntarily consults with the community on a variety of decisions, such as the Annual Budget and changes to the ICANN Bylaws. To gather feedback, the ICANN Board uses mechanisms, such as public consultations, to gauge community support and/or identify issues on the topic. These consultation mechanisms are referred to as an engagement process.
- 19 The CCWG-Accountability is recommending that this engagement process be constituted in the Fundamental Bylaws. Although the ICANN Board already convenes this process, this recommendation would require the ICANN Board to undertake an extensive engagement process (including, at a minimum, a full public consultation process that complies with ICANN rules for public consultations) before taking action on any of the following:
- Approving ICANN's Five-Year Strategic Plan.
  - Approving ICANN's Five-Year Operating Plan.
  - Approving ICANN's Annual Operating Plan & Budget.
  - Approving the IANA Functions Budget.
  - Approving any modification to Standard or Fundamental Bylaws or the Articles of Incorporation, or approving ICANN's sale or other disposition of all or substantially all of ICANN's assets.
  - Making any ICANN Board decision relating to reviews of IANA functions, including the triggering of any PTI separation process.
- 20 If it is determined that there is divergence between the ICANN Board and the community during the engagement process, the Empowered Community may decide to use a Community Power after the appropriate escalation process is satisfied.
- 21 The Empowered Community may begin an escalation process to:
- Reject a Five-Year Strategic Plan, Five-Year Operating Plan, Annual Operating Plan & Budget, or the IANA Functions Budget.
  - Reject a change to ICANN Standard Bylaws.

- Approve a change to Fundamental Bylaws and/or Articles of Incorporation, and/or approve ICANN's sale or other disposition of all or substantially all of ICANN's assets.
- Remove an individual ICANN Board Director.
- Recall the entire ICANN Board.
- Initiate a binding IRP (where a panel decision is enforceable in any court recognizing international arbitration results) or a non-binding Request for Reconsideration (where the ICANN Board of Directors is obliged to reconsider a recent decision or action/inaction by ICANN's Board or staff).
- Reject an ICANN Board decision relating to reviews of IANA functions, including the triggering of any PTI separation process.

## 22 Escalation

- 23 The escalation process can differ, sometimes significantly, from one Community Power to another. One of the most standardized versions of the escalation process is required for all Community Powers to "reject," remove individual Nominating Committee-nominated Board Directors, or recall the entire Board.
- Note: Certain exceptions apply to the power to reject changes to Standard Bylaws in cases where the Standard Bylaw change is the result of a Policy Development Process, as described in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers.
- 24 The right to reject an ICANN Board decision relating to IANA Function Reviews (including the triggering of any PTI separation process) may be exercised by the Empowered Community an unlimited number of times.
- Note: The power to approve changes to Fundamental Bylaws and the Articles of Incorporation, and to approve ICANN's sale or other disposition of all or substantially all of ICANN's assets, and the power to remove individual Directors nominated by an SO or AC contain special features that are covered in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers.

25 **Step 1. Triggering Review by Community Petition**

26 (21 days)

- ⦿ Note: To exercise any of the rejection powers, such as rejection of a budget, the 21-day period begins at the time the Board publishes its vote on the element that may be rejected. If the first step of the petition is not successful within 21 days of the Board publication of the vote, the rejection process cannot be used. A petition begins in an SO or AC that is a Decisional Participant in the Empowered Community.
- ⦿ Any individual can begin a petition as the first step to using a Community Power.
- ⦿ For the petition to be accepted, the SO or AC, in accordance with its own mechanisms, must accept the petition.

27 **Decision point:**

- ⦿ If the SO or AC does not approve the petition within 21 days, the escalation process terminates.
- ⦿ If the SO or AC approves the petition, it can proceed to the next step.

---

28 **Step 2. Triggering Review by Community Petition, Part Two**

29 (7 days from the end of the previous step)

- ⦿ The SO or AC that approved the petition contacts the other Decisional Participants in the Empowered Community to ask them to support the petition. At least one additional Decisional Participant must support the petition (for a minimum of two) for a Community Forum to be organized to discuss the issue. To petition for a Community Forum to consider the recall of the entire ICANN Board requires three Decisional Participants to support the petition.

30 **Decision point:**

- ⦿ If the petition fails to gather the required level of support within seven days, the escalation process terminates.
- ⦿ If a minimum of two (or three, as applicable) Decisional Participants support the petition within seven days, a Community Forum is organized.

- ⦿ Note: For ICANN Board resolutions on changes to Standard Bylaws, Annual Budget, and Strategic or Operating Plans, the Board would be required to automatically provide a 28-day period before the resolution takes effect to allow for the escalation to be confirmed. If the petition is supported by a minimum of two Decisional Participants within the 28-day period, the Board is required to put implementation of the contested resolution on hold until the escalation and enforcement processes are completed. The purpose of this is to avoid requiring ICANN to undo things (if the rejection is approved), which could be potentially very difficult.

---

31 **Step 3. Holding a Community Forum**

32 (21 days to organize and hold the event from the date of the petition causing it)

- ⦿ The purpose of the Community Forum is information-sharing (the rationale for the petition, etc.) and airing views on the petition by the community. Accordingly, any SO or AC may circulate in writing their preliminary views on the exercise of this Community Power, before or in the Community Forum.
- ⦿ The Forum is to be held within 21 days of the successful petition to hold a Community Forum.
- ⦿ Within 24 hours of a petition being approved, the petitioning Decisional Participant will:

- Circulate a detailed rationale for proposing to use the Community Power to all Decisional Participants. Any SO or AC may contribute preliminary thoughts or questions in writing via a specific publicly archived email list set up for this specific issue.
  - Designate a representative(s) to liaise with Decisional Participants to answer questions from the SOs/ACs.
  - If desired, optionally, request that ICANN organize a conference call for the community to discuss the issue.
- ⊙ Community Forum format:
- It is expected that for most powers, this will only involve remote participation methods such as teleconferences and Adobe Connect-type meetings over a period of one or two days at most. Unless the timing allows participants to meet at a regularly scheduled ICANN meeting, there is no expectation that participants will meet face to face. The one exception to this is the power to recall the entire Board, which would require a face-to-face meeting.
  - The Decisional Participants who supported the petition would decide if holding the Community Forum can wait until the next regularly scheduled ICANN meeting or if a special meeting is required to bring participants together (only in the case of Board recall). In both these cases, the Decisional Participants who supported the petition leading to the Community Forum will publish the date for holding the event, which will not be subject to the 21-day limitation. In this case, the Community Forum would be considered completed at the end of the face-to-face meeting. Note: This extension is not available for exercise of the Community Power regarding the ICANN or IANA Budgets, due to the importance of maintaining a timely budget approval process.
  - Open to all interested participants.
  - Managed and moderated in a fair and neutral manner.
  - ICANN to provide support services. ICANN support staff will collect and publish a public record of the Forum(s), including all written submissions.
  - Representatives of the ICANN Board are expected to attend and be prepared to address the issues raised.
  - Should the relevant Decisional Participants determine a need for further deliberation, a second and third session of the Community Forum could be held.
  - The Forum will not make decisions or seek consensus, and will not decide whether to advance the petition to the decision stage, although the issue may be resolved before or in the Community Forum, as discussed below.

33 **Decision point:**

- ⊙ If the Empowered Community and ICANN Board can resolve the issue before or in the Community Forum, the escalation process terminates. Resolving an issue will be confirmed by the Decisional Participants who supported the petition formally agreeing, in accordance with their own mechanisms, that the escalation process should be halted.
- ⊙ If the Empowered Community and ICANN Board cannot resolve the issue, the Empowered Community must decide if it wishes to take further action.

34 **Step 4. Decision to Use a Community Power as an Empowered Community**

35 (21 days from the conclusion of the Community Forum)

36 **Decision point:**

- ⦿ If four or more (for some powers, three) Decisional Participants support and no more than one objects within the 21-day period, the Empowered Community will use its power. The Empowered Community will also publish an explanation of why it has chosen to do so. The published explanation can reflect the variety of underlying reasons.
- ⦿ If the proposal does not meet the required thresholds during the 21-day period, the escalation process terminates.

37 **Step 5. Advising the ICANN Board**

38 (1 day)

- ⦿ The Empowered Community will advise the ICANN Board of its decision and direct the Board to take any necessary action to comply with the decision.

39 **Enforcement**

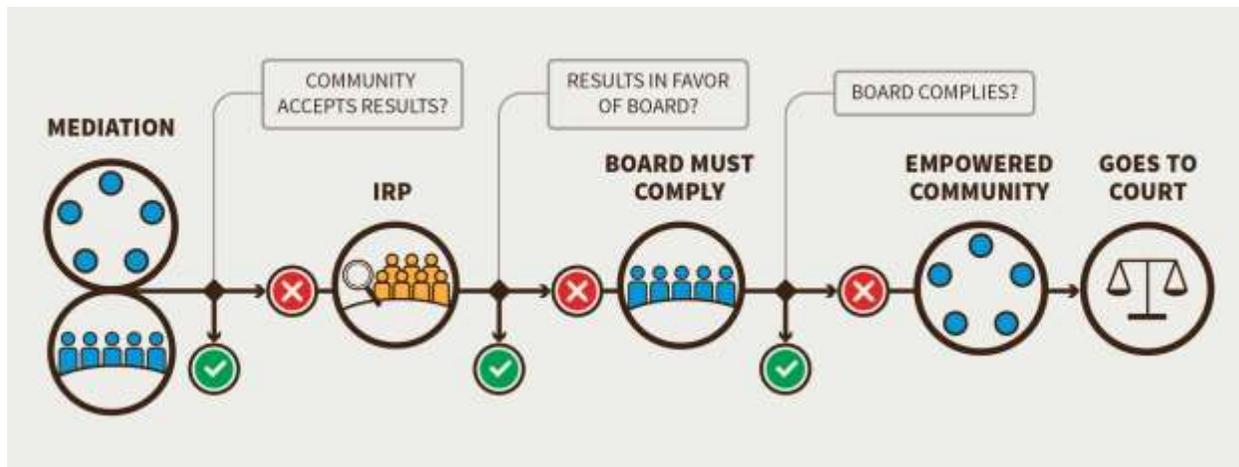

40 If the ICANN Board refuses or fails to comply with a decision of the Empowered Community to use a Community Power (other than a decision to remove an individual Director or the entire ICANN Board pursuant to the Empowered Community's statutory power, as discussed below), the Empowered Community must decide if it wishes to begin the enforcement process.

41 The ICANN Board will be deemed to have refused or failed to comply with a request by the Empowered Community to use one of its Community Powers if it has not complied with the request within 30 days of being advised of the request by the Empowered Community.

42 The exception to this is removal of ICANN Board Directors or the entire ICANN Board, which should be effective immediately upon notice being provided to the Board. If the ICANN Board refuses or fails to comply with a decision of the Empowered Community to use the statutory power to remove an individual ICANN Director or recall the entire ICANN Board (or with the Empowered Community's appointment of a Director), the Empowered Community could address that refusal by bringing a claim in a court that has jurisdiction; there is no need for the Empowered Community to initiate or undertake other enforcement processes such as mediation or an IRP to enforce the power.

43 The enforcement process can proceed in one of two ways, discussed below.

44 **Option 1: Initiate mediation and community IRP procedures.**

**a) Representatives from ICANN Board and Empowered Community undertake a formal mediation phase.**

- If the Empowered Community accepts the result from the mediation phase (as discussed below), the enforcement process would be terminated.
- If the Empowered Community does not accept the result from the mediation phase, the Empowered Community will proceed with a community IRP.
- Process specification (general guidelines for implementation):
  - The individuals selected by the Decisional Participants to represent them in the Empowered Community will be the Empowered Community representatives in the mediation process.
  - Once the mediator has determined that mediation efforts are completed, the Empowered Community will produce and publicly post a report with its recommendations within 14 days.
  - The Decisional Participants in the Empowered Community should use the standard escalation process to confirm whether to proceed with a community IRP challenge to the Board failing to comply with a decision of the Empowered Community to use a Community Power, using the above report as the basis for the petition. If the Empowered Community does not approve initiating a community IRP, the Empowered Community will be considered as having accepted the result of the mediation.

**b) Representatives from the ICANN Board and Empowered Community undertake a formal and binding IRP.**

- If the result of the community IRP is in favor of the ICANN Board, the enforcement process is terminated.
- If the result of the binding IRP is in favor of the Empowered Community, then the ICANN Board must comply within 30 days of the ruling.

**c) If the ICANN Board does not comply with the decision of the IRP, the Empowered Community has two options:**

- The Empowered Community can petition a court of valid jurisdiction to enforce the result of the IRP.
- The Empowered Community can use its Community Power to recall the entire ICANN Board.

**45 Option 2: Initiate an escalation process to recall the entire ICANN Board.**

- If the requisite threshold of support of Decisional Participants is achieved, the Empowered Community will remove all of the members of the ICANN Board (except the CEO) and replace them with an Interim Board until a new Board can be seated.
- The Empowered Community may legally enforce the power to recall the entire Board in court.

**Table: Required Thresholds for the Various Escalation and Enforcement Processes (Based on a Minimum of Five Decisional Participants in the Empowered Community)**

Required Community Powers?	Petition Threshold to convene a Community Forum	Is there consensus support to exercise a Community Power?
46 1. Reject a proposed Operating Plan/Strategic Plan/Budget	47 Two SOs/ACs	48 Four support rejection, and no more than one objection
49 2. Approve a change to Fundamental Bylaws and Articles of Incorporation, and approve ICANN's sale or other disposition of all or substantially all of ICANN's assets	50 N/A	51 Three support approval, and no more than one objection
52 3. Reject changes to Standard Bylaws	53 Two SOs/ACs, including the SO that led the PDP that requires the Bylaw change (if any)	54 Three support rejection, including the SO that led the PDP that requires the Bylaw change (if any), and no more than one objection

Required Community Powers?	Petition Threshold to convene a Community Forum	Is there consensus support to exercise a Community Power?
55 4a. Remove an individual Board Director nominated by an SO or AC (and appointed by the Empowered Community)	56 Majority within nominating SO/AC	57 Invite and consider comments from all SOs/ACs. 3/4 majority within the nominating SO/AC to remove their director
58 4b. Remove an individual Board Director nominated by the Nominating Committee (and appointed by the Empowered Community)	59 Two SOs/ACs	60 Three support, and no more than one objection
61 5. Recall the entire Board of Directors	62 Three SOs/ACs	63 Four support, and no more than one objection <sup>1</sup>
64 6. Initiate a binding IRP or a Request for Reconsideration	65 Two SOs/ACs	66 Three support, including the SO(s) that approved the policy recommendations from the PDP which result is being challenged through the IRP (if any), and no more than one objection 67 Require mediation before IRP begins
68 7. Reject an ICANN Board decision relating to reviews of IANA functions, including the triggering of any PTI separation process	69 Two SOs/ACs	70 Four support, and no more than one objection

71 Implementation of the Empowered Community currently anticipates that all of ICANN's SOs, the ALAC and GAC (if the GAC chooses to participate) would participate in the Empowered Community – that is, they will be listed in the Bylaws as the five Decisional Participants.

72 The thresholds presented in this document were determined based on this assessment. If fewer than five of ICANN's SOs and ACs agree to be Decisional Participants, these thresholds for consensus support may be adjusted. Thresholds may also have to be adjusted if ICANN changes to have more SOs or ACs.

<sup>1</sup> A minority of CCWG-Accountability participants prefer to require five SOs and ACs, or allow one objection to block consensus.

- 73 In the event of the creation (or removal) of SOs/ACs, the corresponding percentage could be used as useful guidelines in refining the thresholds. There would, however, need to be a conscious decision, depending on the circumstances, regarding these adjustments. If such a change were to affect the list of Decisional Participants in the Empowered Community, the change would follow the Fundamental Bylaw change process, which enables such a conscious decision to be undertaken.
- 74 The CCWG-Accountability also recommends that in a situation where the GAC may not participate as a Decisional Participant because the Community Power is proposed to be used to challenge the Board's implementation of GAC consensus advice and the threshold is set at four in support, the power will still be validly exercised if three are in support and no more than one objects, with the following exception:
- Where the power to be exercised is recalling the entire Board for implementing GAC advice, the reduced threshold would apply only after an IRP has found that, in implementing GAC advice, the Board acted inconsistently with the ICANN Bylaws. If the Empowered Community has brought such an IRP and does not prevail, the Empowered Community may not exercise its power to recall the entire the Board solely on the basis of the matter decided by the IRP. It may, however, exercise that power based on other grounds.

## 4. Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”

- Extended time for certain escalation steps in response to comments. Kept overall timeline similar by combining and removing some steps (mandatory conference call).
- Made it mandatory for petitioning party to reach out to SOs/ACs to socialize relevant information before Community Forum.
- Acknowledged comments regarding the thresholds adjustment in case the number of Decisional Participants is lower (page 12, paragraph 60 of the Third Draft Proposal), by removing this option and replacing it with a lower threshold for approving changes to Fundamental Bylaws. Since the Fundamental Bylaw change process is a requirement for “approval” and not a “rejection” option, this would preserve the requirement for stronger protection of Fundamental Bylaws.
- Determined that the use of the corresponding percentage for thresholds as recommended by the Board can be suggested as a guideline in the event of the creation of new SOs/ACs, but there would need to be a conscious decision, depending on the circumstances. If such a new SO/AC were to become a Decisional Participant in the Empowered Community, this change would require a change to the Fundamental Bylaws and would therefore require approval by the Empowered Community.
- Implemented the compromise for Recommendation #11: Board Obligations with Regard to Governmental Advisory Committee Advice (Stress Test 18) that the threshold requirements would be modified if the GAC was a Decisional Participant.

## 5. Stress Tests Related to this Recommendation

- ST5, 6, 7, 8, 9, 10, 16, 24, powers
- ST12
- ST13
- ST27
- ST28

## 6. How does this meet the CWG-Stewardship Requirements?

- 75 The CWG-Stewardship required community empowerment mechanisms that would be able to:
- Appoint and remove members of the ICANN Board and to recall the entire ICANN Board.
  - Exercise oversight with respect to key ICANN Board decisions (including with respect to the ICANN Board's oversight of the IANA functions) by reviewing and approving (1) ICANN Board decisions with respect to recommendations resulting from an IANA Function Review (IFR) or Special IFR and (2) the ICANN budget.
  - Approve amendments to ICANN's Fundamental Bylaws.
- The defined escalation and decision-making mechanism recommended by the CCWG-Accountability provide the processes needed to meet these requirements.

## 7. How does this address NTIA Criteria?

76 **Support and enhance the multistakeholder model.**

- Decentralizing power within ICANN through an Empowered Community.
- Solidifying consultation processes between the ICANN Board and community into the ICANN Bylaws.
- Establishing a public Community Forum to ensure that all voices and perspectives are heard before execution of a Community Power.
- Retaining decision-making based on consensus rather than voting.

---

77 **Maintain the security, stability and resiliency of the Internet DNS.**

- Proposing a series of procedures that ensure both sides have had the chance to completely and thoroughly discuss any disagreements and have multiple opportunities to resolve any such issues without having to resort to the powers of the Empowered Community for accountability or enforceability.
- Embedding thresholds into procedures to eliminate any risks of capture.

---

78 **Meet the needs and expectation of the global customers and partners of the IANA services.**

- Including limited timeframes, transparent processes and associated thresholds to maintain operational viability.

---

79 **Maintain the openness of the Internet.**

- Establishing a public Community Forum to ensure that all voices and perspectives are heard.
- Preserving policies of open participation in ICANN's SOs and ACs.

---

80 **NTIA will not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution.**

- To the extent the Government Advisory Committee (GAC) wishes to participate in decision-making by the Empowered Community, which the GAC has the flexibility to determine, it would be one of five Decisional Participants. In addition, the GAC will not participate as a decision-maker in community deliberations involving a challenge to the Board's implementation of GAC consensus advice. This "carve out," combined with the safeguards in Recommendation #11, leads the CCWG-Accountability to believe that this NTIA requirement is met, even when considering the increased threshold from 50 to 60% for the Board to reject GAC consensus advice.
  - Enabling all interested stakeholders to join consultations through SOs and ACs or through the Community Forum.
-

# Annex 03 – Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation

---

## 1. Summary

- 01 Currently, the Bylaws of the Internet Corporation for Assigned Names and Numbers (ICANN) have a single mechanism for amendment.
  - Any provision of the ICANN Bylaws can be changed by a 2/3 vote of all the Directors on the ICANN Board.
  - The ICANN Board is not required to consult the multistakeholder community or the wider public before amending the Bylaws, but has voluntarily done so up to this point.
- 02 The CCWG-Accountability recommends classifying each ICANN Bylaw as either a “Fundamental Bylaw” or a “Standard Bylaw,” with Fundamental Bylaws being more difficult to change.
- 03 Specifically, the CCWG-Accountability recommends that:
  - Public consultations be required on all changes to ICANN Bylaws, both Fundamental and Standard.
  - The requirement for public consultations to be added to the ICANN Bylaws as a Fundamental Bylaw to ensure that ICANN must continue to engage with the community in the future.
  - Any changes to Fundamental Bylaws require approval from both the ICANN Board and Empowered Community, as outlined in the respective Community Power (as described in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers).
  - The threshold for ICANN Board approval for changing a Fundamental Bylaw is raised from 2/3 to 3/4.
  - Approval for changes to the Articles of Incorporation use the same process required for approving changes to Fundamental Bylaws, including public consultations.
- 04 Why is the CCWG-Accountability recommending this?
  - The CCWG-Accountability felt that it was critical to ensure that the ICANN Bylaws that embody the purpose of the organization (Mission, Commitments and Core Values) and are meant to ensure the accountability of the ICANN Board, cannot be changed by the ICANN Board acting alone.

## 2. CCWG-Accountability Recommendations

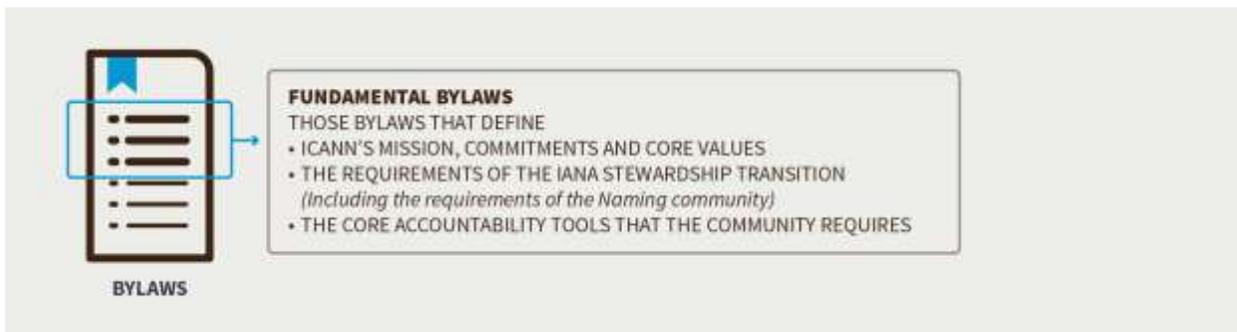

05 The CCWG-Accountability recommends:

- Classifying each ICANN Bylaw as either a Fundamental Bylaw or a Standard Bylaw.
- Making the following CCWG-Accountability and CWG-Stewardship Recommendations Fundamental Bylaws:
  - The Empowered Community for enforcing Community Powers, including the role of Sole Designator of ICANN's Directors, as described in Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers.
  - The escalation and enforcement mechanisms as described in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement.
  - The process for amending Fundamental Bylaws and/or Articles of Incorporation, and for approving ICANN's sale or other disposition of all or substantially all of ICANN's assets as described in Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation.
  - The seven Community Powers as described in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers.
  - The Mission, Commitments and Core Values as described in Recommendation #5: Changing Aspects of ICANN's Mission, Commitments and Core Values.
  - The framework for the Independent Review Process (IRP) as described in Recommendation #7: Strengthening ICANN's Independent Review Process.
  - The IANA Function Review, Special IANA Function Review and the Separation Process, accountability mechanisms for the IANA naming functions that are required under the CWG-Stewardship Proposal.
  - The PTI Governance and Customer Standing Committee (CSC) structures, also required by the CWG-Stewardship Proposal.
  - The rights of investigation and inspection as described in Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers.
- Requiring ICANN to conduct public consultations on any proposed changes to Standard Bylaws, Fundamental Bylaws or the Articles of Incorporation.
- Requiring approval for any changes to Fundamental Bylaws and the Articles of Incorporation from both the ICANN Board and the Empowered Community as outlined in the Community Power as described in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers.
- Raising the threshold for ICANN Board approval for changing a Fundamental Bylaw or the Articles of Incorporation from 2/3 to 3/4 of all the Directors on the ICANN Board.

## 3. Detailed Explanation of Recommendations

06 **What Is a Fundamental Bylaw?**

- 07 ICANN Bylaws describe how power is exercised in ICANN, including setting out the organization's Mission, Commitments and Core Values. Together with the Articles of Incorporation, the Bylaws are an essential part of ICANN because they set the scope of the organization's corporate authority, determine its governance framework and define working practices.
- 08 Today, ICANN Bylaws can be changed by a resolution of the Board upon a 2/3 vote of all the Directors. The CCWG-Accountability believes that the set of key Bylaws that are fundamental to ICANN's stability and operational continuity and essential for the community's decision-rights should be given additional protection from changes by requiring Empowered Community approval of any amendments.
- 09 These key Bylaws will be identified as Fundamental Bylaws.

- 10 As such, the CCWG-Accountability proposes making Fundamental Bylaws harder to change than Standard Bylaws in two ways:
  - By sharing the authority to authorize changes between the ICANN Board and the Empowered Community, organized through participating Supporting Organizations (SOs) and Advisory Committees (ACs) as the “Decisional Participants” in the Empowered Community, as outlined in Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers.
  - By requiring a higher threshold of ICANN Board support to authorize changes to Fundamental Bylaws than for Standard Bylaws.
- 11 The establishment of Fundamental Bylaws would indirectly enhance ICANN's accountability to the global Internet community by sharing the authority of decision-making more widely and increasing the difficulty of amending these key aspects of ICANN.
- 12 This recommendation is important in the context of the IANA Stewardship Transition because the historical contractual relationship with the U.S. Government provided assurance to the multistakeholder community that the fundamental nature of ICANN was unlikely to be changed without widespread agreement. Without that relationship in place, procedural protections and more widely shared decision-rights on core components of ICANN's scope and authority should help maintain the community's confidence in ICANN.

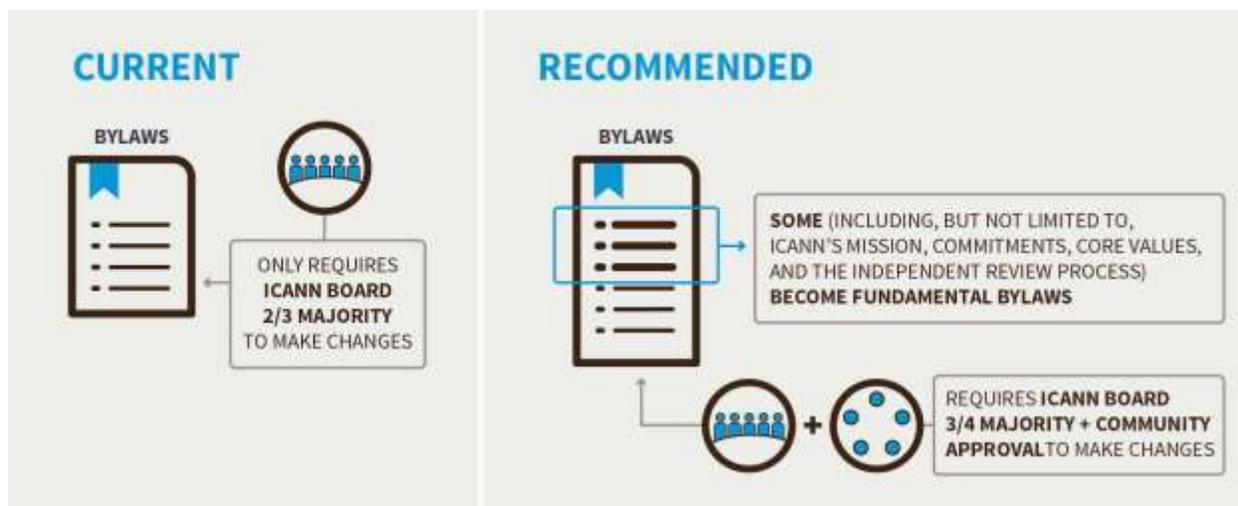

### 13 **Establishing Fundamental Bylaws**

- 14 To implement the establishment of Fundamental Bylaws, a new provision would be added to the Bylaws that sets out:

- Which sections of the Bylaws are Fundamental Bylaws (i.e., a list of the fundamental articles/sections/subsections).
- How new Fundamental Bylaws can be defined, and how existing Fundamental Bylaws can be amended or removed.

15 **Adding New or Amending Existing Fundamental Bylaws**

- 16 While the CCWG-Accountability recommends fortifying certain aspects of the ICANN Bylaws, the global public interest would not be served if ICANN could not evolve in response to the changing Internet environment.
- 17 Therefore, the CCWG-Accountability recognizes the importance of the ability to define new Fundamental Bylaws over time, or to amend or remove existing ones.

- 18 The following steps would be required to establish a new Fundamental Bylaw, or to amend or remove an existing one, where the ICANN Board (or the staff through the ICANN Board) is proposing the addition, amendment or removal:

- The Board proposes a new Fundamental Bylaw, amendment of a Fundamental Bylaw, or removal of a Fundamental Bylaw.
- The Board approves the addition, amendment, or removal of the Fundamental Bylaw with a 3/4 vote of all the Directors on the ICANN Board.
- The Empowered Community approves the addition, amendment or removal of the Fundamental Bylaw (as described in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers).

- 19 If the addition, amendment, or removal of the Fundamental Bylaw is agreed upon by both the ICANN Board and the Empowered Community:

- The new/revised Fundamental Bylaw would be inserted into the ICANN Bylaws, and an appropriate reference to the text as a Fundamental Bylaw would be added (if needed) to the part of the Bylaws that lists them.
- In the case of an amendment to existing ICANN Bylaws text, the text would be updated.

- In the case of a removal, the text would be removed from the ICANN Bylaws.

20 The CCWG-Accountability does not propose that the community gain the power to directly propose changes to the Bylaws.

## 21 **Which of the Current Bylaws Would Become Fundamental Bylaws?**

22 The CCWG-Accountability recommends that only critical aspects of the ICANN Bylaws be classified as Fundamental Bylaws to avoid introducing unnecessary rigidity into ICANN's structures. The CCWG-Accountability concluded that recommending that all changes to ICANN Bylaws should face the same thresholds that are proposed for Fundamental Bylaws would harm, not help, ICANN's overall accountability.

23 The CCWG-Accountability views "critical aspects" as those that define ICANN's Mission, Commitments and Core Values; the requirements of the CWG-Stewardship Proposal; and the core accountability tools the community requires.

24 Accordingly, the CCWG-Accountability recommends that the following aspects be made Fundamental Bylaws as a part of Work Stream 1:

- The Empowered Community for enforcing Community Powers, including the role of sole designator of ICANN's Directors, as described in Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers.
- The escalation and enforcement mechanisms, as described in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement.
- The process for amending Fundamental Bylaws and/or Articles of Incorporation, and for approving ICANN's sale or other disposition of all or substantially all of ICANN's assets, as described in Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation.
- The seven Community Powers, as described in Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers.
- The Mission, Commitments and Core Values, as described in Recommendation #5: Changing Aspects of ICANN's Mission, Commitments and Core Values.
- The framework for the Independent Review Process, as described in Recommendation #7: Strengthening ICANN's Independent Review Process.
- The IANA Function Review, Special IANA Function Review and the Separation Process, accountability mechanisms for the IANA naming functions that are required under the CWG-Stewardship Proposal.
- The PTI Governance and Customer Standing Committee (CSC) structures, also required by the CWG-Stewardship Proposal.
- The rights of investigation and inspection, as described in Recommendation #1: Establishing an Empowered Community for Enforcing Community Powers.

## 25 **Articles of Incorporation**

26 The CCWG-Accountability legal counsel has advised the following when considering changes to the ICANN Articles of Incorporation:

*“The constituent documents of a California nonprofit public benefit corporation such as ICANN are its Articles of Incorporation and its Bylaws. There is a hierarchy between these documents—the articles prevail to the extent that there is any conflict between the Articles and the Bylaws. This hierarchical relationship holds even if the conflict is between the Articles and a “fundamental” Bylaw that requires the consent of a third-party (in the case of ICANN, the Empowered Community) to be amended.*

*Under California nonprofit corporation law, if a corporation has no statutory members, amendments to the articles may be adopted by the Board. However, the amendment of articles may be made subject to the consent of a third party, just as the amendment of bylaws may be. In the case of ICANN, if the Empowered Community is not provided a right to approve amendments to the Articles, there is a risk that Fundamental Bylaw provisions could be undermined by amendment of the Articles by the ICANN Board, given the hierarchical relationship described above. Thus, we recommend including an approval right with respect to amendments to ICANN’s Articles in favor of the Empowered Community in the same way the Empowered Community has approval rights with respect to Fundamental Bylaws.”*

- 27 As such, the CCWG-Accountability is recommending that changes to the ICANN Articles of Incorporation follow the same approval process and thresholds described above for approving changes to Fundamental Bylaws.

- 28 It is important to note ICANN’s current Articles of Incorporation state that:

*“9. These Articles may be amended by the affirmative vote of at least two-thirds of the directors of the Corporation. When the Corporation has members, any such amendment must be ratified by a two-thirds (2/3) majority of the members voting on any proposed amendment.”*

- 29 Therefore, the CCWG-Accountability recommends that the Articles of Incorporation be modified to remove the notion of members and reflect the need for a higher affirmative vote of at least 3/4 of all the Directors on the ICANN Board, as well as approval by the Empowered Community using the same approval process and thresholds as for approving changes to Fundamental Bylaws.

30 **Does the location of ICANN’s principal office need to be a Fundamental Bylaw?**

31 The ICANN Articles of Incorporation and Bylaws address both the state of incorporation (or corporate domicile) of ICANN and the location of its principal office:

- ICANN’s present Articles of Incorporation state:

*“3. This Corporation is a nonprofit public benefit corporation and is not organized for the private gain of any person. It is organized under the California Nonprofit Public Benefit Corporation Law for charitable and public purposes.”*

- ICANN’s present Bylaws Article XVIII Section 1 state:

*“OFFICES. The principal office for the transaction of the business of ICANN shall be in the County of Los Angeles, State of California, United States of America. ICANN may also have an additional office or offices within or outside the United States of America as it may from time to time establish.”*

- The Affirmation of Commitments paragraph 8(b) states:

*“ICANN affirms its commitments to: (b) remain a not for profit corporation, headquartered in the United States of America with offices around the world to meet the needs of a global community...”*

32 As recommended by the CCWG-Accountability in the above section, the Articles of Incorporation would require that approval of any changes to the Articles of Incorporation use the same process and thresholds required for approving changes to Fundamental Bylaws.

33 Thus, ICANN’s state of incorporation/corporate domicile could not be changed without the affirmative consent of the Empowered Community. However, to ensure that ICANN’s status as a California nonprofit public benefit corporation could not be changed by way of transfer of assets and/or dissolution without the affirmative consent of the Empowered Community, a provision will need to be added to the Articles of Incorporation requiring Empowered Community approval for a transfer of all or substantially all of the assets of ICANN.

34 The ICANN Board could propose a change to the Bylaws provision requiring the location of ICANN’s “principal office” in California, but the Empowered Community could block the change.

35 There was not consensus to support making this provision a Fundamental Bylaw requiring the affirmative consent of the Empowered Community.

36 **Community Power: Approve Changes to Fundamental Bylaws and the Articles of Incorporation**

37 Establishing Fundamental Bylaws and requiring Empowered Community approval of amendments to the Articles of Incorporation would ensure that critical aspects of the powers and processes required to maintain ICANN’s accountability to the community, and the organization’s Mission, Commitments and Core Values, can only be changed as a result of broad consensus of both the ICANN Board and the community.

- 38 The Empowered Community would have to affirmatively consent to any change proposed and adopted by the ICANN Board before the amendment could become legally effective, as part of a joint decision process between the ICANN Board and the Empowered Community. By creating this special joint decision process, authority to change fundamental aspects of ICANN's governing framework is shared more broadly than it is today.
- 39 The CCWG-Accountability is working under the assumption that the Articles of Incorporation and the ICANN Bylaws provisions that are recommended to become Fundamental Bylaws are not likely to change frequently. Where changes are made, they are unlikely to arise on short notice or be needed to deal with short-term operational situations.
- 40 The CCWG-Accountability therefore does not believe that this Community Power, as proposed, poses any challenges to ICANN's ongoing operational viability, stability or efficiency.
- 41 Such changes require a high degree of support from the Decisional Participants in the Empowered Community, as the purpose of this power is to make changing Fundamental Bylaws or the Articles of Incorporation possible only with very wide support from the community.
- 42 For further information about the other Community Powers recommended by the CCWG-Accountability, see Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers.

## 4. Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”

- Clarified that IANA Function Review (IFR) provisions apply only to the IANA naming functions (CWG-Stewardship requirement).
- Clarified the process for changes of Articles of Incorporation to be similar to process for changes to Fundamental Bylaws, as well as the process for approving ICANN's sale or other disposition of all or substantially all of ICANN's assets.
- Added a specific recommendation that the current Articles of Incorporation be modified to remove the notion of members and reflect the need for an affirmative vote of at least 3/4 of all the Directors on the ICANN Board, as well as approval by the Empowered Community.

## 5. Stress Tests Related to this Recommendation

- N/A

## 6. How does this meet the CWG-Stewardship Requirements?

- 43 These recommendations meet the CWG-Stewardship requirement that the CCWG-Accountability recommend the creation of Fundamental Bylaws. These include the following:

- ICANN Budgets and Strategic/Operating Plans and IANA Budgets: Community rights regarding the development and consideration of ICANN Budgets, Strategic/Operating Plans and IANA Budgets.
- ICANN Board: Community rights regarding the ability to appoint/remove Directors of the ICANN Board and recall the entire Board.
- ICANN Bylaws: Incorporation of the following into ICANN's Bylaws: IANA Function Review, Special IANA Function Review, PTI Governance, Customer Standing Committee, and the Separation Process.
- Independent Review Process: Should be made applicable to IANA functions and accessible by managers of top-level domains.

## 7. How does this address NTIA Criteria?

44 **Support and enhance the multistakeholder model.**

- Ensuring the multistakeholder model accountability mechanisms cannot be modified without the Empowered Community's approval.
- 

45 **Maintain the security, stability and resiliency of the Internet DNS.**

- Establishing Fundamental Bylaws that provide additional protections to ICANN Bylaws that are critical to the organization's stability and operational continuity.
- 

46 **Meet the needs and expectation of the global customers and partners of the IANA services.**

- N/A
- 

47 **Maintain the openness of the Internet.**

- N/A
- 

48 **NTIA will not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution.**

- N/A
-

# Annex 04 –Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Powers

---

## 1. Summary

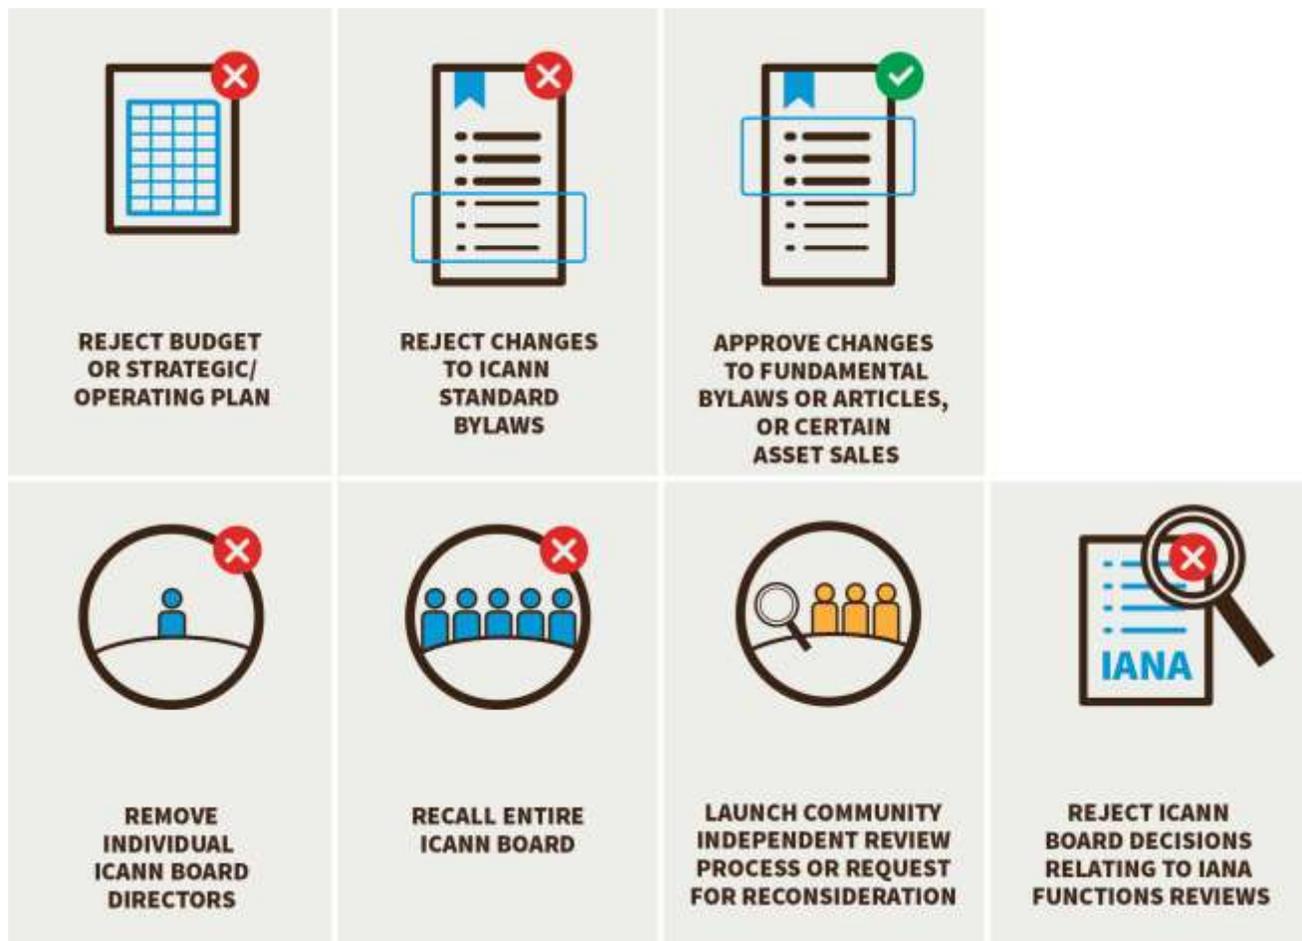

- 01 The CCWG-Accountability has recommended seven powers for the community that should be in place to improve ICANN's accountability and ensure community engagement.
- 02 These “Community Powers” are:
1. Reject a Five-Year Strategic Plan, Five-Year Operating Plan, Annual Operating Plan & Budget or IANA Functions Budget.
  2. Reject a change to ICANN Standard Bylaws.
  3. Approve a change to Fundamental Bylaws and/or Articles of Incorporation, and/or approve ICANN's sale or other disposition of all or substantially all of ICANN's assets.
  4. Remove an individual ICANN Board Director.
  5. Recall the entire ICANN Board.
  6. Initiate a binding Independent Review Process (IRP) (where a panel decision is enforceable in any court recognizing international arbitration results) or a non-binding Request for Reconsideration (where the ICANN Board of Directors is obliged to reconsider a recent decision or action/inaction by ICANN's Board or staff).
  7. Reject an ICANN Board decision relating to reviews of IANA functions, including the triggering of any Post-Transition IANA (PTI) separation process for the IANA naming functions.
- 03 The Community Powers and associated processes were designed to ensure that no stakeholder can singlehandedly exercise any power, and that under no circumstances, would any individual segment of the community be able to block the use of a power.

## 2. CCWG-Accountability Recommendations

- 04 The CCWG-Accountability recommends:
- Defining the following Community Powers as Fundamental Bylaws:
    1. Reject a Five-Year Strategic Plan, Five-Year Operating Plan, Annual Operating Plan & Budget or IANA Functions Budget.
    2. Reject a change to ICANN Standard Bylaws.

3. Approve a change to Fundamental Bylaws and/or Articles of Incorporation, and/or approve ICANN's sale or other disposition of all or substantially all of ICANN's assets.
  4. Remove an individual ICANN Board Director.
  5. Recall the entire ICANN Board.
  6. Initiate a binding IRP (where a panel decision is enforceable in any court recognizing international arbitration results) or a non-binding Request for Reconsideration (where the ICANN Board of Directors is obliged to reconsider a recent decision or action/inaction by ICANN's Board or staff).
  7. Reject ICANN Board decisions relating to reviews of IANA functions, including the triggering of any PTI separation process for the IANA naming functions.
- Adding an ICANN Bylaw that states that if the entire ICANN Board is removed, an Interim Board will be established only as long as is required for the selection/election process for the Replacement Board to take place. Supporting Organizations (SOs), Advisory Committees (ACs), and the Nominating Committee (NOMCOM) will develop replacement processes that ensure the Interim Board will not be in place for more than 120 days. The Interim Board will have the same powers and duties as the Board it replaces. Having a Board in place at all times is critical to the operational continuity of ICANN and is a legal requirement.
    - The ICANN Bylaws will state that, except in circumstances in which urgent decisions are needed to protect the security, stability and resilience of the DNS, the Interim Board will consult with the community through the SO and AC leaderships before making major decisions. Where relevant, the Interim Board will also consult through the ICANN Community Forum before taking any action that would mean a material change in ICANN's strategy, policies or management, including replacement of the serving President and CEO.
    - Note: Details on what the powers do is presented in greater detail in the following section and the details of how these can be used can be found in Annex 2.
  - That there be an exception to rejecting Standard Bylaws in cases where the Standard Bylaw change is the result of a Policy Development Process. The exception would be as follows:
    - Fundamental Bylaws would require that the ICANN Board not combine the approval of ICANN Bylaw changes that are the result of a Policy Development Process with any other Bylaw changes.
    - Fundamental Bylaws would require the ICANN Board to clearly indicate if an ICANN Bylaw change is the result of a Policy Development Process when the Board approves it.
    - Fundamental Bylaws would require that if the change to the ICANN Bylaws is the result of a Policy Development Process, the SO that led the Policy Development Process must formally support holding a Community Forum and exercise the power to reject the Bylaw change. If the SO that led the Policy Development Process that requires the Bylaw change does not support holding a Community Forum or exercising the power to reject the Bylaw, then the Community Power to reject the Bylaw cannot be used.

### 3. Detailed Explanation of Recommendations

05 The CCWG-Accountability has proposed a set of seven Community Powers designed to empower the community to hold ICANN accountable for the organization's Principles (the Mission, Commitments and Core Values).

06 **The proposed Community Powers are:**

The Power to Reject ICANN's Budget, IANA Functions Budget or Strategic/Operating Plans

The Power to Reject Changes to ICANN Standard Bylaws

The Power to Remove Individual ICANN Board Directors

The Power to Recall the Entire ICANN Board

The Power to Approve Changes to Fundamental Bylaws and/or Articles of Incorporation and/or Approve ICANN's Sale or Other Disposition of All or Substantially All of ICANN's Assets

The Power to Initiate a Binding IRP or a Non-Binding Request for Reconsideration

The Power to Reject ICANN Board Decisions Relating to Reviews of IANA Functions, including the Triggering of Any PTI Separation Process

---

07 It is important to note that the above powers, as well as the launch of a Separation Cross Community Working Group<sup>1</sup> (as required by the CWG-Stewardship dependencies), can be enforced by using the community IRP or the Community Power to recall the entire Board.

08 If the ICANN Board refuses or fails to comply with a decision of the Empowered Community to use the statutory power to remove an individual ICANN Director or recall the entire ICANN Board (or with the Empowered Community's appointment of a Director), the Empowered Community could address that refusal by bringing a claim in a court that has jurisdiction; there is no need for the Empowered Community to initiate or undertake other enforcement processes such as mediation or an IRP to enforce the power.

09 **The Power to Reject ICANN's Budget or Strategic/Operating Plans**

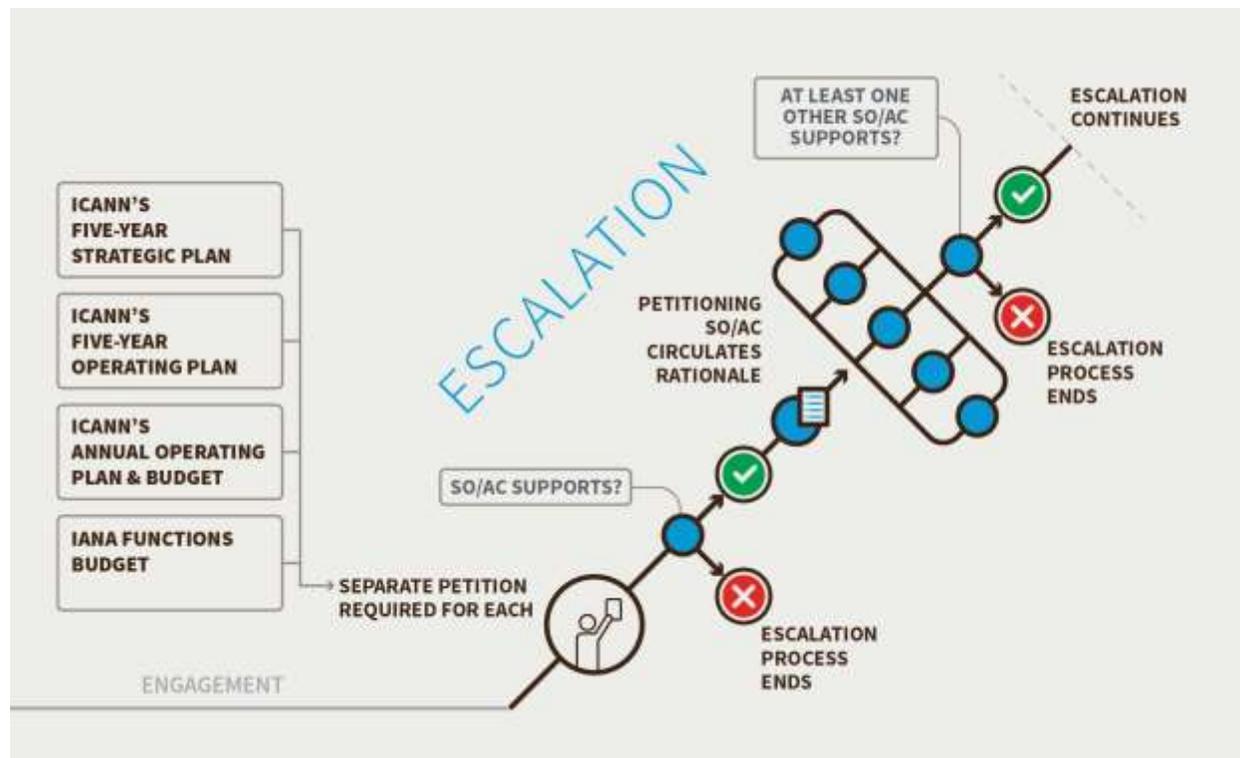

10 The right to set budgets and strategic direction is a critical governance power for any organization. By allocating resources and defining the goals to which these resources are directed, strategic plans, operating plans, and budgets have a significant impact on what ICANN does and how effectively it fulfills its role. The ICANN community already plays an active role in giving input into these key documents through participation in the existing consultation processes ICANN organizes.

11 To provide additional accountability safeguards, the CCWG-Accountability has proposed that the Empowered Community be given the power to reject:

- ICANN's Five-Year Strategic Plan
- ICANN's Five-Year Operating Plan
- ICANN's Annual Operating Plan & Budget
- IANA Functions Budget

---

<sup>1</sup> If the CWG-Stewardship's IANA Function Review determines that a Separation Process for the IANA naming functions is necessary, it will recommend the creation of a Separation Cross Community Working Group. This recommendation will need to be approved by a supermajority of each of the Generic Names Supporting Organization and the Country-Code Names Supporting Organization Councils, according to their normal procedures for determining supermajority, and will need to be approved by the ICANN Board after a Public Comment Period, as well as by the Empowered Community.

- 12 The CCWG-Accountability has determined that a separate petition would be required for each budget or strategic/operating plan being challenged. A budget or strategic/operating plan could only be challenged if there are significant issue(s) brought up in the engagement process that were not addressed prior to approval.
- 13 To reinforce the bottom-up, transparent and collaborative approach that ICANN currently uses to enable the community to give input into ICANN's budget documents, the CCWG-Accountability recommends adding a similar consultation process into the ICANN Bylaws for both the ICANN Budget and the IANA Functions Budget. The Bylaws must assure that sufficient budget detail is available, in a timely way, for the community to carefully consider budget matters and provide informed and constructive input (and for this input to be thoroughly considered) prior to the Board making decisions on budget matters.
- 14 A community decision to reject a budget or a plan after it has been approved by the ICANN Board will be based on perceived inconsistency with the purpose, Mission and role set out in ICANN's Articles and Bylaws; the global public interest; the needs of ICANN stakeholders; financial stability, or other matters of concern to the community. The veto could only concern issues that had been raised in the public consultations conducted before the Board approved the budget or plan.
- 15 An SO or AC that is a Decisional Participant in the Empowered Community petitioning to reject a budget or strategic/operating plan would be required to circulate a rationale and obtain support for its petition from at least one other Decisional Participant according to the escalation process.
- 16 The escalation and enforcement processes for rejecting any strategic/operating plan or budget is detailed in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement.
- 17 If the Community Power to reject the Annual Budget is used, a caretaker budget would be implemented. A caretaker budget is one that provides ongoing funding for crucial ICANN

functions, while the issue/s that caused the Empowered Community's use of the Community Power are resolved. It will be based on current ICANN operations, according to rules developed in the implementation process (which will form a public and transparent "defined approach" to the caretaker budget).

- 18 The CCWG-Accountability also recommends that the caretaker budget concept be embedded in the Fundamental Bylaws, including the responsibility of ICANN's Chief Financial Officer to establish the caretaker budget in accordance with the defined approach.

## 19 **The IANA Functions Budget**

- 20 Under this power, the community will be able to consider the IANA Functions Budget as a separate budget. The IANA Functions Budget is currently part of ICANN's Annual Operating Plan & Budget.

- 21 Under the CWG-Stewardship Final Proposal, an itemization of IANA costs as set forth in the IANA Functions Budget would include "direct costs for the IANA Department", "direct costs for shared resources" and "support functions allocation." Furthermore, the CWG-Stewardship Final Proposal states that these costs should be itemized into more specific costs related to each specific function to the project level and below as needed.

- 22 The IANA Functions Budget requires protection, as recommended by the CWG-Stewardship's Final Proposal. The IANA Functions Budget must be managed carefully and not decreased (without public input) regardless of the status of the other portions of the budget.

- 23 The CCWG-Accountability recommends that there be two distinct processes with respect to the Community Power to reject the IANA Functions Budget and the Community Power to reject the ICANN Budget, meeting the requirements of the CWG-Stewardship. The use of the Community Power to reject the ICANN Budget would have no impact on the IANA Functions Budget, and a rejection of the IANA Functions Budget would have no impact on the ICANN Budget.

- 24 The escalation and enforcement processes for rejecting an IANA Functions Budget is detailed in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement.

- 25 Should the power be used to reject the annual IANA Functions Budget, a caretaker budget would be implemented (details regarding the caretaker budget are currently under development as noted above).

- 26 The CCWG-Accountability recommends that the caretaker budget approach be embedded in the Fundamental Bylaws, including the responsibility of ICANN's Chief Financial Officer to establish the caretaker budget in accordance with the defined approach.

- 27 The CCWG-Accountability acknowledges that the CWG-Stewardship (or a successor implementation group) is required to develop a proposed process for the IANA Functions Operations-specific Budget establishment and review. This process will be a key input for the implementation of this specific power.

- 28 The CWG-Stewardship may wish to detail the planning process by which the IANA Functions Budget is established as part of its implementation program of work, including the level of detail required to be provided for community input and the timeframes for consultations and approvals. The CCWG-Accountability limits its requirements to those set out in this Recommendation.

- 29 In implementation, any process through which a portion or the whole of the IANA Functions Budget is subject to rejection should include the voice of the operational communities served by the IANA functions (i.e., Domain Names, Numbering Resources and Protocol Parameters). The process must also be implemented in such a way as to ensure the stable and continuous

delivery of the IANA functions, and the proper delivery of contractual service levels to the respective operational communities.

### 30 **The Power to Reject Changes to ICANN Standard Bylaws**

31 In addition to the safeguard against the possibility of the ICANN Board unilaterally amending Fundamental Bylaws without consulting the community, the CCWG-Accountability recommends that the Empowered Community be given the power to reject changes to Standard ICANN Bylaws after the Board approves them, but before the changes go into effect.

32 Any changes approved by the Board would take 30 days to go into effect to enable the Empowered Community to decide whether a petition to reject the change should be initiated.

33 This power, with respect to Standard Bylaws, is a rejection process that is used to tell the ICANN Board that the Empowered Community does not support a Board-approved change. It does not enable the Empowered Community to rewrite a Standard Bylaw change that has been proposed by the Board.

34 It is important to note that the CCWG-Accountability has been careful to try not to change ICANN's core policy-making processes. The tools it has proposed to improve accountability are generally aimed at ICANN-wide issues, not policy development in the SOs. However, the power to reject a Standard Bylaw change could interfere with the implementation of a Policy Development Process that requires such a change.

- To ensure this power does not interfere with ICANN's bottom-up Policy Development Processes, the CCWG-Accountability has added an exception to the Standard Bylaws rejection power to ensure that a Bylaw change that is the result of a Policy Development Process cannot be rejected after it is approved by the ICANN Board without the approval of the SO that led the Policy Development Process.

35 The escalation and enforcement processes for this power are described in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement, with the following exception:

- The CCWG-Accountability proposes that there be an exception to rejecting Standard Bylaws in cases where the Standard Bylaw change is the result of a Policy Development Process. The exception would be as follows:
  - Fundamental Bylaws would require that the ICANN Board not combine the approval of ICANN Bylaw changes that are the result of a Policy Development Process with any other Bylaw changes.
  - Fundamental Bylaws would require the ICANN Board to clearly indicate if an ICANN Bylaw change is the result of a Policy Development Process when the Board approves it.
    - Fundamental Bylaws dealing with rejection of an ICANN Bylaw change would require, if the Bylaws change is the result of a Policy Development Process, that the SO that led the Policy Development Process must formally support holding a Community Forum and exercise the power to reject the Bylaw change.
    - If the SO that led the Policy Development Process that requires the ICANN Bylaw change does not support holding a Community Forum or exercising the power to reject the Bylaw, then the Community Power to reject the Bylaw cannot be used.

36 **The Power to Approve Changes to Fundamental Bylaws and/or Articles of Incorporation and/or Approve ICANN's Sale or Other Disposition of All or Substantially All of ICANN's Assets**

37 To safeguard against the possibility that the ICANN Board could unilaterally amend ICANN Bylaws and/or the Articles of Incorporation without consulting the community, the CCWG-Accountability determined that the community consultation process should be reinforced in Fundamental Bylaws.

38 The proposed set of Fundamental Bylaws would be harder to change than the Standard Bylaws for two reasons:

- The authority to change Fundamental Bylaws and/or the Articles of Incorporation would be shared between the ICANN Board and the Empowered Community.
- The required threshold of ICANN Board support to change a Fundamental Bylaw would be significantly higher than the threshold to change a Standard Bylaw.

39 The CCWG-Accountability emphasizes the importance for the ICANN Board and Empowered Community to be able to define new Fundamental Bylaws and/or Articles of Incorporation over time, or to change or remove existing ones to ensure that ICANN can adapt to the changing Internet environment.

40 The same escalation process applies to ICANN's sale or other disposition of all or substantially all of ICANN's assets.

41 **The escalation process for this power is as follows:**

42 **Step 1. The ICANN Board publishes its approval of a change to the Fundamental Bylaws and/or Articles of Incorporation and/or sale or other disposition of all or substantially all of ICANN's assets**

---

43 **Step 2. Holding a Community Forum**

44 (30 days to organize and hold the event from the date of the publication by the Board)

- ⊙ It is expected that this will only involve remote participation methods, such as teleconferences and Adobe Connect-type meetings over a period of one or two days at most. Unless the timing allows participants to meet at a regularly scheduled ICANN meeting, there is no expectation that participants will meet face-to-face.
- ⊙ The Community Forum would be open to all interested participants and ICANN will provide support services, including the publishing of recordings and transcripts.
- ⊙ Representatives of the ICANN Board are expected to attend and be prepared to address the issues raised.
- ⊙ The purpose of the Community Forum is information-sharing (the rationale for the petition, etc.) and airing views on the petition by the community. Accordingly, any SO or AC may circulate their preliminary views in writing on the exercise of this Community Power.
- ⊙ The Community Forum will neither make decisions nor seek consensus. It will not decide whether to advance the petition to the decision stage; although the issue may be resolved before or in the Community Forum. Resolving an issue will be confirmed by the Decisional

Participants that supported the petition formally agreeing, in accordance with their own mechanisms, that the escalation process should be halted.

- ⊙ The Community Forum should be managed/moderated in a fair and neutral manner.
  - ⊙ Should the relevant Decisional Participants determine a need for further deliberation, a second and third session of the Community Forum could be held.
  - ⊙ ICANN staff will collect and publish a public record of the Forum(s), including all written submissions.
- 

45 **Step 3. Decision to use a Community Power as an Empowered Community**

46 (21 days from the conclusion of the Community Forum)

- ⊙ If three or more Decisional Participants support and no more than one objects within the 21-day period, the Empowered Community will use its power to approve the change to the Fundamental Bylaws or Articles of Incorporation.
  - ⊙ If the required thresholds during the 21-day period are not met, the escalation ends without the change to the Fundamental Bylaws or Articles of Incorporation being approved.
- 

47 **Step 4. Advising the ICANN Board**

48 (1 day)

- ⊙ The Empowered Community will advise the Board of its decision.
- 

49 **The Power to Remove Individual ICANN Board Directors**

50 The power to remove individual ICANN Board Directors would allow for the removal of an ICANN Board Director before the Director's current term comes to an end. This was a formal requirement from the CWG-Stewardship. Note that this power applies only to voting members of the ICANN Board, and not to liaisons (who, as non-voting members of the Board are not treated as Directors under California law).

51 Given that ICANN Board Directors can be nominated in two significantly different ways, (1) Specific SO or AC nomination or (2) Nomination Committee nomination, the processes for removing each type of Director will be different.

52 In cases where the nominating SO or AC perceives that there is a significant issue with its appointed Director, it can use the following escalation process to determine if removal of the Director is recommended.

- It is important to note that this power can only be used once during a Director's term if the escalation process reaches the step of holding a Community Forum, as described above, and then fails to remove the Director.

53 As a condition to being nominated by an SO, AC or the Nominating Committee and seated on the Board, each Director-nominee shall be required to sign an irrevocable letter agreement that:

- Expresses a contractual commitment that: (1) Acknowledges that the nominating AC or SO, or, for Directors nominated by the Nominating Committee, the Empowered Community, has the right to remove the Director from service at any time and for any reason through the processes set out in the ICANN Bylaws (as described below); and (2) Confirms that service as an ICANN Board Director does not establish any employment or other relationship to ICANN, the Empowered Community, the SOs, the ACs, the Nominating Committee, or the agents of any of them, that provides any due process rights related to termination of service as a Director other than those specified in the Bylaws.
- Provides a conditional irrevocable resignation from the ICANN Board that is automatically effective upon a final determination of removal through the individual Director removal process or the full Board recall process upon communication of such decision to the Board (as set forth below).

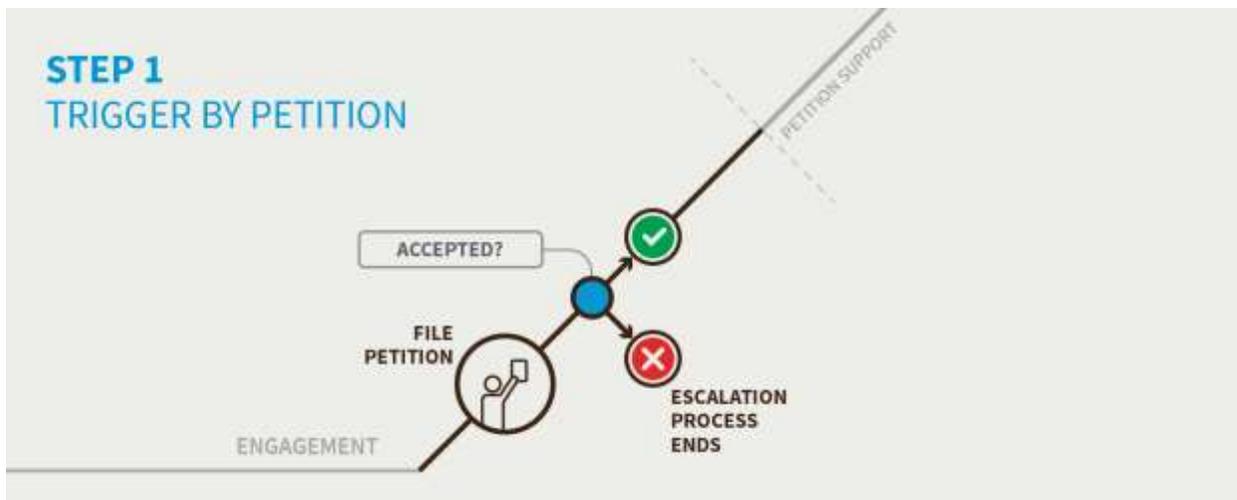

54 Indemnification associated with the removal of individual ICANN Board Directors:

- If a Director initiates a lawsuit in connection with his or her removal or recall (for example, a Director claims that he was libeled in the written rationale calling for his removal), ICANN will provide indemnification and advance expenses as provided below.
- Indemnification will be available (1) to a member of an SO, an AC, the Nominating Committee, or the Empowered Community (2) who is acting as a representative of such organization or committee (3) for actions taken by such representative in such capacity pursuant to processes and procedures set forth in the Bylaws (for example, the chair of an SO submitting a written rationale for the removal of a Director).
- As required by California law and consistent with ICANN's current Bylaws, indemnification will only be available if the actions were taken (1) in good faith and (2) in a manner that the indemnified person reasonably believed to be in the best interests of ICANN.
- Guidelines for standards of conduct that will be presumed to be in good faith (for example, conducting reasonable due diligence as to the truthfulness of a statement) will be developed in Work Stream 2.
- Indemnification will cover amounts actually and reasonably incurred in connection with the lawsuit, such as reasonable attorneys' fees of no more than one firm, judgments, and settlements approved by the Board in its reasonable discretion.
- ICANN will advance funds to cover defense expenses where the person meeting the requirements set forth above undertakes to repay to ICANN amounts received for expenses for which the requirements for indemnification are ultimately determined not to have been met.

55 **Directors Nominated by the Nominating Committee (and Appointed by the Empowered Community)**

56 **Step 1. Triggering Individual ICANN Board Director Removal by Community Petition**

57 (21 days from the official posting of the original petition)

- ⊙ Begin a petition in an SO or AC that is a Decisional Participant in the Empowered Community.
- ⊙ Any individual can begin a petition as the first step to using a Community Power. A petition must be supported by a written rationale stating the reasons why removal is sought.
- ⊙ For the petition to be accepted, the SO or AC, in accordance with its own mechanisms, must accept the petition.
- ⊙ Prior to completion of the petition phase, the affected Director and the Chair of the Board (or Vice Chair if appropriate) are invited to a dialogue, which also includes the individual(s) bringing the petition and the chair of the SO/AC where the petition is under consideration. The purpose of the dialogue is to gain a full understanding of the issues leading to the petition and consider if there are other ways to address the concerns.
- ⊙ If the SO or AC does not approve the petition within 21 days, the escalation process terminates.
- ⊙ If the SO or AC approves the petition, it can proceed to the next step.

58 **Step 2. Triggering Review by Community Petition, Part Two**

59 (7 days from the end of the previous step)

- ⦿ The SO or AC that approved the petition contacts the other Decisional Participants in the Empowered Community to ask them to support the petition. At least one additional Decisional Participant must support the petition (for a minimum of two) for a Community Forum to be organized to discuss the issue.
- ⦿ If the petition fails to gather the required level of support within seven days, the escalation process terminates.
- ⦿ If a minimum of two Decisional Participants support the petition within seven days, a Community Forum is organized.

60 **Step 3. Holding a Community Forum**

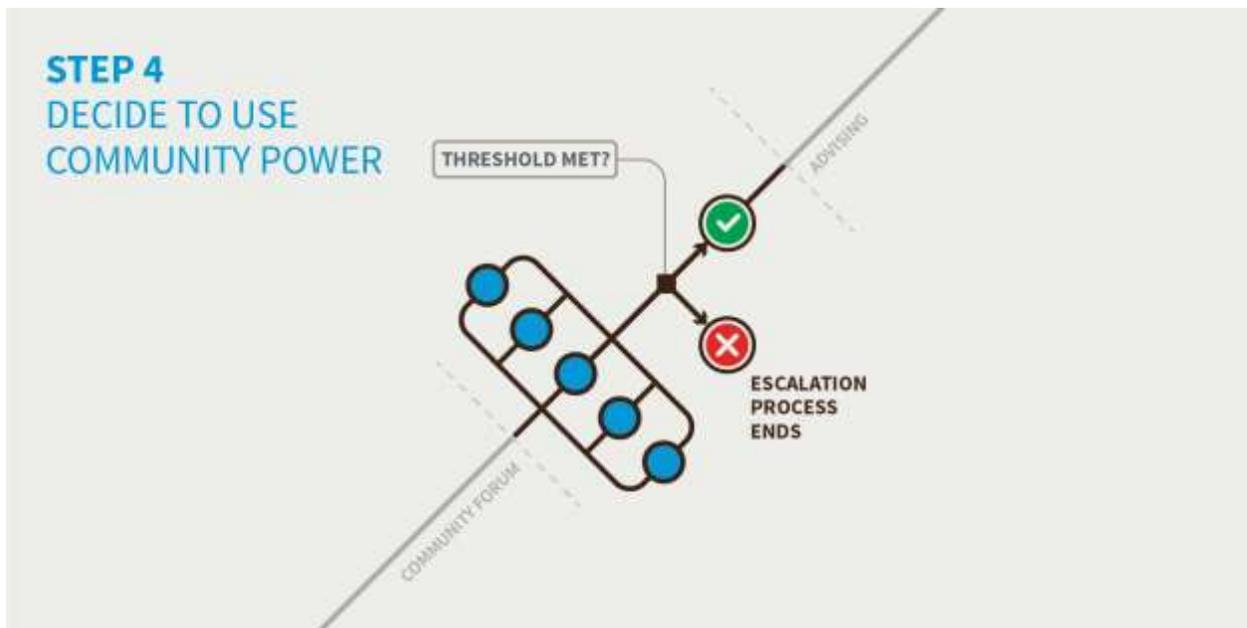

61 (21 days to organize and hold the event from the date of the decision to hold It)

- ⦿ It is expected that this will only involve remote participation methods, such as teleconferences and Adobe Connect-type meetings over a period of one or two days at most. Unless the timing allows participants to meet at a regularly scheduled ICANN meeting, there is no expectation that participants will meet face-to-face.
- ⦿ The Community Forum would be open to all interested participants and ICANN will provide support services. The ICANN Board Director who is the subject of the petition would be invited and expected to attend and be prepared to address the issues raised.
- ⦿ The purpose of the Community Forum is information-sharing (the rationale for the petition, etc.) and airing views on the petition by the community. Accordingly, any SO or AC may circulate in writing their preliminary views on the exercise of this Community Power.
- ⦿ The Community Forum will neither make decisions nor seek consensus. It will not decide whether to advance the petition to the decision stage; although the issue may be resolved before or in the Community Forum. Resolving an issue will be confirmed by the Decisional Participants that supported the petition formally agreeing, in accordance with their own mechanisms, that the escalation process should be halted.
- ⦿ The Community Forum should be managed/moderated in a fair and neutral manner.
- ⦿ Should the relevant SOs or ACs determine a need for further deliberation, a second and third session of the Community Forum could be held.
- ⦿ Staff will collect and publish a public record of the Forum(s), including all written submissions.
- ⦿ If the Empowered Community and the ICANN Board Director can resolve the issue in the Community Forum, the escalation process terminates. Note after this point, this process cannot be used again by the Empowered Community to remove this specific ICANN Board Director during his or her current term.
- ⦿ If the Empowered Community and the ICANN Board Director cannot resolve the issue, the Empowered Community must decide if it wishes to take further action.

62 **Step 4. Decision to Use a Community Power as an Empowered Community**

63 (21 days from the conclusion of the Community Forum)

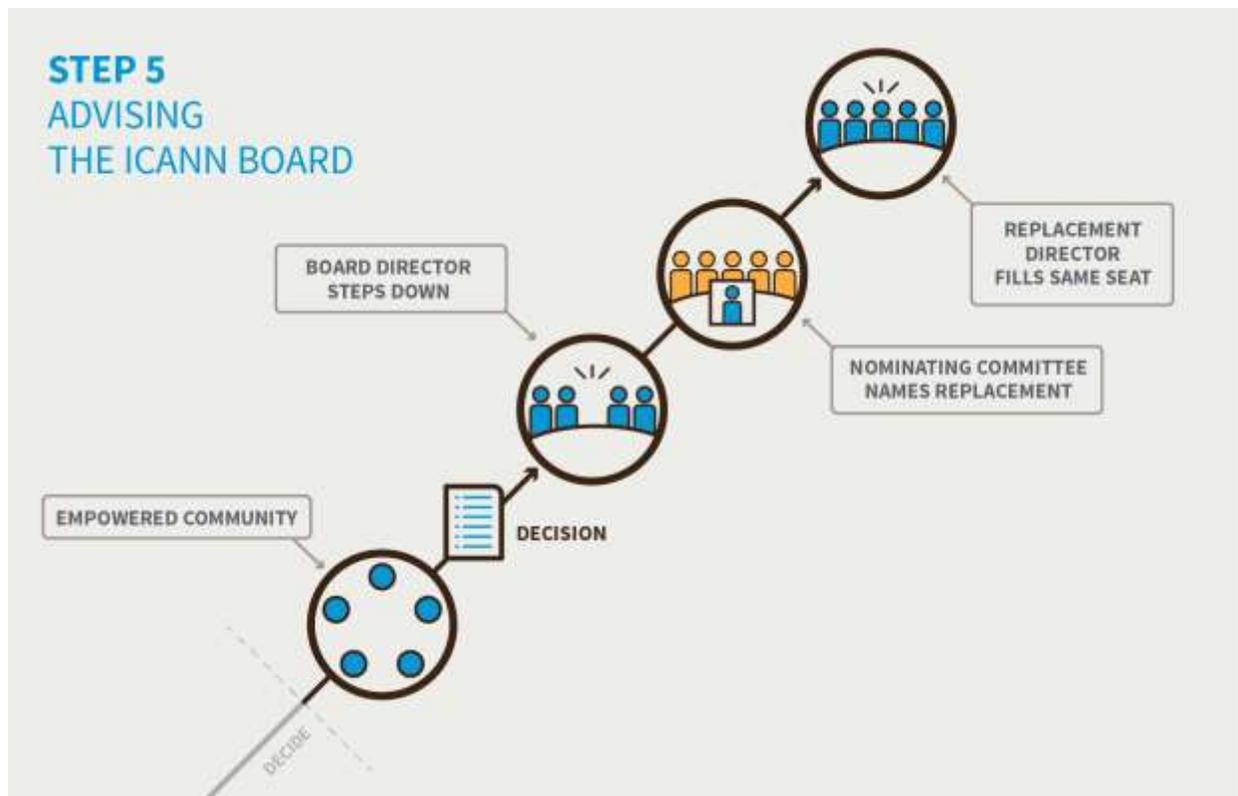

- ⦿ If three or more Decisional Participants support and no more than one objects within the 21-day period, the Empowered Community will use its power. The Empowered Community will also publish an explanation of why it has chosen to do so. The published explanation can reflect the variety of underlying reasons.
- ⦿ If the proposal for the Empowered Community to use a Community Power does not meet the required thresholds during the 21-day period, the escalation process terminates.

---

64 **Step 5. Advising the ICANN Board**

65 (1 day)

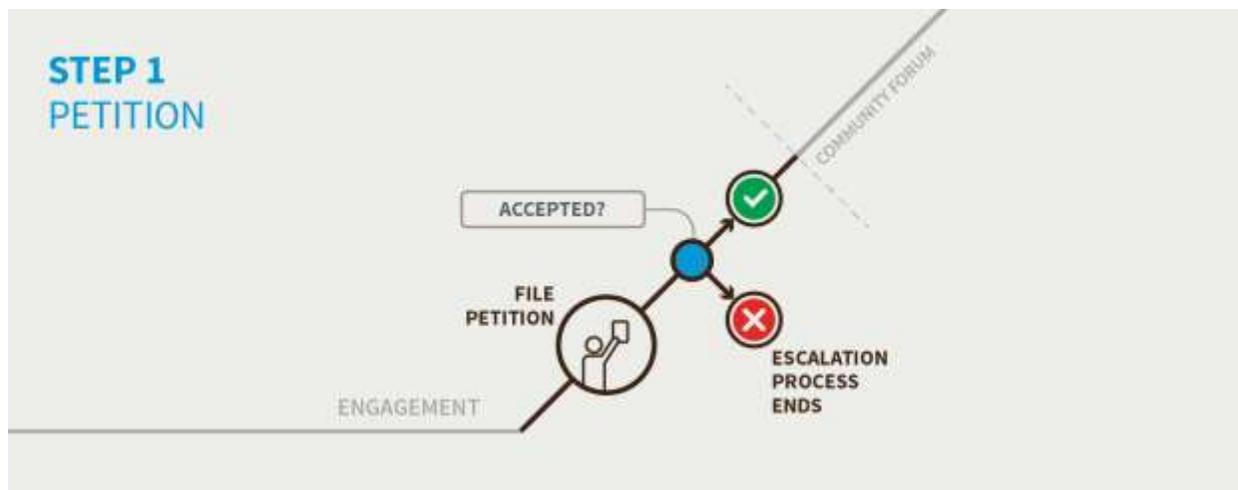

- ⦿ If the Empowered Community has decided to use its power, it will advise the ICANN Board Director of the decision and direct him or her to comply with the decision.
- ⦿ Naming a replacement:
  - The Nominating Committee may instruct the Empowered Community to appoint a new Director. It is expected that the Nominating Committee will amend its procedures so as to have several “reserve” candidates in place.
  - Replacement Directors will fill the same “seat” and their term will come to an end when the term of the original Director was to end.

66 **Directors Nominated by a Supporting Organization or Advisory Committee (and Appointed by the Empowered Community)**

67 **Step 1. Triggering Individual ICANN Board Director Removal by Community Petition**

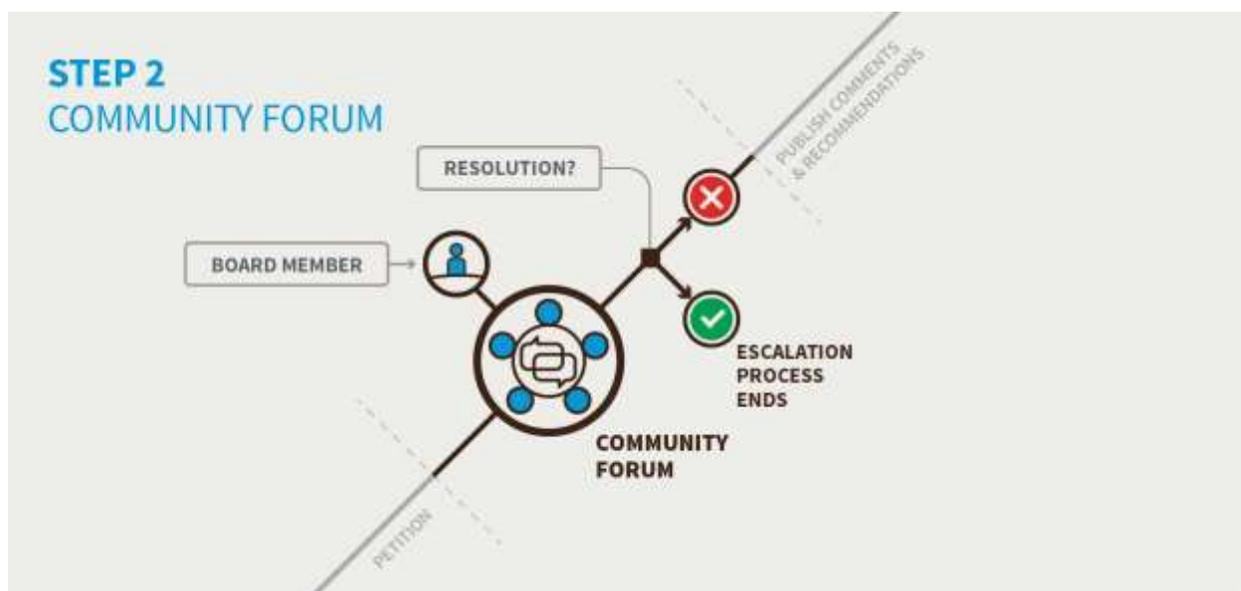

68 (21 days from the official posting of the original petition)

- ⦿ The petition can only be started in the SO or AC that nominated the Director and that is a Decisional Participant in the Empowered Community.
- ⦿ Any individual can begin a petition as the first step to using a Community Power.
- ⦿ For the petition to be accepted, the SO or AC, in accordance with its own mechanisms, must accept the petition.
- ⦿ If the SO or AC does not approve the petition within 21 days, the escalation process terminates.
- ⦿ If the SO or AC approves the petition, it can proceed to the next step.

69 **Step 2. Holding a Community Forum**

70 (21 days to organize and hold the event from the date of the decision to hold it)

- ⦿ It is expected that this will only involve remote participation methods, such as teleconferences and Adobe Connect-type meetings over a period of one or two days at most. Unless the timing allows participants to meet at a regularly scheduled ICANN meeting, there is no expectation that participants will meet face to face. The Community Forum would be open to all interested participants, and ICANN will provide support services. The ICANN Board Director that is the subject of the petition would be invited and expected to attend and be prepared to address the issues raised.
- ⦿ The purpose of the Community Forum is information-sharing (the rationale for the petition, etc.) and airing views on the petition by the community. Accordingly, any SO or AC may circulate in writing its preliminary views on the exercise of this Community Power.
- ⦿ The Community Forum will neither make decisions nor seek consensus. It will not decide whether to advance the petition to the decision stage, although the issue may be resolved before or in the Community Forum. Resolving an issue will be confirmed by the nominating SO/AC that supported the petition formally agreeing, in accordance with its own mechanisms, that the escalation process should be halted.
- ⦿ The Community Forum should be managed/moderated in a fair and neutral manner and cannot involve a representative of the nominating SO or AC.
- ⦿ Should the relevant SO or AC determine a need for further deliberation, a second and third session of the Community Forum could be held.
- ⦿ Staff will collect and publish a public record of the Forum(s), including all written submissions.
- ⦿ If the Empowered Community and the ICANN Board Director can resolve the issue in the Community Forum, the escalation process terminates. Note after this point, this process cannot be used again by the Empowered Community to remove this specific ICANN Board Director during his or her current term.
- ⦿ If the Empowered Community and the ICANN Board Director cannot resolve the issue, the Empowered Community must decide if it wishes to take further action.
  - At the end of the Community Forum, the Community Forum Chair will issue a formal call for comments and recommendations from the community within seven days, and input received will be sent to the relevant SO or AC and posted publicly.

---

71 **Step 3. Supporting Organizations and/or Advisory Committees Publish Their Comments and Recommendations**

72 (7 Days)

73 **Step 4. Decision to Use a Community Power as a Decisional Participant**

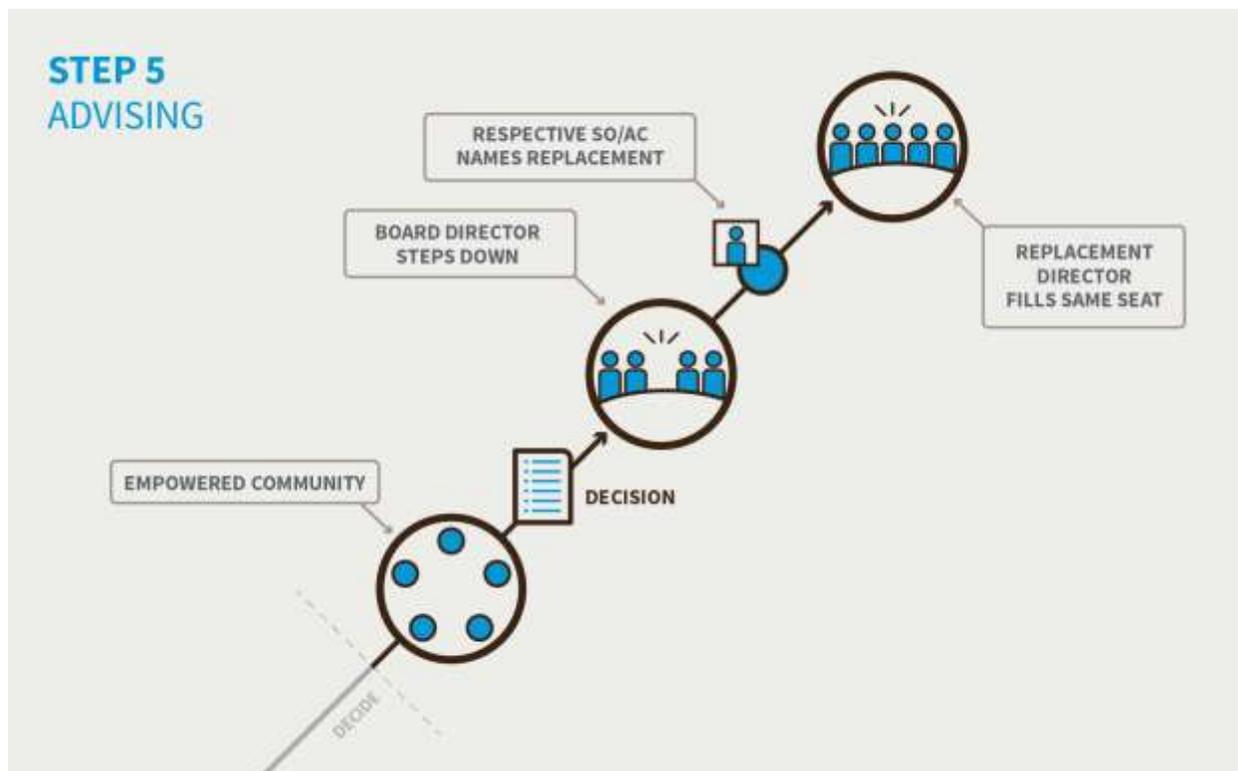

74 (21 days from the conclusion of the period for Supporting Organization and Advisory Committee comments)

- ⦿ If a three-quarters majority within the nominating SO or AC supports using the power within the 21-day period, the Empowered Community will use its power. The SO or AC will also publish an explanation of why it has chosen to do so.
- ⦿ If the nominating SO or AC does not adequately support using the power within the 21-day period, the escalation process terminates.

75 **Step 5. Advising the ICANN Board**

76 (1 Day)

- ⦿ If the Empowered Community has decided to use its power, it will advise the ICANN Board Director of the decision and direct him or her to comply with the decision.
- ⦿ Naming a replacement:
  - The nominating SO or AC is responsible for nominating an individual to fill the vacancy on the ICANN Board through its usual process (as set out in Article VI, Section 12.1 of the Bylaws).
  - Replacement Directors will fill the same “seat” and their term will come to an end when the term of the original Director was to end. Directors appointed in such circumstances will not have their remaining time in the role counted against any term limits, to which they would otherwise be subject.

77 **The Power to Recall the Entire ICANN Board**

78 The CCWG-Accountability believes there may be situations where removing individual Directors from the ICANN Board may not be a sufficient accountability remedy for the community.

- 79 In cases where the community perceives that a set of problems has become impossible to resolve, the community may wish to signal its lack of confidence in the ICANN Board by petitioning for a recall (i.e., the removal) of the entire Board (except the CEO, who is appointed by the Board).
- 80 The power to recall a Board is a critical enforcement mechanism for the Empowered Community because it can be used to support the other Community Powers and provide a final and binding accountability mechanism.
- 81 By exercising this power, the entire ICANN Board (except the CEO and liaisons who, as non-voting members of the Board are not treated as Directors under California law) could be removed by the Empowered Community. However, it is unlikely that the Empowered Community would use this power lightly, and the engagement and escalation processes are designed to encourage agreement between the ICANN Board and the Empowered Community.
- 82 If the ICANN Board were to be recalled, an Interim Board would be put in place. Interim Directors would be named with the exercising of the Community Power to ensure continuity.
- 83 The CCWG-Accountability expects that this power would only be exercised as a last resort after all other attempts at resolution have failed. As a recall of the Board would be extremely disruptive for the entire organization, the CCWG-Accountability has included several safeguards in the proposed escalation process to ensure that this decision reaches the maturity and level of support needed before it can be used
- Note: Special conditions may apply if the “carve out” is invoked for recalling the entire Board. Please consult Annex 2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement for further details.
- 

84 **Step 1. Triggering Recalling the ICANN Board Directors by Community Petition**

85 (21 days from the official posting of the original petition)

- ⊙ Begin a petition in an SO or AC that is a Decisional Participant in the Empowered Community.
  - ⊙ Any individual can begin a petition as the first step in using a Community Power.
  - ⊙ For the petition to be accepted, the SO or AC, in accordance with its own mechanisms, must accept the petition.
  - ⊙ If the SO or AC does not approve the petition within 21 days, the escalation process terminates.
  - ⊙ If the SO or AC does approve the petition within the 21-day period, it proceeds to the next step.
- 

86 **Step 2. Triggering Removal of ICANN Board by Community Petition, Part Two**

87 (7 days from the end of the 21-day period of the previous step)

- ⊙ The SO or AC that approved the petition contacts the other Decisional Participants in the Empowered Community to ask them to support the petition. At least two additional Decisional Participants must support the petition (for a minimum total of three) for a Community Forum to be organized to discuss the issue.

- ⊙ If the petition fails to gather the required level of support within seven days, the escalation process terminates.
- ⊙ If a minimum of three Decisional Participants support the petition within seven days, a Community Forum is organized.

---

88 **Step 3. Holding a Community Forum**

89 (21 days to organize and hold the event from the date of the decision to hold it)

- ⊙ The power to recall the entire Board would require a face-to-face meeting. The three or more SOs or ACs that approved holding the Community Forum would decide if holding the Community Forum can wait until the next regularly scheduled ICANN meeting or if a special meeting is required to bring participants together. In both of these cases, the three or more SO or ACs that have requested the Community Forum will publish the date for holding the event which will not be subject to the 21-day limitation. In this case, the Community Forum would be considered completed at the end of the face-to-face meeting.
- ⊙ The Community Forum would be open to all interested participants, and ICANN will provide support services. The ICANN Board would be invited and expected to attend and be prepared to address the issues raised.
- ⊙ The purpose of the Community Forum is information-sharing (the rationale for the petition, etc.) and airing views on the petition by the community. Accordingly, any SO or AC may circulate in writing its preliminary views on the exercise of this Community Power.
- ⊙ The Community Forum will neither make decisions nor seek consensus. It will not decide whether to advance the petition to the decision stage, although the issue may be resolved before or in the Community Forum. Resolving an issue will be confirmed by the Decisional Participants that supported the petition formally agreeing, in accordance with their own mechanisms, that the escalation process should be halted.
- ⊙ The Community Forum should be managed/moderated in a fair and neutral manner.
- ⊙ Should the relevant SOs or ACs determine a need for further deliberation, a second and third session of the Community Forum could be held.
- ⊙ Staff will collect and publish a public record of the Forum(s), including all written submissions.
- ⊙ If the Empowered Community and the ICANN Board can resolve the issue in the Community Forum, the escalation process terminates.
- ⊙ If the Empowered Community and the ICANN Board cannot resolve the issue, the Empowered Community must decide if it wishes to take further action.

---

90 **Step 4. Decision to Use a Community Power as an Empowered Community**

91 (21 days from the conclusion of the Community Forum)

- ⊙ If four or more Decisional Participants support and no more than one objects within the 21-day period, the Empowered Community will use its power. The Empowered Community will also publish an explanation of why it has chosen to do so. The published

explanation can reflect the variety of underlying reasons. In a situation where the GAC may not participate as a Decisional Participant because the Community Power is proposed to be used to challenge the Board's implementation of GAC consensus advice and the threshold is set at four in support, the power will still be validly exercised if three are in support and no more than one objects.

- ⊙ If the proposal to use a Community Power as the Empowered Community does not meet the required thresholds during the 21-day period, the escalation process terminates.

---

92 **Step 5. Advising the ICANN Board**

93 (1 day)

- ⊙ If the Empowered Community has decided to use its power, it will advise the ICANN Board of the decision and direct it to comply with the decision.

---

94 **Interim Board**

95 The CCWG-Accountability proposes that a Bylaw be added that states that if the Board is removed, the Interim Board will be in place only as long as is required for the selection/election process for the Replacement Board to take place.

96 SOs, ACs and the Nominating Committee will develop replacement processes that ensure the Interim Board will not be in place for more than 120 days.

97 The Interim Board will have the same powers and duties as the Board it replaces. Having a Board in place at all times is critical to the operational continuity of ICANN and is a legal requirement.

98 The ICANN Bylaws will state that, except in circumstances of where urgent decisions are needed to protect the security, stability and resilience of the DNS, the Interim Board will consult with the community through the SO and AC leaderships before making major decisions. Where relevant, the Interim Board will also consult through the ICANN Community Forum before taking any action that would mean a material change in ICANN's strategy, policies or management, including replacement of the serving President and CEO.

99 **The Power to Initiate a Community Independent Review Process or Request for Reconsideration**

100 A community IRP or Request for Reconsideration may be launched as described in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement. One example could be to require ICANN to provide documents as required under the right of inspection requirement.

101 A community IRP may be launched for any of the following reasons:

- To hear and resolve claims that ICANN, through its Board of Directors or staff, has acted (or has failed to act) in violation of its Articles of Incorporation or Bylaws (including any violation of the Articles of Incorporation or Bylaws resulting from action taken in response to advice/input from any AC or SO).

- To hear and resolve claims that PTI, through its Board of Directors or staff, has acted (or has failed to act) in violation of its contract with ICANN and the CWG-Stewardship requirements for issues related to the IANA naming functions.
- To hear and resolve claims that expert panel decisions are inconsistent with the ICANN Bylaws.
- To hear and resolve issues relating to Documentary Information Disclosure Policy (DIDP) decisions by ICANN, which are inconsistent with the ICANN Bylaws.
- To hear and resolve claims initiated by the Empowered Community with respect to matters reserved to the Empowered Community in the Articles of Incorporation or ICANN Bylaws.

102 A Request for Reconsideration can be initiated, to require the Board of Directors to reconsider a recent decision or action/inaction by the ICANN Board or staff.

103 The escalation and enforcement processes for initiating a community IRP or a Request for Reconsideration are detailed in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement.

104 **The Power to Reject ICANN Board Decisions Relating to Reviews of IANA Functions, Including the Triggering of any Post-Transition IANA Separation Process for the IANA Naming Functions**

105 The IANA Functions Review, Special IANA Function Review, and the Separation Cross Community Working Group are all accountability mechanisms for the IANA naming functions that the CWG-Stewardship has requested the CCWG-Accountability constitute in the Fundamental Bylaws.

106 As such, these structures will exist within ICANN and many of their recommendations will require ICANN Board approval before implementation (i.e., change in the Statement of Work for the IANA Functions Operator). The CWG-Stewardship determined it was critical that the recommendations of these various bodies be respected by the ICANN Board, and so further required that the CCWG-Accountability provide mechanisms to ensure that the recommendations from these bodies could be enforced.<sup>2</sup>

107 The escalation and enforcement processes for rejecting an ICANN Board decision relating to IANA Function Review, Special IANA Function Review and Separation Cross Community Working Group recommendations are detailed in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, Enforcement.

108 The right to reject ICANN Board decisions relating to reviews of IANA naming functions, including ICANN Board decisions relating to Special IANA Function Review and Separation Cross Community Working Group recommendations, can be exercised by the Empowered Community an unlimited number of times.

---

<sup>2</sup> Consult the [CWG-Stewardship Final Report](#) for further details.

## 4. Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”

- Budget rejection for PTI significantly updated.
- Caretaker budget expanded.
- Indemnification for removal of an ICANN Board Director greatly expanded.
- Escalation steps amended to match process in Recommendation #2: Empowering the Community through Consensus: Engagement, Escalation, and Enforcement.
- Scope of community IRP modified to match Recommendation #7: Strengthening ICANN’s Independent Review Process.
- “The Power to Approve Changes to Fundamental Bylaws and/or Articles of Incorporation” is now: “The Power to Approve Changes to Fundamental Bylaws and/or Articles of Incorporation and/or Approve ICANN’s Sale or Other Disposition of All or Substantially All of ICANN’s Assets.”
- “The Power to Initiate a Binding IRP (Where a Panel Decision is Enforceable in any Court Recognizing International Arbitration Results)” now includes the possibility for the Empowered Community to file a Request for Reconsideration.

## 5. How does this meet the CWG-Stewardship Requirements?

- “The Power to Reject ICANN’s Budget or Strategy/Operating Plans” directly meets the following CWG-Stewardship requirement:
  - ICANN Budget: Community rights regarding the development and consideration of the ICANN Budget.
- “The Power to Remove Individual ICANN Board Directors” and “The Power to Recall the Entire ICANN Board” directly meets the following CWG-Stewardship requirement:
  - ICANN Board: community rights regarding the ability to appoint/remove Directors of the ICANN Board, and recall the entire Board.
- “The Power to Approve Changes to Fundamental Bylaws” is directly related to the following CWG-Stewardship requirement:
  - Fundamental Bylaws: All of the foregoing mechanisms are to be provided for in the ICANN Bylaws as Fundamental Bylaws.

## 6. How does this address NTIA Criteria?

### 109 Support and enhance the multistakeholder model.

- Decentralizing power within ICANN through an Empowered Community.
- Establishing a public Community Forum to ensure that all voices and perspectives are heard before execution of a Community Power.

- Recommending a process where all are welcome to participate in the consultation processes prior to designing the document that will be put for discussion.
  - Retaining decision-making based on consensus rather than voting.
- 

110 **Maintain the security, stability, and resiliency of the Internet DNS.**

- Elaborating Community Powers associated with a defined escalation process.
  - The multi-step engagement process associated with the escalation process prevents single-step actions and encourages a conciliatory approach.
  - The escalation process includes high thresholds for using accountability actions that are based on consensus of the Empowered Community. This process provides safeguards to prevent a situation where an SO/AC might initiate a petition to reject with the intention of negatively impacting another SO/AC's budget by ensuring that no single SO/AC can use a power singlehandedly and no single AC/SO can singlehandedly block the use of a power.
- 

111 **Meet the needs and expectation of the global customers and partners of the IANA services.**

- Including limited timeframes, transparent processes, and associated thresholds to maintain operational viability.
- 

112 **Maintain the openness of the Internet.**

- Establishing a public Community Forum to ensure that all voices and perspectives are heard before execution of a Community Power.
  - Preserving policies of open participation in ICANN's SOs and ACs.
  - The escalation process includes the convening of a Community Forum where all would be welcome to participate as a potential step. In addition, all are welcome to participate in the consultation process that organized to elaborate these key documents.
- 

113 **NTIA will not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution.**

- To the extent the Government Advisory Committee (GAC) wishes to participate in decision-making by the Empowered Community, which the GAC has the flexibility to determine, it would be one of five Decisional Participants. In addition, the GAC will not participate as a decision-maker in community deliberations involving a challenge to the Board's implementation of GAC consensus advice. This "carve out," combined with the safeguards in Recommendation #11, leads the CCWG-Accountability to believe that this NTIA requirement is met, even when considering the increased threshold from 50 to 60% for the Board to reject GAC consensus advice.

- Enabling all interested stakeholders to join consultations through SOs and ACs or through the Community Forum.
-

# Annex 05 – Recommendation #5: Changing Aspects of ICANN’s Mission, Commitments and Core Values

---

## 1. Summary

01 The CCWG-Accountability is recommending changes to the ICANN Bylaws to assure that the Bylaws reflect the CCWG-Accountability recommendations.

- Note: The language proposed in this recommendation for ICANN Bylaw revisions is conceptual in nature at this stage. External legal counsel and the ICANN legal team will draft final language for these revisions to the Articles of Incorporation and Bylaws.

### 02 **Mission Statement**

03 The CCWG-Accountability recommends the following changes to ICANN’s “Mission Statement,” (Bylaws, Article I, Section 1):

- Clarify that ICANN’s Mission is limited to coordinating the development and implementation of policies that are designed to ensure the stable and secure operation of the Domain Name System and are reasonably necessary to facilitate its openness, interoperability, resilience, and/or stability.
- Clarify that ICANN’s Mission does not include the regulation of services that use the Domain Name System or the regulation of the content these services carry or provide.
- Clarify that ICANN’s powers are “enumerated.” Simply, this means that anything that is not articulated in the Bylaws is outside the scope of ICANN’s authority.
  - Note: This does not mean ICANN’s powers can never evolve. However, it ensures that any changes will be deliberate and supported by the community.

### 04 **Core Values**

05 The CCWG-Accountability recommends the following changes to ICANN’s “Core Values” (Bylaws, Article I, Section 2 and Article II, Section 3):

- Divide ICANN’s existing Core Values provisions into “Commitments” and “Core Values”.
  - Incorporate ICANN’s obligation to “operate for the benefit of the Internet community as a whole, and to carry out its activities in accordance with applicable law and international law and conventions through open and transparent processes that enable competition” into the Bylaws.
  - Note: These obligations are currently contained in ICANN’s Articles of Incorporation.

- Designate certain Core Values as “Commitments.” ICANN’s Commitments will include the values that are fundamental to ICANN’s operation, and are intended to apply consistently and comprehensively.

Commitments will include ICANN’s obligations to:

- Preserve and enhance the stability, reliability, security, global interoperability, resilience, and openness of the DNS and the Internet.
  - Limit its activities to those within ICANN’s Mission that require, or significantly benefit from, global coordination.
  - Employ open, transparent, bottom-up, multistakeholder processes.
  - Apply policies consistently, neutrally, objectively and fairly, without singling any party out for discriminatory treatment.
- Slightly modify the remaining Core Values to:
    - Reflect various provisions in the Affirmation of Commitments, such as efficiency, operational excellence, and fiscal responsibility.
    - Add an obligation to avoid capture.
    - Although previous CCWG-Accountability draft proposals proposed to modify existing Core Value 5 (“Where feasible and appropriate, depending on market mechanisms to promote and sustain a competitive environment”) to drop the phrase “where feasible and appropriate,” the CCWG-Accountability has reconsidered this recommendation. While acknowledging that ICANN is not an antitrust authority, on balance the CCWG-Accountability elected to retain the introductory language to ensure that ICANN continues to have the authority, for example, to refer competition-related questions regarding new registry services to competent authorities under the RSEP program and to establish bottom-up policies for allocating top-level domains (e.g., community preference).

## 06 **Balancing or Reconciliation Test**

- 07 The CCWG-Accountability recommends modification to the “balancing” language in the ICANN Bylaws to clarify the manner in which this balancing or reconciliation takes place. Specifically:

*These Commitments and Core Values are intended to apply in the broadest possible range of circumstances. The Commitments reflect ICANN’s fundamental compact with the global Internet community and are intended to apply consistently and comprehensively to ICANN’s activities. The specific way in which Core Values apply, individually and collectively, to each new situation may depend on many factors that cannot be fully anticipated or enumerated. Situations may arise in which perfect fidelity to all Core Values simultaneously is not possible. In any situation where one Core Value must be reconciled with another, potentially competing Core Value, the balancing must further an important public interest goal within ICANN’s Mission that is identified through the bottom-up, multistakeholder process.*

## 08 **Fundamental Bylaws Provisions**

- 09 The CCWG-Accountability recommends that the revised Mission Statement, Commitments and Core Values be constituted as Fundamental Bylaws. See Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation.

## 2. CCWG-Accountability Recommendations

- 10 Modify ICANN's Fundamental Bylaws to implement the following:

11 **Mission**

- 12 The Mission of the Internet Corporation for Assigned Names and Numbers ("ICANN") is to ensure the stable and secure operation of the Internet's unique identifier systems as described below. Specifically, ICANN:

1. Coordinates the allocation and assignment of names in the root zone of the Domain Name System ("DNS"). In this role, ICANN's scope is to coordinate the development and implementation of policies:
  - For which uniform or coordinated resolution is reasonably necessary to facilitate the openness, interoperability, resilience, security and/or stability of the DNS; and
  - That are developed through a bottom-up, consensus-based multistakeholder process and designed to ensure the stable and secure operation of the Internet's unique names systems.
2. Facilitates coordination of the operation and evolution of the DNS root name server system.
3. Coordinates the allocation and assignment of the top-most level of Internet Protocol ("IP") and Autonomous System ("AS") numbers. In this role, ICANN provides registration services and open access for global number registries as requested by the Internet Engineering Task Force and the Regional Internet Registries and facilitates the development of related global number registry policies by the affected community as agreed with the RIRs.
4. Collaborates with other bodies as appropriate to publish core registries needed for the functioning of the Internet. In this role, with respect to protocol ports and parameters, ICANN's scope is to provide registration services and open access for registries in the public domain requested by Internet protocol development organizations.

- 13 ICANN shall act strictly in accordance with, and only as reasonably appropriate, to achieve its Mission.

- 14 ICANN shall not impose regulations on services that use the Internet's unique identifiers, or the content that such services carry or provide.

- 15 ICANN shall have the ability to negotiate, enter into and enforce agreements, including Public Interest Commitments ("PICs"), with contracted parties in service of its Mission.

- 16 Note to drafters: In crafting proposed Bylaws language to reflect this Mission Statement, the CCWG wishes the drafters to note the following:

1. The prohibition on the regulation of "content" is not intended to prevent ICANN policies from taking into account the use of domain names as identifiers in various natural languages.

2. The issues identified in Specification 1 to the Registry Agreement and Specification 4 to the Registrar Accreditation Agreement (the so-called “Picket Fence”) are intended and understood to be within the scope of ICANN’s Mission. A side-by-side comparison of the formulation of the Picket Fence in the respective agreements is included for reference at the end of this Annex.
3. For the avoidance of uncertainty only, the language of existing registry agreements and registrar accreditation agreements (including PICs and as-yet unsigned new gTLD Registry Agreements for applicants in the new gTLD round that commenced in 2013) should be grandfathered to the extent that such terms and conditions might otherwise be considered to violate ICANN’s Bylaws or exceed the scope of its Mission. This means that the parties who entered/enter into existing contracts intended (and intend) to be bound by those agreements. It means that until the expiration date of any such contract following ICANN’s approval of a new/substitute form of Registry Agreement or Registrar Accreditation Agreement, neither a contracting party nor anyone else should be able to bring a case alleging that any provisions of such agreements on their face are ultra vires. It does not, however, modify any contracting party’s right to challenge the other party’s interpretation of that language. It does not modify the right of any person or entity materially affected (as defined in the Bylaws) by an action or inaction in violation ICANN’s Bylaws to seek redress through an IRP. Nor does it modify the scope of ICANN’s Mission.
4. The CCWG-Accountability anticipates that the drafters may need to modify provisions of the Articles of Incorporation to align with the revised Bylaws.

17 **Section 2. Commitments & Core Values**

18 In carrying out its Mission, ICANN will act in a manner that complies with and reflects ICANN’s Commitments and respects ICANN’s Core Values, both described below.

19 **Commitments**

20 In performing its Mission, ICANN must operate in a manner consistent with its Bylaws for the benefit of the Internet community as a whole, carrying out its activities in conformity with relevant principles of international law and international conventions, and applicable local law and through open and transparent processes that enable competition and open entry in Internet-related markets. Specifically, ICANN’s action must:

1. Preserve and enhance its neutral and judgment-free administration of the DNS, and the operational stability, reliability, security, global interoperability, resilience, and openness of the DNS and the Internet.
2. Maintain the capacity and ability to coordinate the DNS at the overall level and to work for the maintenance of a single, interoperable Internet.
3. Respect the creativity, innovation, and flow of information made possible by the Internet by limiting ICANN’s activities to matters that are within ICANN’s Mission and require or significantly benefit from global coordination.
4. Employ open, transparent and bottom-up, multistakeholder policy development processes, led by the private sector, including business stakeholders, civil society, the technical community, academia, and end users, while duly taking into account the public policy advice of governments and public authorities that (1) seek input from the public, for whose benefit ICANN shall in all events act, (2) promote well-informed decisions based on expert advice, and (3) ensure that those entities most affected can assist in the policy development process.

5. Make decisions by applying documented policies consistently, neutrally, objectively, and fairly, without singling out any particular party for discriminatory treatment.
6. Remain accountable to the Internet Community through mechanisms defined in the Bylaws that enhance ICANN's effectiveness.

21 **Core Values**

22 In performing its Mission, the following Core Values should also guide the decisions and actions of ICANN:

1. To the extent feasible and appropriate, delegating coordination functions to or recognizing the policy role of other responsible entities that reflect the interests of affected parties and the roles of both ICANN's internal bodies and external expert bodies.
2. Seeking and supporting broad, informed participation reflecting the functional, geographic, and cultural diversity of the Internet at all levels of policy development and decision-making to ensure that the bottom-up, multistakeholder policy development process is used to ascertain the global public interest and that those processes are accountable and transparent.
3. Where feasible and appropriate, depending on market mechanisms to promote and sustain a healthy competitive environment in the DNS market.
4. Introducing and promoting competition in the registration of domain names where practicable and beneficial in the public interest as identified through the bottom-up, multistakeholder policy development process.
  - a. Operating with efficiency and excellence, in a fiscally responsible and accountable manner and at a speed that is responsive to the needs of the global Internet community.
5. While remaining rooted in the private sector, including business stakeholders, civil society, the technical community, academia, and end users, recognizing that governments and public authorities are responsible for public policy and duly taking into account the public policy advice of governments and public authorities.
6. Striving to achieve a reasonable balance between the interests of different stakeholders.

23 These Commitments and Core Values are intended to apply in the broadest possible range of circumstances. The Commitments reflect ICANN's fundamental compact with the global Internet community and are intended to apply consistently and comprehensively to ICANN's activities.

24 The specific way in which Core Values apply, individually and collectively, to each new situation may depend on many factors that cannot be fully anticipated or enumerated. Situations may arise in which perfect fidelity to all Core Values simultaneously is not possible.

25 In any situation where one Core Value must be reconciled with another, potentially competing Core Value, the balancing must further an important public interest goal within ICANN's Mission that is identified through the bottom-up, multistakeholder process.

26 Note: Specific recommendations on how to implement these modifications can be found at the end of the next section.

### 3. Detailed Explanation of Recommendations

#### 27 **Background**

28 To whom is ICANN accountable? For what is it accountable? Those questions were a necessary starting point for the work of the CCWG-Accountability, and the answers inform all of our recommendations. The Bylaws changes recommended here are designed to answer these questions. Most important, ICANN has a limited Mission, and it must be accountable for actions that exceed the scope of its Mission. In undertaking its Mission, ICANN is also obligated to adhere to policy supported by community consensus and an agreed-upon standard of behavior, articulated through its Commitments and Core Values. Taken together, the proposed Mission, Commitments, and Core Values articulate the standard against which ICANN's behavior can be measured and to which it can be held accountable. Because these Bylaws provisions are fundamental to ICANN's accountability, we propose that they be adopted as Fundamental Bylaws that can only be changed with the approval of the Empowered Community subject to procedural and substantive safeguards.

#### 29 **Mission and Core Values**

30 ICANN's current Bylaws contain:

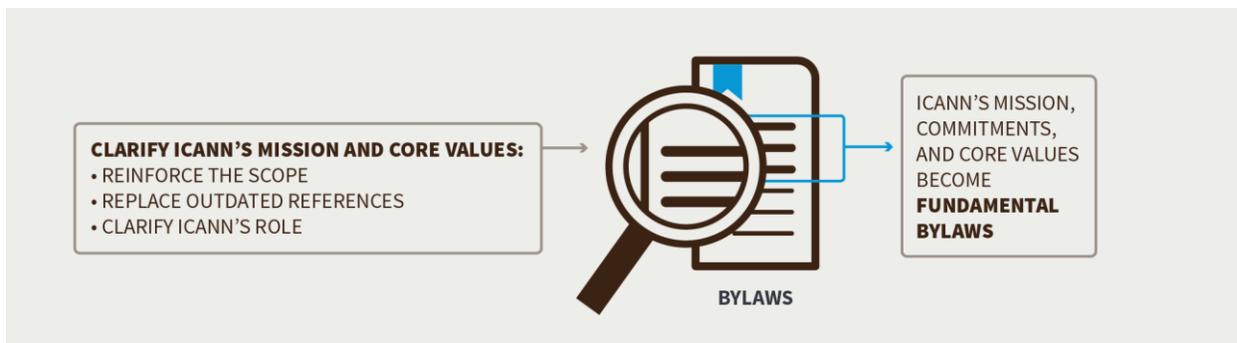

- Mission statement.
- Statement of Core Values.
- Provision prohibiting policies and practices that are inequitable or single out any party for disparate treatment.

31 These three sections are at the heart of ICANN's accountability because they obligate ICANN to act only within the scope of its limited Mission, and to conduct its activities in accordance with certain fundamental principles. As such, these three sections also provide a standard against which ICANN's conduct can be measured and held accountable through existing and enhanced mechanisms such as the Request for Reconsideration process and the Independent Review Process.<sup>1</sup>

32 Based on community input and CCWG-Accountability discussions, it was concluded that these ICANN Bylaws provisions, which were originally adopted in 2003, should be strengthened and enhanced to provide greater assurances that ICANN is accountable to its stakeholders and the global Internet community.

---

<sup>1</sup> The current relevant language on this in the ICANN Bylaws was adopted in 2003.

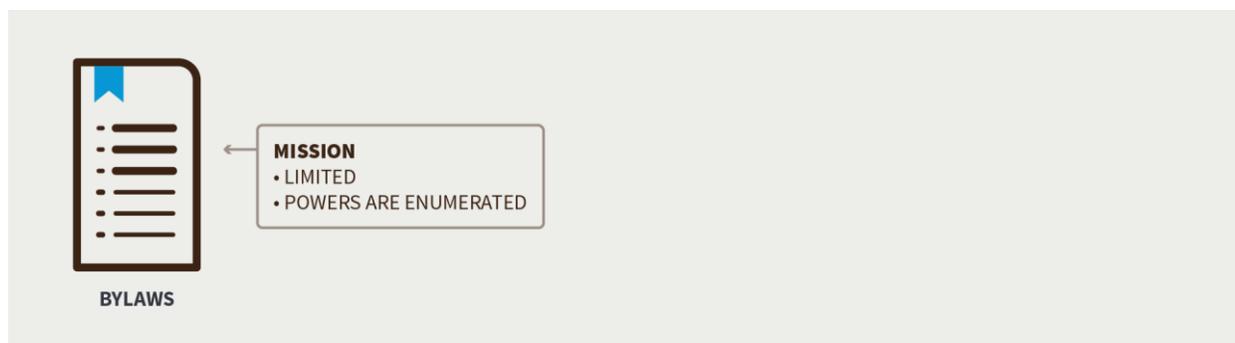

33 In particular, the CCWG-Accountability found that:

- ICANN's Mission statement needed clarification with respect to the scope of ICANN's policy authority.
- The language in the Bylaws describing how ICANN should apply its Core Values was weak and could permit ICANN decision-makers to exercise excessive discretion.
- The current Bylaws did not reflect key elements of the Affirmation of Commitments.
- The Board should have only a limited ability to change these key accountability provisions of ICANN's Bylaws.

34 The CCWG-Accountability recommendations to change aspects of ICANN's Mission, Commitments and Core Values are to address the deficiencies described above. The CCWG-Accountability discussed how to balance the needs of limiting ICANN's Mission and the necessary ability of the organization to adjust to a changing environment.

### 35 Mission Statement

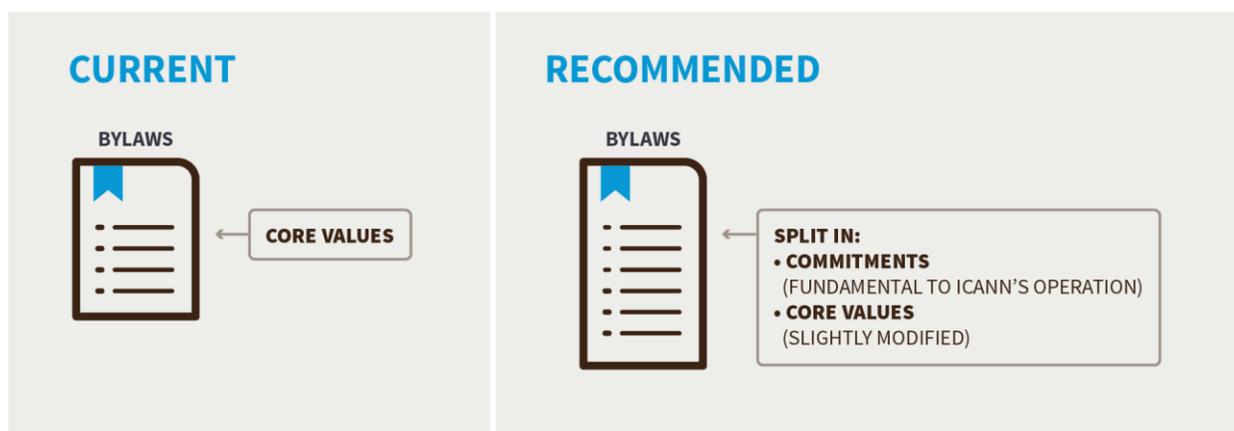

36 The CCWG-Accountability recommends the following changes to ICANN's "Mission Statement," (Bylaws, Article I, Section 1):

- Clarify that ICANN's Mission with respect to naming is limited to coordinating the development and implementation of policies that are designed to ensure the stable and secure operation of the Domain Name System and are reasonably necessary to facilitate its openness, interoperability, resilience, and/or stability.

- Clarify ICANN’s Mission with respect to numbering, protocol ports and parameters, and the DNS root name server system.
- Clarify that ICANN’s Mission does not include the regulation of services that use the Domain Name System or the regulation of the content these services carry or provide.
- Clarify that ICANN’s powers are “enumerated.” Simply, this means that anything that is not articulated in the Bylaws is outside the scope of ICANN’s authority.
  - Note: This does not mean ICANN’s powers can never evolve, however it ensures that any changes will be deliberate and supported by the community.

## 37 Core Values

38 The CCWG-Accountability recommends the following changes to ICANN’s Core Values (Bylaws, Article I, Section 2 and Article II, Section 3):

- Divide ICANN’s existing Core Values provisions into Commitments and Core Values.
  - Incorporate ICANN’s obligation to “operate for the benefit of the Internet community as a whole, and to carry out its activities in accordance with applicable law and international law and conventions through open and transparent processes that enable competition” into the Bylaws.
  - Note: These obligations are currently contained in ICANN’s Articles of Incorporation.
- Designate certain Core Values as Commitments. ICANN’s Commitments will include the values that are fundamental to ICANN’s operation, and are intended to apply consistently and comprehensively.

Commitments will include ICANN’s obligations to:

- Preserve and enhance the stability, reliability, security, global interoperability, resilience, and openness of the DNS and the Internet.
- Limit its activities to those within ICANN’s Mission that require or significantly benefit from global coordination.
- Employ open, transparent, bottom-up, multistakeholder processes.

- Apply policies consistently, neutrally, objectively and fairly, without singling any party out for discriminatory treatment.
- Slightly modify the remaining Core Values to:
  - Reflect various provisions in the Affirmation of Commitments, such as efficiency, operational excellence, and fiscal responsibility.
  - Add an obligation to avoid capture.

### 39 **Balancing or Reconciliation Test**

40 The CCWG-Accountability recommends modification to the “balancing” language in the ICANN Bylaws to clarify the manner in which this balancing or reconciliation takes place. Specifically:

*These Commitments and Core Values are intended to apply in the broadest possible range of circumstances. The Commitments reflect ICANN’s fundamental compact with the global Internet community and are intended to apply consistently and comprehensively to ICANN’s activities. The specific way in which Core Values apply, individually and collectively, to each new situation may depend on many factors that cannot be fully anticipated or enumerated. Situations may arise in which perfect fidelity to all Core Values simultaneously is not possible. In any situation where one Core Value must be reconciled with another, potentially competing Core Value, the balancing must further an important public interest goal within ICANN’s Mission that is identified through the bottom-up, multistakeholder process.*

### 41 **Fundamental Bylaws Provisions**

42 The CCWG-Accountability recommends that the revised Mission Statement, Commitments and Core Values be constituted as Fundamental Bylaws. See Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation.

### 43 **Proposed Mission, Commitments and Core Values** **Mission**

44 The Mission of the Internet Corporation for Assigned Names and Numbers (ICANN) is to ensure the stable and secure operation of the Internet’s unique identifier systems as described below. Specifically, ICANN:

1. Coordinates the allocation and assignment of names in the root zone of the Domain Name System (DNS). In this role, ICANN’s scope is to coordinate the development and implementation of policies:
  - a. For which uniform or coordinated resolution is reasonably necessary to facilitate the openness, interoperability, resilience, security and/or stability of the DNS; and
  - b. That are developed through a bottom-up, consensus-based multistakeholder process and designed to ensure the stable and secure operation of the Internet’s unique names systems.
2. Facilitates coordination of the operation and evolution of the DNS root name server system.
3. Coordinates the allocation and assignment of the top-most level of Internet Protocol (IP) and Autonomous System (AS) numbers. In this role, ICANN provides registration services

and open access for global number registries as requested by the Internet Engineering Task Force and the Regional Internet Registries and facilitates the development of related global number registry policies by the affected community as agreed with the RIRs.

4. Collaborates with other bodies as appropriate to publish core registries needed for the functioning of the Internet. In this role, with respect to protocol ports and parameters, ICANN's scope is to provide registration services and open access for registries in the public domain requested by Internet protocol development organizations.

45 ICANN shall act strictly in accordance with, and only as reasonably appropriate to achieve its Mission.

46 ICANN shall not impose regulations on services that use the Internet's unique identifiers, or the content that such services carry or provide.

47 ICANN shall have the ability to negotiate, enter into and enforce agreements, including Public Interest Commitments (PICs), with contracted parties in service of its Mission.

48 Note to drafters: In crafting proposed Bylaws language to reflect this Mission Statement, the CCWG wishes the drafters to note the following:

1. The prohibition on the regulation of "content" is not intended to prevent ICANN policies from taking into account the use of domain names as identifiers in various natural languages.
2. The issues identified in Specification 1 to the Registry Agreement and Specification 4 to the Registrar Accreditation Agreement (the so-called "Picket Fence") are intended and understood to be within the scope of ICANN's Mission. A side-by-side comparison of the formulation of the Picket Fence in the respective agreements is included for reference at the end of this Annex.
3. For the avoidance of uncertainty only, the language of existing registry agreements and registrar accreditation agreements (including PICs and as-yet unsigned new gTLD Registry Agreements for applicants in the new gTLD round that commenced in 2013) should be grandfathered to the extent that such terms and conditions might otherwise be considered to violate ICANN's Bylaws or exceed the scope of its Mission. This means that the parties who entered/enter into existing contracts intended (and intend) to be bound by those agreements. It means that until the expiration date of any such contract following ICANN's approval of a new/substitute form of Registry Agreement or Registrar Accreditation Agreement, neither a contracting party nor anyone else should be able to bring a case alleging that any provisions of such agreements on their face are ultra vires. It does not, however, modify any contracting party's right to challenge the other party's interpretation of that language. It does not modify the right of any person or entity materially affected (as defined in the Bylaws) by an action or inaction in violation ICANN's Bylaws to seek redress through an IRP. Nor does it modify the scope of ICANN's Mission.
4. The CCWG-Accountability anticipates that the drafters may need to modify provisions of the Articles of Incorporation to align with the revised Bylaws.

## 49 **Section 2. Commitments & Core Values**

50 In carrying out its Mission, ICANN will act in a manner that complies with and reflects ICANN's Commitments and respects ICANN's Core Values, both described below.

## 51 **Commitments**

1. In performing its Mission, ICANN must operate in a manner consistent with its Bylaws for the benefit of the Internet community as a whole, carrying out its activities in conformity with relevant principles of international law and international conventions, and applicable local law and through open and transparent processes that enable competition and open entry in Internet-related markets. Specifically, ICANN's action must:
2. Preserve and enhance its neutral and judgment free administration of the DNS, and the operational stability, reliability, security, global interoperability, resilience, and openness of the DNS and the Internet;
3. Maintain the capacity and ability to coordinate the DNS at the overall level and to work for the maintenance of a single, interoperable Internet;
4. Respect the creativity, innovation, and flow of information made possible by the Internet by limiting ICANN's activities to matters that are within ICANN's Mission and require or significantly benefit from global coordination;
5. Employ open, transparent and bottom-up, multistakeholder policy development processes, led by the private sector, including business stakeholders, civil society, the technical community, academia, and end users, while duly taking into account the public policy advice of governments and public authorities that (i) seek input from the public, for whose benefit ICANN shall in all events act, (ii) promote well-informed decisions based on expert advice, and (iii) ensure that those entities most affected can assist in the policy development process;
6. Make decisions by applying documented policies consistently, neutrally, objectively, and fairly, without singling out any particular party for discriminatory treatment;
7. Remain accountable to the Internet Community through mechanisms defined in the Bylaws that enhance ICANN's effectiveness.

52 **Core Values**

53 In performing its Mission, the following Core Values should also guide the decisions and actions of ICANN:

1. To the extent feasible and appropriate, delegating coordination functions to or recognizing the policy role of other responsible entities that reflect the interests of affected parties and the roles of both ICANN's internal bodies and external expert bodies.
2. Seeking and supporting broad, informed participation reflecting the functional, geographic, and cultural diversity of the Internet at all levels of policy development and decision-making to ensure that the bottom-up, multistakeholder policy development process is used to ascertain the global public interest and that those processes are accountable and transparent.
3. Where feasible and appropriate, depending on market mechanisms to promote and sustain a healthy competitive environment in the DNS market.
4. Introducing and promoting competition in the registration of domain names where practicable and beneficial in the public interest as identified through the bottom-up, multistakeholder policy development process.
  - a. Operating with efficiency and excellence, in a fiscally responsible and accountable manner and at a speed that is responsive to the needs of the global Internet community.
5. While remaining rooted in the private sector, including business stakeholders, civil society, the technical community, academia, and end users, recognizing that

governments and public authorities are responsible for public policy and duly taking into account the public policy advice of governments and public authorities.

6. Striving to achieve a reasonable balance between the interests of different stakeholders.

- 54 These Commitments and Core Values are intended to apply in the broadest possible range of circumstances. The Commitments reflect ICANN’s fundamental compact with the global Internet community and are intended to apply consistently and comprehensively to ICANN’s activities.
- 55 The specific way in which Core Values apply, individually and collectively, to each new situation may depend on many factors that cannot be fully anticipated or enumerated. Situations may arise in which perfect fidelity to all Core Values simultaneously is not possible.
- 56 In any situation where one Core Value must be reconciled with another, potentially competing Core Value, the balancing must further an important public interest goal within ICANN’s Mission that is identified through the bottom-up, multistakeholder process.

## 4. Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”

### 57 Comparison of Mission Statement in Current Bylaws, 3<sup>rd</sup> Draft Proposal and Final Proposal

58 Existing Bylaws	59 3 <sup>rd</sup> Draft Proposal 60 (Text in RED shows changes from Existing Bylaws)	61 Final Proposal 62 (Text in RED shows changes from 3 <sup>rd</sup> Draft Proposal)
63 The mission of The Internet Corporation for Assigned Names and Numbers ("ICANN") is to coordinate, at the overall level, the global Internet's systems of unique identifiers, and in particular to ensure the stable and secure operation of the Internet's unique identifier systems. In particular, ICANN:	64 The Mission of The Internet Corporation for Assigned Names and Numbers ("ICANN") is to <del>coordinate, at the overall level, the global Internet's systems of unique identifiers and in particular</del> to ensure the stable and secure operation of the Internet's unique identifier systems <del>as described below. # Annex 06 – Recommendation #6: Reaffirming ICANN's Commitment to Respect Internationally Recognized Human Rights as it Carries Out its Mission

---

## 1. Summary

- 01 The subject of including a commitment to respect Human Rights in the ICANN Bylaws has been extensively discussed by the CCWG-Accountability.
- 02 The CCWG-Accountability sought legal advice on whether, upon the termination of the IANA Functions Contract between ICANN and the U.S. National Telecommunications and Information Administration (NTIA), ICANN's specific Human Rights obligations could be called into question. It was found that, upon termination of the contract, there would be no significant impact on ICANN's Human Rights obligations. However, the CCWG-Accountability reasoned that a commitment to respect Human Rights should be included in ICANN's Bylaws in order to comply with the NTIA criteria to maintain the openness of the Internet.
- 03 This proposed draft Bylaw on Human Rights would reaffirm ICANN's existing obligations within its Core Values, and would clarify ICANN's commitment to respect Human Rights.
- 04 Amendments to the proposed draft Bylaw text since the Second Draft Proposal aimed to prevent Mission expansion or "Mission creep," and under the proposed draft Bylaw, ICANN commits to respect internationally recognized Human Rights "within its Core Values."
- 05 The proposed draft Bylaw does not impose any enforcement duty on ICANN, or any obligation on ICANN to take action in furtherance of the Bylaw.
- 06 The proposed draft Bylaw also clarifies that no IRP challenges can be made on the grounds of this Bylaw until a Framework of Interpretation on Human Rights (FOI-HR) is developed and approved as part of Work Stream 2 activities. It further clarifies that acceptance of the FOI-HR will require the same process as for Work Stream 1 recommendations (as agreed for all Work Stream 2 recommendations).
- 07 Additionally, the CCWG-Accountability has identified several work areas that need to be undertaken as part of Work Stream 2 in order to fully operationalize ICANN's commitment to respect Human Rights.

## 2. CCWG-Accountability Recommendations

- Include a Bylaw with the following intent in Work Stream 1 recommendations:

“Within its Core Values, ICANN will commit to respect internationally recognized Human Rights as required by applicable law. This provision does not create any additional obligation for ICANN to respond to or consider any complaint, request, or demand seeking the enforcement of Human Rights by ICANN. This Bylaw provision will not enter into force until (1) a Framework of Interpretation for Human Rights (FOI-HR) is developed by the CCWG-Accountability as a consensus recommendation in Work Stream 2 (including Chartering Organizations’ approval) and (2) the FOI-HR is approved by the ICANN Board using the same process and criteria it has committed to use to consider the Work Stream 1 recommendations.”

- Note: This proposed draft Bylaw will be reviewed by both CCWG-Accountability’s lawyers and ICANN’s legal department and then submitted to the CCWG-Accountability for approval before its submission to the Board for approval.
- Include the following in Work Stream 2 activities:
  - Develop an FOI-HR for the Human Rights Bylaw.
  - Consider which specific Human Rights conventions or other instruments, if any, should be used by ICANN in interpreting and implementing the Human Rights Bylaw.
  - Consider the policies and frameworks, if any, that ICANN needs to develop or enhance in order to fulfill its commitment to respect Human Rights.
  - Consistent with ICANN’s existing processes and protocols, consider how these new frameworks should be discussed and drafted to ensure broad multistakeholder involvement in the process.
  - Consider what effect, if any, this Bylaw will have on ICANN’s consideration of advice given by the Governmental Advisory Committee (GAC).
  - Consider how, if at all, this Bylaw will affect how ICANN’s operations are carried out.
  - Consider how the interpretation and implementation of this Bylaw will interact with existing and future ICANN policies and procedures.

### 3. Detailed Explanation of Recommendations

- 08 As part of the discussion of the inclusion of a draft Bylaw on Human Rights, the CCWG-Accountability requested analysis from its legal counsel about whether, upon the termination of the IANA Functions Contract between ICANN and the NTIA, ICANN's specific Human Rights obligations could be called into question. The key aspects are as follows:
- Only nation states have direct Human Rights obligations under international law. However, private sector organizations are required to comply with all applicable laws, including those related to Human Rights.
  - Upon termination of the Contract, there would be no significant impact on ICANN's Human Rights obligations.<sup>1</sup>
- 09 However, the CCWG-Accountability reasoned that a commitment to respect Human Rights **should be included** in ICANN's Bylaws in order to comply with the NTIA criteria to maintain the openness of the Internet. These criteria include free expression and the free flow of information.
- 10 Further, the CCWG-Accountability emphasized that adding a commitment to respect Human Rights to the ICANN Bylaws should not lead to an expansion of ICANN's Mission or scope. While there was general agreement that ICANN should commit to respect Human Rights within the limited scope of its Core Values, any type of external enforcement or regulatory activity would be wholly out of scope.
- 11 The CCWG-Accountability also disagreed with any attempt to single out any specific Human Right (such as "freedom of expression") in the proposed draft Bylaw text on the basis that Human Rights cannot be selectively mentioned, emphasized, or applied since they are universal, indivisible, interdependent, and interrelated.
- 12 The CCWG-Accountability considered comments received during the third public comment period, which were overall in favor of including Human Rights language. There remained a few not in favor of the inclusion, including the ICANN Board.
- 13 The CCWG-Accountability engaged with the ICANN Board to specifically address its concerns through discussion and debate in three plenary calls. Additionally, ICANN's legal team and CCWG-Accountability's legal advisors discussed the concerns raised by ICANN legal regarding the possibility of having a significant number of IRP challenges initiated on the grounds of Human Rights claims and the problems this could create without having a Framework of Interpretation in place to properly implement the proposed Bylaw provision.
- 14 The CCWG-Accountability developed compromise text based on a proposal by its legal advisors, which it believed addressed these concerns. The ICANN Board maintained that this compromise text did not address its concerns, but did not provide any specific examples of its concerns regarding the alleged unintended consequences.
- 15 The Board responded with proposed changes to the draft Bylaw text, which reflected a compromise position and included a commitment to respect Human Rights within ICANN's Core Values, which was accepted by the CCWG-Accountability.

---

<sup>1</sup> See the 29 July 2015 memorandum here:

[https://community.icann.org/download/attachments/53783718/Memo\\_%20%20%20ICANN%20%20Human%20Rights%20Obligations.pdf?version=1&modificationDate=1438504619000&api=v2](https://community.icann.org/download/attachments/53783718/Memo_%20%20%20ICANN%20%20Human%20Rights%20Obligations.pdf?version=1&modificationDate=1438504619000&api=v2). All other legal documents provided are available at <https://community.icann.org/x/OiQnAw>.

- 16 This proposed draft Bylaw on Human Rights reaffirms ICANN's existing obligations within its Core Values and clarifies ICANN's commitment to respect Human Rights.
- 17 Amendments to the proposed draft Bylaw text since the Second Draft Proposal aimed to prevent Mission expansion or "Mission creep", and under the proposed draft Bylaw, ICANN commits to respect internationally recognized Human Rights "within its Core Values."
- 18 The proposed draft Bylaw does not impose any enforcement duty on ICANN, or any obligation on ICANN to take action in furtherance of the Bylaw.
- 19 The proposed draft Bylaw also clarifies that no IRP challenges can be made on the grounds of this Bylaw until an FOI-HR is developed and approved as part of Work Stream 2 activities. It further clarifies that acceptance of the FOI-HR will require the same process as for Work Stream 1 recommendations (as agreed for all Work Stream 2 recommendations).
- 20 Additionally, the CCWG-Accountability has identified several work areas that need to be undertaken as part of Work Stream 2 in order to fully operationalize ICANN's commitment to respect Human Rights, including the development of an FOI-HR.

### 21 **Draft Bylaw on Human Rights**

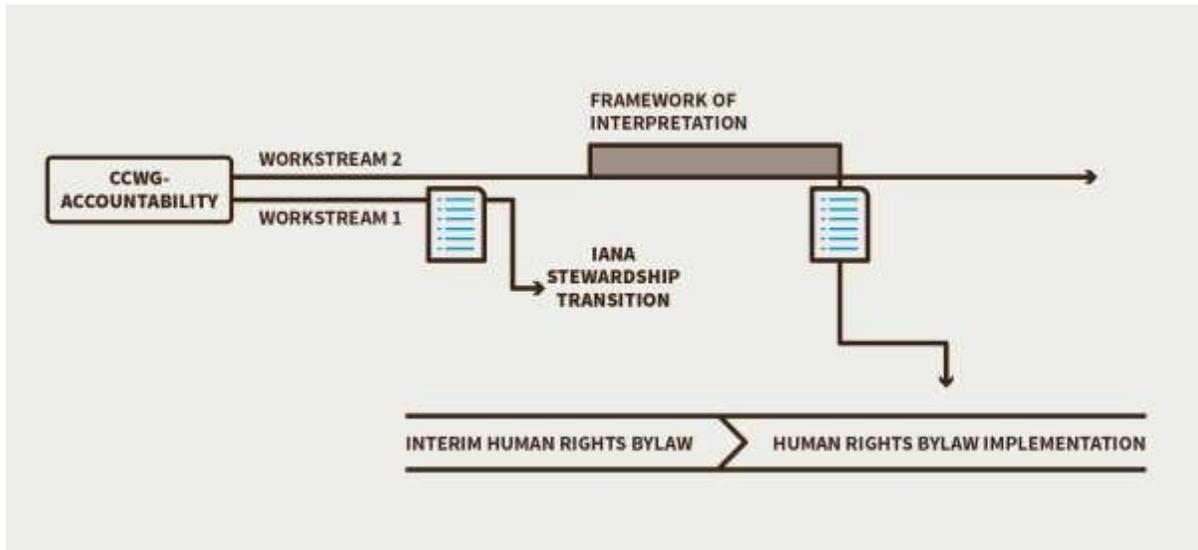

- 22 Responding to public comments received on the Third Draft Proposal, the CCWG-Accountability presents the following proposed draft Bylaw for consideration:

- 23 "Within its Core Values, ICANN will commit to respect internationally recognized Human Rights as required by applicable law. This provision does not create any additional obligation for ICANN to respond to or consider any complaint, request, or demand seeking the enforcement of Human Rights by ICANN. This Bylaw provision will not enter into force until (1) a Framework of Interpretation for Human Rights (FOI-HR) is developed by the CCWG-Accountability as a consensus recommendation in Work Stream 2 (including Chartering Organizations' approval) and (2) the FOI-HR is approved by the ICANN Board using the same process and criteria it has committed to use to consider the Work Stream 1 recommendations."

### 24 **Operationalizing the Commitment to Respect Human Rights**

- 25 To ensure that these Work Stream 2 activities are implemented, the CCWG-Accountability requires that a Bylaw be adopted as part of Work Stream 1. The Bylaw proposed for adoption as part of Work Stream 1 will not enter into force until the FOI-HR is approved.
- 26 The CCWG-Accountability has identified several activities that it recommends be undertaken as part of Work Stream 2 that will fully operationalize ICANN's commitment to respect Human Rights. Work Stream 2 focuses on accountability topics for which a timeline for developing solutions and full implementation may extend beyond the IANA Stewardship Transition.

27

28 The Human Rights-related activities to be addressed in Work Stream 2 are:

- Developing an FOI-HR for the Bylaw.
- Considering which specific Human Rights conventions or other instruments should be used by ICANN in interpreting and implementing the Bylaw.
- Considering the policies and frameworks, if any, that ICANN needs to develop or enhance in order to fulfill its commitment to respect Human Rights.
- Considering how these new frameworks should be discussed and drafted to ensure broad multistakeholder involvement in the process, consistent with ICANN's existing processes and protocols.
- Considering what effect, if any, this Bylaw will have on ICANN's consideration of advice given by the GAC.
- Considering how, if at all, this Bylaw will affect how ICANN's operations are carried out once an FOI-HR is developed by the CCWG-Accountability as a consensus recommendation in Work Stream 2 (including Chartering Organizations' approval) and the FOI-HR is approved by the ICANN Board using the same process and criteria it has committed to use to consider the Work Stream 1 recommendations.
- Considering how the interpretation and implementation of this Bylaw will interact with existing and future ICANN policies and procedures.

## 4. Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”

- The CCWG-Accountability considered comments received during the third public comment period, which were overall in favor of including Human Rights language with a few exceptions which included the ICANN Board.
- The CCWG-Accountability engaged with the ICANN Board to specifically address its concerns through discussion and debate in three plenary calls. Additionally, ICANN's legal team and CCWG-Accountability's legal advisors discussed the concerns raised by ICANN legal regarding the possibility of having a significant number of IRP challenges initiated on the grounds of Human Rights claims and the problems this could create without having a Framework of Interpretation in place to properly implement the proposed Bylaw provision.
- The CCWG-Accountability developed compromise text based on a proposal by its legal advisors, which it believed addressed these concerns. The ICANN Board maintained that this compromise text did not address its concerns, but did not provide any specific examples of its concerns regarding the alleged unintended consequences.
- The ICANN Board responded with proposed changes to the draft Bylaw text, which reflected a compromise position and included a commitment to respect Human Rights within ICANN's Core Values, which were accepted by the CCWG-Accountability.

## 5. Stress Tests Related to this Recommendation

# Annex 07 – Recommendation #7: Strengthening ICANN’s Independent Review Process

---

## 1. Summary

- 01 The purpose of the Independent Review Process (IRP) is to ensure that ICANN does not exceed the scope of its limited technical Mission and complies with its Articles of Incorporation and Bylaws.
- 02 A consultation process undertaken by ICANN produced numerous comments calling for overhaul and reform of ICANN’s existing IRP. Commenters called for ICANN to be held to a substantive standard of behavior rather than just an evaluation of whether or not its action was taken in good faith.
- 03 The CCWG-Accountability therefore proposes several enhancements to the IRP to ensure that the process is:
  - Transparent, efficient and accessible (both financially and from a standing perspective).
  - Designed to produce consistent and coherent results that will serve as a guide for future actions.
- 04 The CCWG-Accountability also proposes that the IRP:
  - Hear and resolve claims that ICANN, through its Board of Directors or staff, has acted (or has failed to act) in violation of its Articles of Incorporation or Bylaws – including any violation of the Bylaws resulting from action taken in response to advice/input from any Supporting Organization (SO) or Advisory Committee (AC).
  - Hear and resolve claims that Post-Transition IANA (PTI), through its Board of Directors or staff, has acted (or has failed to act) in violation of its contract with ICANN and the CWG-Stewardship requirements for issues related to the IANA naming functions.
  - Hear and resolve claims that expert panel decisions are inconsistent with the ICANN Bylaws.
  - Hear and resolve claims that DIDP decisions by ICANN are inconsistent with the ICANN Bylaws.
  - Hear and resolve claims initiated by the Empowered Community with respect to matters reserved to the Empowered Community in the Articles of Incorporation or Bylaws. In such cases, ICANN will bear the costs associated with the Standing Panel, as well as the Empowered Community’s legal expenses.
  - Be subject to certain exclusions relating to the results of an SO’s policy development process, country code top-level domain delegations/redelegations, numbering resources, and protocols parameters.

## 2. CCWG-Accountability Recommendations

- Modifying the Fundamental Bylaws to implement the modifications associated with this recommendation on the IRP which include:
  - Hear and resolve claims that ICANN through its Board of Directors or staff has acted (or has failed to act) in violation of its Articles of Incorporation or Bylaws (including any violation of the Bylaws resulting from action taken in response to advice/input from any AC or SO).
  - Hear and resolve claims that PTI through its Board of Directors or staff has acted (or has failed to act) in violation of its contract with ICANN and the CWG-Stewardship requirements for issues related to the IANA naming functions.
  - Hear and resolve claims that expert panel decisions are inconsistent with ICANN's Bylaws.
  - Hear and resolve claims that DIDP decisions by ICANN are inconsistent with ICANN's Bylaws.
  - Hear and resolve claims initiated by the Empowered Community with respect to matters reserved to the Empowered Community in the Articles of Incorporation or Bylaws.
- A standing judicial/arbitral panel: The IRP should have a standing judicial/arbitral panel tasked with reviewing and acting on complaints brought by individuals, entities, and/or the community who have been materially affected by ICANN's action or inaction in violation of the Articles of Incorporation and/or Bylaws.
  - Composition of Panel and Expertise: Significant legal expertise, particularly international law, corporate governance, and judicial systems/dispute resolution/arbitration is necessary.
  - Diversity: English will be the primary working language with provision of translation services for claimants as needed. Reasonable efforts will be taken to achieve cultural, linguistic, gender, and legal diversity, with an aspirational cap on number of panelists from any single region (based on the number of members of the Standing Panel as a whole).
  - Size of Panel:
    - Standing Panel: Minimum of seven panelists.
    - Decisional Panel: Three panelists.
  - Independence: Panel members must be independent of ICANN, including ICANN SOs and ACs.
  - Recall: Appointments shall be made for a fixed term of five years with no removal except for specified cause (corruption, misuse of position for personal use, etc.). The recall process will be developed by way of the IRP subgroup.
- Initiation of the Independent Review Process: An aggrieved party would trigger the IRP by filing a complaint with the panel alleging that a specified action or inaction is in violation of ICANN's Articles of Incorporation and/or Bylaws, or otherwise within the scope of IRP jurisdiction. The Empowered Community could initiate an IRP with respect to matters reserved to the Empowered Community in the Articles of Incorporation or Bylaws.

- **Standing:** Any person/group/entity “materially affected” by an ICANN action or inaction in violation of ICANN’s Articles of Incorporation and/or Bylaws shall have the right to file a complaint under the IRP and seek redress. The Board’s failure to fully implement an Empowered Community decision will be sufficient for the Empowered Community to be materially affected.
- **Community Independent Review Process:** The CCWG-Accountability recommends giving the Empowered Community the right to present arguments on behalf of the Empowered Community to the IRP Panel. In such cases, ICANN will bear the costs associated with the Standing Panel, as well as the Empowered Community’s legal expenses.
- **Standard of Review:** The IRP Panel, with respect to a particular IRP, shall decide the issue(s) presented based on its own independent interpretation of the ICANN Articles of Incorporation and Bylaws in the context of applicable governing law and prior IRP decisions.
- **Accessibility and Cost:** The CCWG-Accountability recommends that ICANN bear all the administrative costs of maintaining the system (including panelist salaries), while each party should bear the costs of their own legal advice, except that the legal expenses of the Empowered Community associated with a community IRP will be borne by ICANN. The panel may provide for loser pays/fee shifting in the event it identifies a challenge or defense as frivolous or abusive. ICANN should seek to establish access – for example access to pro bono representation for community, non-profit complainants and other complainants that would otherwise be excluded from utilizing the process.
- **Implementation:** The CCWG-Accountability proposes that the revised IRP provisions be adopted as Fundamental Bylaws. Implementation of these enhancements will necessarily require additional detailed work. Detailed rules for the implementation of the IRP (such as rules of procedure) are to be created by the ICANN community through a CCWG (assisted by counsel, appropriate experts, and the Standing Panel when confirmed), and approved by the Board, such approval not to be unreasonably withheld. The functional processes by which the Empowered Community will act, such as through a council of the chairs of the ACs and SOs, should also be developed. These processes may be updated in the light of further experience by the same process, if required. In addition, to ensure that the IRP functions as intended, the CCWG-Accountability proposes to subject the IRP to periodic community review.
- **Transparency:** The community has expressed concerns regarding the ICANN document/information access policy and implementation. Free access to relevant information is an essential element of a robust IRP, and as such, the CCWG-Accountability recommends reviewing and enhancing ICANN’s Documentary Information Disclosure Policy as part of the accountability enhancements in Work Stream 2.

### 3. Detailed Explanation of Recommendations

- 05 A consultation process undertaken by ICANN produced numerous comments calling for overhaul and reform of ICANN’s existing IRP. Commenters called for ICANN to be held to a substantive standard of behavior rather than just an evaluation of whether or not its action was taken in good faith. Commenters called for an IRP that was binding rather than merely advisory, and also strongly urged that the process be:
- Transparent, efficient and accessible (both financially and from a standing perspective).

- Designed to produce consistent and coherent results that will serve as a guide for future actions.

## 06 **Purpose of the Independent Review Process**

07 The purpose of the IRP is to ensure that ICANN does not exceed the scope of its limited technical Mission, and otherwise complies with its Articles of Incorporation and Bylaws. The IRP should:

- Empower the community and affected individuals/entities to prevent “Mission creep,” and enforce compliance with the Articles of Incorporation and Bylaws through meaningful, affordable, accessible expert review of ICANN actions or inaction.
- Ensure that ICANN is accountable to the community and individuals/entities for actions or inaction outside its Mission or that otherwise violate its Articles of Incorporation or Bylaws.
- Reduce disputes going forward by creating precedent to guide and inform the ICANN Board, staff, Supporting Organizations (SOs) and Advisory Committees (ACs), and the community in connection with policy development and implementation.
- Hear and resolve claims that PTI, through its Board of Directors or staff, has acted (or has failed to act) in violation of its contract with ICANN and the CWG-Stewardship requirements for issues related to the IANA naming functions.

## 08 **Role of the Independent Review Process**

09 The role of the IRP will be to:

- Hear and resolve claims that ICANN, through its Board of Directors or staff, has acted (or has failed to act) in violation of its Articles of Incorporation or Bylaws (including any violation of the Bylaws resulting from action taken in response to advice/input from any AC or SO).
- Hear and resolve claims that PTI, through its Board of Directors or staff, has acted (or has failed to act) in violation of its contract with ICANN and the CWG-Stewardship requirements for issues related to the IANA naming functions.
  - Per the CWG-Stewardship Final Proposal, ICANN will enter into a contract with PTI that grants PTI the rights and obligations to serve as the IANA Functions Operator for the IANA naming functions, sets forth the rights and obligations of ICANN and PTI, and includes service level agreements for the IANA naming functions.
  - The ICANN Bylaws will require ICANN to enforce its rights under the ICANN-PTI Contract/Statement of Work, to ensure that PTI complies with its contractual obligations. ICANN’s failure to enforce material obligations will constitute a Bylaws violation and be grounds for an IRP by the Empowered Community.
  - The ICANN Bylaws will provide that PTI service complaints of direct customers of the IANA naming functions that are not resolved through mediation may be appealed by way of the IRP, in both cases as provided for in the CWG-Stewardship Final Proposal Annex I, Phase 2.
    - Note that CWG-Stewardship Final Proposal Annex I, Phase 2 also permits PTI Direct Customers to pursue “other applicable legal recourses that may

be available.” ICANN must modify Registry Agreements with gTLD Operators to expand the scope of arbitration available thereunder to cover PTI service complaints and potential inclusion of optional arbitration under agreements with ccTLD registries if developed through the appropriate processes or the development of another alternative dispute resolution mechanism.

- The standard of review for PTI cases will be an independent assessment of whether there was a material breach of PTI obligations under the contract with ICANN, whether through action or inaction, where the alleged breach has resulted in material harm to the complainant.
- Hear and resolve claims that expert panel decisions are inconsistent with the ICANN Bylaws.
- Hear and resolve claims that DIDP decisions by ICANN are inconsistent with the ICANN Bylaws.
- Hear and resolve claims initiated by the Empowered Community with respect to matters reserved to the Empowered Community in the Articles of Incorporation or Bylaws.

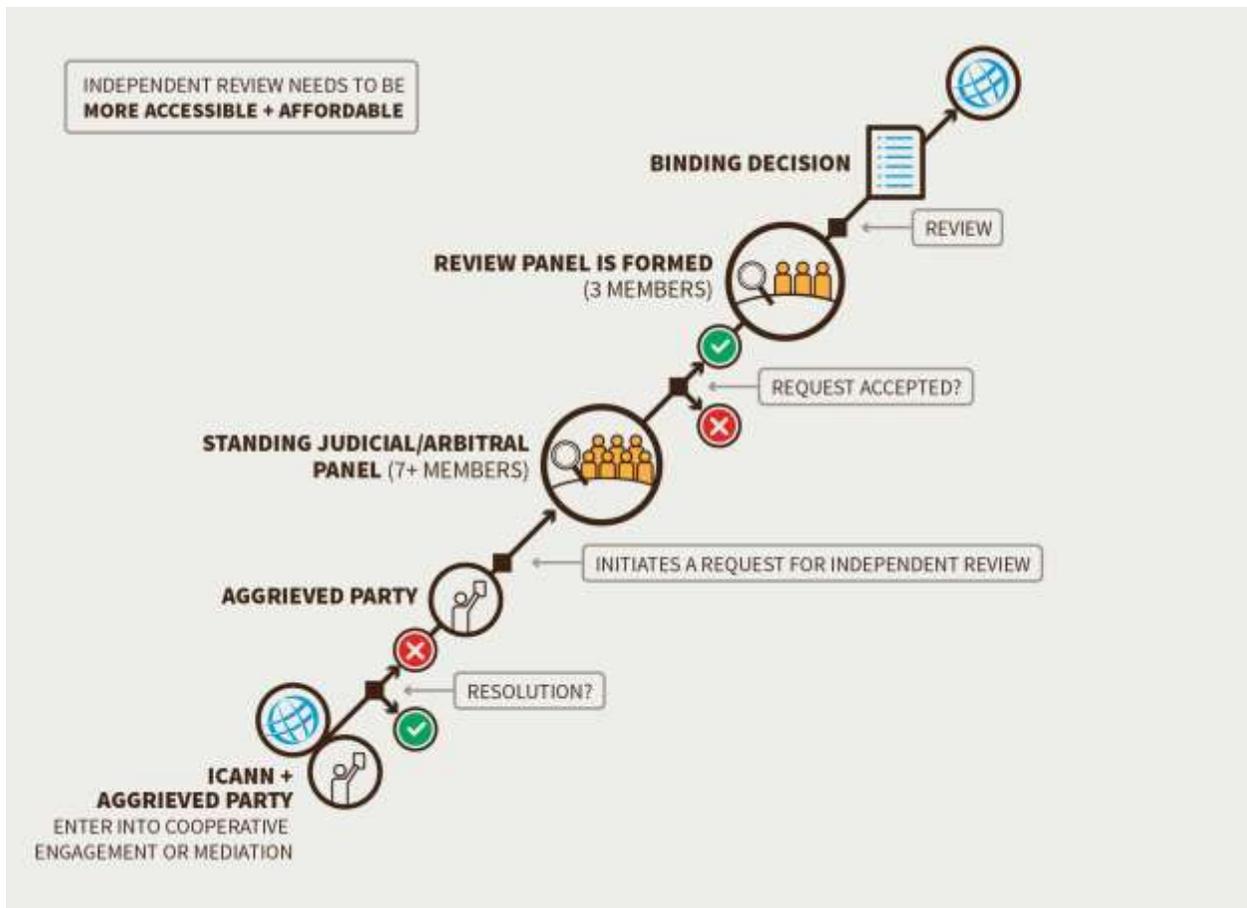

## 10 **Standing Panel**

11 The IRP should have a standing judicial/arbitral panel tasked with reviewing and acting on complaints brought forward by individuals, entities, and/or the community who have been materially affected by ICANN’s action or inaction in violation of the Articles of Incorporation and/or Bylaws.

## 12 **Initiation of the Independent Review Process**

13 An aggrieved party would trigger the IRP by filing a complaint with the panel alleging that a specified action or inaction is in violation of ICANN’s Articles of Incorporation and/or Bylaws, or otherwise within the scope of IRP jurisdiction. The Empowered Community could initiate an IRP with respect to matters reserved to the Empowered Community in ICANN’s Articles of Incorporation or Bylaws.

14 When the Empowered Community has decided to pursue an IRP, the decision would be implemented by the chairs of the SOs and ACs who supported the proposal. The chairs of the SOs and ACs who supported the decision to file a community IRP would constitute a “Chairs Council” that would act subject to the direction of those SOs and ACs of the Empowered Community that supported the proposal. The Chairs Council would, by majority vote, act on behalf of the Empowered Community in taking any reasonably necessary ministerial steps to implement the decision to pursue the community IRP, and to delegate and oversee tasks related to the community IRP, including but not limited to, engagement of legal counsel to represent the Empowered Community in the community IRP, approval of court filings, or enforcement of a community IRP award in court if ultimately necessary.

## 15 Possible Outcomes of the Independent Review Process

16 An IRP would result in a declaration that an action/failure to act *complied* or *did not comply* with ICANN's Articles of Incorporation and/or Bylaws. To the extent permitted by law, IRP decisions shall be binding on ICANN.

- Decisions of a three-member Decisional Panel will be appealable to the full IRP Panel sitting en banc, based on a clear error of judgment or the application of an incorrect legal standard. The standard may be revised or supplemented by way of the IRP Subgroup process, which will be developed.
- This balance between the limited right of appeal and the limitation to the type of decision made is intended to mitigate the potential effect that one key decision of the panel might have on several third parties, and to avoid an outcome that would force the Board to violate its fiduciary duties.
- The limited right to appeal is further balanced by the seven Community Powers, relevant policy development processes, and advice from ACs, each as set forth in the Bylaws.
- IRP panelists shall consider and give precedential effect to prior decisions of other Independent Review Processes that address similar issues.
- Interim (prospective, interlocutory, injunctive, status quo preservation) relief will be available in advance of Board/management/staff actions where a complainant can demonstrate each of the following factors:

- Harm that cannot be cured once a decision has been taken or for which there is no adequate remedy once a decision has been taken.
- Whichever:
  - A likelihood of success on the merits.
  - Sufficiently serious questions going to the merits.
  - A balance of hardships tipping decidedly toward the party seeking the relief.

17 **Standing**

- 18 Any person, group or entity “materially affected” by an ICANN action or inaction in violation of ICANN’s Articles of Incorporation and/or Bylaws shall have the right to file a complaint under the IRP and seek redress.
- 19 They must do so within a certain number of days (to be determined by the IRP Subgroup) after becoming aware of the alleged violation and how it allegedly affects them. The Empowered Community has standing to bring claims involving its rights under the Articles of Incorporation and ICANN Bylaws.
- 20 The ICANN Board’s failure to fully implement an Empowered Community decision will be sufficient for the Empowered Community to be materially affected. Issues relating to joinder and intervention will be determined by the IRP Subgroup, assisted by experts and the initial Standing Panel, based on consultation with the community.

21 **Community Independent Review Process**

- 22 The CCWG-Accountability recommends giving the Empowered Community the right to present arguments on behalf of the Empowered Community to the IRP Panel (see Recommendation #4: Ensuring Community Involvement in ICANN Decision-Making: Seven New Community Power). In such cases, ICANN will bear the costs associated with the Standing Panel as well as the Empowered Community’s legal expenses, although the IRP Subgroup may recommend filing or other fees to the extent necessary to prevent abuse of the process.

23 **Exclusions:**

24 **Challenges the result(s) of a Supporting Organization’s Policy Development Process (PDP)**

- 25 Notwithstanding the foregoing and notwithstanding any required threshold for launching a community IRP, no community IRP that challenges the result(s) of an SO’s PDP may be launched without the support of the SO that approved the policy recommendations from the PDP or, in the case of the result(s) of a Cross Community Working Group (CCWG) chartered by more than one SO, without the support of the SOs that approved the policy recommendations from that CCWG.

26 **Country Code Top-Level Domain Delegation/Redelegation**

27 In its letter dated 15 April 2015, the CWG-Stewardship indicated that “any appeals mechanism developed by the CCWG-Accountability should not cover country code top-level domain delegation/redelegation issues as these are expected to be developed by the country code top-level domain community through the appropriate processes.”

28 As requested by the CWG-Stewardship, decisions regarding country code top-level domain delegations or redelegations would be excluded from standing, until the country code top-level domain community, in coordination with other parties, has developed relevant appeals mechanisms.

### 29 **Numbering Resources**

30 The Address Supporting Organization (ASO) has likewise indicated that disputes related to Internet number resources should be out of scope for the IRP, since an existing dispute settlement mechanism already exists as part of the ICANN Address Supporting Organization Memorandum of Understanding<sup>1</sup>. As requested by the ASO, decisions regarding numbering resources would be excluded from standing.

### 31 **Protocol Parameters**

32 The Internet Architecture Board (IAB) has likewise indicated that disputes related to protocol parameters should be out of scope for the IRP, since an existing dispute settlement mechanism already exists as part of the ICANN / IANA - IETF MoU. As requested, decisions regarding resources for protocol parameters would be excluded from standing.

### 33 **Standard of Review**

34 The IRP Panel, with respect to a particular IRP, shall decide the issue(s) presented based on its own independent interpretation of ICANN’s Articles of Incorporation and Bylaws in the context of applicable governing law and prior IRP decisions. The standard of review shall be an objective examination as to whether the complained-of action exceeds the scope of ICANN’s Mission and/or violates ICANN’s Articles of Incorporation and/or Bylaws and prior IRP decisions. Decisions will be based on each IRP panelist’s assessment of the merits of the claimant’s case. The panel may undertake a de novo review of the case, make findings of fact, and issue decisions based on those facts.

35 With respect to PTI cases, the standard of review will be an independent assessment of whether there was a material breach of PTI obligations under the contract with ICANN, whether through action or inaction, where the alleged breach has resulted in material harm to the complainant.

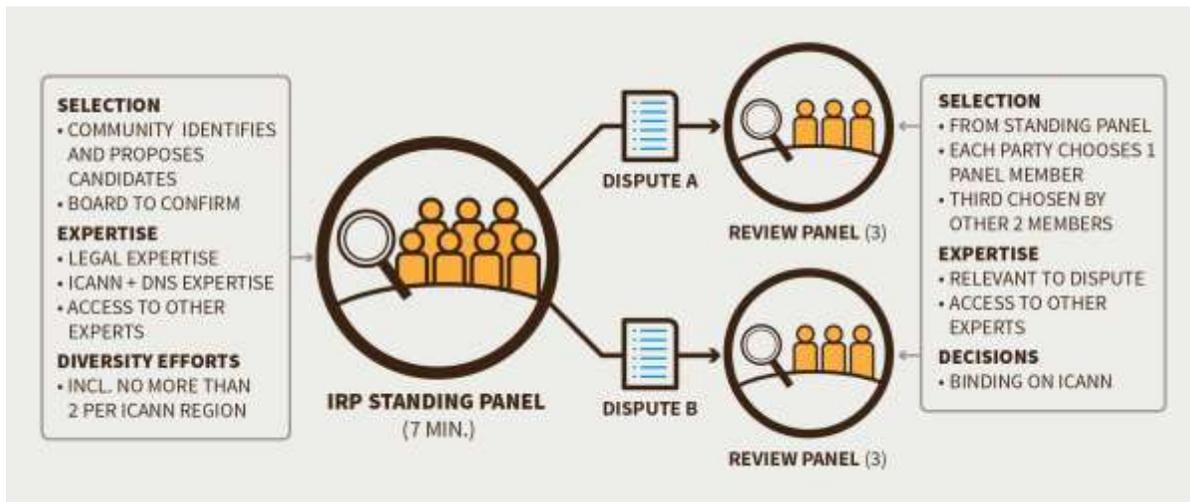

### 36 **Composition of Panel and Expertise**

37 Significant legal expertise, particularly international law, corporate governance, and judicial systems/dispute resolution/arbitration, is necessary. Panelists should either already possess expertise about the DNS and ICANN’s policies, practices, and procedures, or commit to develop an expertise through training, at a minimum, on the workings and management of the DNS. Panelists must have access to skilled technical experts upon request. In addition to legal expertise and a strong understanding of the DNS, panelists may confront issues where highly technical, civil society, business, diplomatic, and regulatory skills are needed. To the extent that

---

<sup>1</sup> <https://archive.icann.org/en/aso/aso-mou-29oct04.htm>

individual Panelists have one or more of these areas of expertise, the process must ensure that this expertise is available upon request.

### 38 Diversity

39 English will be the primary working language with provision of translation services for claimants as needed. Reasonable efforts will be taken to achieve cultural, linguistic, gender, and legal diversity, with an aspirational cap on number of panelists from any single region (based on the number of members of the Standing Panel as a whole).

### 40 Size of Panel

- Standing Panel: Minimum of seven panelists.
- Decisional Panel: Three panelists.

### 41 Independence

42 Panel members must be independent of ICANN, including ICANN SOs and ACs. Members should be compensated at a rate that cannot decline during their fixed term. To ensure independence, term limits should apply (five years, no renewal), and post-term appointment to the ICANN Board, Nominating Committee, or other positions within ICANN will be prohibited for a specified time period. Panelists will have an ongoing obligation to disclose any material relationship with ICANN, SOs, ACs, or any other party in an IRP. Panelists will be supported by a clerk’s office that is separate from ICANN.

### 43 Selection and Appointment

44 The selection of panelists would follow a four-step process:

1. ICANN, in consultation with the community, will initiate a tender process for an organization to provide administrative support for the IRP, beginning by consulting the community on a draft tender document.

2. ICANN will then issue a call for expressions of interest from potential panelists, work with the community and Board to identify and solicit applications from well-qualified candidates with the goal of securing diversity, conduct an initial review and vetting of applications, and work with ICANN and community to develop operational rules for IRP.
3. The community would nominate a slate of proposed panel members.
4. Final selection is subject to ICANN Board confirmation.

#### 45 **Recall**

46 Appointments shall be made for a fixed term of five years with no removal except for specified cause (corruption, misuse of position for personal use, etc.). The recall process will be developed by the IRP subgroup.

#### 47 **Settlement Efforts**

48 Reasonable efforts, as specified in a published policy, must be made to resolve disputes informally prior to/in connection with filing an IRP case.

49 Parties may cooperatively engage informally, but either party may inject an independent dispute resolution facilitator (mediator) after an initial Cooperative Engagement Process (CEP) meeting. Either party can terminate informal dispute resolution efforts (CEP or mediation) if, after a specified period, that party concludes in good faith that further efforts are unlikely to produce agreement.

50 The process must be governed by clearly understood and prepublished rules applicable to both parties and be subject to strict time limits. In particular, the CCWG-Accountability will review the CEP as part of Work Stream 2.

#### 51 **Decision-Making**

52 In each case, a three-member panel will be drawn from the Standing Panel. Each party will select one panelist, and those panelists will select the third. The CCWG-Accountability anticipates that the Standing Panel would draft, issue for comment, and revise procedural rules. The Standing Panel should focus on streamlined, simplified processes with rules that conform with international arbitration norms and are easy to understand and follow.

53 Panel decisions will be based on each IRP Panelist's assessment of the merits of the claimant's case. The panel may undertake a de novo review of the case, make findings of fact, and issue decisions based on those facts. All decisions will be documented and made public, and will reflect a well-reasoned application of the standard to be applied.

#### 54 **Decisions**

55 Panel decisions would be determined by a simple majority. Alternatively, this could be included in the category of procedures that the IRP Panel itself should be empowered to set.

56 The CCWG-Accountability recommends that IRP decisions be precedential, meaning that IRP Panelists shall consider and give precedential effect to prior IRP decisions. By conferring precedential weight on panel decisions, the IRP can provide valuable guidance for future actions and inaction by ICANN decision-makers. It also reduces the chances of inconsistent treatment of

one claimant over another, based on the specific individuals making up the Decisional Panel in particular cases.

57 The CCWG-Accountability intends that if the panel determines that an action or inaction by the Board or staff is in violation of ICANN's Articles of Incorporation or Bylaws, then that decision is binding and the ICANN Board and staff shall be directed to take appropriate action to remedy the breach. However, the Panel shall not replace the Board's fiduciary judgment with its own judgment.

58 It is intended that judgments of a Decisional Panel or the Standing Panel would be enforceable in the court of the United States and other countries that accept international arbitration results.

### 59 **Accessibility and Cost**

60 The CCWG-Accountability recommends that ICANN bear all the administrative costs of maintaining the system (including panelist salaries and the costs of technical experts), while each party should bear the costs of their own legal advice, except that the legal expenses of the Empowered Community associated with a community IRP will be borne by ICANN. The panel may provide for loser pays/fee shifting in the event it identifies a challenge or defense as frivolous or abusive. ICANN should seek to establish access – for example access to pro bono representation for community, non-profit complainants, and other complainants that would otherwise be excluded from utilizing the process.

61 The panel should complete work expeditiously, issuing a scheduling order early in the process and in the ordinary course, and should issue decisions within a standard time frame (six months). The panel will issue an update and estimated completion schedule in the event it is unable to complete its work within that period.

### 62 **Implementation**

63 The CCWG-Accountability proposes that the revised IRP provisions be adopted as Fundamental Bylaws. Implementation of these enhancements will necessarily require additional detailed work. Detailed rules for the implementation of the IRP (such as rules of procedure) are to be created by the ICANN community through a CCWG (assisted by counsel, appropriate experts, and the Standing Panel when confirmed), and approved by the Board, such approval not to be unreasonably withheld. The functional processes by which the Empowered Community will act, such as through a council of the chairs of the ACs and SOs, should also be developed. These processes may be updated in the light of further experience by the same process, if required. In addition, to ensure that the IRP functions as intended, the CCWG-Accountability proposes to subject the IRP to periodic community review.

### 64 **Transparency**

65 The community has expressed concerns regarding the ICANN document/information access policy and implementation. Free access to relevant information is an essential element of a robust IRP, and as such, the CCWG-Accountability recommends reviewing and enhancing the ICANN Documentary Information Disclosure Policy as part of the accountability enhancements in Work Stream 2.

66 All IRP proceedings will be conducted on the record, in public, except for settlement negotiations or other proceedings which could materially and unduly harm participants if conducted in public, such as by exposing trade secrets or violating rights of personal privacy.

## 4. Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”

- The scope of the IRP will be restricted to the IANA naming functions for claims that PTI through its Board of Directors or staff has acted (or has failed to act) in violation of its contract with ICANN.
- The scope of the IRP will include actions and inactions of PTI by way of the PTI Board being bound to ensure that PTI complies with its contractual obligations with ICANN in the Bylaws. ICANN’s failure to enforce material obligations will be appealable by way of the IRP as a Bylaws violation.
- The scope of the IRP will include claims that DIDP decisions by ICANN are inconsistent with ICANN’s Bylaws.
- Clarified that ICANN must modify Registry Agreements with gTLD Operators to expand scope of arbitration available thereunder to cover PTI service complaints.
- Exclusion: The IRP will not be applicable to protocols parameters.
- Exclusion: An IRP cannot be launched that challenges the result(s) of an SO’s policy development process (PDP) without the support of the SO that developed such PDP or, in the case of joint PDPs, without the support of all of the SOs that developed such PDP.
- Limitation: An IRP challenge of expert panel decisions is limited to a challenge of whether the panel decision is consistent with ICANN’s Bylaws.
- The legal expenses of the Empowered Community associated with a community IRP will be borne by ICANN.

## 6. How does this meet the CWG-Stewardship Requirements?

- 67 The recommendations as outlined above meet the CWG-Stewardship requirements by:
- Creating the IRP directly meets the requirement of the CWG-Stewardship for an IRP.
  - Excluding ccTLD delegation/re-delegation from the IRP.
  - As requested by the CWG-Stewardship, decisions regarding country code top-level domains delegations or re-delegations would be excluded from standing, until the country code top-level domains community, in coordination with other parties, has developed relevant appeals mechanisms.
  - Excluding Number Resources from the IRP. The ASO has indicated that disputes related to Internet Number Resources should be out of scope for the IRP. As requested by the ASO, decisions regarding numbering resources would be excluded from standing.

## 7. How does this address NTIA Criteria?

68 **Support and enhance the multistakeholder model.**

- By enhancing ICANN's appeals mechanisms and binding arbitration processes and further fortifying and expanding their remit, the community is further empowered.
- 

69 **Maintain the security, stability and resiliency of the Internet DNS.**

- These accountability measures were designed to contribute to maintaining the operational functioning of the organization.
- 

70 **Meet the needs and expectation of the global customers and partners of the IANA services.**

- These accountability measures were designed to contribute to maintaining the operational functioning of the organization.
- 

71 **Maintain the openness of the Internet.**

- The accountability measures help to mitigate the likelihood of problematic scenarios by ensuring that robust accountability mechanisms are in place.
- 

72 **NTIA will not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution.**

- N/A

# Annex 08 – Recommendation #8: Improving ICANN’s Request for Reconsideration Process

---

## 1. Summary

- 01 Currently, any person or entity may submit a Request for Reconsideration or review of an ICANN action or inaction as provided for in [Article IV, Section 2 of ICANN's Bylaws](#).
- 02 The CCWG-Accountability proposes a number of key reforms to ICANN's Request for Reconsideration process, including:
  - Expanding the scope of permissible requests.
  - Extending the time period for filing a Request for Reconsideration from 15 to 30 days.
  - Narrowing the grounds for summary dismissal.
  - Making the ICANN Board of Directors responsible for determinations on all requests (rather than a committee handling staff issues).
  - Making ICANN's Ombudsman responsible for initial substantive evaluation of the requests.
- 03 The CCWG-Accountability also proposes several enhancements to transparency requirements and firm deadlines in issuing of determinations, including:
  - Recordings/transcripts of Board discussion should be posted at the option of the requestor.
  - An opportunity to rebut the Board Governance Committee’s (BGC’s) final recommendation before a final decision by the ICANN Board should be provided.
  - Adding hard deadlines to the process, including an affirmative goal that final determinations of the Board be issued within 75 days from request filing wherever possible, and in no case more than 135 days from the date of the request.
- 04 ICANN’s Document and Information Disclosure Policy (DIDP) will be addressed in Work Stream 2. The CCWG-Accountability recommends that the policy should be improved to accommodate the legitimate need for requestors to obtain internal ICANN documents that are relevant to their requests.

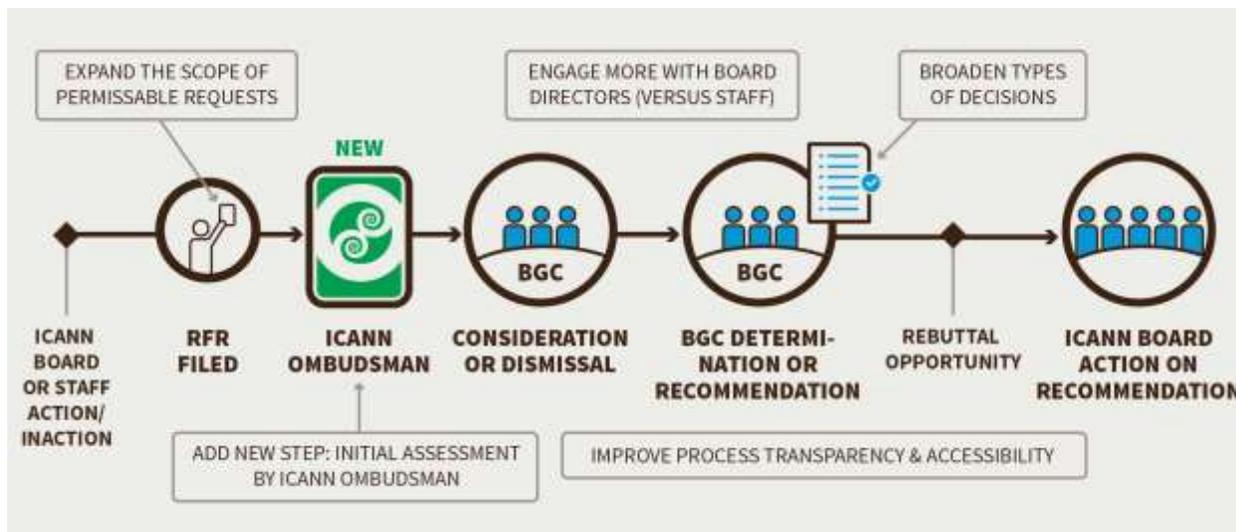

## 2. CCWG-Accountability Recommendations

- 05 Modify [Article IV, Section 2 of ICANN's Bylaws](#) to reflect the following changes:
  - Expanding the scope of permissible requests.
  - Extending the time period for filing a Request for Reconsideration from 15 to 30 days.
  - Narrowing the grounds for summary dismissal.

- Requiring determinations on all requests to be made by the ICANN Board of Directors (rather than a committee handling staff issues).
- Requiring ICANN's Ombudsman to make the initial substantive evaluation of the requests.
- Requiring recordings/transcripts of Board discussion to be posted at the option of the requestor.
- Providing a rebuttal opportunity to the BGC's final recommendation before a final decision by the ICANN Board.
- Adding hard deadlines to the process, including an affirmative goal that final determinations of the Board be issued within 75 days from request filing wherever possible, and in no case more than 135 days from the date of the request.

### 3. Detailed Explanation of Recommendations

- 06 The CCWG-Accountability proposes a number of key reforms to ICANN's Request for Reconsideration process, whereby the ICANN Board of Directors is obliged to reconsider a recent decision or action/inaction by ICANN's Board or staff, and which is provided for in Article IV, Section 2 of ICANN's Bylaws.
- 07 The key reforms proposed include:
- The scope of permissible requests should be expanded to include Board/staff actions or inactions that contradict ICANN's Mission, Commitments, and/or Core Values and for reconciling conflicting/inconsistent "expert opinions."
  - The time for filing a Request for Reconsideration should be extended from 15 to 30 days.
  - The grounds for summary dismissal should be narrowed and the ICANN Board of Directors must make determinations on all requests (rather than a committee handling staff issues).
  - ICANN's Ombudsman should make the initial substantive evaluation of the requests to aid the BGC in its recommendation.
  - Requestors should be provided an opportunity to rebut the BGC's recommendation before a final decision by the entire ICANN Board.
  - More transparency requirements and firm deadlines should be added for issuing of determinations.

## 08 Standing

- 09 The CCWG-Accountability recommends amending "who" has proper standing to file a Request for Reconsideration to widen its scope by including Board/staff actions/inactions that contradict ICANN's Mission, Commitments, and/or Core Values (was only policies before). It is noted that under the existing ICANN Bylaws, paragraph 2 significantly reduces the rights purportedly granted in paragraph 1 of the Request for Reconsideration.
- 10 ICANN's Bylaws could be revised (added text in red below, text to be removed is in strike-through):
1. ICANN shall have in place a process by which any person or entity materially affected by an action **or inaction** of **the ICANN Board or staff** may request the review or reconsideration of that action **or inaction** by the Board.
  2. Any person or entity may submit a Request for Reconsideration or review of an ICANN action or inaction to the extent that he, she, or it has been adversely affected by:
    - a. One or **more ICANN Board or staff** actions or inactions that contradict established ICANN policy/policies, **its Mission, Commitments, and/or Core Values**; or
    - b. One or more actions or inactions of the ICANN Board/staff that have been taken or refused to be taken without consideration of material information, except where the party submitting the request could have submitted, but did not submit, the information for the Board's consideration at the time of action or refusal to act; or
    - c. One or more actions or inactions of the ICANN Board/staff that are taken as a result of the Board's reliance on false or inaccurate ~~material~~ **relevant** information.
- 11 Note: The language proposed in recommendations for ICANN Bylaw revisions are conceptual in nature at this stage. The CCWG-Accountability's external legal counsel and the ICANN legal team will draft final language for these revisions to the Bylaws.
- 12 In a letter dated 15 April 2015, the CWG-Stewardship request indicated, "As such, any appeal mechanism developed by the CCWG-Accountability should not cover Country Code Top Level Domain (ccTLD) delegation/redelegation issues as these are expected to be developed by the ccTLD community through the appropriate processes." As requested by the CWG-Stewardship, decisions regarding ccTLD delegations or redelegations would be excluded from standing until

relevant appeals mechanisms have been developed by the ccTLD community, in coordination with other interested parties.

- 13 Disputes related to Internet number resources, protocols and parameters are out of scope of the Request for Reconsideration process.

## 14 **Goals**

- 15 The CCWG-Accountability recommendations aim to:

- Broaden the types of decisions that can be re-examined to include Board/staff action/inaction that contradicts ICANN's Mission, Commitments, and/or Core Values (as stated in Bylaws/Articles) and for the purpose of reconciling conflicting/inconsistent expert panel opinions.
- Provide more transparency in the dismissal and reconsideration processes.
- Provide the Board Governance Committee (BGC) with the reasonable right to dismiss frivolous requests, but not solely on the grounds that the complainant failed to participate in a relevant policy development or Public Comment Period or that the request is vexatious or querulous.
- Propose to amend paragraph nine on BGC summary dismissal as follows:
  - The Board Governance Committee shall review each Request for Reconsideration upon its receipt to determine if it is sufficiently stated. The Board Governance Committee may summarily dismiss a Request for Reconsideration if:
    - (i) The requestor fails to meet the requirements for bringing a Reconsideration Request; or
    - (ii) It is frivolous, ~~querulous or vexatious~~(iii) ~~the requestor had notice and opportunity to, but did not, participate in the public comment period relating to the contested action, if applicable.~~

The Board Governance Committee's summary dismissal of a Request for Reconsideration shall be **documented and promptly** posted on the website.

## 16 **Composition**

- 17 The CCWG-Accountability determined there is a need to rely less on the ICANN legal department (which holds a strong legal obligation to protect the corporation) to guide the BGC on its recommendations. More ICANN Board Director engagement is needed in the overall decision-making process.
- 18 Requests should no longer go to ICANN's lawyers (in-house or external legal counsel) for the first substantive evaluation. Instead, the Requests for Reconsideration should go to ICANN's Ombudsman, who will make the initial recommendation to the BGC because the CCWG-Accountability believes that the Ombudsman may have more of an eye for fairness to the community in reviewing requests. Note that the ICANN Bylaws charge the BGC with these duties, which means the BGC would utilize the Ombudsman instead of its current practice of using ICANN's lawyers to aid the BGC in its initial evaluation.
- 19 All final determinations of Requests for Reconsideration (other than requests that have been summarily dismissed by the BGC as discussed above) are to be made by the ICANN Board (not only requests about Board actions as is the current practice).

20 Amend paragraph 3:

3. The Board has designated the BGC to review and consider any such Request for Reconsideration. The BGC shall have the authority to:

- Evaluate requests for review or reconsideration.
- Summarily dismiss insufficient or frivolous requests.
- Evaluate requests for urgent consideration.
- Conduct whatever factual investigation is deemed appropriate.
- Request additional written submissions from the affected party or from other parties.
- ~~Make a final determination on Reconsideration Requests regarding staff action or inaction, without reference to the Board of Directors;~~
- Make a recommendation to the Board of Directors on the merits of the request, as necessary.

21 Delete paragraph 15, because the Board will make all final decisions regarding requests related to staff action/inaction.

## 22 **Decision-Making**

23 Transparency improvements are needed regarding the information that goes into the ICANN Board's decision-making process and the rationale for why decisions are ultimately taken. Recordings and transcripts should be posted of the substantive Board discussions at the option of the requestor.

24 A rebuttal opportunity to the BGC's final recommendation (although requestors cannot raise new issues in a rebuttal) needs to be provided before the full Board finally decides.

25 Hard deadlines to the process are to be added, including an affirmative goal that final determinations of the Board be issued within 75 days from request filing wherever possible, and in no case more than 135 days from the date of the request.

26 It is proposed that the rules for a Request for Reconsideration be amended as follows:

*The Board Governance Committee (BGC) shall make a final recommendation to the Board with respect to a Request for Reconsideration within 30 days following its receipt of the request, unless impractical, in which case it shall report to the Board the circumstances that prevented it from making a final recommendation and its best estimate of the time required to produce such a final recommendation. In any event, the BGC's final recommendation to the Board shall be made within 90 days of receipt of the request. The final recommendation shall be promptly posted on ICANN's website and shall address each of the arguments raised in the request. The requestor may file a rebuttal to the recommendation of the BGC within 15 days of receipt of it, which shall also be promptly posted to ICANN's website and provided to the Board for its evaluation.*

*The Board shall not be bound to follow the recommendations of the BGC. The final decision of the Board and its rationale shall be made public as part of the preliminary report and minutes of the Board meeting at which action is taken. The Board shall issue its decision on the recommendation of the BGC within 45 days of receipt of the recommendation or as soon thereafter as feasible. Any circumstances that delay the Board from acting within this*

*timeframe must be identified and posted on ICANN's website. In any event, the Board's final decision shall be made within 135 days of receipt of the request. The final decision shall be promptly posted on ICANN's website.*

## 27 **Accessibility**

28 The CCWG-Accountability recommends that the time deadline for filing a Request for Reconsideration be extended from 15 to 30 days from when requestor learns of the decision/inaction, except as otherwise described below.

29 Amend paragraph 5 so that it reads:

5. All Requests for Reconsideration must be submitted to an email address designated by the BGC within 30 days after:
  - a) For requests challenging Board actions, the date on which information about the challenged Board action is first published in a resolution, unless the posting of the resolution is not accompanied by a rationale. In that instance, the request must be submitted within 30 days from the initial posting of the rationale; or
  - b) For requests challenging staff actions, the date on which the party submitting the request became aware of, or reasonably should have become aware of, the challenged staff action; or
  - c) For requests challenging either Board or staff inaction, the date on which the affected person reasonably concluded, or reasonably should have concluded, that action would not be taken in a timely manner.

## 30 **Due Process**

31 ICANN's DIDP is an important issue to be addressed in Work Stream 2 and should be improved to accommodate the legitimate need for requestors to obtain internal ICANN documents that are relevant to their requests.

32 All briefing materials supplied to the Board should be provided to the requestor so that they may know the arguments against them and have an opportunity to respond (subject to legitimate and documented confidentiality and privilege requirements).

33 Final decisions should be issued sooner. Changes will include an affirmative goal that final determinations of the Board should be issued within 75 days from request filing wherever possible, and in no case more than 135 days from the date of the request.

34 Requestors should be provided more time to learn of action/inaction and to file the request.

35 Transparency improvements throughout the process are called for, including more complete documentation and prompt publication of submissions and decisions including their rationale.

## **4. Changes from the "Third Draft Proposal on Work Stream 1 Recommendations"**

- Conflicts in timing for Board approval addressed by changing 60 days to 75 days and the total of 120 days to 135 days.

## 5. Stress Tests Related to this Recommendation

- N/A

## 6. How does this meet the CWG-Stewardship Requirements?

- N/A

## 7. How does this address NTIA Criteria?

### 36 **Support and enhance the multistakeholder model.**

- By enhancing ICANN's appeals mechanisms and binding arbitration processes and further fortifying and expanding their remit, the community is further empowered.
- 

### 37 **Maintain the security, stability and resiliency of the Internet DNS.**

- These accountability measures were designed to contribute to maintaining the operational functioning of the organization.
- 

### 38 **Meet the needs and expectation of the global customers and partners of the IANA services.**

- These accountability measures were designed to contribute to maintaining the operational functioning of the organization.
- 

### 39 **Maintain the openness of the Internet.**

- The accountability measures help to mitigate the likelihood of problematic scenarios by ensuring that robust accountability mechanisms are in place.
- 

### 40 **NTIA will not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution.**

- N/A

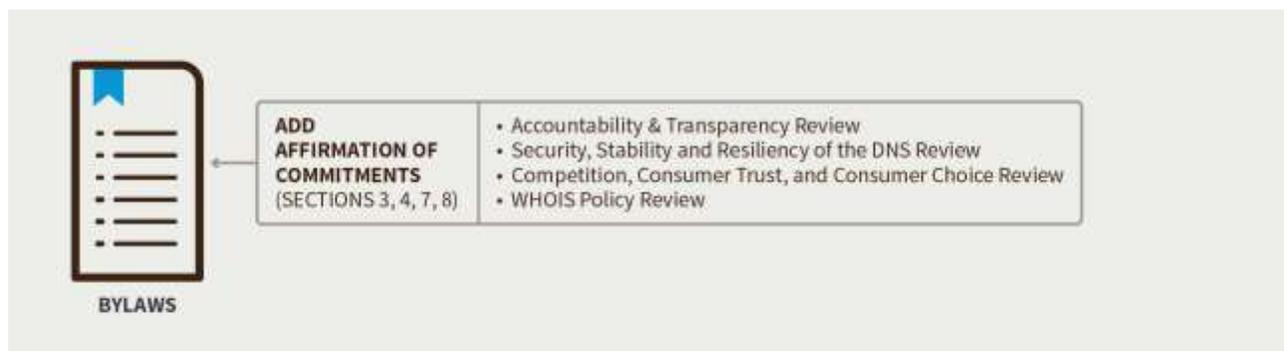

# Annex 09 – Recommendation #9: Incorporating the Affirmation of Commitments in ICANN’s Bylaws

## 1. Summary

- 01 Based on stress test analysis, the CCWG-Accountability recommends incorporating the reviews specified in the Affirmation of Commitments, a 2009 bilateral agreement between ICANN and the U.S. National Telecommunications and Information Administration (NTIA), into the ICANN Bylaws. This will ensure that community reviews remain a central aspect of ICANN’s accountability and transparency framework.
- 02 Specifically, the CCWG-Accountability proposes to:
- Add the relevant ICANN Commitments from the Affirmation of Commitments into the ICANN Bylaws.
  - Add the four review processes specified in the Affirmation of Commitments to the ICANN Bylaws, including:
    - Ensuring accountability, transparency, and the interests of global Internet users.
    - Enforcing ICANN’s existing policy relating to WHOIS, subject to applicable laws.
    - Preserving security, stability, and resiliency of the Domain Name System (DNS).
    - Promoting competition, consumer trust, and consumer choice.
- 03 In addition, to support the common goal of improving the efficiency and effectiveness of reviews, ICANN will publish operational standards to be used as guidance by the community, ICANN staff and the Board in conducting future reviews. The community will review these operational standards on an ongoing basis to ensure that they continue to meet the community’s needs.

## 2. CCWG-Accountability Recommendations

- 04 The CCWG-Accountability evaluated the contingency of ICANN or NTIA unilaterally withdrawing from the Affirmation of Commitments (see information about Stress Test #14 in the “Detailed Explanation of Recommendations” section, below).
- 05 To ensure continuity of these key commitments, the CCWG-Accountability proposes the following two accountability measures:
- Preserve in the ICANN Bylaws any Relevant ICANN Commitments from the Affirmation of Commitments<sup>1</sup>
    - This includes Sections 3, 4, 7, and 8 of the Affirmation of Commitments. Sections 3, 4, 8a, and 8c would be included in the Core Values section of the ICANN Bylaws.
    - Part of the content of Section 8b of the Affirmation of Commitments (the part relating to the location of ICANN’s principal office), is already covered by ICANN Bylaws Article XVIII. Article XVIII is to be classified as a Standard Bylaw and is not to be moved into the Core Values section with material derived from Affirmation of Commitments Sections 8a and 8c.
    - Section 7 of the Affirmation of Commitments would be inserted as a new Section 8 in Article III, Transparency, of the ICANN Bylaws.
  - Bring the Four Affirmation of Commitments Review Processes into the ICANN Bylaws
    - The following four reviews will be preserved in the reviews section of the Bylaws:
      - Ensuring accountability, transparency, and the interests of global Internet users.
      - Enforcing ICANN’s existing policy relating to WHOIS, subject to applicable laws.
      - Preserving security, stability, and resiliency of the DNS.
      - Promoting competition, consumer trust, and consumer choice.
- 06 After these elements of the Affirmation of Commitments are adopted in the ICANN Bylaws, the following should take place:
- ICANN and NTIA should mutually agree to terminate the Affirmation of Commitments.
  - New review rules will prevail as soon as the Bylaws have been changed, but care should be taken when terminating the Affirmation of Commitments to not disrupt any Affirmation of Commitments reviews that may be in process at that time. Any in-progress reviews will adopt the new rules to the extent practical. Any planned Affirmation of Commitments review should not be deferred simply because the new rules allow up to five years between review cycles. If the community prefers to do a review sooner than five years from the previous review, that is allowed under the new rules.
  - Through its Work Party IRP Implementation Oversight Team (WP-IRP IOT), the CCWG-Accountability will examine the suggestion to include a mid-term review of the Independent Review Process (IRP).
  - To support the common goal of improving the efficiency and effectiveness of reviews, ICANN will publish operational standards to be used as guidance by the community,

---

<sup>1</sup> Sections 3, 4, 7, and 8 of the Affirmation of Commitments contain relevant ICANN commitments. The remaining sections in the Affirmation of Commitments are preamble text and commitments of the U.S. Government. As such, they do not contain commitments by ICANN, and cannot usefully be incorporated in the Bylaws.

ICANN staff, and the Board in conducting future reviews. The community will review these operational standards on an ongoing basis to ensure that they continue to meet the community's needs.

- These operational standards should include issues such as: composition of Review Teams, Review Team working methods (meeting protocol, document access, role of observers, budgets, decision making methods, etc.), and methods of access to experts. These standards should be developed with the community and should require community input and review to be changed. The standards are expected to reflect levels of detail that are generally not appropriate for governance documents, and should not require a change to the Bylaws to modify. This is an implementation issue aligned with the need for review of the proposed Bylaws text developed by the CCWG-Accountability that has been provided as guidance to legal counsel.

07 A section related to the IANA Function Review and Special IANA Function Review will fit into these new sections of the Bylaws and will be classified as Fundamental Bylaws. Specifications will be based on the requirements detailed by the CWG-Stewardship. It is anticipated that the Bylaw drafting process will include the CWG-Stewardship.

### 3. Detailed Explanation of Recommendations

#### Background

The Affirmation of Commitments is a 2009 bilateral agreement between the U.S. Government and ICANN. After the IANA agreement is terminated, the Affirmation of Commitments will become the next target for termination since it would be the last remaining aspect of a unique U.S. Government role with ICANN.

Termination of the Affirmation of Commitments as a separate agreement would be a simple matter for a post-transition ICANN, since the Affirmation of Commitments can be terminated by either party with a 120-day notice. The CCWG-Accountability evaluated the contingency of ICANN or NTIA unilaterally withdrawing from the Affirmation of Commitments in Stress Test #14, as described below.

08 <b>Stress Test #14:</b> ICANN or NTIA chooses to terminate the Affirmation of Commitments.	
09 Consequence(s): ICANN would no longer be held to the Affirmation of Commitments, including the conduct of community reviews and required implementation of Review Team recommendations.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
10 The Affirmation of Commitments can be terminated by either ICANN or NTIA with 120 days' notice.	14 One proposed mechanism would give the Empowered Community standing to challenge a Board decision by referral to an IRP with the power to issue a binding decision. If ICANN cancelled the Affirmation
11 As long as NTIA controls the IANA contract,	

<p>ICANN feels pressure to maintain the Affirmation of Commitments.</p> <p>12 But as a result of the IANA Stewardship Transition, ICANN would no longer have the IANA contract as external pressure from NTIA to maintain the Affirmation of Commitments.</p> <p>13 Note: none of the proposed measures could prevent NTIA from canceling the Affirmation of Commitments.</p>	<p>of Commitments, the IRP could enable reversal of that decision.</p> <p>15 Another proposed measure is to import Affirmation of Commitments provisions into the ICANN Bylaws, and dispense with the bilateral Affirmation of Commitments with NTIA. Bylaws would be amended to include Affirmation of Commitments 3, 4, 7, and 8, plus the 4 periodic reviews required in paragraph 9.</p> <p>16 If ICANN's Board proposed to amend the AoC commitments and reviews that were added to the Bylaws, another proposed measure would empower the Empowered Community to veto that proposed Bylaws change.</p> <p>17 If any of the AoC commitments or review processes were classified as Fundamental Bylaws, changes would require approval by the Empowered Community.</p>
<p><b>CONCLUSIONS:</b></p> <p>18 Existing measures are inadequate after NTIA or ICANN terminates the IANA contract.</p>	<p>19 Proposed measures in combination are adequate.</p>

20 If the Affirmation of Commitments were to be terminated without a replacement, ICANN would no longer be held to these important affirmative commitments, including the related requirement to conduct community reviews. If this were allowed to occur, it would significantly diminish ICANN's accountability to the global multistakeholder community. This consequence is avoided by adding the Affirmation of Commitments reviews and commitments to ICANN's Bylaws.

21 **Objectives of the Recommendations**

22 Suggestions gathered during comment periods in 2014 on ICANN accountability and the IANA Stewardship Transition suggested several ways the Affirmation of Commitments reviews should be adjusted as part of incorporating them into the ICANN Bylaws:

- Ability to sunset reviews, amend reviews, and create new reviews.
- Community stakeholder groups should appoint their own representatives to Review Teams. Regarding composition and size of Review Teams, based on composition of prior Review Teams, 21 Review Team members from Supporting Organizations (SOs) and Advisory Committees (ACs) would be more than needed.
- Give Review Teams access to ICANN internal documents.

- Require the ICANN Board to consider approval and begin implementation of Review Team recommendations, including from previous reviews.

23 The CCWG-Accountability concluded that some Review Team recommendations could be rejected or modified by ICANN, for reasons such as feasibility, time, or cost. If the community disagreed with the Board’s decision on implementation, it could invoke a Request for Reconsideration or IRP to challenge that decision, with a binding result in the case of an IRP. In addition, the CCWG-Accountability independent legal counsel advised that the ICANN Bylaws could not require the Board to implement all Review Team recommendations because some could conflict with the Board’s fiduciary duties or other Bylaws obligations.

In Bylaws Article IV, a new section will be added for periodic review of ICANN Execution of Key Commitments, with an overarching framework for the way these reviews are conducted and then one subsection for each of the four current Affirmation of Commitments reviews.

24 **Recommended Changes to the ICANN Bylaws**

*Note: Legal counsel has not reviewed the proposed Bylaw revisions at this stage. The proposed language for Bylaw revisions is conceptual in nature; once there is consensus about direction, legal counsel will need time to draft appropriate proposed language for revisions to the Articles of Incorporation and Bylaws.*

25 There are four areas of change required to the ICANN Bylaws to enshrine the Affirmation of Commitments reviews, as described below.

26 **Principle language to be added to Bylaws:**

ICANN Commitments in the Affirmation of Commitments	As expressed in the ICANN Bylaws
<p>27 3. This document affirms key commitments by the Department of Commerce (DOC) and ICANN, including commitments to:</p> <p>28 (a) ensure that decisions made related to the global technical coordination of the DNS are made in the public interest and are accountable and transparent;</p> <p>29 (b) preserve the security, stability, and resiliency of the DNS;</p> <p>30 (c) promote competition, consumer trust, and consumer choice in the DNS marketplace; and</p> <p>31 (d) facilitate international participation in DNS technical coordination.</p>	<p>32 Proposed revision to ICANN Core Values:</p> <p>33 Seeking and supporting broad, informed participation reflecting the functional, geographic, and cultural diversity of the Internet at all levels of policy development and decision-making to ensure that the bottom-up, multistakeholder policy development process is used to ascertain the global public interest and that those processes are accountable and transparent;</p> <p>34 Proposed Bylaw requiring Affirmation of Commitments review of Promoting Competition, Consumer Trust, and Consumer Choice:</p> <p>35 ICANN will ensure that as it expands the Top-Level Domain (TLD) space, it will adequately address issues of competition, consumer protection, security, stability and resiliency,</p>

<p><b>ICANN Commitments in the Affirmation of Commitments</b></p>	<p><b>As expressed in the ICANN Bylaws</b></p>
	<p>malicious abuse issues, sovereignty concerns, and rights protection.</p>
<p>36 4. DOC affirms its commitment to a multi-stakeholder, private sector led, bottom-up policy development model for DNS technical coordination that acts for the benefit of global Internet users. A private coordinating process, the outcomes of which reflect the public interest, is best able to flexibly meet the changing needs of the Internet and of Internet users. ICANN and DOC recognize that there is a group of participants that engage in ICANN's processes to a greater extent than Internet users generally. To ensure that its decisions are in the public interest, and not just the interests of a particular set of stakeholders, ICANN commits to perform and publish analyses of the positive and negative effects of its decisions on the public, including any financial impact on the public, and the positive or negative impact (if any) on the systemic security, stability, and resiliency of the DNS.</p>	<p>37 Proposed new Section 8 in Bylaws Article III Transparency:</p> <p>38 ICANN shall perform and publish analyses of the positive and negative effects of its decisions on the public, including any financial or non-financial impact on the public, and the positive or negative impact (if any) on the systemic security, stability, and resiliency of the DNS.</p>
<p>39 7. ICANN commits to adhere to transparent and accountable budgeting processes, fact-based policy development, cross community deliberations, and responsive consultation procedures that provide detailed explanations of the basis for decisions, including how comments have influenced the development of policy consideration, and to publish each year an annual report that sets out ICANN's progress against ICANN's Bylaws, responsibilities, and Strategic and Operating Plans. In addition, ICANN commits to provide a thorough and reasoned explanation of decisions taken, the rationale thereof and the sources of data and information on which ICANN relied.</p>	<p>40 Proposed revision to ICANN Commitments:</p> <p>41 In performing its Mission, ICANN must operate in a manner consistent with its Bylaws for the benefit of the Internet community as a whole, carrying out its activities in conformity with relevant principles of international law and international conventions, and applicable local law and through open and transparent processes that enable competition and open entry in Internet-related markets.</p> <p>42 Proposed revision to ICANN Core Values:</p> <p>43 Seeking and supporting broad, informed participation reflecting the functional, geographic, and cultural diversity of the Internet at all levels of policy development and decision-making to ensure that the bottom-up, multistakeholder policy development process is</p>

<b>ICANN Commitments in the Affirmation of Commitments</b>	<b>As expressed in the ICANN Bylaws</b>
	<p>used to ascertain the global public interest and that those processes are accountable and transparent;</p> <p>44 Proposed requirement for annual report, to be included in Bylaws section on required reviews:</p> <p>45 ICANN will produce an annual report on the state of improvements to Accountability and Transparency. ICANN will be responsible for creating an annual report that details the status of implementation on all reviews defined in this section. This annual review implementation report will be opened for a public review and comment period that will be considered by the ICANN Board and serve as input to the continuing process of implementing the recommendations from the Review Teams defined in this section.</p> <p>46 Proposed new Section 9 in Bylaws Article III Transparency:</p> <p>47 ICANN shall adhere to transparent and accountable budgeting processes, providing advance notice to facilitate stakeholder engagement in policy decision-making, fact-based policy development, cross community deliberations, and responsive consultation procedures that provide detailed explanations of the basis for decisions, including how comments have influenced the development of policy consideration, and to publish each year an annual report that sets out ICANN's progress against ICANN's Bylaws, responsibilities, and Strategic and Operating Plans.</p>

<b>ICANN Commitments in the Affirmation of Commitments</b>	<b>As expressed in the ICANN Bylaws</b>
--	---

<b>ICANN Commitments in the Affirmation of Commitments</b>	<b>As expressed in the ICANN Bylaws</b>
<p>48 9. Recognizing that ICANN will evolve and adapt to fulfill its limited, but important technical Mission of coordinating the DNS, ICANN further commits to take the following specific actions together with ongoing commitment reviews specified below:</p>	<p>49 See next section for proposed Bylaws to preserve ICANN commitments to perform the Affirmation of Commitments regular reviews.</p>

50 The Bylaws will provide a framework for all periodic reviews.

51 The left-hand column of the following chart shows proposed Bylaws language for periodic reviews (subject to revision by legal counsel during actual drafting), with comments on the right:

<b>PROPOSED BYLAW TEXT</b>	<b>COMMENT</b>
<p>52 ICANN will produce an annual report on the state of improvements to Accountability and Transparency.</p> <p>53 ICANN will be responsible for creating an annual report that details the status of implementation on all reviews defined in this section. This annual review implementation report will be opened for a public review and comment period that will be considered by the ICANN Board and serve as input to the continuing process of implementing the recommendations from the Review Teams defined in this section.</p>	<p>54 This is a new recommendation based on one in Accountability and Transparency Review Team 2 (ATRT2) and is more important as reviews are spread further apart.</p>
<p>55 Review Teams are established to include both a limited number of members and an open number of observers. Each SO and AC participating in the review may suggest up to seven prospective members for the Review Team. The group of chairs of the participating SOs and ACs will select a group of up to 21 Review Team members, balanced for diversity and skills, allocating at least three members from each participating SO and AC that suggests three or more prospective members. In addition, the ICANN Board may designate one Director as a member of the Review Team.</p>	<p>56 The Affirmation of Commitments has no specific requirements for the number of members from each SO and AC.</p> <p>57 The Affirmation of Commitments lets the Board and GAC Chairs designate Review Team members, and has no diversity requirement.</p>
<p>58 In the event a consensus cannot be found</p>	<p>59 While showing a preference for consensus,</p>

PROPOSED BYLAW TEXT	COMMENT
among the members, a majority vote of the members may be taken. In this case, both a majority recommendation and a minority response should be provided in the final report of the Review Team.	a resolution procedure should be defined. It is important to avoid both tyranny of the majority and capture by a minority.
60 Review Teams may also solicit and select independent experts to render advice as requested by the Review Team, and the Review Team may choose to accept or reject all or part of this advice.	61 This was not stated in the Affirmation of Commitments, but experts have been appointed to advise some Affirmation of Commitments Review Teams.
62 Each Review Team may recommend termination or amendment of its respective review.	63 This is new. A recommendation to amend or terminate an existing review would be subject to public comment, and the Empowered Community would have power to reject a change to Standard Bylaws and approve a change to Fundamental Bylaws.
<p>64 Confidential Disclosure to Review Teams:</p> <p>65 To facilitate transparency and openness regarding ICANN's deliberations and operations, the Review Teams, or a subset thereof, shall have access to ICANN internal information and documents. If ICANN refuses to reveal documents or information requested by the Review Team, ICANN must provide a justification to the Review Team. If the Review Team is not satisfied with ICANN's justification, it can appeal to the Ombudsman and/or the ICANN Board for a ruling on the disclosure request.</p> <p>66 For documents and information that ICANN does disclose to the Review Team, ICANN may designate certain documents and information as not for disclosure by the Review Team, either in its report or otherwise. If the Review Team is not satisfied with ICANN's designation of non-disclosable documents or information, it can appeal to the Ombudsman and/or the ICANN Board for a ruling on the non-disclosure designation.</p> <p>67 A confidential disclosure framework shall be published by ICANN. The confidential disclosure framework shall describe the process by which documents and information are classified, including a description of the levels of classification that</p>	71 New ability to access internal documents, with non-disclosure provisions.

PROPOSED BYLAW TEXT	COMMENT
<p>documents or information may be subject to, and the classes of persons who may access such documents and information.</p> <p>68 The confidential disclosure framework shall describe the process by which a Review Team may request access to documents and information that are designated as classified or restricted access.</p> <p>69 The confidential disclosure framework shall also describe the provisions of any non-disclosure agreement that members of a Review Team may be asked to sign.</p> <p>70 The confidential disclosure framework must provide a mechanism to escalate and/or appeal the refusal to release documents and information to duly recognized Review Teams.</p>	
<p>72 The draft report of the Review Team should describe the degree of consensus reached by the Review Team.</p>	<p>73 From public comments.</p>
<p>74 The Review Team should attempt to assign priorities to its recommendations.</p>	<p>75 Board requested prioritization of recommendations.</p>
<p>76 The draft report of the review will be published for public comment. The Review Team will consider such public comment and amend the review, as it deems appropriate before issuing its final report and forwarding the recommendations to the Board.</p>	
<p>77 The final output of all reviews will be published for public comment. The final report should include an explanation of how public comments were considered. Within six months of receipt of a recommendation, the Board shall consider approval and promptly either begin implementation or publish a written explanation for why the recommendation was not approved.</p>	<p>78 Affirmation of Commitments requires the Board to “take action” within six months. In practice, the Board has considered review recommendations and either approved or explained why it would not approve each recommendation.</p>

79 **Proposed Bylaws text for this Affirmation of Commitments review:**

PROPOSED BYLAWS TEXT FOR THIS AFFIRMATION OF COMMITMENTS REVIEW	NOTES

<p>80 <b>1. Accountability &amp; Transparency Review.</b></p> <p>81 The Board shall cause a periodic review of ICANN’s execution of its commitment to maintain and improve robust mechanisms for public input, accountability, and transparency so as to ensure that the outcomes of its decision-making will reflect the public interest and be accountable to all stakeholders.</p>	<p>82 The commitment to do a review now becomes part of the ICANN Bylaws.</p> <p>83 The second part of this sentence (“its commitment to maintain...”) clarifies an ICANN commitment that would also become part of the Bylaws.</p>
<p>84 Issues that may merit attention in this review include:</p> <p>85 (a) assessing and improving ICANN Board governance, which shall include an ongoing evaluation of Board performance, the Board selection process, the extent to which Board composition meets ICANN's present and future needs, and the consideration of an appeal mechanism for Board decisions;</p>	<p>86 Public commenter suggested making this a suggestion instead of a mandated list of topics.</p>
<p>87 (b) assessing the role and effectiveness of GAC interaction with the Board and with the broader ICANN community and making recommendations for improvement to ensure effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the DNS;</p> <p>88 (c) assessing and improving the processes by which ICANN receives public input (including adequate explanation of decisions taken and the rationale thereof);</p> <p>89 (d) assessing the extent to which ICANN’s decisions are embraced, supported, and accepted by the public and the Internet community;</p> <p>90 (e) assessing the policy development process to facilitate enhanced cross community deliberations, and effective and timely policy development; and</p> <p>91 (f) assessing and improving the Independent Review Process.</p>	<p>92 Rephrased to avoid implying a review of GAC’s effectiveness.</p>
<p>93 The Review Team shall assess the extent to which prior Accountability and Transparency review recommendations have been implemented.</p>	<p>94 Affirmation of Commitments required ATRT to assess all Affirmation of Commitments reviews.</p>

<p>95 The Review Team may recommend termination or amendment of other periodic reviews required by this section, and may recommend additional periodic reviews.</p>	<p>96 This is new. A recommendation to amend or terminate an existing review would be subject to public comment, and the Empowered Community would have power to reject a change to Standard Bylaws and approve a change to Fundamental Bylaws.</p>
<p>97 This Review Team should complete its review within one year of convening its first meeting.</p>	<p>98 New.</p>
<p>99 This periodic review shall be convened no less frequently than every five years, measured from the date the previous review was convened.</p>	<p>100 The Affirmation of Commitments required this review every three years.</p>

<p><b>PROPOSED BYLAWS TEXT FOR THIS AFFIRMATION OF COMMITMENTS REVIEW</b></p>	<p><b>NOTES</b></p>
<p>101 <b>2. Preserving Security, Stability, and Resiliency.</b></p> <p>102 The Board shall cause a periodic review of ICANN's execution of its commitment to enhance the operational stability, reliability, resiliency, security, and global interoperability of the DNS.</p> <p>103 In this review, particular attention will be paid to:</p> <p>104 (a) security, stability, and resiliency matters, both physical and network, relating to the secure and stable coordination of the Internet DNS;</p> <p>105 (b) ensuring appropriate contingency planning; and</p> <p>106 (c) maintaining clear processes.</p> <p>107 Each of the reviews conducted under this section will assess the extent to which ICANN has successfully implemented the security plan, the effectiveness of the plan to deal with actual and potential challenges and threats, and the extent to which the security plan is sufficiently robust to meet future challenges and threats to the security, stability, and resiliency of the Internet DNS, consistent with ICANN's limited technical Mission.</p>	<p>108 The new ICANN Mission Statement will include the following revision to reflect the incorporation of this AoC review into the Bylaws:</p> <p>109 <b>In this role, with respect to domain names, ICANN's Mission is to coordinate the development and implementation of policies:</b></p> <p>110 <b>- For which uniform or coordinated resolution is reasonably necessary to facilitate the openness, interoperability, resilience, security and/or stability of the DNS; and</b></p>

111 The Review Team shall assess the extent to which prior review recommendations have been implemented.	112 Make this explicit.
113 This periodic review shall be convened no less frequently than every five years, measured from the date the previous review was convened.	114 Affirmation of Commitments required this review every three years.

<b>PROPOSED BYLAWS TEXT FOR THIS AFFIRMATION OF COMMITMENTS REVIEW</b>	<b>NOTES</b>
<p>115 3. Promoting Competition, Consumer Trust, and Consumer Choice.</p> <p>116 ICANN will ensure that as it expands the Top-Level Domain (TLD) space, it will adequately address issues of competition, consumer protection, security, stability and resiliency, malicious abuse issues, sovereignty concerns, and rights protection.</p>	117 This review includes a commitment that becomes part of the ICANN Bylaws, regarding future expansions of the TLD space.
<p>118 The Board shall cause a review of ICANN's execution of this commitment after any batched round of new gTLDs have been in operation for one year.</p> <p>119 This review will examine the extent to which the expansion of gTLDs has promoted competition, consumer trust, and consumer choice, as well as effectiveness of:</p> <p>120 (a) the gTLD application and evaluation process; and</p> <p>121 (b) safeguards put in place to mitigate issues involved in the expansion.</p>	122 Re-phrased to cover future new gTLD rounds. "Batched" is used to designate a batch of applications, as opposed to continuous applications.
123 The Review Team shall assess the extent to which prior review recommendations have been implemented.	124 Make this explicit.
125 For each of its recommendations, this Review Team should indicate whether the recommendation, if accepted, must be implemented before opening subsequent rounds of gTLD expansion.	126 Board proposal, accepted by CCWG-Accountability as Option B in Dublin.

127 These periodic reviews shall be convened no less frequently than every five years, measured from the date the previous review was convened.	128 AoC also required this review 2 years after the 1st year review.
---	--

<b>PROPOSED BYLAWS TEXT FOR THIS AFFIRMATION OF COMMITMENTS REVIEW</b>	<b>NOTES</b>
129 4. Reviewing effectiveness of WHOIS/future Registration Directory Services policy and the extent to which its implementation meets the legitimate needs of law enforcement and promotes consumer trust.	130 Changed title to reflect likelihood that WHOIS will be replaced by new Registration Directory Services.
131 ICANN commits to enforcing its policy relating to the current WHOIS and any future Generic Top Level Domain (gTLD) Directory Service, subject to applicable laws, and working with the community to explore structural changes to improve accuracy and access to gTLD registration data, as well as consider safeguards for protecting data.  132 This review includes a commitment that becomes part of the ICANN Bylaws, regarding enforcement of the current WHOIS and any future gTLD Directory Service policy requirements.	133 This review includes a commitment that becomes part of the ICANN Bylaws, regarding enforcement of existing policy relating to WHOIS requirements, as proposed by the ICANN Board (1 September 2015).
134 The Board shall cause a periodic review to assess the extent to which WHOIS/Directory Services policy is effective and its implementation meets the legitimate needs of law enforcement, promotes consumer trust, and safeguards data.	135 Per Board proposal (1 September 2015).
136 This review will consider the Organization for Economic Co-operation and Development (OECD) guidelines regarding privacy, as defined by the OECD in 1980 and amended in 2013.	137 New. A public comment submission noted that OECD guidelines do not have the force of law.

138 The Review Team shall assess the extent to which prior review recommendations have been completed, and the extent to which implementation has had the intended effect.	139 Per Board proposal (1 September 2015).
140 This periodic review shall be convened no less frequently than every five years, measured from the date the previous review was convened.	141 The Affirmation of Commitments required this review every three years.

142 **Bylaws to add an IANA Function Review and Special IANA Function Review:**

<b>IANA FUNCTION REVIEW AND SPECIAL IANA FUNCTION REVIEW</b>	
143	The CWG-Stewardship recommends that Post-Transition IANA's (PTI's) performance against the ICANN-PTI contract and the Statement of Work (SOW) be reviewed as part of the IANA Function Review (IFR). The IFR would be obliged to take into account multiple input sources including community comments, IANA Customer Standing Committee (CSC) evaluations, reports submitted by the PTI, and recommendations for technical or process improvements. The outcomes of reports submitted to the CSC, reviews, and comments received on these reports during the relevant time period will be included as input to the IFR. The IFR will also review the SOW to determine if any amendments should be recommended. The IFR mandate is strictly limited to evaluation of PTI performance against the SOW and does not include any evaluation relating to policy or contracting issues that are not part of the IANA Functions Contract between ICANN and PTI or the SOW. In particular, it does not include issues related to policy development and adoption processes, or contract enforcement measures between contracted registries and ICANN.
144	The first IFR is recommended to take place no more than two years after the transition is completed. After the initial review, the periodic IFR should occur at intervals of no more than five years.
145	The IFR should be outlined in the ICANN Bylaws and included as a Fundamental Bylaw as part of the work of the CCWG-Accountability and would operate in a manner analogous to an Affirmation of Commitments review. The members of the IANA Function Review Team (IFRT) would be selected by the SOs and ACs and would include several liaisons from other communities. While the IFRT is intended to be a smaller group, it will be open to participants in much the same way as the CWG-Stewardship is.
146	While the IFR will normally be scheduled based on a regular cycle of no more than five years in line with other ICANN reviews, a Special IANA Function Review (Special IFR) may also be initiated when CSC Remedial Action Procedures (as described in the CWG-Stewardship Proposal) are followed and fail to correct the identified deficiency and the IANA Problem Resolution Process (as described in the CWG-Stewardship Proposal) is followed and fails to correct the identified deficiency. Following the exhaustion of these escalation mechanisms, the ccNSO and GNSO will be responsible for checking and reviewing the outcome of the CSC process, and the IANA Problem Resolution Process and for determining whether or not a Special IFR is necessary. After consideration, which may include a public comment period and must include meaningful consultation with other SOs and ACs, the Special IFR could be triggered. In order to trigger a Special IFR, it would require a vote of both of the ccNSO and GNSO Councils (each by a supermajority vote according to their normal procedures for determining supermajority).

147 The Special IFR will follow the same multistakeholder cross community composition and process structure as the periodic IFR. The scope of the Special IFR will be narrower than a periodic IFR, focused primarily on the identified deficiency or problem, its implications for overall IANA performance, and how that issue is best resolved. As with the periodic IFR, the Special IFR is limited to a review of the performance of the IANA Functions operation, including the CSC, but should not consider policy development and adoption processes or the relationship between ICANN and its contracted TLDs. The results of the IFR or Special IFR will not be prescribed or restricted and could include recommendations to initiate a separation process, which could result in termination or non-renewal of the IANA Functions Contract between ICANN and PTI among other actions.

148 **Composition of Review Teams for various reviews to date:**

149 <b>ATRT1</b> (14 people; 12 from AC & SOs):	157 <b>ATRT2</b> (15 people; 11 from AC & SOs)
150 1 ALAC	158 2 ALAC
151 2 GAC	159 3 GAC
152 1 ASO	160 1 SSAC
153 3 ccNSO	161 1 ASO
154 5 GNSO	162 2 ccNSO
155 ICANN Board Chair or designee	163 2 GNSO
156 Assistant Secretary for NTIA	164 2 Experts
	165 ICANN Board Chairman or designee
	166 Assistant Secretary for NTIA
167 <b>SSR</b> (15 people; 12 from AC & SOs):	177 <b>WHOIS</b> (13 people; 9 from AC & SOs):
168 1 ALAC	178 2 ALAC
169 1 GAC	179 1 GAC
170 2 SSAC	180 1 SSAC
171 1 RSSAC	181 1 ASO
172 2 ASO	182 1 ccNSO
173 3 ccNSO	183 3 GNSO
174 2 GNSO	184 3 Experts/Law Enforcement
175 2 Experts	185 ICANN CEO or designated nominee
176 ICANN CEO or designee	

## 4. Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”

- The AoC text for Competition, Consumer Trust & Consumer Choice review is reintroduced.
- All AoC reviews (and the IFR and Special IFR) should be incorporated into the Bylaws.

- The WP-IRP IOT will examine the suggestion to include a mid-term review of the IRP. The ATRT scope will be expanded to suggest a review of the IRP (paragraph 89).
- The representation and number of seats on Review Teams that relate to gTLD reviews will remain unchanged from the Third Draft Proposal (paragraph 54).
- The Board amendment on WHOIS/future Registration Directory Services policy (paragraph 127) should be included.
- The ICANN Articles of Incorporation address ICANN's state of incorporation (or corporate domicile), and the ICANN Bylaws (Article XVIII) address the separate issue of the location of ICANN's principal office. Article XVIII of the ICANN Bylaws will be classified as a Standard Bylaw (see paragraph 5).
- The Board suggestion regarding AoC reviews operational standards to be developed as part of implementation should be included on the understanding that Recommendation #9 would be respected and that this text would address implementation details only (see paragraph 8).
- CCWG-Accountability lawyers advised clarifying "diversity" in paragraph 54 regarding composition of AoC Review Teams. CCWG-Accountability notes that "diversity" considerations could include geography, skills, gender, etc., and that chairs of participating ACs and SOs should have flexibility in their consideration of factors in selecting Review Team members.
- CCWG-Accountability lawyers suggested "the group of chairs can solicit additional nominees or appoint less than 21 members to avoid potential overrepresentation of particular ACs or SOs if some nominate less than 3 members." The CCWG-Accountability proposed "up to 21", so it is not actually proposing a fixed number of Review Team members. "Fixed" has been replaced with "limited" in paragraph 54. CCWG-Accountability purposely allowed AC/SO chairs to select additional Review Team members from ACs/SOs that had offered more than 3 candidates. This is to accommodate ACs/SOs that had greater interest in a review, such as the GNSO, which would be the most concerned with reviews of new gTLDs and WHOIS/Directory Services. Therefore, the representation and number of seats on the Review Team will remain unchanged from the Third Draft Proposal.
- Replaced "participants" with "observers" in paragraph 54.

## 5. Stress Tests Related to this Recommendation

- ST9, 11, 17
- ST3, 4
- ST 14
- ST20, 22

## 6. How does this meet the CWG-Stewardship Requirements?

- The CWG-Stewardship has proposed an IFR and Special IFR that should be added to the ICANN Bylaws as a Fundamental Bylaw. The CCWG-Accountability's recommendations include this as part of the reviews to be added to the ICANN Bylaws.

## 7. How does this address NTIA Criteria?

### 186 **Support and enhance the multistakeholder model.**

- Reinforcing multistakeholder nature of the organization by incorporating into its principles the commitment to remaining a nonprofit, public benefit corporation that operates under transparent and bottom-up, multistakeholder policy development processes; includes business stakeholders, civil society, the technical community, academia, and end users; and seeks input from the public for whose benefit ICANN shall in all events act.
  - Reflecting the functional, geographic, and cultural diversity of the Internet at all levels of policy development and decision-making to ensure that the bottom-up, multistakeholder policy development process fully addresses this criterion.
- 

### 187 **Maintain the security, stability and resiliency of the Internet DNS.**

- Maintaining nonprofit public benefit corporation status and headquarters in the U.S.
  - Adding Bylaw requirement that ICANN produce an annual report on the state of improvements to Accountability and Transparency.
  - Publishing analyses of the positive and negative effects of its decisions on the public, including any financial or non-financial impact on the public, and the positive or negative impact (if any) on the systemic security, stability, and resiliency of the DNS.
  - Including the commitment to preserve and enhance the neutral and judgment-free operation of the DNS, and the operational stability, reliability, security, global interoperability, resilience, and openness of the DNS and the Internet.
  - Incorporating Affirmation of Commitments reviews into Bylaws and, in particular, the security, stability, and resiliency of the DNS review.
- 

### 188 **Meet the needs and expectation of the global customers and partners of the IANA services.**

- Transferring Affirmation of Commitments that ICANN preserve and enhance the neutral and judgment free operation of the DNS, and the operational stability, reliability, security, global interoperability, resilience, and openness of the DNS and the Internet as well maintain the capacity and ability to coordinate the DNS at the overall level and to work for the maintenance of a single, interoperable Internet.

- Solidifying commitment to maintain the capacity and ability to coordinate the DNS at the overall level and to work for the maintenance of a single, interoperable Internet. The criteria is also addressed through the Bylaw addition: ICANN will ensure that as it expands the TLD space, it will adequately address issues of competition, consumer protection, security, stability and resiliency, malicious abuse issues, sovereignty concerns, and rights protection.
  - Visibility in finance and accountability reporting.
- 

189 **Maintain the openness of the Internet.**

- Convening a Community Forum where all would be welcome to participate as a potential step.
  - All are welcome to participate in the consultation process that organized to elaborate these key documents.
- 

190 **NTIA will not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution.**

- Adding commitment to seek and support broad, informed participation reflecting the functional, geographic, and cultural diversity of the Internet at all levels of policy development and decision-making to ensure that the bottom-up, multistakeholder policy development process is used to ascertain the global public interest and that those processes are accountable and transparent.
  - Producing an annual report on the state of improvements to Accountability and Transparency and adhering to transparent and accountable budgeting processes, providing advance notice to facilitate stakeholder engagement in policy decision-making.
-

# Annex 10 – Recommendation #10: Enhancing the Accountability of Supporting Organizations and Advisory Committees

---

## 1. Summary

- 01 The CCWG-Accountability recommends addressing the accountability of Supporting Organizations (SOs) and Advisory Committees (ACs) in a two-stage approach:
- In Work Stream 1: Include the review of SO and AC accountability mechanisms in the independent structural reviews performed on a regular basis.
  - In Work Stream 2: Include the subject of SO and AC accountability as part of the work on the Accountability and Transparency Review process.

## 2. CCWG-Accountability Recommendations

- 02 Having reviewed and inventoried the existing mechanisms related to SO and AC accountability, it is clear that the current mechanisms need to be enhanced in light of the new responsibilities associated with the Work Stream 1 recommendations.
- 03 The CCWG-Accountability recommends the following.

### 04 **Work Stream 1:**

- 05 Include the review of SO and AC accountability mechanisms in the independent periodical structural reviews that are performed on a regular basis.
- These reviews should include consideration of the mechanisms that each SO and AC has in place to be accountable to their respective Constituencies, Stakeholder Groups, Regional At-Large Organizations, etc.
  - This recommendation can be implemented through an amendment of Section 4 of Article IV of the ICANN Bylaws, which currently describes the goal of these reviews as:

*The goal of the review, to be undertaken pursuant to such criteria and standards as the Board shall direct, shall be to determine (i) whether that organization has a continuing purpose in the ICANN structure, and (ii) if so, whether any change in structure or operations is desirable to improve its effectiveness.*

- The periodic review of ICANN Accountability and Transparency required under the Affirmation of Commitments is being incorporated into the ICANN Bylaws as part of Work

Stream 1. In Recommendation #9: Incorporating the Affirmation of Commitments in ICANN's Bylaws, the Accountability and Transparency Review will include the following among the issues that merit attention in the review:

*assessing the role and effectiveness of GAC interaction with the Board and with the broader ICANN community, and making recommendations for improvement to ensure effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the DNS*

06 **Work Stream 2:**

07 Include the subject of SO and AC accountability as part of the Accountability and Transparency Review process.

- Evaluate the proposed “Mutual Accountability Roundtable” to assess its viability and, if viable, undertake the necessary actions to implement it.<sup>1</sup>
- Develop a detailed working plan on enhancing SO and AC accountability taking into consideration the comments made during the public comment period on the Third Draft Proposal.
- Assess whether the Independent Review Process (IRP) would also be applicable to SO and AC activities.

### 3. Detailed Explanation of Recommendations

08 As the community's power is enhanced, legitimate concerns have arisen regarding the accountability of the community (organized as SOs and ACs) in using those powers. In other words, “Who watches the watchers?”

09 In response to these concerns, the CCWG-Accountability:

- Identified the existing accountability mechanisms in place for SOs and ACs.
- Reviewed existing mechanisms in order to assess whether and how they address the concerns expressed by the community during the First Public Comment Period.
- Built a list of steps to enhance SO and AC accountability that should be addressed in Work Stream 1 and Work Stream 2.

---

<sup>1</sup> CCWG-Accountability Advisor Willie Currie introduced a short description of the mutual accountability roundtable: *The idea of mutual accountability is that multiple actors are accountable to each other. How might this work in ICANN? It would be necessary to carve out a space within the various forms of accountability undertaken within ICANN that are of the principal-agent variety. So where the new Community Powers construct the community as a principal who calls the Board as agent to account, a line of mutual accountability would enable all ICANN structures to call one another to account. So one could imagine a Mutual Accountability Roundtable that meets at each ICANN meeting, perhaps replacing the current Public Forum. The form would be a roundtable of the Board, CEO, and all Supporting Organizations and Advisory Committees, represented by their chairpersons. The roundtable would designate a chairperson for the roundtable from year to year who would be responsible for facilitating each Mutual Accountability Roundtable. Each Roundtable may pick one or two key topics to examine. Each participant could give an account of how his or her constituency addressed the issue, indicating what worked and didn't work. This could be followed by a discussion on how to improve matters of performance. The purpose would be to create a space for mutual accountability as well as a learning space for improvement.*

10 A review of existing ICANN documentation shows that the provisions that oblige SOs and ACs to be held accountable to their Constituents or the larger Internet community with regard to their actions, decisions, or advice, are limited in number and scope.

11 The reviewed documents were:

1. [ICANN Bylaws](#)

ICANN Bylaws state that each SO and AC shall establish its own charter and procedural documents. Further research needs to be done at the SO and AC level to verify existing accountability mechanisms put in place for each SO and AC.

It is also important to review whether SOs and ACs should be added to specific sections in the Bylaws as subject to provisions applicable to ICANN as a corporation. For example, it should be reviewed and discussed if Core Values should be applicable not only to the corporation's actions, but also to SO and AC activities.

2. [The Affirmation of Commitments](#)

The Affirmation of Commitments includes some key commitments that while oriented to ICANN as an organization, should also apply to the SOs and ACs that form the wider ICANN organizational structure as defined in ICANN's Bylaws.

The identified mechanisms or criteria in the Affirmation of Commitments by which SOs and ACs should conduct their work in relation to the DNS are: paragraph 3 and paragraph 9.

3. [ATRT 1 Recommendations](#) and [ATRT 2 Recommendations](#)

The Accountability and Transparency Reviews have made no direct recommendations with regard to SO and AC transparency or accountability.

4. [Operational Rules and Procedures of the Various Supporting Organizations and Advisory Committees](#)

Having inventoried the existing mechanisms related to SO and AC accountability in light of the new responsibilities associated with the Work Stream 1 Proposals, it became clear that the current framework for SO and AC accountability needed to be enhanced.

The aim of the enhancements is to ensure that SOs and ACs are accountable not only to their current members but also to the wider communities that these bodies are designed to represent.

12 Having reviewed and inventoried the existing mechanisms related to SO and AC accountability, it is clear that the current mechanisms need to be enhanced in light of the new responsibilities associated with the Work Stream 1 recommendations.

13 The CCWG-Accountability recommends the following.

14 **Work Stream 1:**

- 15 Include the review of SO and AC accountability mechanisms in the independent periodic structural reviews that are performed on a regular basis.
- These reviews should include consideration of the mechanisms that each SO and AC has in place to be accountable to their respective Constituencies, Stakeholder Groups, Regional At-Large Organizations, etc.
  - This recommendation can be implemented through an amendment of Section 4 of Article IV of the ICANN Bylaws, which currently describes the goal of these reviews as:  
*The goal of the review, to be undertaken pursuant to such criteria and standards as the Board shall direct, shall be to determine (i) whether that organization has a continuing purpose in the ICANN structure, and (ii) if so, whether any change in structure or operations is desirable to improve its effectiveness.*
  - The periodic review of ICANN Accountability and Transparency required under the Affirmation of Commitments is being incorporated into the ICANN Bylaws as part of Work Stream 1. In Recommendation #9: Incorporating the Affirmation of Commitments in ICANN's Bylaws, the Accountability and Transparency Review will include the following among the issues that merit attention in the review:  
*assessing the role and effectiveness of GAC interaction with the Board and with the broader ICANN community, and making recommendations for improvement to ensure effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the DNS*
- 16 **Work Stream 2:**
- 17 Include the subject of SO and AC accountability as part of the Accountability and Transparency Review process.
- Evaluate the proposed “Mutual Accountability Roundtable” to assess its viability and, if viable, undertake the necessary actions to implement it.<sup>2</sup>
  - Develop a detailed working plan on enhancing SO and AC accountability taking into consideration the comments made during the public comment period on the Third Draft Proposal.
  - Assess whether the Independent Review Process (IRP) would also be applicable to SO and AC activities.

## 4. Changes Made Since the Third Draft Proposal

- Added: The periodic review of ICANN Accountability and Transparency required under the Affirmation of Commitments is being incorporated into the ICANN Bylaws as part of Work Stream 1. In Recommendation #9: Incorporating the Affirmation of Commitments in ICANN's Bylaws, the Accountability and Transparency Review will include the following

---

<sup>2</sup> See the short description of the mutual accountability roundtable provided by CCWG-Accountability Advisor Willie Currie in footnote 1, above.

among the issues that merit attention in the review:

*assessing the role and effectiveness of GAC interaction with the Board and with the broader ICANN community, and making recommendations for improvement to ensure effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the DNS*

- In Work Stream 2 recommendations, added: Develop a detailed working plan on enhancing SO and AC accountability taking into consideration the comments made during the public comment period on the Third Draft Proposal.

## 5. Stress Tests Related to this Recommendation

- ST12
- ST33
- ST34

## 6. How does this meet the CWG-Stewardship Requirements?

- N/A

## 7. How does this address NTIA Criteria?

### 18 Support and enhance the multistakeholder model.

- Enhancements of ICANN's accountability are all enhancements to ICANN's overall multistakeholder model. Greater accountability of SOs and ACs to their members and stakeholders is a part of enhancing the wider multistakeholder model of ICANN.

---

### 19 Maintain the security, stability and resiliency of the Internet DNS.

- N/A

---

### 20 Meet the needs and expectation of the global customers and partners of the IANA services.

- N/A

---

21 **Maintain the openness of the Internet.**

- N/A

---

22 **NTIA will not accept a proposal that replaces the NTIA role with a government-led or an intergovernmental organization solution.**

- The proposals for enhanced SO and AC accountability are based on mutual accountability enhancements, instead of accountability towards a government-led or intergovernmental organization. Governments are recognized as key stakeholders, especially in their role with regard to public policy.
-

# Annex 11 – Recommendation #11: Board Obligations with Regard to Governmental Advisory Committee Advice (Stress Test #18)

---

## 1. Summary

- 1 Currently, Governmental Advisory Committee (GAC) advice to the ICANN Board has special status as described in the ICANN Bylaws Article XI, Section 2:

*j. The advice of the Governmental Advisory Committee on public policy matters shall be duly taken into account, both in the formulation and adoption of policies. In the event that the ICANN Board determines to take an action that is not consistent with the Governmental Advisory Committee advice, it shall so inform the Committee and state the reasons why it decided not to follow that advice. The Governmental Advisory Committee and the ICANN Board will then try, in good faith and in a timely and efficient manner, to find a mutually acceptable solution.*

- 2 Stress Test #18 considers a scenario where ICANN's GAC would amend its operating procedures to change from consensus decisions (no objections) to majority voting for advice to the ICANN Board. Since the Board must seek a mutually acceptable solution if it rejects GAC advice, concerns were raised that the ICANN Board could be forced to arbitrate among sovereign governments if they were divided in their support for the GAC advice on public policy matters.
- 3 In addition, if the GAC lowered its decision threshold while also participating in the new Empowered Community (if the GAC chooses to so participate), some stakeholders believe that this could increase government influence over ICANN.
- 4 In order to mitigate these concerns, the CCWG-Accountability is recommending changes be made to the ICANN Bylaws relating to GAC advice.

## 2. CCWG-Accountability Recommendations

- 5 The CCWG-Accountability recommends that the following changes be made to the ICANN Bylaws Article XI, Section 2 (emphasis added):
- 6 *j. The advice of the Governmental Advisory Committee on public policy matters shall be duly taken into account, both in the formulation and adoption of policies. In the event that the ICANN Board determines to take an action that is not consistent with the Governmental Advisory Committee advice, it shall so inform the Committee and state the reasons why it decided not to follow that advice. **Any Governmental Advisory Committee advice approved by a full Governmental Advisory Committee consensus, understood to mean the practice of***

**adopting decisions by general agreement in the absence of any formal objection, may only be rejected by a vote of 60% of the Board**, and the Governmental Advisory Committee and the ICANN Board will then try, in good faith and in a timely and efficient manner, to find a mutually acceptable solution.

- 7 This recommendation is intended only to limit the conditions under which the ICANN Board and GAC must “try to find a mutually acceptable solution,” as required in ICANN’s current Bylaws. This recommendation shall not create any new obligations for the ICANN Board to consider, vote upon, or to implement GAC advice, relative to the Bylaws in effect prior to the IANA Stewardship Transition. This recommendation does not create any presumption or modify the standard applied by the Board in reviewing GAC advice.
- 8 The GAC has the autonomy to refine its operating procedures to specify how objections are raised and considered (for example, disallowing a single country to continue an objection on the same issue if no other countries will join in an objection). When transmitting consensus advice to the ICANN Board for which the GAC seeks to receive special consideration, the GAC has the obligation to confirm the lack of any formal objection.
- 9 The CCWG-Accountability recommends inserting a requirement that all ACs provide a rationale for their advice. A rationale must be provided for formal advice provided by an Advisory Committee to the ICANN Board. The Board shall have the responsibility to determine whether the rationale provided is adequate to enable determination of whether following that advice would be consistent with ICANN’s Bylaws.
- 10 To address concerns regarding GAC advice that is inconsistent with the ICANN Bylaws, the CCWG-Accountability recommends adding this clarification for legal counsel to consider when drafting Bylaws language:

*ICANN cannot take action - based on advice or otherwise – that is inconsistent with its Bylaws. While the GAC is not restricted as to the advice it can offer to ICANN, it is clear that ICANN may not take action that is inconsistent with its Bylaws. Any aggrieved party or the Empowered Community will have standing to bring claims through the IRP that the Board acted (or failed to act) in a manner inconsistent with the ICANN Articles of Incorporation or Bylaws, even if the Board acted on GAC advice.*

- 11 Note: The language proposed in recommendations for ICANN Bylaw revisions are conceptual in nature at this stage. The CCWG-Accountability’s external legal counsel and the ICANN legal team will draft final language for these revisions to the Articles of Incorporation and Bylaws.

## 3. Detailed Explanation of Recommendations

### 12 Background

- 13 Stress Test #18 is related to a scenario where ICANN's GAC would amend its operating procedures to change from consensus decisions to majority voting for advice to the ICANN Board. Since the ICANN Board must seek a mutually acceptable solution if it rejects GAC advice, concerns were raised that the Board could be forced to arbitrate among sovereign governments if they were divided in their support for the GAC advice. In addition, if the GAC lowered its decision threshold while also participating in the Empowered Community (if the GAC chooses to so participate), some stakeholders believe this could inappropriately increase government influence over ICANN.
- 14 The goal of the recommendation is also to reflect the principles, derived from the [GAC Dublin Communiqué](#), and agreed upon by the CCWG-Accountability when investigating further on Stress Test #18:
- The GAC may define its own rules.
  - The GAC is committed to working by consensus.
  - The GAC will not work on the basis of a simple majority for GAC advice.
  - The Board has the ability to disagree with GAC advice, after trying to find a mutually acceptable solution.
  - GAC advice needs to provide clear direction and provide a rationale.

## Process and Considerations Leading Up to the Recommendation

- 15 The Second Draft Proposal drew a significant number of comments, with a majority in support of the proposed Bylaws change and with objections from several governments. After the close of the second round of public comments, other governments expressed their concerns regarding the proposed Bylaws change.
- 16 The CCWG-Accountability also received communication from the GAC after its Dublin meeting, as part of its communiqué, which stated:

*“The discussions on Stress Test #18 have helped the Governmental Advisory Committee to have a better understanding of the different views on the issue. In assessing the different rationales presented so far related to Stress Test #18, the Governmental Advisory Committee considered:*

- The need that each and every AC ensures that the advice provided is clear and reflects the consensus view of the Committee.
- The need that each and every AC should preserve its own autonomy in its definition of consensus.
- The value the Board attributes to receiving consensus advice.
- The recommendation of the Board-GAC Recommendation Implementation Working Group, as reiterated by the Accountability and Transparency Review Team 2 (ATRT2), to set the threshold for the ICANN Board to reject GAC advice to a 2/3 majority voting, consistent with the threshold established for rejection of Country Code Names Supporting Organization and Generic Names Supporting Organization Policy Development Process recommendations.”

- 17 Following the Second Public Comment Period, and the input received from the GAC Communiqué in Dublin, the CCWG-Accountability organized a specific Subgroup to:
- Assess existing options, and areas of agreement/disagreement.
  - Provide the full CCWG-Accountability with a brief summary of views and options.
  - Report to the CCWG-Accountability so that consensus can be assessed around how to respond to Stress Test #18, which identified the risk that GAC could change its decision-making rule and thereby require the ICANN Board to arbitrate among sovereign governments.
- 18 Within this Subgroup, the following conclusions were agreed upon:
- The GAC may define its own rules.
  - The GAC is committed to working by consensus.
  - The GAC will not work on the basis of a simple majority for GAC advice.
  - The Board has the ability to disagree with GAC advice, after trying to find a mutually acceptable solution.
  - GAC advice needs to provide clear direction and provide a rationale.

19 **Alternative options considered and rejected**

20 Within this group, several options were introduced and considered.

21 Brazil introduced a proposal with the following Bylaw changes:

*[...] Where the ICANN Board is obliged to pay due deference to advice from Advisory Committees and where that advice, if not followed, requires finding mutually agreed solutions for implementation of that advice, the Advisory Committee will make every effort to ensure that the advice provided is clear and reflects the consensus view of the committee. In this context, each Advisory Committee has the right to determine its particular definition of consensus.” [...]*

*[...] Any Governmental Advisory Committee Advice approved by a Governmental Advisory Committee consensus may only be rejected by a vote of more than two-thirds (2/3) of the Board. The Governmental Advisory Committee and the ICANN Board will then try, in good faith and in a timely and efficient manner, to find a mutually acceptable solution. [...]*

22 After discussions within the Subgroup, and concerns raised by some stakeholders that the Brazil proposal would create stronger obligations for the ICANN Board while not providing enough guarantees that the GAC decision-making would remain strongly focused on consensus, a proposal based on initial drafting by Denmark and enhanced by a group of European GAC members, was considered (emphasis added):

*“The advice of the Governmental Advisory Committee on public policy matters shall be duly taken into account, both in the formulation and adoption of policies.*

*In the event that the ICANN Board determines to take an action that is not consistent with the Governmental Advisory Committee advice, it shall so inform the Committee and state the reasons why it decided not to follow that advice.*

*Any Governmental Advisory Committee advice approved by a **full Governmental Advisory Committee consensus, understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection, may only be rejected by a vote of two-thirds of the Board.***

*Any advice approved by the Governmental Advisory Committee by consensus with objections only from a very small minority of Governmental Advisory Committee members, may be rejected by a majority vote of the Board.*

*In both instances, the Governmental Advisory Committee and the ICANN Board will try, in good faith and in a timely and efficient manner, to find a mutually acceptable solution.”*

- 23 Several stakeholders supported an amendment to this proposal to remove the words “Any advice approved by the Governmental Advisory Committee by consensus with objections only from a very small minority of Governmental Advisory Committee members, may be rejected by a majority vote of the ICANN Board.” It was met with support as well as resistance, with the argument that this would not address the concerns expressed during the Second Public Comment Period about the lack of flexibility regarding GAC decision-making procedures.
- 24 As some participants remained concerned about the introduction of the 2/3 decision-making threshold for the ICANN Board, a compromise proposal was introduced as such (emphasis added):

*“j. The advice of the Governmental Advisory Committee on public policy matters shall be duly taken into account, both in the formulation and adoption of policies.*

*In the event that the ICANN Board determines to take an action that is not consistent with the Governmental Advisory Committee advice, it shall so inform the Committee and state the reasons why it decided not to follow that advice.*

*Governmental Advisory Committee **advice which enjoys broad support of Governmental Advisory Committee members in the absence of significant objection** may be rejected by a majority vote of the Board.*

*In this case, the Governmental Advisory Committee and the ICANN Board will try, in good faith and in a timely and efficient manner, to find a mutually acceptable solution”.*

- 25 This compromise proposal was submitted to the CCWG-Accountability on 24 November 2015. After thorough discussion, while some stakeholders expressed their willingness to accept the proposal as a compromise, significant objections remained. The co-Chairs assessed that the level of support was insufficient to call rough consensus on this proposal.
- 26 When discussing the way forward within the CCWG-Accountability on 26 November 2015, the group took stock of the past discussions and noted the [statement by Larry Strickling of NTIA](#) from 25 November about Stress Test #18. A proposal was introduced jointly by Denmark and Keith Drazek (ICG Liaison).
- 27 After being unable to reach consensus on the two-thirds proposal, in January 2016 the CCWG-Accountability re-launched the discussions to identify a consensus position for Recommendation #11. In early February, the CCWG-Accountability concluded that the consensus position should include the clarifications made to the version of Recommendation #11 in the Third Draft Proposal (no new obligations, rationale and conformity with ICANN Bylaws) and change the 2/3 threshold to 60%. Additionally, as part of the compromise, an exception was added in

Recommendations #1 and #2 that the GAC, should it decide to be a Decisional Participant in the Empowered Community, would not be able to participate as a decision-maker in the Empowered Community’s exercise of a Community Power to challenge the ICANN Board’s implementation of GAC consensus advice; however, the GAC would be able to participate in an advisory capacity in all other aspects of the escalation process.

28 **The Stress Test which encompasses this is now:**

29	<b>Stress Test #18:</b> Governments in ICANN’s Governmental Advisory Committee (GAC) amend their operating procedures to change from consensus decisions to majority voting for advice to ICANN’s Board	
30	<b>Consequence(s):</b> Under current Bylaws, ICANN must consider and respond to Governmental Advisory Committee advice, even if that advice were not supported by consensus. A majority of governments could thereby approve Governmental Advisory Committee advice.	
	<b>EXISTING ACCOUNTABILITY MEASURES</b>	<b>PROPOSED ACCOUNTABILITY MEASURES</b>
31	Current ICANN Bylaws (Article XI) require ICANN to try to find a mutually acceptable solution for Governmental Advisory Committee advice.	35 The proposed measure would amend ICANN Bylaws (Article XI, Section 2, item 1j) to require trying to find a mutually acceptable solution only where
32	Today, Governmental Advisory Committee adopts formal advice according to its Operating Principle 47: <i>“consensus is understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection.”</i>	Governmental Advisory Committee advice was supported by full Governmental Advisory Committee consensus, understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection.
33	The Governmental Advisory Committee may at any time change its procedures instead of its present consensus rule.	36 The proposed accountability measure recognizes that the decision not to follow GAC consensus advice would require a 60% majority of the ICANN Board.
34	The requirement to try to find a mutually acceptable solution in the current Bylaws would then apply, not just for Governmental Advisory Committee consensus advice.	37 The Governmental Advisory Committee can still give ICANN advice at any time, with or without full consensus.
		38 Recognizing the general principle that an AC should have the autonomy to refine its Operating Procedures, the Governmental Advisory Committee could specify how objections are raised and considered.

39 **Why is the CCWG-Accountability Recommending This?**

40 Stress Test #18 was among the plausible scenarios that could test how and whether the ICANN community could challenge actions taken by the ICANN Board. The rationale to develop this stress test involves two factors:

1. ICANN community members were aware that some GAC members had expressed a desire to change the GAC's historical method of using consensus for its decision-making, where "consensus is understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection." Moreover, it would take only a simple majority of GAC members to change its decision-making methods to a lesser standard.
  2. The CCWG-Accountability realized that ICANN's present Bylaws obligate the ICANN Board to try to find "a mutually acceptable solution" if it decided not to follow GAC advice. That level of required deference is unique to the GAC and not required for advice from other SOs and ACs. Importantly, the ICANN Board's obligation to seek a mutually acceptable solution applies to all GAC advice, even if that advice was not supported by GAC consensus or was opposed by a significant minority of GAC members.
- 41 For these reasons, the CCWG-Accountability added Stress Test #18 to the First Draft Proposal, and the Stress Test Working Party concluded that existing accountability measures were not adequate to let the community hold the ICANN Board accountable for its actions if the Board were obliged to seek a negotiated solution with the GAC.
- 42 In order to address Stress Test #18, the CCWG-Accountability proposed an amendment to the ICANN Bylaws regarding the ICANN Board's obligations with respect to GAC advice. The amendment would preserve the requirement for the ICANN Board to seek a mutually acceptable solution, but only for GAC advice that was supported by consensus among GAC members.
- 43 The GAC advice that is opposed by a significant minority of governments should not trigger the ICANN Board's obligation to enter bi-lateral negotiations with the GAC on a matter that affects the global Internet community. A negotiation between the ICANN Board and the GAC should be mandatory only for resolving differences between ICANN and governments, not to resolve differences among governments themselves.
- 44 As a corollary to the importance of consensus GAC advice, the proposal includes a requirement that the Board would need a 60% majority to decide not to follow consensus GAC advice.
- 45 To avoid any ambiguity, when transmitting consensus advice to the ICANN Board for which the GAC seeks to receive special consideration, the GAC has the obligation to confirm the lack of any formal objection among GAC members.
- 46 The proposed Bylaws change is aligned with the practice presently used by the GAC, which uses the following consensus rule for its decisions:
- "Consensus is understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection."*
- 47 The proposed Bylaws change recognizes that the GAC may, at its discretion, amend its [Operating Principle 47](#) regarding "Provision of Advice to the ICANN Board." Similar rules for consensus policy and advice are already present in the ICANN Bylaws, which require supermajority support for policy recommendations coming from GNSO and ccNSO.
- 48 The proposed Bylaws change for Stress Test #18 does not interfere with the GAC's method of decision-making. The GAC has the autonomy to refine its operating procedures to specify how objections are raised and considered (for example, disallowing a single country to continue an objection on the same issue if no other countries will join in an objection).
- 49 If the GAC decided to adopt advice by methods other than a consensus process, ICANN would still be obligated to give GAC advice due consideration: "advice shall be duly taken into account, both in the formulation and adoption of policies."

- 50 Moreover, ICANN would still have to explain why it chose not to follow GAC advice: “In the event that the ICANN Board determines to take an action that is not consistent with the Governmental Advisory Committee advice, it shall so inform the Committee and state the reasons why it decided not to follow that advice”.
- 51 The only effect of this Bylaws change is to limit the kind of advice where ICANN is obligated to “try, in good faith and in a timely and efficient manner, to find a mutually acceptable solution.” That delicate and sometimes difficult consultation requirement would only apply for GAC advice that was approved by consensus among GAC members.
- 52 It is important to note that although this was the only proposal that would allow the CCWG-Accountability to achieve consensus on this topic, it was not unanimously supported. A number of dissenters amongst members and participants thought this proposal was overly restrictive and discriminatory toward the GAC, while others thought that if the GAC wanted to keep its privileged AC status, then it should not be allowed to be a Decisional Participant.

## 4. Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”

- Changed the 2/3rds threshold for the Board rejecting GAC consensus advice to 60%. As part of the compromise, this required changes in Recommendations #1 and #2 to implement a GAC “carve out”.

## 5. Stress Tests Related to this Recommendation

- Stress Test #18: Governments in ICANN’s GAC can amend their operating procedures to change from consensus decisions to majority voting for advice to ICANN’s Board.

## 6. How does this meet the CWG-Stewardship Requirements?

- N/A

## 7. How does this address NTIA Criteria?

- NTIA gave specific requirements for this transition, including advice that Stress Test #18 is a direct test of the requirement to avoid significant expansion of the role of governments in ICANN decision-making. The proposed Bylaws change is therefore an important part of the Proposal.

- 
- By ensuring that the provision of GAC advice remains a consensus-driven decision, the Proposal provides a safeguard against the possibility of a large group of governments trying to overly influence the ICANN Board.
- 

- At the same time, the Proposal would enable the GAC, if it ever came to a point where a single government would abuse its ability to formally object to veto public policy advice, to amend its operating principles to address this contingency. The principles adopted would however be required to fit with the consensus requirement stated in the Bylaws.
-

# Annex 12 – Recommendation #12: Committing to Further Accountability Work in Work Stream 2

---

## 1. Summary

- 01 The CCWG-Accountability Work Stream 2 is focused on addressing those accountability topics for which a timeline for developing solutions may extend beyond the IANA Stewardship Transition.
- 02 As part of Work Stream 2, the CCWG-Accountability proposes that further enhancements be made to a number of designated mechanisms:
  - Considering improvements to ICANN’s standards for diversity at all levels.
  - Staff accountability.
  - Supporting Organizations and Advisory Committee accountability.
  - Improving ICANN’s transparency with a focus on:
    - Enhancements to ICANN’s existing Documentary Information Disclosure Policy (DIDP).
    - Transparency of ICANN’s interactions with governments.
    - Improvements to the existing whistleblower policy.
    - Transparency of Board deliberations.
  - Developing and clarifying a Framework of Interpretation for ICANN’s Human Rights commitment and proposed Draft Bylaw.
  - Addressing jurisdiction-related questions, namely: “Can ICANN’s accountability be enhanced depending on the laws applicable to its actions?” The CCWG-Accountability anticipates focusing on the question of applicable law for contracts and dispute settlements.
  - Considering enhancements to the Ombudsman’s role and function.
- 03 The CCWG-Accountability expects to begin refining the scope of Work Stream 2 during the upcoming [ICANN55 Meeting](#) in March 2016. It is intended that Work Stream 2 recommendations will be published for comments by the end of 2016.
- 04 The community raised concerns that after the IANA Stewardship Transition, there may be a lack of incentive for ICANN to implement the proposal arising out of Work Stream 2. To prevent this scenario, the CCWG-Accountability recommends that the ICANN Board adopt an Interim Bylaw that would commit ICANN to consider the CCWG-Accountability Work Stream 2 recommendations according to the same process and criteria it has committed to use to consider the Work Stream 1 recommendations. In a [letter](#) dated 13 November 2015, the ICANN

Board confirmed its intent to work with the ICANN community and to provide adequate support for work on these issues.

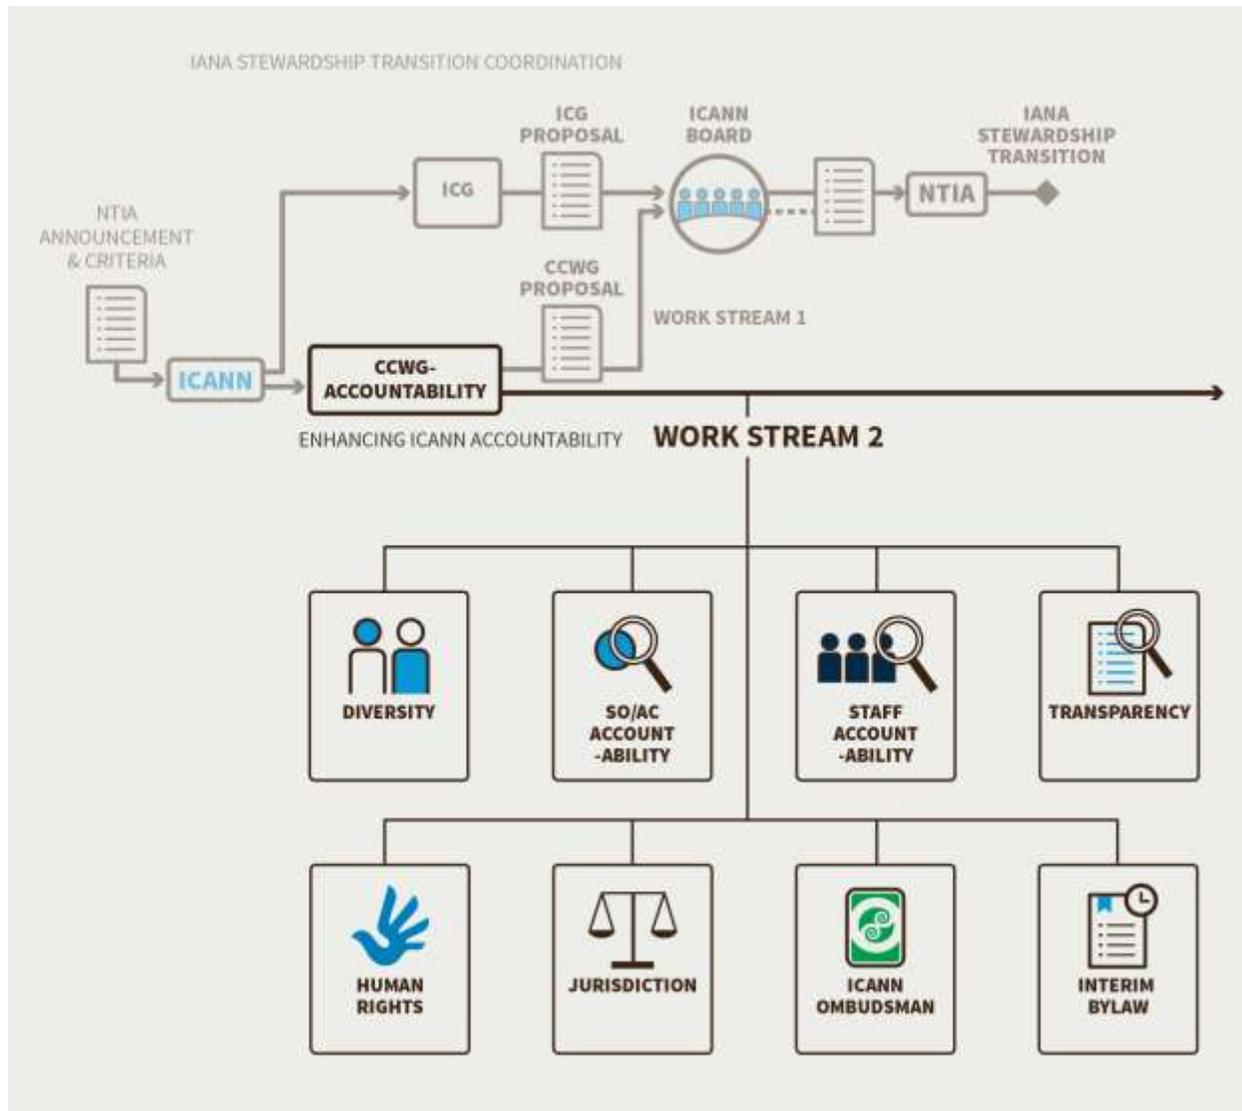

## 2. CCWG-Accountability Recommendations

05 The CCWG-Accountability recommends that the Board adopt an Interim Bylaw that would commit ICANN to consider the CCWG-Accountability consensus recommendations according to the same process and criteria it has committed to use to consider the Work Stream 1 recommendations. The Bylaw would task the group with creating further enhancements to ICANN's accountability limited to the Work Stream 2 list of issues:

- Considering improvements to ICANN's standards for diversity at all levels.
- Staff accountability.
- Supporting Organizations and Advisory Committee accountability.
  - Include the subject of SO and AC accountability as part of the work on the Accountability and Transparency Review process.
  - Evaluate the proposed "Mutual Accountability Roundtable" to assess viability.
  - Propose a detailed working plan on enhancing SO and AC accountability as part of Work Stream 2.
  - Assess whether the IRP would also be applicable to SO and AC activities.
- Improving ICANN's transparency with a focus on:
  - Enhancements to ICANN's existing DIDP.
  - Transparency of ICANN's interactions with governments.
  - Improvements to the existing whistleblower policy.
  - Transparency of Board deliberations.
- Developing and clarifying a Framework of Interpretation for ICANN's Human Rights commitment and proposed Draft Bylaw.
- Addressing jurisdiction-related questions, namely: "Can ICANN's accountability be enhanced depending on the laws applicable to its actions?" The CCWG-Accountability anticipates focusing on the question of applicable law for contracts and dispute settlements.
- Considering enhancements to the Ombudsman's role and function.

The CCWG-Accountability notes that further enhancements to ICANN accountability can be accommodated through the accountability review process (see Recommendation #10: Enhancing the Accountability of Supporting Organizations and Advisory Committees) or through specific, ad hoc, cross community working group initiatives.

### 3. Detailed Explanation of Recommendations

06 Commenters made the observation that general accountability requirements, such as diversity and Supporting Organization (SO) and Advisory Committee (AC) accountability, were not fully addressed. Specific criteria were developed for these two key parameters, as described below.

#### 07 Diversity

08 Comments received on prior drafts asked that concrete steps to ensure the diversity of the views, origins, and interests of the global Internet community be adequately represented through a multidimensional approach, specifically as the community becomes more empowered. While acknowledging the importance of diversity in the accountability mechanisms, commenters have

also expressed the view that any diversity requirement should not prevail over skills or experience requirements.

- 09 The CCWG-Accountability acknowledges the specific advice received from the Public Expert Group Advisors which stresses the importance of such diversity enhancements. Maximum participation and transparent deliberations by all affected stakeholders are necessary in order to capture the diversity of views that constitute the (global) public interest in a given instance.
- 10 In assessing diversity, the CCWG-Accountability identified that existing mechanisms were in place for entities constituting the ICANN ecosystem. Requirements stemming from the following initiatives and governance documents were evaluated:
- [ICANN Bylaws.](#)
  - [The Affirmation of Commitments.](#)
  - [ATRT 1 Recommendations.](#)
  - [ATRT 2 Recommendations.](#)
  - Documents from each of ICANN's SOs and ACs.
- 11 Analysis of the above documents determined that improvements are needed. During its discussions, the CCWG-Accountability considered a non-exhaustive list of criteria and sought input on the following suggestions:
- Expanding ATRT reviews into Accountability, Transparency, and Diversity reviews.
  - Establishing threshold regarding composition of each body.
  - Incorporating the Structural Reviews into Structural Accountability, Transparency, and Diversity Reviews of SOs and ACs, under the Board's supervision.
- 12 Comments received on the Second Draft Proposal revealed that incorporating the diversity component into Accountability and Transparency Reviews may overburden Review Teams. Therefore, the CCWG-Accountability recommends the following actions with the view to further enhancing ICANN's effectiveness in promoting diversity:
- Including diversity as an important element for the creation of any new structure, such as the Independent Review Process (IRP) – for diversity requirements for the panel – and the ICANN Community Forum.
  - Adding Accountability, Transparency, and Diversity reviews of SOs and ACs to structural reviews as part of Work Stream 2.
  - Performing, as part of Work Stream 2, a more detailed review to establish a full inventory of the existing mechanisms related to diversity for each and every ICANN group (including Stakeholder Groups, Constituencies, Regional At-Large Organizations, the Fellowship program, and other ICANN outreach programs). After an initial review of the current documents, it became clear that they do not address the full concerns raised by the wider community on the issue of diversity.
  - Identifying the possible structures that could follow, promote and support the strengthening of diversity within ICANN.
  - Carrying out a detailed working plan on enhancing ICANN diversity as part of Work Stream 2.

- Strengthening commitments to outreach and engagement in order to create a more diverse pool of ICANN participants, so that diversity is better reflected in the overall community and thus more naturally reflected in ICANN structures and leadership positions.

### 13 **Staff Accountability**

14 In general, management and staff work for the benefit of the community and in line with ICANN's purpose and Mission. While it is obvious that they report to and are held accountable by the ICANN Board and the President and CEO, the purpose of their accountability is the same as that of the organization:

- Complying with ICANN's rules and processes.
- Complying with applicable Bylaws.
- Achieving certain levels of performance, as well as security.
- Making their decisions for the benefit of the community and not in the interest of a particular stakeholder or set of stakeholders or ICANN the organization alone.

15 Having reviewed and inventoried the existing mechanisms related to staff accountability, areas for improvement include clarifying expectations from staff, as well as establishing appropriate redress mechanisms. The CCWG-Accountability recommends as part of its Work Stream 2:

- The CCWG-Accountability work with ICANN to develop a document that clearly describes the role of ICANN staff vis-à-vis the ICANN Board and the ICANN community. This document should include a general description of the powers vested in ICANN staff by the ICANN Board of Directors that need, and do not need, approval of the ICANN Board of Directors.
- The CCWG-Accountability work with ICANN to consider a Code of Conduct, transparency criteria, training, and key performance indicators to be followed by staff in relation to their interactions with all stakeholders, establish regular independent (internal and community) surveys and audits to track progress and identify areas that need improvement, and establish appropriate processes to escalate issues that enable both community and staff members to raise issues. This work should be linked closely with the Ombudsman enhancement item of Work Stream 2.

### 16 **Supporting Organizations and Advisory Committee Accountability**

17 As the community's power is enhanced, legitimate concerns have arisen regarding the accountability of the community (organized as SOs and ACs) in using new Community Powers, i.e., "who watches the watcher."

18 The CCWG-Accountability reviewed existing accountability mechanisms for SOs and ACs as well as governance documents (see above). Analysis revealed that mechanisms are limited in quantity and scope. Having reviewed and inventoried the existing mechanisms related to SO and AC accountability, it is clear that current mechanisms need to be enhanced in light of the new responsibilities associated with the Empowered Community.

19 The CCWG-Accountability recommends the following.

20 **As part of Work Stream 1:**

- Include the review of SO and AC accountability mechanisms in the independent periodical structural reviews performed on a regular basis. These reviews should include consideration of the mechanisms that each SO and AC has in place to be accountable to their respective Constituencies, Stakeholder Groups, and Regional At-Large Organizations, etc.
- This recommendation can be implemented through an amendment of Section 4 of Article IV of the ICANN Bylaws, which currently states: “The goal of the review, to be undertaken pursuant to such criteria and standards as the Board shall direct, shall be to determine (1) whether that organization has a continuing purpose in the ICANN structure, and (2) if so, whether any change in structure or operations is desirable to improve its effectiveness.”

21 **As part of Work Stream 2:**

- Include the subject of SO and AC accountability as part of the work on the Accountability and Transparency Review process.
- Evaluate the proposed “Mutual Accountability Roundtable” to assess viability and, if viable, undertake the necessary actions to implement it.
- Propose a detailed working plan on enhancing SO and AC accountability as part of Work Stream 2.
- Assess whether the IRP would also be applicable to SO and AC activities.

22 **Transparency**

23 Transparency is considered quintessential to the viability of community empowerment and its associated legal framework. As such, the CCWG-Accountability recommends reviewing the following to ensure appropriate safeguards are in place:

- Improving ICANN’s transparency with a focus on:
  - Enhancements to ICANN’s existing DIDP: The CCWG-Accountability sets an objective to review and update ICANN’s DIDP within two years, with the goal of justifying denials with a specific harm and limiting the scope of non-disclosure.
  - ICANN’s interactions with governments: The CCWG-Accountability is considering if ICANN should be required to compile and publicly post a quarterly report providing: the names of individuals acting on ICANN’s behalf who have been in contact with a government official; the names and titles of such government officials; and the date, nature, and purpose of those government contacts. In addition, it considers that a line item accounting of the amount ICANN spent on government engagement activities should be reported.
  - Improvements to the existing whistleblower policy.
  - Transparency of Board deliberations.

## Human Rights

24 To ensure that adding the proposed Human Rights Bylaw provision into the ICANN Bylaws does not lead to an expansion of ICANN's Mission or scope, the CCWG-Accountability will develop a Framework of Interpretation for Human Rights (FOI-HR) as a consensus recommendation in Work Stream 2 to be approved by the ICANN Board using the same process and criteria as for Work Stream 1 recommendations, and the Bylaw provision will not enter into force before the FOI-HR is in place. The CCWG-Accountability will consider the following as it develops the FOI-HR:

- Consider which specific Human Rights conventions or other instruments, if any, should be used by ICANN in interpreting and implementing the Human Rights Bylaw.
- Consider the policies and frameworks, if any, that ICANN needs to develop or enhance in order to fulfill its commitment to respect Human Rights.
- Consistent with ICANN's existing processes and protocols, consider how these new frameworks should be discussed and drafted to ensure broad multistakeholder involvement in the process.
- Consider what effect, if any, this Bylaw would have on ICANN's consideration of advice given by the Governmental Advisory Committee (GAC).
- Consider how, if at all, this Bylaw will affect how ICANN's operations are carried out.
- Consider how the interpretation and implementation of this Bylaw will interact with existing and future ICANN policies and procedures.

## 25 **Jurisdiction**

26 Jurisdiction directly influences the way ICANN's accountability processes are structured and operationalized. The fact that ICANN is incorporated under the laws of the U.S. State of California grants the corporation certain rights and implies the existence of certain accountability mechanisms. It also imposes some limits with respect to the accountability mechanisms it can adopt.

27 The topic of jurisdiction is, as a consequence, very relevant for the CCWG-Accountability. ICANN is a nonprofit public benefit corporation incorporated in California and subject to applicable California state laws, applicable U.S. federal laws and both state and federal court jurisdiction. ICANN is subject to a provision in paragraph eight<sup>1</sup> of the Affirmation of Commitments, signed in 2009 between ICANN and the U.S. Government.

28 ICANN's Bylaws (Article XVIII) also state that its principal offices shall be in California.

29 The CCWG-Accountability has acknowledged that jurisdiction is a multi-layered issue and has identified the following "layers":

---

<sup>1</sup> 8. ICANN affirms its commitments to: (a) maintain the capacity and ability to coordinate the Internet DNS at the overall level and to work for the maintenance of a single, interoperable Internet; (b) **remain a not for profit corporation, headquartered in the United States of America with offices around the world to meet the needs of a global community**; and (c) to operate as a multi-stakeholder, private sector led organization with input from the public, for whose benefit ICANN shall in all events act.

- Place and jurisdiction of incorporation and operations, including governance of internal affairs, tax system, human resources, etc.
- Jurisdiction of places of physical presence.
- Governing law for contracts with registrars and registries and the ability to sue and be sued in a specific jurisdiction about contractual relationships.
- Ability to sue and be sued in a specific jurisdiction for action or inaction of staff and for redress and review of Board action or inaction, including as relates to IRP outcomes and other accountability and transparency issues, including the Affirmation of Commitments.
- Relationships with the national jurisdictions for particular domestic issues (ccTLDs managers, protected names either for international institutions or country and other geographic names, national security, etc.), privacy, freedom of expression.
- Meeting NTIA requirements.

30 At this point in the CCWG-Accountability's work, the main issues that need to be investigated within Work Stream 2 relate to the influence that ICANN's existing jurisdiction may have on the actual operation of policies and accountability mechanisms. This refers primarily to the process for the settlement of disputes within ICANN, involving the choice of jurisdiction and of the applicable laws, but not necessarily the location where ICANN is incorporated:

- Consideration of jurisdiction in Work Stream 2 will focus on the settlement of dispute jurisdiction issues and include:
  - Confirming and assessing the gap analysis, clarifying all concerns regarding the multi-layer jurisdiction issue.
  - Identifying potential alternatives and benchmarking their ability to match all CCWG-Accountability requirements using the current framework.
  - Consider potential Work Stream 2 recommendations based on the conclusions of this analysis.

31 A specific Subgroup of the CCWG-Accountability will be formed to undertake this work.

## 32 **Considering Enhancements to the Ombudsman's Role and Function**

33 Through the enhanced Request for Reconsideration process (see Recommendation #8: Improving ICANN's Request for Reconsideration Process), the CCWG-Accountability has given increased responsibility to the Ombudsman.

34 The Ombudsman can perform a critical role in ensuring that ICANN is transparent and accountable, preventing and resolving disputes, supporting consensus-development, and protecting bottom-up, multistakeholder decision-making at ICANN. ICANN's Office of Ombudsman must have a clear charter that reflects, supports, and respects ICANN's Mission, Commitments and Core Values, and must have sufficient authority and independence to ensure that it can perform these important roles effectively. As part of Work Stream 2, the CCWG-Accountability will evaluate the current Ombudsman charter and operations against industry best practices and recommend any changes necessary to ensure that the ICANN Ombudsman has the tools, independence, and authority needed to be an effective voice for ICANN stakeholders.

## 35 **Interim Bylaw**

- 36 The CCWG-Accountability recommends that the ICANN Board adopt an Interim Bylaw that would commit ICANN to consider the CCWG-Accountability consensus recommendations according to the same process and criteria it has committed to use to consider the Work Stream 1 recommendations. The Interim Bylaw would task the group with creating further enhancements to ICANN's accountability related to the Work Stream 2 list of issues, according to process and procedures similar to those of Work Stream 1: openness to all participants, transparency of deliberations, public comment inputs.
- 37 This Interim Bylaw must be incorporated in the ICANN Bylaws as part of Work Stream 1, prior to the IANA Stewardship Transition. This Interim Bylaw has been proposed to address concerns that after the IANA Stewardship Transition, an absence of incentives may lead to the ICANN Board dismissing the CCWG-Accountability's proposed Work Stream 2 recommendations. However, in a [letter](#) dated 13 November 2015, the ICANN Board confirmed its intent to work with the ICANN community and to provide adequate support for work on these issues.
- 38 Enshrining the commitment to Work Stream 2 as an Interim (transitional) Bylaw provides stronger guarantees compared to an approach that would rely on a Board resolution. A Board resolution could indeed be changed by the Board itself at any time, and the composition of the Board changes over time. Also, enshrining the process and conditions within a Bylaw (even if it is a transitional provision) triggers the ability for IRP challenge if the CCWG-Accountability or the Board did not comply with the process or conditions described in the Bylaw.
- 39 The language of this Interim Bylaw provision should provide that the CCWG-Accountability Work Stream 2 recommendations, when supported by full consensus or consensus as described in the CCWG-Accountability Charter, and endorsed by the Chartering Organizations, be considered in a similar status to Work Stream 1 recommendations. The ICANN Board's actions or inaction would be subject to challenge through enhanced Request for Reconsideration and Independent Review Processes.
- 40 The Interim Bylaw would be consistent with the language described in the CCWG-Accountability Charter, and explicitly mention the NTIA criteria as a reference for the recommendations, as well as the requirement that recommendations are based on consensus.
- 41 The Bylaw would also describe the process outlined in the ICANN Board's resolution of 16 October 2014 (see <https://www.ICANN.org/resources/board-material/resolutions-2014-10-16-en#2.d>), such as:
- The requirement for Work Stream 2 recommendations to be consensus recommendations, endorsed by the Chartering Organizations.
  - The requirement to initiate a specific dialogue in case the Board believes it is not in the global public interest to implement a recommendation, as well as the description of the steps of this dialogue.
  - The requirement of a 2/3 majority of the Board to determine that implementing a recommendation is not in the global public interest.

## 42 **Timeline**

- 43 The initial plan includes the following key milestones:
- March 2016 (ICANN55): Definition of scope of work and organization into subgroups.

- March 2016 to end of June 2016: Drafting of Proposals by Subgroup, under supervision by CCWG-Accountability.
- June 2016 till early October 2016: 40-day Public Comment Period, including discussions during ICANN56 and/or ICANN57.
- October – mid-January 2017: Refinement of Proposals by Subgroups, under supervision of the CCWG-Accountability or other CCWG as appropriate.
- Mid-January – March 2017: Second 40-day Public Comment Period, including discussions during ICANN58.
- By end of June 2017: Finalize Proposals and deliver to Chartering Organizations.
- Obtain approval and deliver Proposals to ICANN Board at ICANN59.

#### **4. Changes from the “Third Draft Proposal on Work Stream 1 Recommendations”**

- Interim Bylaws clarifications to address Board’s concerns by highlighting that Work Stream 2 will be following similar rules as Work Stream 1: consensus recommendations, endorsement by Chartering Organizations, ability for the Board to engage in special dialogue, 2/3 threshold for such Board decision, etc.
- Edits to the documents will include focus on fact that Work Stream 2 deliberations will be open to all (similar to Work Stream 1).
- List of Work Stream 2 items is “limited to” instead of “related to.” A note is added that clarifies that further items beyond this list can be accommodated through regular review cycles, or specific CCWG-Accountability.
- Timeframe discussion: target dates are needed, but hard deadlines would not be appropriate or helpful.
- Agreed to incorporate Public Experts Group (PEG) Advisor input to strengthen the diversity requirement.
- Enhancing the Ombudsman role and function is confirmed as a Work Stream 2 item.
- Re-inserted staff accountability requirement.

#### **5. Stress Tests Related to this Recommendation**

- ST1
- ST2
- ST11

## 6. How does this meet the CWG-Stewardship Requirements?

- N/A

## 7. How does this address NTIA Criteria?

### 44 **Support and enhance the multistakeholder model.**

- In-depth review of diversity and SO and AC accountability is planned for Work Stream 2.
  - Addition of an Interim Bylaw will secure Work Stream 2 towards enhancing the general accountability framework.
- 

### 45 **Maintain the security, stability and resiliency of the Internet DNS.**

- Accountability of SO and AC structures and their components will help ensure that one entity cannot singlehandedly change or block a process.
  - Addressing the question of applicable law for contracts and dispute settlements.
- 

### 46 **Meet the needs and expectation of the global customers and partners of the IANA services.**

- Analysis of transparency will help contribute to ensuring that visibility is given into operations of ICANN.
  - Development of a Framework of Interpretation for Human Rights Bylaw will help maintain limited scope of ICANN's Mission.
- 

### 47 **Maintain the openness of the Internet.**

- Consolidating, enhancing diversity and SO and AC accountability.
- 

### 48 **NTIA will not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution**

- Transparency of interactions with governments is flagged as a topic to explore further.
-

# Annex 13 – CWG-Stewardship Requirements of the CCWG-Accountability

---

## 1. Summary and References to the CCWG-Accountability Proposal

- 01 The CCWG-Accountability Work Stream 1 recommendations address each of the CWG-Stewardship dependencies as follows:
- 02 The ability for the community to approve or veto the ICANN or IANA budget after it has been approved by the ICANN Board but before it comes into effect.  
See Recommendation #4: Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers.
- 03 The ability for the community to appoint and remove ICANN Board Directors and to recall the entire ICANN Board.  
See Recommendation #4: Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers.
- 04 The ability for the community to review and approve ICANN Board decisions with respect to recommendations resulting from an IANA Function Review (IFR) or Special IANA Function Review (Special IFR).  
See Recommendation #4: Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers.
- 05 The ability for the community to approve amendments to ICANN's Fundamental Bylaws.  
See Recommendation #4: Ensuring Community Involvement in ICANN Decision-making: Seven New Community Powers.
- 06 The creation of an IFR that is empowered to conduct periodic and special reviews of the IANA functions. IFR and Special IFR Reviews will be incorporated into the Affirmation of Commitments-mandated reviews set forth in the ICANN Bylaws.
- 07 See Recommendation #9: Incorporating the Affirmation of Commitments in ICANN's Bylaws.
- 08 The creation of a Customer Standing Committee (CSC) that is empowered to monitor the performance of the IANA functions and escalate non-remediated issues to the

Country Code Names Supporting Organization (ccNSO) and Generic Names Supporting Organization (GNSO). The ccNSO and GNSO should be empowered to address matters escalated by the CSC.

See Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation.

- 09 The empowerment of the Special IFR Review to determine that a separation process is necessary and, if so, to recommend that a Separation Cross-Community Working Group (SCCWG) be established to review the identified issues and make recommendations.

See Recommendation #9: Incorporating the Affirmation of Commitments in ICANN's Bylaws.

- 10 An appeal mechanism, for example in the form of an Independent Review Panel, for issues relating to the IANA functions.

See Recommendation #7: Strengthening ICANN's Independent Review Process.

- 11 All of the foregoing mechanisms are to be provided for in the ICANN Bylaws as Fundamental Bylaws.

See Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation.

- 12 Governance provisions related to PTI are to be incorporated into the ICANN Bylaws as Fundamental Bylaws.

See Recommendation #3: Standard Bylaws, Fundamental Bylaws and Articles of Incorporation.

## 2. Recommendations from the CWG-Stewardship Final Report

- 13 The CWG-Stewardship Final Proposal can be found at: <https://community.icann.org/x/aJ00Aw> (Section III.A.i. Proposed Post-Transition Structure).

- 14 The CWG-Stewardship proposal is significantly dependent and expressly conditioned on the implementation of ICANN-level accountability mechanisms by the Cross Community Working Group on Enhancing ICANN Accountability (CCWG-Accountability) as described below. The co-chairs of the CWG-Stewardship and the CCWG-Accountability have coordinated their efforts and the CWG-Stewardship is confident that the CCWG-Accountability recommendations, if implemented as envisaged, will meet the requirements that the CWG-Stewardship has previously communicated to the CCWG-Accountability.

- 15 If any element of these ICANN level accountability mechanisms is not implemented as contemplated by the CWG-Stewardship proposal, this CWG-Stewardship proposal will require revision. Specifically, the proposed legal structure and overall CWG-Stewardship proposal requires ICANN accountability in the following respects:

- 16 1. ICANN Budget and IANA Budget.

17 The ability for the community to approve or veto the ICANN budget after it has been approved by the ICANN Board but before it comes into effect. The community may reject the ICANN Budget based on perceived inconsistency with the purpose, mission and role set forth in ICANN's Articles and Bylaws, the global public interest, the needs of ICANN stakeholders, financial stability or other matters of concern to the community. The CWG-Stewardship recommends that the IFO's comprehensive costs should be transparent and ICANN's operating plans and budget should include itemization of all IANA operations costs to the project level and below as needed. An itemization of IANA costs would include "Direct Costs for the IANA department", "Direct Costs for Shared resources" and "Support functions allocation". Furthermore, these costs should be itemized into more specific costs related to each specific function to the project level and below as needed. PTI should also have a yearly budget that is reviewed and approved by the ICANN community on an annual basis. PTI should submit a budget to ICANN at least nine months in advance of the fiscal year to ensure the stability of the IANA services. It is the view of the CWG-Stewardship that the IANA budget should be approved by the ICANN Board in a much earlier timeframe than the overall ICANN budget. The CWG (or a successor implementation group) will need to develop a proposed process for the IANA-specific budget review, which may become a component of the overall budget review.

## 18 2. Community Empowerment Mechanisms

19 The empowerment of the multistakeholder community to have the following rights with respect to the ICANN Board, the exercise of which should be ensured by the related creation of a stakeholder community / member group:

- a. The ability to appoint and remove members of the ICANN Board and to recall the entire ICANN Board;
- b. The ability to exercise oversight with respect to key ICANN Board decisions (including with respect to the ICANN Board's oversight of the IANA functions) by reviewing and approving (i) ICANN Board decisions with respect to recommendations resulting from an IANA Function Review or Special IANA Function Review and (ii) the ICANN budget; and
- c. The ability to approve amendments to ICANN's "Fundamental Bylaws," as described below.

## 20 3. IANA Function Review

21 The creation of an IANA Function Review that is empowered to conduct periodic and special reviews of the IANA functions. IANA Function Reviews and Special IANA Function Reviews will be incorporated into the Affirmation of Commitments mandated reviews set forth in the ICANN Bylaws.

## 22 4. Customer Standing Committee

23 The creation of a Customer Standing Committee that is empowered to monitor the performance of the IANA functions and escalate non-remediated issues to the Country Code Names Supporting Organization and Generic Names Supporting Organization. The Country Code Names Supporting Organization and Generic Names Supporting Organization should be empowered to address matters escalated by the Customer Standing Committee.

## 24 5. Separation Process

- 25 The empowerment of the Special IANA Function Review to determine that a separation process is necessary and, if so, to recommend that a Separation Cross-Community Working Group be established to review the identified issues and make recommendations.
- 26 **6. Appeals mechanism**
- 27 An appeal mechanism, for example in the form of an Independent Review Panel, for issues relating to the IANA functions. For example, direct customers with non-remediated issues or matters referred by Country Code Names Supporting Organization or Generic Names Supporting Organization after escalation by the Customer Standing Committee will have access to an Independent Review Panel. The appeal mechanism will not cover issues relating to country code top-level domains delegation and re-delegation, which mechanism is to be developed by the country code top-level domains community post-transition.
- 28 **7. Fundamental Bylaws**
- 29 All of the foregoing mechanisms are to be provided for in the ICANN bylaws as “Fundamental Bylaws.” A “Fundamental Bylaw” may only be amended with the prior approval of the community and may require a higher approval threshold than typical bylaw amendments (for example, a supermajority vote).
- 30 **8. Post-Transition IANA (PTI)**
- 31 The CWG-Stewardship Final Proposal contemplates the formation of a PTI as a new legal entity. PTI will have ICANN as its sole member and PTI will therefore be a controlled affiliate of ICANN. As a result, the ICANN Bylaws will need to include governance provisions related to PTI, in particular as it relates to ICANN’s role as the sole member of PTI.

# Annex 14 – Meeting NTIA’s Criteria for the IANA Stewardship Transition

---

- 1 On March 14, 2014, the U.S. National Telecommunications and Information Administration (NTIA) announced its intent to transition stewardship of key Internet Domain Name System functions to the global multistakeholder community. NTIA also asked ICANN to convene an inclusive, global discussion that involved the full range of stakeholders to collectively develop a proposal for the transition.
- 2 To guide this global discussion, NTIA provided ICANN with a clear framework for the transition proposal. The CCWG-Accountability has outlined how its Work Stream 1 Recommendations to enhance ICANN’s accountability meet these requirements below:
- 3 **Support and enhance the multistakeholder model**
  - Decentralizing power within ICANN through an Empowered Community.
  - Solidifying consultation processes between the ICANN Board and Empowered Community into the ICANN Bylaws.
  - Establishing a Community Forum, in which all are welcome to participate, to ensure that all voices and perspectives are heard before execution of a Community Power.
  - Decision-making based on consensus.
  - Enhancing ICANN’s appeals mechanisms and binding arbitration processes to be more accessible and transparent.
  - Protecting representation of global public interest by engraving it into ICANN’s Mission, Commitments and Core Values; now considered a “Fundamental Bylaw.”
  - Ensuring that ICANN Board Directors can be held accountable to the Empowered Community through recall mechanisms.

---

- 4 **Maintain the security, stability, and resiliency of the Internet DNS**
  - Accountability measures do not affect any operational activities of ICANN which could directly or indirectly affect the security, stability, and resiliency of the Internet DNS.
  - Maintain ICANN’s Bylaws commitment to the security, stability, and resiliency of the Internet DNS.
  - Binding IRP that allows users or the Empowered Community to challenge ICANN if it is not operating as per its Mission and Bylaws.
  - Revising ICANN’s Mission, Commitments and Core Values to prevent “mission creep” or expansion of the Mission beyond its original goals.
  - Implementing Fundamental Bylaws that require a higher threshold for approval by the Board.

- Accountability measures that require Empowered Community approval of changes to Fundamental Bylaws.
  - Accountability measures that allow the Empowered Community to reject Standard Bylaws changes that could affect security, stability, and resiliency of the Internet DNS.
  - Accountability measures which allow the Empowered Community to reject budgets and strategic/operating plans which could affect security, stability, and resiliency of the Internet while ensuring the protection of the Post-Transition IANA Functions Budget and the availability of a caretaker budget for ICANN activities.
  - Accountability measures which allow the Empowered Community to remove the Board if its actions threaten the security, stability, and resiliency of the Internet.
  - Bylaws changes which can require the review of Post-Transition IANA operations.
  - Bylaws changes which provide for the separation of Post-Transition IANA and the reallocation of IANA functions if the actions or inactions of Post-Transition IANA are threatening the security, stability, and resiliency of the Internet.
  - Accountability measures that allow the Empowered Community to force ICANN to accept IANA Function Review recommendations and the separation of Post-Transition IANA.
  - Reviews which will ensure the components of the community effectively represent the views of their stakeholders.
- 

5 **Meet the needs and expectation of the global customers and partners of the IANA services**

- Accountability recommendations implement all the requirements of the CWG-Stewardship.
  - Accountability recommendations do not affect ICANN’s day-to-day operational or policy development processes.
  - Accountability requirements allow for multiple paths to resolve issues before using Community Powers.
  - Legally enforceable powers.
  - Revising ICANN’s Mission, Commitments and Core Values to prevent “mission creep” or expansion of the mission beyond its original goals.
  - Adoption of stronger commitments to respect Human Rights by ICANN.
  - Effective accountability powers which are open to all parts of the community and require action by the Empowered Community.
  - Appeals mechanisms to be reviewed and improved. The Independent Review Process is strengthened by binding ICANN to IRP outcomes and by being more accessible to the community. The CCWG-Accountability also makes recommendations to have a more effective and transparent Reconsideration process.
  - Maintaining Bylaw Article XVIII, which states that ICANN has its principal office in Los Angeles, California, USA.
-

6 Maintain the openness of the Internet

- Executing “stress tests” to assess the sufficiency of existing and proposed accountability mechanisms available to the ICANN community against plausible and problematic scenarios.
- Establishing a public Community Forum to ensure that all voices and perspectives are heard before execution of a Community Power.
- Establishing later commitments to:
  - Improving the accountability of ICANN’s Supporting Organizations and Advisory Committees.
  - Reviewing and updating ICANN’s Documentary Information Disclosure and Whistleblower policies.
  - Enhancing ICANN’s diversity standards.
  - Improving staff accountability.
- Reinforcing ICANN’s commitment to respect Human Rights in the ICANN Bylaws.
- Preserving policies of open participation in ICANN’s Supporting Organizations and Advisory Committees.

---

7 NTIA will not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution

- To the extent the Government Advisory Committee (GAC) wishes to participate in decision-making by the Empowered Community, which the GAC has the flexibility to determine, it would be one of five Decisional Participants. In addition, the GAC will not participate as a decision-maker in community deliberations involving a challenge to the Board’s implementation of GAC consensus advice. This “carve out”, combined with the safeguards in Recommendation #11: Board Obligations with Regard to Governmental Advisory Committee Advice (Stress Test 18), leads the CCWG-Accountability to believe that this NTIA requirement is met, even when considering the increased threshold from 50 to 60% for the Board to reject GAC consensus advice.
- Enabling all interested stakeholders to join consultations through SOs and ACs or through the Community Forum.
- Establishing a later commitment to investigating options for increasing the transparency of ICANN’s relationships with governments.

# Annex 15 – Stress Testing

---

## 1. Overview

- 1 An essential part of the CCWG-Accountability Charter calls for stress testing to evaluate proposed accountability enhancements.
- 2 ‘Stress Testing’ is a simulation exercise where a set of plausible, but not necessarily probable, hypothetical scenarios are used to gauge how certain events will affect a system, product, company or industry. In the financial industry for example ‘stress testing’ is routinely run to evaluate the strength of institutions.
- 3 The CCWG-Accountability Charter calls for stress testing of accountability enhancements in Work Streams 1 and 2. Among the deliverables listed in the charter is the following:

*Identification of contingencies to be considered in the stress tests: Review of possible solutions for each Work Stream including stress tests against identified contingencies.*

- 4 The purpose of the stress tests was to determine the stability of ICANN in the event of consequences and/or vulnerabilities, and to assess the adequacy of existing and proposed accountability mechanisms available to the ICANN community.
- 5 **The CCWG-Accountability ran a total of 37 Stress Test scenarios.**

## 2. Purpose and Methodology

### 6 **Methodology**

- 7 The CCWG-Accountability considered the following methodology for stress tests:
  - Analyze potential weaknesses and risks.
  - Analyze existing accountability mechanisms and their robustness.
  - Analyze additions and modifications to accountability mechanisms.
  - Describe how the proposed accountability measures would mitigate the risk of contingencies and enable the community to challenge ICANN actions taken in response to the contingencies.
- 8 The CCWG-Accountability Stress Test Work Party documented contingencies identified in prior public comment rounds. The Stress Test Work Party then prepared a draft document showing how these stress tests are useful in evaluating existing and proposed accountability measures.
- 9 The exercise of applying stress tests identified changes to the current ICANN Articles of Incorporation and Bylaws that might be necessary to enable the CCWG-Accountability to evaluate proposed accountability mechanisms as adequate to meet the challenges identified.

### 10 **Purpose**

- 11 The purpose of the stress tests was to determine the stability of ICANN in the event of consequences and/or vulnerabilities, and to assess the adequacy of existing and proposed accountability mechanisms available to the ICANN community.
- 12 The CCWG-Accountability Charter does not ask that probability estimates be assigned for contingencies. Probabilities are not needed to determine whether the community has adequate means to challenge ICANN's reactions to the contingency.
- 13 In its initial phases of work, the CCWG-Accountability gathered an [inventory](#) of contingencies identified in prior public comments. The Work Team responsible for this then consolidated the inventory into five 'stress test categories' as listed below, and prepared draft documents showing how these stress tests are useful to evaluate ICANN's existing, and CCWG-Accountability's proposed, accountability measures.

### 3. Stress Test Categories

#### 14 **I. Financial Crisis or Insolvency (Stress Tests #5, 6, 7, 8 and 9)**

- 15 **Scenario:** ICANN becomes fiscally insolvent, and lacks the resources to adequately meet its obligations. This could result from a variety of causes, including financial crisis specific to the Domain Name industry, or the general global economy. It could also result from a legal judgment against ICANN, fraud or theft of funds, or technical evolution that makes Domain Name registrations obsolete.

#### 16 **II. Failure To Meet Operational Expectations (#1, 2, 11, 17, and 21)**

- 17 **Scenario:** ICANN fails to process change or delegation requests to the IANA Root Zone, or executes a change or delegation despite objections of stakeholders, such as those defined as '[Significantly Interested Parties](#)'.

#### 18 **III. Legal/Legislative Action (#3, 4, 19 and 20)**

- 19 **Scenario:** ICANN is the subject of litigation under existing or future policies, legislation, or regulation. ICANN attempts to delegate a new TLD, or re-delegate a non-compliant existing TLD, but is blocked by legal action.

#### 20 **IV. Failure Of Accountability (#10, 12, 13, 16, 18, 22, 23, 24 and 26)**

- 21 **Scenario:** Actions (or expenditure of resources) by one or more ICANN Board Directors, the President and CEO, or other Staff, are contrary to ICANN's Mission or Bylaws. ICANN is "captured" by one stakeholder segment, including governments via the GAC, which either is able to drive its agenda on all other stakeholders, or abuse accountability mechanisms to prevent all other stakeholders from advancing their interests (veto).

#### 22 **V. Failure Of Accountability To External Stakeholders (#14, 15 and 25)**

- 23 **Scenario:** ICANN modifies its structure to avoid obligations to external stakeholders, such as terminating the Affirmation of Commitments, terminating its presence in a jurisdiction where it faces legal action, or moving contracts or contracting entities to a favorable jurisdiction. ICANN delegates, subcontracts or otherwise, abdicates its obligations to a third party in a manner that is

inconsistent with its Bylaws or otherwise not subject to accountability. ICANN merges with or is acquired by an unaccountable third party.

#### 24 **Stress Tests Suggested by NTIA**

25 The CCWG-Accountability added four stress test items that were suggested by NTIA in Secretary Larry Strickling’s [statement](#) issued on 16 June 2015:

- **NTIA-1:** Test preservation of the multistakeholder model if individual ICANN Supporting Organizations and/or Advisory Committees choose not to be Decisional Participants in the Empowered Community.
- **NTIA-2:** Address the potential risk of internal capture. ST 12 and 13 partly address capture by external parties, but not for capture by internal parties in a Supporting Organization and/or Advisory Committee.
- **NTIA-3:** Barriers to entry for new participants.
- **NTIA-4:** Unintended consequences of “operationalizing” groups that to date have been advisory in nature (e.g. Governmental Advisory Committee).

#### 26 **Stress Tests Related to Transition of the IANA Naming Functions Contract**

27 Note that several stress tests can specifically apply to the work of the CWG-Stewardship regarding transition of the IANA naming functions contract (see Stress Tests #1 & 2, 11, 17, 19, 20, 21, 25).

28 Across all of the Stress Test categories, this exercise demonstrates that CCWG-Accountability’s Work Stream 1 recommendations significantly enhance the community’s ability to hold the ICANN’s Board and management accountable, relative to present accountability measures. For Stress Tests that explore risks of “capture” of an Advisory Committee or Supporting Organization, the proposed Community Powers preserve the ability for aggrieved parties to challenge and block ICANN actions based on inappropriate Advisory Committee or Supporting Organization behavior.

#### 29 **Stress Test #21 to be addressed by ccNSO**

30 Stress Test #21, regarding appeals of country code top-level domains revocations and assignments, has not been adequately addressed in either the CWG-Stewardship or CCWG-Accountability proposals. Instead, the Country Code Naming Related Functions is undertaking policy development work pursuant to the Framework of Interpretation approved in 2014.

## 4. Outcomes of Stress Testing

31 The following section gives a short overview of the stress test scenarios and outlines whether existing accountability measures and proposed accountability measures are adequate to mitigate the potential risks and enable the community to challenge ICANN actions taken in response to the scenarios.

## Stress test category I: Financial Crisis or Insolvency

32	<b>Stress Test #5:</b> Domain industry financial crisis.		
33	<b>Stress Test #6:</b> General financial crisis.		
34	<b>Stress Test #7:</b> Litigation arising from private contract, e.g., breach of contract.		
35	<b>Stress Test #8:</b> Technology competing with DNS.		
36	<b>Consequence(s):</b> Significant reduction in domain sales generated revenues and significant increase in registrar and registry costs, threatening ICANN's ability to operate; loss affecting reserves sufficient to threaten business continuity.		
	<b>EXISTING ACCOUNTABILITY MEASURES</b>	<b>PROPOSED ACCOUNTABILITY MEASURES</b>	
37	ICANN could propose revenue increases or spending cuts, but these decisions are not subject to challenge by the ICANN community.	41	One proposed measure would empower the community to veto ICANN's proposed operating plan and annual budget. This measure enables the community to block a proposal by ICANN to increase its revenues by adding fees on registrars, registries, and/or registrants.
38	The community has input in ICANN's budgeting and the Strategic Plan.		
39	Registrars must approve ICANN's variable registrar fees. If not, registry operators pay the fees.	42	Another proposed measure is community challenge to a Board decision using a reconsideration request and/or referral to an Independent Review Panel (IRP) with the power to issue a binding decision. If ICANN made a revenue or expenditure decision, the new IRP could reverse that decision.
40	ICANN's reserve fund could support operations in a period of reduced revenue. The reserve fund is independently reviewed periodically.		
	<b>CONCLUSIONS:</b>		
43	Existing measures would be adequate, unless the revenue loss was extreme and sustained.	44	Proposed measures are helpful, but might not be adequate if revenue loss was extreme and sustained.

45 <b>Stress Test #9:</b> Major corruption or fraud.	
46 <b>Consequence(s):</b> Major impact on corporate reputation, significant litigation and loss of reserves.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>47 ICANN has an annual independent audit that includes testing of internal controls designed to prevent fraud and corruption.</p> <p>48 ICANN maintains an anonymous hotline for employees to report suspected fraud.</p> <p>49 ICANN Board can dismiss the CEO and/or executives responsible.</p> <p>50 The community has no ability to force the Board to report or take action against suspected corruption or fraud.</p>	<p>51 One proposed measure is to empower the community to force ICANN's Board to consider a recommendation from an Accountability and Transparency Review Team (ATRT). An ATRT could make recommendations to avoid conflicts of interest. An ICANN Board decision against those recommendations could be challenged with a Reconsideration and/or IRP.</p> <p>52 Another proposed measure would empower the community to veto ICANN's proposed annual budget. This measure enables blocking a budget proposal that is tainted by corruption or fraud.</p> <p>53 If ICANN's Board were involved, or if the Board did not act decisively in preventing corruption or fraud (e.g., by enforcing internal controls or policies), a proposed measure empowers the community to remove individual directors or recall the entire Board.</p>
<p><b>CONCLUSIONS:</b></p> <p>54 Existing measures would not be adequate if litigation costs or losses were extreme and sustained.</p>	<p>55 Proposed measures are helpful, but might not be adequate if litigation costs and losses were extreme and sustained.</p>

## 7.6 Stress test category II: Failure to Meet Operational Expectations

56	<b>Stress Test #1:</b> Change authority for the root zone ceases to function, in part or in whole.		
57	<b>Stress Test #2:</b> Delegation authority for the root zone ceases to function, in part or in whole.		
58	<b>Consequence(s):</b> Interference with existing policy relating to Root Zone and/or prejudice to the security and stability of one or several TLDs.		
EXISTING ACCOUNTABILITY MEASURES		PROPOSED ACCOUNTABILITY MEASURES	
59	Under the present IANA functions contract, NTIA can revoke ICANN's authority to perform IANA functions and re-assign this role to different entity/entities.	61	The CWG-Stewardship proposal includes various escalation procedures to prevent degradation of service, as well as a framework (operational) for the transition of the IANA function.
60	After NTIA relinquishes the IANA functions contract, this measure will no longer be available.	62	The CWG-Stewardship proposes that IANA naming functions be legally transferred to a new Post-Transition IANA entity (PTI) that would be an affiliate controlled by ICANN.
		63	The CWG-Stewardship proposes a multistakeholder IANA Function Review (IFR) to conduct reviews of PTI. Results of IFR are not prescribed or restricted and could include recommendations to initiate a separation process which could result in termination or non-renewal of the IANA Functions Contract with PTI, among other actions.
		64	The CWG-Stewardship proposes the ability for the multistakeholder community to require, if necessary and after other escalation mechanisms and methods have been exhausted, the selection of a new operator for the IANA functions.
		65	Suggestions for Work Stream 2: Require annual external security audits and publication of results, and require certification per international standards (ISO 27001) and publication of results.

<p><b>CONCLUSIONS:</b></p> <p>66 Existing measures would be inadequate after NTIA terminates the IANA contract.</p>	<p>67 Proposed measures are, in combination, adequate to mitigate this contingency.</p>
---	---

68 <b>Stress Test #11:</b> Compromise of credentials.	
69 <b>Consequence(s):</b> Major impact on corporate reputation, significant loss of authentication and/or authorization capacities.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>70 Regarding compromise of internal systems:</p> <p>71 Based upon experience of the recent security breach, it is not apparent how the community holds ICANN management accountable for implementation of adopted security procedures.</p> <p>72 It also appears that the community cannot force ICANN to conduct an after-action report on a security incident and reveal that report.</p> <p>73 Regarding DNS security:</p> <p>74 Beyond operating procedures, there are credentials employed in DNSSEC.</p> <p>75 ICANN annually seeks SysTrust Certification for its role as the Root Zone KSK manager.</p> <p>76 The IANA Department has achieved EFQM Committed to Excellence certification for its Business Excellence activities.</p> <p>77 Under C.5.3 of the IANA Functions Contract, ICANN has undergone annual independent audits of its security provisions for the IANA functions.</p>	<p>78 Regarding compromise of internal systems:</p> <p>79 The proposed IRP measure could challenge ICANN’s Board or management for any action or inaction that conflicts with Bylaws. An IRP challenge might therefore be able to force ICANN to conduct an after-action report and disclose it to the community.</p> <p>80 Through the IRP measure, the community might also be able to force ICANN management to execute its stated security procedures for employees and contractors.</p> <p>81 Regarding DNS security:</p> <p>82 One proposed measure empowers the community to force ICANN’s Board to consider a recommendation arising from an Affirmation of Commitments Review such as Security Stability and Resiliency. An ICANN Board decision against those recommendations could be challenged with a Reconsideration and/or IRP.</p> <p>83 A proposed Bylaws change would require ICANN’s Board to respond to formal advice from advisory committees such as SSAC and RSSAC. If the Board took a decision to reject or only partially accept formal AC advice, the community could challenge that Board decision with an IRP.</p> <p>84 Suggestions for Work Stream 2:</p> <p>85     · Require annual external security audits and publication of results.</p> <p>86     · Require certification per standards (ISO 27001) and publication of results.</p>
CONCLUSIONS:	
87 Existing measures would not be adequate.	88 Proposed measures, in combination, would

	be helpful to mitigate effects of this scenario. Work Stream 2 suggestions could add risk prevention measures.
--	--

89 **Stress Test #17:** ICANN attempts to add a new top-level domain in spite of security and stability concerns expressed by the technical community or other stakeholder groups.

90 **Consequence(s):** DNS security and stability could be undermined, and ICANN actions could impose costs and risks upon external parties.

EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
----------------------------------	----------------------------------

<p>91 In 2013-14, the community demonstrated that it could eventually prod ICANN management to attend to risks identified by SSAC. For example: dotless domains (SAC 053); security certificates and name collisions such as .mail and .home (SAC 057)</p> <p>92 NTIA presently gives clerical approval for each delegation to indicate that ICANN has followed its processes. NTIA could delay a delegation if it finds that ICANN has not followed its processes. It is not clear if that would/could have been a finding if ICANN attempted to delegate a new TLD such as .mail or .home.</p>	<p>93 One proposed measure is to empower the community to force ICANN’s Board to consider recommendations from an Affirmation of Commitments Review such as a Review of Security, Stability, and Resiliency. An ICANN Board decision against those recommendations could be challenged with a Reconsideration and/or IRP.</p> <p>94 A proposed Bylaws change would require ICANN Board to respond to formal advice from advisory committees such as SSAC and RSSAC. If the Board took a decision to reject or only partially accept formal AC advice, the community could challenge that Board decision with an IRP.</p>
--	--

<p><b>CONCLUSIONS:</b></p> <p>95 Existing measures were adequate to mitigate the risks of this scenario.</p>	<p>96 Proposed measures enhance community’s power to mitigate the risks of this scenario.</p>
--	---

<p>97 <b>Stress Test #21:</b> A government official demands ICANN rescind responsibility for management of a ccTLD from an incumbent ccTLD manager.</p> <p>98 However, the IANA functions manager is unable to document voluntary and specific consent for the revocation from the incumbent ccTLD manager. Also, the government official demands that ICANN assign management responsibility for a ccTLD to a designated manager.</p> <p>99 But the IANA functions manager does not document that: significantly interested parties agree; that other stakeholders had a voice in selection; the designated manager has demonstrated required capabilities; there are not objections of many significantly interested parties.</p> <p>100 This stress test examines the community’s ability to hold ICANN accountable to follow established policies. It does not deal with the adequacy of policies in place.</p>	
<p>101 <b>Consequence(s):</b> Faced with this re-delegation request, ICANN lacks measures to resist re-delegation while awaiting the bottom-up consensus decision of affected stakeholders.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>102 Under the present IANA contract with NTIA, the IANA Department issues a boiler-plate report to the ICANN Board, which approves this on the Consent Agenda and forwards to NTIA, which relies on the Board’s certification and approves the revocation, delegation or transfer.</p> <p>103 There is presently no mechanism for the incumbent ccTLD Manager or the community to challenge ICANN’s certification that process was followed properly.</p> <p>104 See GAC Principles for delegation and administration of ccTLDs. GAC Advice published in 2000 and updated in 2005 specifically referenced to Sections 1.2 &amp; 7.1.</p> <p>105 See Framework of Interpretation, 20-Oct-2014.</p>	<p>106 From the CWG-Stewardship final proposal: “CWG-Stewardship recommends not including any appeal mechanism that would apply to ccTLD delegations and re-delegations in the IANA Stewardship Transition proposal.”</p> <p>107 From CWG-Stewardship co-chair correspondence on 15-Apr-2015: “As such, any appeal mechanism developed by the CCWG-Accountability should not cover ccTLD delegation / re-delegation issues as these are expected to be developed by the ccTLD community through the appropriate processes.”</p> <p>108 Regarding CCWG-Accountability proposed measures:</p> <p>109 One proposed CCWG-Accountability measure could give the community standing to request Reconsideration of management’s decision to certify the ccTLD change. Would require a standard of review that is more specific than amended ICANN Mission, Commitments and Core Values.</p> <p>110 Another proposed CCWG-Accountability mechanism is community challenge to a Board decision, referring it to an Independent Review Panel (IRP) with the</p>

	<p>power to issue a binding decision. If ICANN took action to revoke or assign management responsibility for a ccTLD, the IRP mechanism might be enabled to review that decision. Would require a standard of review.</p>
<p><b>CONCLUSIONS:</b>          111 Existing measures would not be adequate.</p>	<p>112 Proposed measures do not adequately empower the community to address this scenario. ccNSO is developing policy pursuant to the Framework of Interpretation.</p>

## 7.7 Stress test category III: Legal/Legislative Action

113 <b>Stress Test #3:</b> Litigation arising from existing public policy, e.g., antitrust suit. In response, ICANN Board would decide whether to litigate, concede, settle, etc.	
114 <b>Consequence(s):</b> Significant interference with existing policies and/or policy development relating to relevant activities.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>115 The community could develop new policies that respond to litigation challenges.</p> <p>116 An ICANN Board decision (litigate or settle) could not be challenged by the community at-large, which lacks standing to use the IRP.</p> <p>117 Reconsideration looks at process but not the substance of a decision.</p> <p>118 ICANN must follow orders from courts of competent jurisdiction.</p>	<p>119 After ICANN Board responded to the lawsuit (litigating, changing policies or enforcement, etc.) the community would have several response options:</p> <p>120 The community could develop new policies that respond to litigation challenges.</p> <p>121 Another measure would give the community standing to file for Reconsideration or file an IRP challenging ICANN action or inaction that is inconsistent with the Articles, Bylaws (including Mission, Commitments and Core Values) and ICANN's established policies.</p> <p>122 However, it is highly unlikely that Reconsideration or an IRP could be used by the community to reopen a settlement reached with a third party or cause ICANN to act contrary to the decision of a court or regulator.</p> <p>123 Note also that generally the community will not be able to use an IRP to reopen matters that are within the core powers and fiduciary judgment of the ICANN Board.</p> <p>124 An Advisory Committee or Affirmation of Commitments review team could develop recommendations to address this scenario. An ICANN Board decision against those recommendations could be challenged with a Reconsideration and/or IRP.</p>
CONCLUSIONS:	
125 Existing measures are inadequate.	126 Proposed measures would help the community hold ICANN accountable, but might not be adequate to stop interference with ICANN policies.

<p>127 <b>Stress Test #4:</b> New regulations or legislation.</p> <p>128 For example, a government could cite anti-trust or consumer protection laws and find unlawful some rules that ICANN imposes on TLDs. That government could impose fines on ICANN, withdraw from the GAC, and/or force ISPS to use a different root, thereby fragmenting the Internet.</p> <p>129 In response, ICANN’s Board would decide whether to litigate, concede, settle, etc.</p>	
<p>130 <b>Consequence(s):</b> Significant interference with existing policies and/or policy development relating to relevant activities.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>131 The community could develop new policies that respond to new regulations.</p> <p>132 An ICANN Board decision on how to respond to the regulation (litigate or change policy/implementation) could not be challenged by the community at-large, which lacks standing to use the IRP.</p> <p>133 Reconsideration looks at the process but not the substance of a decision.</p> <p>134 ICANN must follow orders from courts of competent jurisdiction.</p>	<p>135 After ICANN’s Board responded to the regulation (litigate or change policy/implementation), the community would have several response options:</p> <p>136 The community could develop new policies that respond to the regulation.</p> <p>137 Another measure would give the community standing to file for Reconsideration or file an IRP challenging ICANN action or inaction that is inconsistent with the Articles, Bylaws, and ICANN’s established policies. However, it is highly unlikely that Reconsideration or an IRP could be used by the community to cause ICANN to act contrary to the decision of a court or regulator. Note also that generally the community will not be able to use an IRP to reopen matters that are within the core powers and fiduciary judgment of the ICANN Board.</p> <p>138 An Advisory Committee or Affirmation of Commitments review team could develop recommendations to address this scenario. An ICANN Board decision against those recommendations could be challenged with a Reconsideration and/or IRP.</p>
CONCLUSIONS:	
<p>139 Existing measures are inadequate.</p>	<p>140 Proposed measures would be an improvement but might still be inadequate.</p>

<p>141 <b>Stress Test #19:</b> ICANN attempts to re-delegate a gTLD because the registry operator is determined to be in breach of its contract, but the registry operator challenges the action and obtains an injunction from a national court.</p> <p>142 In response, the ICANN Board would decide whether to litigate, concede, settle, etc.</p>	
<p>143 <b>Consequence(s):</b> The entity charged with root zone maintenance could face the question of whether to follow ICANN's re-delegation request or to follow the court order.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>144 Under the present agreement with NTIA, the entity performing root zone maintenance is protected from lawsuits since it is publishing the root per a contract with the US Government.</p> <p>145 However, the IANA Stewardship Transition might result in root zone maintainer not operating under USG contract, so would not be protected from lawsuits.</p> <p>146 A separate consideration:</p> <p>147 An ICANN Board decision (litigate or settle) could not be challenged by the community at-large, which lacks standing to use IRP.</p> <p>148 Reconsideration looks at the process but not the substance of a decision.</p> <p>149 ICANN must follow orders from courts of competent jurisdiction.</p>	<p>150 ICANN could indemnify the root zone maintainer against liability, so long as the RZM was performing under the scope of contract and not in breach.</p> <p>151 While it would not protect the root zone maintainer from lawsuits, one proposed mechanism is community challenge of ICANN decision to re-delegate. This challenge would take the form of a Reconsideration or IRP. However, it is highly unlikely that Reconsideration or an IRP could be used by the community to reopen a settlement reached with a third party or cause ICANN to act contrary to the decision of a court or regulator. Note also that generally the community will not be able to use an IRP to reopen matters that are within the core powers and fiduciary judgment of the ICANN Board.</p> <p>152 After ICANN Board responded to the lawsuit (litigating, changing policies or enforcement, etc.) the decision could be challenged via Reconsideration or IRP, based on the standard of review in the Bylaws. However, it is highly unlikely that the community could cause ICANN to reopen a settlement reached with a third party, or act contrary to a court decision.</p>
CONCLUSIONS:	
<p>153 Existing measures are not adequate.</p>	<p>154 Proposed measures are adequate to allow the community to challenge and reject</p>

	certain decisions of ICANN Board and management.
--	--

<p>155 <b>Stress Test #20:</b> A court order is issued to block ICANN’s delegation of a new TLD, because of a complaint by existing TLD operators or other aggrieved parties.</p> <p>156 For example, an existing gTLD operator might sue to block delegation of a plural version of the existing string.</p> <p>157 In response, the ICANN Board would decide whether to litigate, concede, settle, etc.</p>	
<p>158 <b>Consequence(s):</b> ICANN’s decision about how to respond to court order could bring liability to ICANN and its contract parties.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>159 Before delegation, the community lacked standing to object to string similarity decisions. Reconsideration requests look at the process but not at substance of the decision.</p> <p>160 An ICANN Board decision (litigate or settle) could not be challenged by the community at-large, which lacks standing to use an IRP.</p> <p>161 Reconsideration looks at the process but not the substance of a decision.</p> <p>162 ICANN must follow orders from courts of competent jurisdiction, and may consider such factors as the as cost of litigation and insurance.</p>	<p>163 Preventive: At the conclusion of policy development, the community would have standing to challenge ICANN Board decisions about policy implementation.</p> <p>164 A future new gTLD Guidebook could give the community standing to file objections.</p> <p>165 Remedial: After the ICANN Board responded to the lawsuit (litigating, changing policies or enforcement, etc.) the community would have several response options:</p> <p>166 One measure would give the community standing to file for Reconsideration or an IRP challenging ICANN action or inaction that is inconsistent with the Articles, Bylaws, and ICANN’s established policies. However, it is highly unlikely that Reconsideration or an IRP could be used by the community to reopen a settlement reached with a third party or cause ICANN to act contrary to the decision of a court or regulator. Note also that generally the community will not be able to use an IRP to reopen matters that are within the core powers and fiduciary judgment of the ICANN Board. The IRP could assess ICANN’s response to the court decision, although it would not alter the court’s decision.</p> <p>167 One proposed measure empowers the community to force ICANN’s Board to consider a recommendation arising from an Affirmation of Commitments Review – namely, Consumer Trust, Choice, and Competition. An ICANN Board decision</p>

	against those recommendations could be challenged with a Reconsideration and/or IRP.
<b>CONCLUSIONS:</b> 168 Existing measures would be inadequate.	169 Proposed measures would be an improvement but might still be inadequate.

## 7.8 Stress test category IV: Failure of Accountability

<p>170 <b>Stress Test #10:</b> Chairman, CEO, or Officer acting in a manner inconsistent with the organization’s mission.</p> <p>171 <b>Stress Test #24:</b> An incoming Chief Executive institutes a “strategic review” that arrives at a new, extended mission for ICANN. Having just hired the new CEO, the Board approves the new mission / strategy without community consensus.</p>	
<p>172 Consequence(s): The community ceases to see ICANN as the community’s mechanism for limited technical functions, and views ICANN as an independent, sui generis entity with its own agenda, not necessarily supported by the community. Ultimately, the community questions why ICANN’s original functions should remain controlled by a body that has acquired a much broader and less widely supported Mission. This creates reputational problems for ICANN that could contribute to capture risks.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>173 As long as NTIA controls the IANA functions contract, ICANN risks losing IANA functions if it were to expand its scope too broadly.</p> <p>174 The Community has some input in ICANN budgeting and the Strategic Plan, and could register objections to plans and spending on extending ICANN’s Mission.</p> <p>175 California’s Attorney General has jurisdiction over non-profit entities acting outside Bylaws or Articles of Incorporation. California’s Attorney General could intervene where misuse or misspending of substantial charitable assets is alleged.</p>	<p>176 One proposed measure empowers the community to veto ICANN’s proposed strategic plan or annual budget. This measure could block a proposal by ICANN to increase its expenditure on extending its Mission beyond what the community supported.</p> <p>177 Another proposed measure is empowering the community to challenge a Board decision, referring it to an IRP with the power to issue a binding decision, consistent with the fiduciary duties of the directors. The IRP decision would be based on a standard of review in the amended Mission Statement, including “ICANN shall act strictly in accordance with, and only as reasonably appropriate to achieve its Mission”.</p>
CONCLUSIONS:	
<p>178 Existing measures are inadequate after NTIA terminates the IANA contract.</p>	<p>179 Proposed measures in combination are adequate.</p>

180 <b>Stress Test #12:</b> Capture of ICANN processes by one or several groups of stakeholders.	
181 <b>Consequence(s):</b> Major impact on trust in multistakeholder model, prejudice to other stakeholders.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>182 Regarding capture by governments, the GAC could change its Operating Principle 47 to use majority voting for formal GAC advice, but ICANN Bylaws (Article XI, Section 2, item 1j) nonetheless require the Board to try “to find a mutually acceptable solution”.</p> <p>183 The community has no standing to challenge a Board decision to accept GAC advice, thereby allowing GAC to capture some aspects of ICANN policy implementation.</p> <p>184 Regarding internal capture by stakeholders within an AC or SO, see Stress Test 33.</p>	<p>185 CCWG-Accountability proposals for community empowerment rely upon consensus among ACs/SOs, requiring a minimum threshold of support and no more than one AC/SO objecting. These consensus requirements are an effective prevention of capture by one or a few groups.</p> <p>186 Each AC/SO/SG may need improved processes for accountability, transparency, and participation that are helpful to prevent capture from those outside that community. These improvements may be explored in WS2.</p>
CONCLUSIONS:	
187 Existing measures would be inadequate.	188 Proposed measures would be adequate.

189 <b>Stress Test #13:</b> One or several stakeholders excessively rely on accountability mechanism to “paralyze” ICANN.	
190 <b>Consequence(s):</b> Major impact on corporate reputation, inability to take decisions, instability of governance bodies, loss of key staff.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>191 Current redress mechanisms might enable one stakeholder to block implementation of policies. But these mechanisms (IRP, Reconsideration, Ombudsman) are expensive and limited in scope of what can be reviewed.</p> <p>192 There are no present mechanisms for a ccTLD operator to challenge a revocation decision.</p>	<p>193 CCWG-Accountability proposals for community empowerment rely upon consensus among ACs/SOs participating in the Empowered Community as Decisional Participants, requiring a minimum threshold of support and no more than one AC/SO objecting. These consensus requirements are an effective prevention of paralysis by one AC/SO.</p> <p>194 Proposed CCWG-Accountability redress mechanisms (Reconsideration and IRP) are more accessible and affordable to individual stakeholders, increasing their ability to block implementation of policies and decisions. However, proposed Reconsideration and IRP enhancements include the ability to dismiss frivolous or abusive claims and to limit the duration of proceedings.</p>
CONCLUSIONS:	
195 Existing measures seem to be adequate.	196 Improved access to Reconsideration and IRP could allow individuals to impede ICANN processes, although this risk is mitigated by dismissal of frivolous or abusive claims.

<p>197 <b>Stress Test #16:</b> ICANN engages in programs not necessary to achieve its limited technical Mission. For example, ICANN uses fee revenue or reserve funds to expand its scope beyond its technical Mission, giving grants for external causes.</p>	
<p>198 <b>Consequence(s):</b> ICANN has the power to determine fees charged to TLD applicants, registries, registrars, and registrants, so it presents a large target for any Internet-related cause seeking funding sources.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>199 As long as NTIA controls the IANA contract, ICANN would risk losing IANA functions if it were to expand scope without community support. But as a result of the IANA stewardship transition, ICANN would no longer need to limit its scope in order to retain the IANA contract with NTIA.</p> <p>200 The community was not aware of the ICANN Board’s secret resolution to initiate negotiations to create NetMundial. There was no apparent way for the community to challenge/reverse this decision.</p> <p>201 The community has input in ICANN budgeting and the Strategic Plan.</p> <p>202 Registrars must approve ICANN’s variable registrar fees, though Registrars do not view this as an accountability measure.</p> <p>203 California’s Attorney General has jurisdiction over non-profit entities acting outside Bylaws or Articles of Incorporation. California’s Attorney General could intervene where misuse or mispending of substantial charitable assets is alleged.</p>	<p>204 One proposed measure is empowering the community to veto ICANN’s proposed strategic plan and budget. This measure could block a proposal by ICANN to increase its expenditure on initiatives the community believed were beyond ICANN’s limited Mission. However, the entire ICANN budget would have to be rejected since there is no proposal for line-item veto.</p> <p>205 Another proposed mechanism is a challenge to a Board decision, made by an aggrieved party or the community as a whole. This would refer the matter to an IRP with the power to issue a binding decision. If ICANN made a commitment or expenditure outside the annual budget process, the IRP mechanism enables reversal of that decision.</p> <p>206 Another proposal is to amend ICANN Bylaws to prevent the organization from expanding its scope beyond ICANN’s amended Mission, Commitments and Core Values.</p> <p>207 If ICANN’s Board proposed to amend/remove these Bylaws provisions, another measure would empower the community to veto a proposed Standard Bylaws change. For Fundamental Bylaws or the Articles of Incorporation, the Board would need to adopt changes by a 3/4 supermajority, and the community must approve the changes adopted by the Board before they could become legally effective.</p>
<p><b>CONCLUSIONS:</b></p>	

208 Existing measures are inadequate.	209 Proposed measures in combination may be adequate.
---------------------------------------	---

210 <b>Stress Test #18:</b> Governments in ICANN’s Government Advisory Committee (GAC) amend their operating procedures to change from consensus decisions to majority voting for advice to ICANN’s Board.	
211 <b>Consequence(s):</b> Under current Bylaws, ICANN must consider and respond to GAC advice, even if that advice were not supported by consensus. A majority of governments could thereby approve Governmental Advisory Committee advice.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>212 Current ICANN Bylaws (Article XI) require ICANN to try to find a mutually acceptable solution for Governmental Advisory Committee advice.</p> <p>213 Today, GAC adopts formal advice according to its Operating Principle 47: “<i>consensus is understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection.</i>”<sup>[1]</sup></p> <p>214 The Governmental Advisory Committee may at any time change its procedures instead of its present consensus rule.</p> <p>215 The requirement to try to find a mutually acceptable solution in the current Bylaws would then apply, not just for Governmental Advisory Committee consensus advice.</p>	<p>216 The proposed measure would amend ICANN Bylaws (Article XI, Section 2, item 1j) to require trying to find a mutually acceptable solution only where Governmental Advisory Committee advice was supported by full Governmental Advisory Committee consensus, understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection.</p> <p>217 The proposed accountability measure recognizes that the decision not to follow GAC consensus advice would require a 60% majority of the ICANN Board.</p> <p>218 The Governmental Advisory Committee can still give ICANN advice at any time, with or without full consensus.</p> <p>219 Recognizing the general principle that an AC should have the autonomy to refine its Operating Procedures, the Governmental Advisory Committee could specify how objections are raised and considered.</p>
CONCLUSIONS:	
220 Existing measures are inadequate.	221 Proposed measures are adequate.

222 **Stress Test #22:** ICANN Board fails to comply with Bylaws and/or refuses to accept the

<sup>1</sup> ICANN Government Advisory Committee (GAC) - Operating Principles, October, 2011, at <https://gacweb.icann.org/display/gacweb/GAC+Operating+Principles>

decision of a redress mechanism constituted under the Bylaws.	
223 <b>Consequence(s):</b> Community loses confidence in multistakeholder structures to govern ICANN.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>224 As long as NTIA controls the IANA contract, ICANN would risk losing IANA functions if it were to ignore Bylaws or an IRP decision. But as a result of the IANA Stewardship Transition, ICANN would no longer need to follow its Bylaws in order to retain the IANA contract with NTIA.</p> <p>225 Aggrieved parties can ask for Reconsideration of Board decisions, but this is currently limited to questions of whether process was followed.</p> <p>226 Aggrieved parties can file an IRP, but decisions of the panel are not binding on ICANN.</p> <p>227 California’s Attorney General has jurisdiction over non-profit entities acting outside Bylaws or Articles of Incorporation. California’s Attorney General could intervene where misuse or mispending of substantial charitable assets is alleged.</p>	<p>228 One proposed measure is to change the standard for Reconsideration Requests, so that substantive matters may also be challenged.</p> <p>229 Another proposed measure empowers the community to force ICANN’s Board to consider a recommendation arising from an Affirmation of Commitments Review such as an Accountability and Transparency Review. An ICANN Board decision against those recommendations could be challenged with a Reconsideration and/or IRP.</p> <p>230 One proposed measure is empowering the community to challenge a Board decision, referring it to an IRP with the power to issue a binding decision. If ICANN failed to comply with its Articles of Incorporation, Bylaws or policies, the proposed IRP enables a reversal of that decision.</p> <p>231 If the ICANN Board were to ignore binding IRP decisions, the Empowered Community could seek enforcement in any court respecting international arbitration results.</p> <p>232 Another proposed measure empowers the community to recall the entire ICANN Board.</p>
<p><b>CONCLUSIONS:</b></p> <p>233 Existing measures are inadequate.</p>	<p>234 Proposed measures in combination are adequate because the community has power to recall the Board.</p>

<p>235 <b>Stress Test #23:</b> ICANN uses RAA or Registry contracts to impose requirements on third parties, outside the scope of ICANN Mission. (e.g. registrant obligations.)</p> <p>236 Affected third parties, not being contracted to ICANN, have no effective recourse.</p> <p>237 Contracted parties, not affected by the requirements, may choose not to use their ability to</p>
---

<p>challenge ICANN’s decision.</p> <p>238 This issue occurs in policy development, implementation, and compliance enforcement.</p>	
<p>239 <b>Consequence(s):</b> ICANN may be seen as a monopoly leveraging power in one market (domain names) into adjacent markets.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>240 During policy development, affected third parties may participate and file comments.</p> <p>241 Affected third parties may file comments on proposed changes to registry and registrar contracts.</p> <p>242 Affected third parties (e.g. registrants and users) have no standing to challenge ICANN on its approved policies.</p> <p>243 Affected third parties (e.g. registrants and users) have no standing to challenge ICANN’s management and Board on how it has implemented approved policies.</p> <p>244 If ICANN changes its legal jurisdiction, that might reduce the ability of third parties to sue ICANN.</p>	<p>245 A proposed measure to empower an aggrieved party (e.g. registrants and users) to challenge a Board decision, referring it to an IRP with the power to issue a binding decision, based on standard for review in the amended Mission, Commitments and Core Values, or in established policies.</p> <p>246 Another proposed measure is empowering the community to challenge a Board decision, referring it to an IRP with the power to issue a binding decision.</p> <p>247 That IRP decision would be based on a standard of review in the amended Mission statement, including “ICANN shall act strictly in accordance with, and only as reasonably appropriate to achieve its Mission. ”</p>
<b>CONCLUSIONS:</b>	
<p>248 Existing measures are inadequate.</p>	<p>249 Proposed measures would be adequate.</p>

<p>250 <b>Stress Test #26:</b> During implementation of a properly approved policy, ICANN staff substitutes their preferences and creates processes that effectively change or negate the policy developed. Whether staff does so intentionally or unintentionally, the result is the same.</p>	
<p>251 Consequence(s): Staff capture of policy implementation undermines the legitimacy conferred upon ICANN by established community based policy development processes.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>252 The reconsideration review mechanism allows for appeal to the Board of staff actions that contradict established ICANN policies. However, reconsideration looks at the process but not the substance of a decision.</p> <p>253 An ICANN Board decision could not be challenged by the community at-large, which lacks standing to use the IRP.</p>	<p>254 A proposed measure would allow the Empowered Community to challenge a Board decision by reconsideration or referral to an IRP with the power to issue a binding decision. The standard of review would look at the revised ICANN Bylaws, including Core Values requiring "open, transparent and bottom-up, multistakeholder policy development processes".</p>
CONCLUSIONS:	
<p>255 Existing measures are inadequate.</p>	<p>256 Proposed measures would be adequate.</p>

## Stress test category V: Failure of Accountability to External Stakeholders

257 <b>Stress Test #14:</b> ICANN or NTIA chooses to terminate the Affirmation of Commitments.	
258 Consequence(s): ICANN would no longer be held to the Affirmation of Commitments, including the conduct of community reviews and required implementation of review team recommendations.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>259 The Affirmation of Commitments can be terminated by either ICANN or NTIA with 120 days notice.</p> <p>260 As long as NTIA controls the IANA contract, ICANN feels pressure to maintain the Affirmation of Commitments.</p> <p>261 But as a result of the IANA Stewardship Transition, ICANN would no longer have the IANA contract as external pressure from NTIA to maintain the Affirmation of Commitments.</p> <p>262 Note: none of the proposed measures could prevent NTIA from canceling the Affirmation of Commitments.</p>	<p>263 One proposed mechanism would give the Empowered Community standing to challenge a Board decision by referral to an IRP with the power to issue a binding decision. If ICANN cancelled the Affirmation of Commitments, the IRP could enable reversal of that decision.</p> <p>264 Another proposed measure is to import Affirmation of Commitments provisions into the ICANN Bylaws, and dispense with the bilateral Affirmation of Commitments with NTIA. Bylaws would be amended to include Affirmation of Commitments 3, 4, 7, and 8, plus the 4 periodic reviews required in paragraph 9.</p> <p>265 If ICANN’s Board proposed to amend the AoC commitments and reviews that were added to the Bylaws, another proposed measure would empower the community to veto that proposed Bylaws change.</p> <p>266 If any of the AoC commitments were designated as Fundamental Bylaws, changes would require approval by the Empowered Community.</p> <p>267</p>
CONCLUSIONS:	
268 Existing measures are inadequate after NTIA or ICANN terminates the IANA contract.	269 Proposed measures in combination are adequate.

<p>270 <b>Stress Test #15:</b> ICANN terminates its legal presence in a nation where Internet users or domain registrants are seeking legal remedies for ICANN’s failure to enforce contracts, or other actions.</p>	
<p>271 <b>Consequence(s):</b> Affected parties might be prevented from seeking legal redress for commissions or omissions by ICANN.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>272 As long as NTIA controls the IANA contract, ICANN could risk losing IANA functions if it were to move in order to avoid legal jurisdiction.</p> <p>273 Paragraph 8 of the Affirmation of Commitments requires ICANN to remain headquartered in the US, but the Affirmation of Commitments can be terminated by ICANN at any time.</p> <p>274 As long as NTIA controls the IANA contract, ICANN feels pressure to maintain the Affirmation of Commitments.</p> <p>275 ICANN is incorporated as a California nonprofit public benefit corporation, and Article XVIII of ICANN Bylaws provides that ICANN’s “principal office for the transaction of the business of ICANN shall be in the County of Los Angeles, State of California, United States of America.”. But the ICANN Board alone can change the Articles and the Bylaws, and can approve a dissolution or merger of the corporation, and the community has no binding power to block the changes.</p>	<p>276 Under the Articles of Incorporation, ICANN has been formed as a California nonprofit public benefit corporation. Unless dissolved or merged into another entity, it will remain as such and will be subject to California law and regulatory oversight, regardless of where it maintains a physical presence.</p> <p>277 Article XVIII of ICANN Bylaws provides that ICANN’s “principal office for the transaction of the business of ICANN shall be in the County of Los Angeles, State of California, United States of America.”</p> <p>278 If ICANN’s Board proposed to amend the Articles of Incorporation or sell or otherwise dispose of all or substantially all of ICANN’s assets, the action would require supermajority Board approval (3/4) as well as approval by the Empowered Community.</p> <p>279 If Bylaws Article XVIII were designated as a Fundamental Bylaw, changes to ICANN’s principal office would similarly require supermajority Board approval (3/4) as well as approval by the Empowered Community.</p> <p>280 Any change to the Standard Bylaws could be vetoed by the Empowered Community.</p>
CONCLUSIONS:	
<p>281 Existing measures are inadequate once NTIA terminates IANA contract.</p>	<p>282 Proposed measures improve upon existing measures, and may be adequate.</p>

<p>283 <b>Stress Test #25:</b> ICANN delegates or subcontracts its obligations under a future IANA functions operator agreement to a third party. Would also include ICANN merging with or allowing itself to be acquired by another organization.</p>	
<p>284 <b>Consequence(s):</b> Responsibility for fulfilling the IANA functions could go to a third party that was subject to national laws that interfered with its ability to execute IANA functions.</p>	
<p><b>EXISTING ACCOUNTABILITY MEASURES</b></p>	<p><b>PROPOSED ACCOUNTABILITY MEASURES</b></p>
<p>285 The present IANA contract (link) at C.2.1 does not allow ICANN to sub-contract or outsource its responsibilities to a 3rd party without NTIA’s consent.</p> <p>286 NTIA could exert its control over ICANN’s decision as long as it held the IANA contract but would not be able to do so after it relinquishes the IANA contract.</p> <p>287 Nor would NTIA’s required principles for transition be relevant after transition occurred.</p>	<p>288 The CWG-Stewardship “recommends that an ICANN Fundamental Bylaw be created to define a separation process that can be triggered by a Special IFR if needed.” There is no allowance in the CWG-Stewardship proposal to allow ICANN to sub-contract or outsource its IANA responsibilities to a 3rd party other than to PTI. If a separation process were initiated a new IANA functions operator could be selected only with involvement of the empowered community.</p> <p>289 The CCWG-Accountability is proposing to empower the community to challenge a Board decision, referring it to an IRP with the power to issue a binding decision. If ICANN failed to follow Bylaws requirements to have the community define public interest, the IRP enables a reversal of that decision. The standard of review would look at the revised ICANN Bylaws, including Core Values requiring “open, transparent and bottom-up, multistakeholder policy development processes”.</p> <p>290 Note: This would not cover re-assignment of the Root Zone Maintainer role, which NTIA is addressing in a parallel process.</p>
<p><b>CONCLUSIONS:</b></p>	
<p>291 Existing measures would not be adequate after NTIA relinquishes the IANA contract.</p>	<p>292 Proposed measures are adequate to allow the community to challenge ICANN decisions in this scenario.</p>

- 293 After publication of the CCWG-Accountability first draft proposal, new stress tests were suggested in the CCWG-Accountability discussion list and in the public comments received. Below are new stress tests added for publication in the CCWG-Accountability's second draft proposal.
- 294 Stress Tests were suggested by a scenario that might give ultimate authority to a state-based American court and allow it to make binding and precedent setting decisions about the interpretation of ICANN's mission. Two stress tests (27 and 28) were designed for this scenario.

295	<b>Stress Test #27:</b> Board refuses to follow community recommendation, triggering a “member” to sue ICANN in the California courts.	
296	For example, an ATRT (Accountability and Transparency Review Team) recommends a new policy for implementation but the ICANN Board decides to reject the recommendation.	
297	<b>Consequence(s):</b> Gives ultimate authority to an American court, allowing it to make binding and precedent setting decisions about the interpretation of ICANN’s mission.	
	<b>EXISTING ACCOUNTABILITY MEASURES</b>	<b>PROPOSED ACCOUNTABILITY MEASURES</b>
298	This scenario assumes that ICANN converts to a model where members acquire statutory rights to pursue relief in California courts.	300 CCWG’s proposal does not create member status for the Empowered Community. The CCWG-Accountability proposal does not give any of the ACs or SOs the power to force ICANN’s Board to accept and implement the ATRT recommendation. This is intentional, since the ICANN Board could cite cost or feasibility in deciding not to implement part of a Review Team recommendation.
299	Member access to court relief is not available under ICANN’s present structure.	301 If the ICANN Board refused to implement the ATRT recommendation, the Empowered Community could challenge the Board decision with an IRP. An IRP panel of 3 international arbitrators (not a Court) could hold that the ATRT recommendation does not conflict with “substantive limitations on the permissible scope of ICANN’s actions”. The IRP decision cancels the Board decision to reject the ATRT recommendation. Any court recognizing arbitration results could enforce the IRP decision.
		302 If the ICANN Board continued to ignore the IRP decision and court orders to enforce it, the community has 2 more options:
		303 The Empowered Community could recall the Board.
		304 The Empowered Community could block the very next budget or operating plan if it did not include the ATRT recommendation.
	<b>CONCLUSIONS:</b>	
305	Not applicable to ICANN’s existing	306 If a court were asked to enforce an IRP

<p>accountability measures.</p>	<p>ruling, it would examine whether IRP procedures were properly followed and whether those procedures comply with fundamental notions of due process, but the court would not interpret ICANN's mission. Proposed measures are therefore adequate.</p>
---------------------------------	---

<p>307 <b>Stress Test #28:</b> Board follows community recommendation, but is reversed by IRP decision, triggering a “member” to sue ICANN in California courts.</p> <p>308 For example, an ATRT (Accountability and Transparency Review Team) recommends a new policy for implementation. ICANN Board decides to accept the recommendation, believing that it does not conflict with ICANN’s limited Mission Statement in the amended Bylaws</p>	
<p>309 <b>Consequence(s):</b> Gives ultimate authority to an American court, allowing it to make binding and precedent setting decisions about the interpretation of ICANN’s mission.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>310 This scenario assumes that ICANN converts to a model where members acquire statutory rights to pursue relief in California courts.</p> <p>311 Member access to court relief is not available under ICANN’s present structure.</p>	<p>312 CCWG’s proposal does not create member status for the Empowered Community. An aggrieved party or the Empowered Community could challenge Board’s decision with an IRP. An IRP panel (not a court) could determine that the ATRT recommendation does conflict with “substantive limitations on the permissible scope of ICANN’s actions”. The IRP panel could thereby cancel the Board decision to accept and implement the ATRT recommendation.</p> <p>313 If the Board ignored the IRP ruling and continued to implement its earlier decision, parties to the IRP could ask courts to enforce the IRP decision. Judgments of the IRP Panel would be enforceable in any court that accepts international arbitration results.</p> <p>314 If the ICANN Board continued to ignore the IRP decision and court orders to enforce it, the community has 2 more options:</p> <p>315 The Empowered Community could recall the Board.</p> <p>316 The Empowered Community could block the very next budget or operating plan if it did not include the ATRT recommendation.</p>
CONCLUSIONS:	
<p>317 Not applicable to ICANN’s existing accountability measures.</p>	<p>318 If a court were asked to enforce an IRP ruling, it would examine whether IRP procedures were properly followed and whether those procedures comply with fundamental notions of due process, but the</p>

	court would not interpret ICANN's mission. Proposed measures are therefore adequate.
--	---

319 Public commenters requested two additional stress tests regarding enforcement of contract provisions that exceed the limited mission of ICANN.

<p>320 <b>Stress Test #29:</b> (Similar to #23) ICANN strongly enforces the new gTLD registrar contract provision to investigate and respond to reports of abuse, resulting in terminations of some name registrations.</p> <p>321 ICANN also insists that legacy gTLD operators adopt the new gTLD contract on renewal.</p>	
<p>322 <b>Consequence(s):</b> ICANN’s enforcement of registry and registrar contract terms might be blocked by an IRP ruling citing Mission and Core Values.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>323 The GNSO could initiate a policy development process to define registrar obligations. A new Consensus Policy would apply to all Registry contracts and RAA.</p> <p>324 Affected registrants may file comments on the proposed gTLD contract renewals.</p> <p>325 Affected registrants could challenge ICANN’s termination decisions with Reconsideration or IRP, but could not cite Mission and Core Values, because the current IRP only considers whether ICANN followed process.</p>	<p>326 The GNSO could initiate a policy development process to define registrar obligations. A new Consensus Policy would apply to all Registry contracts and RAA.</p> <p>327 The proposed IRP allows any aggrieved party to challenge ICANN’s enforcement actions, resulting in a binding decision. An IRP challenge could assert that an RAA provision was not the result of consensus policy and/or violates ICANN’s Mission Statement, Commitments and Core Values in amended Bylaws.</p> <p>328 The new IRP standard of review would look at revised ICANN Bylaws, including Core Values requiring “open, transparent and bottom-up, multistakeholder policy development processes”.</p>
<p><b>CONCLUSIONS:</b></p> <p>329 Existing measures would not be adequate to challenge ICANN enforcement decision.</p>	<p>330 Proposed measures would be adequate to challenge ICANN enforcement actions, but it is unlikely that IRP panels would block enforcement of contract terms and consensus policies</p>

331 <b>Stress Test #30:</b> (Similar to #23 and #29) ICANN terminates registrars for insufficient response to reports of copyright abuse on registered domains.	
332 <b>Consequence(s):</b> ICANN’s enforcement of registry and registrar contract terms might be blocked by an IRP ruling citing Mission and Core Values.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>333 The GNSO could initiate a policy development process to define registrar obligations. A new Consensus Policy would apply to all Registry contracts and RAA.</p> <p>334 Affected registrars could challenge ICANN’s termination decisions with Reconsideration or IRP, but could not cite Mission and Core Values, because the current IRP only considers whether ICANN followed process.</p> <p>335 Affected registrants and users have no standing to use IRP to challenge ICANN decision.</p>	<p>336 The GNSO could initiate a policy development process to define registrar obligations. A new Consensus Policy would apply to all Registry contracts and RAA.</p> <p>337 The proposed IRP allows any aggrieved party to challenge ICANN’s enforcement actions, resulting in a binding decision. An IRP challenge could assert that RAA provision was not the result of consensus policy and/or violates the Mission, Commitments and Core Values in amended Bylaws.</p> <p>338 The IRP standard of review would look at revised ICANN Bylaws, including Core Values requiring “open, transparent and bottom-up, multistakeholder policy development processes”.</p>
CONCLUSIONS:	
339 Existing measures might be adequate for a registrar, but would not be adequate for a registrant to challenge ICANN enforcement decision.	340 Proposed measures would be adequate to challenge ICANN enforcement actions, but it is unlikely that IRP panels would block enforcement of contract terms and consensus policies

341 Several individuals requested evaluation of a stress test scenario where the individual designated by an AC/SO failed to follow their AC/SO instructions when communicating AC/SO decisions for any of the Community Powers proposed by CCWG-Accountability.

342 <b>Stress Test #31:</b> “Rogue” voting, where an AC/SO vote on a community power is not exercised in accord with the express position of the AC/SO.	
343 <b>Consequence(s):</b> Decisions on exercising a community power would be challenged as invalid, and the integrity of decisions could be questioned more broadly.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
344 AC/SO community powers are not available under ICANN’s Bylaws.	<p>345 An AC/SO could develop internal processes to ensure that any vote communicated would match the AC/SO decision instructions.</p> <p>346 If an AC/SO vote communicator voted against the instructions of their AC/SO, the decision rules for Empowered Community could specify procedures to invalidate a vote:</p> <p>347 If any elected AC/SO officer is aware that the person designated to communicate the AC/SO vote did not follow AC/SO instructions, an AC/SO officer could publicize this issue to ICANN staff and to all other AC/SO communities.</p> <p>348 After notice, the results of the Empowered Community’s exercise of a Community Power would be set aside, pending correction of the problem by the AC/SO. Correction might involve giving more explicit instructions to the vote communicator, or replacing the person in that role.</p> <p>349 After the problem has been remedied, another round of decision would occur.</p>
<b>CONCLUSIONS:</b>	
350 Not applicable to ICANN’s existing accountability measures.	351 Proposed measures would be adequate to avoid “rogue voting” problems.

352 There are four stress test items suggested in NTIA Secretary Larry Strickling’s statement of 16-Jun-2015 ([link](#)):

353 **NTIA-1:** Test preservation of the multistakeholder model if individual ICANN ACs/SOs choose not to be Decisional Participants in the Empowered Community.

354 **NTIA-2:** Address the potential risk of internal capture. ST 12 and 13 partly address capture by external parties, but not for capture by internal parties in an AC/SO.

355 **NTIA-3:** Barriers to entry for new participants.

356 **NTIA-4:** Unintended consequences of “operationalizing” groups that to date have been advisory in nature (e.g. GAC)

Each of these NTIA stress tests is shown below.

<p>357 <b>Stress Test #32:</b> (NTIA-1) Several ACs/SOs choose not to be Decisional Participants in the Empowered Community that is responsible for exercising Community Powers (e.g., blocking budget, blocking strategic/operating plan, blocking changes to Bylaws, approving changes to Fundamental Bylaws, recalling Board members)</p>	
<p>358 <b>Consequence(s):</b> ICANN’s multistakeholder model would be in question if multiple stakeholders did not participate in Community Powers.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>359 AC/SO community powers are not available under ICANN’s Bylaws.</p>	<p>360 In the true spirit of ICANN’s multistakeholder model, CCWG proposes inviting all ACs/SOs to exercise Community Powers. The only restriction would be if the GAC decided to be a Decisional Participant in the Empowered Community, in which case it would not be able to participate as a decision-maker in the Empowered Community’s exercise of a Community Power to challenge the ICANN Board’s implementation of GAC consensus advice. The GAC would, however, be able to participate in an advisory capacity in all other aspects of the escalation process.</p> <p>361 The SSAC and RSSAC said they don’t intend to be Decisional Participants in the Empowered Community. That does not remove these ACs from ICANN’s multistakeholder process. The SSAC and RSSAC would continue advising the Board and community on matters relevant to them. Other ACs/SOs can ask for SSAC/RSSAC</p>

	<p>advice before they exercise Community Powers.</p> <p>362 The SSAC and RSSAC could later decide to become Decisional Participants in the Empowered Community as set forth in the Bylaws, or request Bylaws amendments to enable this.</p> <p>363 If fewer than 3 ACs/SOs participate as Decisional Participants in an Empowered Community decision process, the minimum thresholds for consensus would not be reached.</p> <p>364</p>
<p><b>CONCLUSIONS:</b></p> <p>365 Not applicable to ICANN's existing accountability measures.</p>	<p>366 ICANN's multistakeholder model would be preserved, even if multiple ACs/SOs decided not to exercise the new community powers.</p>

<p>367 <b>Stress Test #33:</b> (NTIA-2) Participants in an AC/SO could attempt to capture an AC/SO, by arranging over-representation in a working group, in electing officers, or making a decision.</p>	
<p>368 <b>Consequence(s):</b> Internal capture, whether actual or perceived, would call into question ICANN’s credibility in applying the multistakeholder model.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>369 ICANN’s Bylaws require periodic reviews of each AC/SO, where protections against internal capture could be recommended for adoption.</p> <p>370 ACs/SOs can revise their charters and operating procedures if they see the need to protect against internal capture. However, capture might inhibit adoption of AC/SO charter amendments.</p> <p>371 If a ‘captured’ AC/SO sent advice /policy to the Board, it is not clear how disenfranchised AC/SO members could challenge the Board decision to follow that advice/policy.</p>	<p>372 ICANN’s Bylaws require periodic reviews of each AC/SO, where protections against internal capture could be recommended for adoption.</p> <p>373 ACs/SOs can revise their charters and operating procedures if they see a need to protect against internal capture. However, capture might inhibit adoption of AC/SO charter amendments.</p> <p>374 If a ‘captured’ AC/SO sent advice /policy to the Board, a disenfranchised AC/SO could challenge the Board decision to follow that advice/policy, using reconsideration or IRP. The standard of review would be ICANN’s Articles of Incorporation and amended Bylaws, including Core Values requiring “open, transparent and bottom-up, multistakeholder policy development processes”.</p>
CONCLUSIONS:	
<p>375 Existing accountability measures are not likely to be adequate.</p>	<p>376 Proposed accountability measures would be adequate, provided that the Bylaws requirement for open, transparent, bottom-up, multistakeholder process is interpreted by the Board and IRP panelists to include assessment of how decisions were reached in an AC or SO.</p>

<p>377 <b>Stress Test #34:</b> (NTIA-3) Stakeholders who attempt to join an ICANN AC/SO encounter barriers that discourage them from participating.</p>	
<p>378 <b>Consequence(s):</b> Barriers to entry, whether actual or perceived, would call into question ICANN’s credibility in applying the multistakeholder model.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>379 ICANN’s Bylaws require periodic reviews of each AC/SO, where barriers to entry could be assessed and could generate recommended changes.</p> <p>380 Affirmation of Commitments requires period reviews of Accountability and Transparency, including “(d) assessing the extent to which ICANN’s decisions are embraced, supported and accepted by the public and the Internet community;”</p> <p>381 ICANN’s Ombudsman might help new entrants to join ACs/SOs.</p>	<p>382 ICANN’s Bylaws require periodic reviews of each AC/SO, where barriers to entry could be assessed and could generate recommended changes.</p> <p>383 Affirmation of Commitments requires periodic reviews of Accountability and Transparency, including “(d) assessing the extent to which ICANN’s decisions are embraced, supported and accepted by the public and the Internet community;”</p> <p>384 ICANN’s Ombudsman might help new entrants to join ACs/SOs.</p> <p>385 CCWG proposes a new Core Value in ICANN’s Bylaws requiring “open, transparent and bottom-up, multistakeholder policy development processes”.</p> <p>386 This would be the standard of review for IRPs that could be brought by anyone encountering barriers to entry to an AC/SO.</p>
CONCLUSIONS:	
<p>387 Existing accountability reviews can help erode barriers to entry, though not in real-time.</p>	<p>388 Proposed changes to Core Values and IRP could provide faster solutions to barriers encountered by new entrants.</p>

<p>389 <b>Stress Test #35:</b> (NTIA-4) Unintended consequences of “operationalizing” groups that formerly only gave advice to the ICANN Board (for example, the GAC).</p>	
<p>390 <b>Consequence(s):</b> An AC that previously gave only advice on a narrow scope of issues could affect decisions on Community Powers that extend beyond that narrow scope.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>391 Advisory Committees (ACs) have no community powers or decisional rights under ICANN’s Bylaws.</p> <p>392 That said, ICANN has given significant deference to GAC advice in the new gTLD program, resulting in significant effects on operations for new gTLD registries and registrars.</p>	<p>393 In the true spirit of ICANN’s multistakeholder model, CCWG proposes inviting all ACs/SOs to participate in decisions about exercising community powers.</p> <p>394 All ACs can thereby expand beyond their present advisory roles. To address concerns that the GAC could gain undue influence over ICANN, CCWG notes proposed changes that reduce GAC’s ability to affect ICANN operations:</p> <p>395 Per Stress Test 18 and the proposed Bylaws change, the Board would be obligated to try to “find a mutually acceptable solution” for GAC consensus advice (i.e., approved “by general agreement in the absence of any formal objection”). Moreover, should the GAC decide to be a Decisional Participant in the Empowered Community, it would not be able to participate as a decision-maker in the Empowered Community’s exercise of a Community Power to challenge the ICANN Board’s implementation of GAC consensus advice, although the GAC would be able to participate in an advisory capacity in all other aspects of the escalation process.</p> <p>396 Proposed Core Values require “open, transparent and bottom-up, multistakeholder policy development processes”. This would allow the community to challenge an ICANN decision to implement any GAC advice that was not supported by the bottom-up process.</p> <p>397 In Core Value #5, CCWG proposes adding that policy development must be “led by the private sector”.</p> <p>398 In Core Values, CCWG restricts ICANN’s</p>

	<p>scope of activities.</p> <p>399 The new IRP gives the community ability to overturn a Board decision to implement GAC advice that goes against the Mission and Core Values in the amended Bylaws. A carve-out is proposed for community decision-making, to avoid having the GAC block a community challenge to Board action based upon GAC advice.</p> <p>400 For the Affirmation of Commitments reviews, the GAC Chair would no longer approve/appoint review team members.</p>
<p><b>CONCLUSIONS:</b></p> <p>401 Existing accountability measures have already given Advisory Committees significant influence over ICANN operations.</p>	<p>402 Proposed accountability measures would treat ACs as multi-equal stakeholders in exercising Community Powers, while also reducing the GAC’s ability to affect ICANN operations.</p>

- 403 The ICANN Board sent a letter on 20-Jun-2015 with 156 questions regarding impact and implementation testing of CCWG proposals. ([link](#)) Two questions included requests for stress testing the CCWG proposal for a membership-based model:
- 404 What unintended consequences may arise from empowering (e.g., approval rights, etc.) entities/individuals who are not required to act in the best interest of ICANN (and who may have their own business, financial or personal interests), other members or the community as a whole and have stress tests been conducted for each of these consequences?
- 405 What are the risks associated with empowering members to bring lawsuits against ICANN, each other and other parties and have stress tests been conducted for reach of these situations?
- 406 Both scenarios are addressed in Stress Test 36:

<p>407 <b>Stress Test #36:</b> Unintended consequences arising from empowering entities/individuals who are not required to act in the best interest of ICANN (and who may have their own business, financial or personal interests), other members, or the community as a whole.</p>	
<p>408 <b>Consequence(s):</b> An entity could exercise statutory powers accorded to members under California law, and pursue legal actions that would harm interests of the ICANN community.</p>	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>409 ACs and SOs have no joint community powers or decisional rights under ICANN's Bylaws.</p> <p>410 ICANN's Bylaws do not recognize any members as defined under California Nonprofit Public Benefit Corporation law.</p>	<p>411 CCWG proposes that each AC and SO may participate in the decision process on whether to exercise an enumerated Community Power (except for the GAC, with respect to the exercise of a Community Power to challenge the ICANN Board's implementation of GAC consensus advice). No other individuals or entities could exercise these powers. Exercise of these powers requires consensus, which prevents any one AC/SO from advancing its interests against the interests of the broader community.</p> <p>412 CCWG proposes to have the Empowered Community be given the role of sole designator of ICANN's Directors and will have the ability to enforce directly or indirectly the Community Powers. A designator does not acquire all of the statutory powers of a member under California law.</p> <p>413 Only the Empowered Community would have legal status and statutory right of a designator and would be given rights under the Bylaws to exercise Community Powers. Consequently, legal action would only be brought if supported by the ACs and SOs participating in the Empowered Community, and a high threshold of consensus is required.</p> <p>414 Individuals and entities – including ACs and SOs – would not become designators and would not be directly given any rights under the Bylaws to exercise Community Powers. They could not acquire statutory rights given to members or designators under California</p>

	law.
<b>CONCLUSIONS:</b> 415 Not applicable to ICANN's existing accountability measures.	416 Proposed Empowered Community measures are adequate to avoid this scenario.

417 After publication of the CCWG-Accountability second draft proposal, one new stress test was suggested in public comments received. ELIG (a law firm) suggested stress testing on a “deadlock” over approving changes to Fundamental Bylaws, and blocking changes to regular Bylaws: “We believe that it would be helpful to also explain the details of the legislation procedures in case of a deadlock during the amendment/enactment of a Bylaw.” See Stress Test 37 below.

418 <b>Stress Test #37:</b> The Empowered Community blocks a Board-proposed change to a regular Bylaw, or withholds its approval of a Board-proposed change to a Fundamental Bylaw.	
419 <b>Consequence(s):</b> A “deadlock” between the ICANN Board and the Empowered Community, where the Board-proposed Bylaws change is not enacted.	
EXISTING ACCOUNTABILITY MEASURES	PROPOSED ACCOUNTABILITY MEASURES
<p>420 ICANN’s present Bylaws allow the Board alone to amend Bylaws: “the Articles of Incorporation or Bylaws of ICANN may be altered, amended, or repealed and new Articles of Incorporation or Bylaws adopted only upon action by a two-thirds (2/3) vote of all members of the Board.”</p> <p>421 There is no requirement for community consultation or public comment for Bylaws changes.</p> <p>422 There is no present power for the community to block or approve Bylaws changes.</p>	<p>423 The Empowered Community is intentionally given the power to block a Board-adopted change to a Standard Bylaw.</p> <p>424 In addition, the Empowered Community is intentionally given the power to withhold its approval of a Board-adopted change to a Fundamental Bylaw.</p> <p>425 Such outcomes might be characterized as “deadlock” by advocates of the Bylaws change. But this would reflect the consensus decision of ACs/SOs representing the community that ICANN is designed to serve.</p> <p>426 This outcome would motivate the Board to understand the concerns of the community over proposed Bylaws changes. The Board could then persuade the community that its concerns were unfounded, or modify its proposed Bylaws change to accommodate concerns expressed.</p>
CONCLUSIONS:	
427 Existing accountability mechanisms prevent “deadlock” because the community has no power to affect Board-proposed Bylaws changes.	428 Proposed community powers enable “deadlock” over Board-proposed Bylaws changes, but only if that is the consensus decision of the community.

# Appendix A – Documenting Process of Building Consensus

---

- 01 The Supplemental Final Proposal on Work Stream 1 Recommendations was developed in a bottom-up, multistakeholder approach, which included multiple “readings” of each recommendation. Each draft was posted publicly and open to comment by CCWG-Accountability members and participants.
- 02 To finalize its report, the CCWG-Accountability established a structured process to ensure input was being accurately discussed and reflected, as appropriate. Step 1 consisted in circulating key discussion items to the list based on public comment received. Following a first reading held on a call, the CCWG-Accountability leadership would circulate conclusions of the first reading along with edits to prepare for the second reading. This process would conclude with the distribution of second reading conclusions. Additional readings and discussions were scheduled and continued on the list depending on difficulties in reaching consensus. Documents prepared for readings can be found [here](#).
- 03 Following the final reading and legal review, finalized recommendations were sent to the CCWG-Accountability for a 48-hour period to note any errors, comments, or statements for the record.
- 04 [The CCWG-Accountability is pleased to provide its Chartering Organizations with the enhancements to ICANN's accountability framework it has identified as essential to happen or be committed to before the IANA Stewardship Transition takes place \(Work Stream 1\) for consideration and approval as per its Charter.](#)
- 05 The Supplemental Proposal on Work Stream 1 Recommendations is the result of extensive work by the CCWG-Accountability’s 28 members, 172 participants and a team of highly qualified legal advisors over the past year, which included over 221 calls or meetings, three public consultations and more than 13,900 email messages. It represents a carefully crafted balance between key requirements, specific legal advice and significant compromises by all who participated. It also includes diligent attention to the input received through the public comment proceedings.
- 06 The final proposal has received the consensus support of the CCWG-Accountability. Minority viewpoints were recorded through 17:00 UTC on 25 February 2016<sup>1</sup>. These viewpoints are provided below for Chartering Organization consideration.
- 07 **Minority statements are published in the order in which they were received.**

---

<sup>1</sup> The co-Chairs of the CCWG-Accountability gave members a final opportunity to revise, retract or add minority statements to the Supplemental Final Report based on a compromise reached on the morning of 23 February 2016. A revised Appendix A was published and distributed to Chartering Organizations on 25 February 2016.

## Minority Statements

08 **Minority Statement by Eberhard W Lisse**

09 **CCWG-Accountability Member, ccNSO**

10 Dear Co-Chairs

11 I am Managing Director of Namibian Network Information Center (Pty) Ltd, the country code Top Level Domain (“ccTLD”) Manager of .NA. I created .NA and have 24 years uninterrupted service and corresponding experience as the ccTLD Manager for .NA.

12 I am appointed by ICANN’s country code Names Supporting Organization (“ccNSO”) as a Member to the Cross Community Working Group on Enhancing ICANN Accountability (“CCWG Accountability”).

13 The CCWG Accountability submits a “Final Proposal on Work Stream 1 Recommendations” (“Final Proposal”) which in terms of its Charter (“Charter”) must focus on

*[...] mechanisms enhancing ICANN accountability that must be in place or committed to within the time frame of the IANA Stewardship Transition.*

14 The Final Proposal does **not** do so.

15 Accordingly I do not agree with and hereby formally record my Objection to the Final Proposal:

1. I still have serious concerns regarding the proposed increase to the powers of Advisory Committees (“AC”) and their proposed elevation to similar status and powers as Supporting Organizations (“SO”).
2. The Final Proposal is entirely silent on accountability measures for ICANN relating to its dealing with ccTLD managers.  
This omission is fatal.
3. I still have very strong concerns about the way the CCWG Accountability has dealt with ICANN’s Accountability to Human Rights.

The Final Report must state, at a minimum, that:

*Within its mission and in its operations, ICANN will respect fundamental human rights, inter alia the exercise of free expression, free flow of information, due process and the right to property*

without **any** qualifications.

4. The questions
  - under what statutory powers this transfer will occur,
  - what in fact it is that is transferred, and
  - what is not transferred

remain unanswered.

And they **must** be answered in order for any transfer of the functions and/or the root zone<sup>2</sup> to occur.

---

<sup>2</sup> see also [http://www.grassley.senate.gov/sites/default/files/judiciary/upload/2015-09-22 CEG Cruz Goodlatte Issa to GAO \(Report on ICANN Oversight Transfer\).pdf](http://www.grassley.senate.gov/sites/default/files/judiciary/upload/2015-09-22%20CEG%20Cruz%20Goodlatte%20Issa%20to%20GAO%20(Report%20on%20ICANN%20Oversight%20Transfer).pdf), last accessed 2016-02-24

5. I have previously placed on record my observations regarding the legitimacy of the way in which the CCWG has conducted itself during its deliberations which has been, more often than not, in violation of its own Charter.

The latest example, occasioning this revision of this Minority report, previously submitted 2016-02-16, is so egregious that it requires some detail:

- (a) The ICANN Board voiced objections against a provision (74) in Recommendation #2 (on which Consensus had been reached), **after** the Final Proposal had been completed.
- (b) Two of the Co-Chairs (in the absence of the third) then re-opened the deliberations culminating in a teleconference on 2016-02-23 where they put the issue to a vote when no Consensus was reached either way.
- (c) Besides that the Charter is **not** silent on voting it is noteworthy that the Co-Chairs permitted the ICANN Staff Liaison, and 11 ICANN Board Members (two of which were not even registered<sup>3</sup> as Participants to the CCWG Accountability (Ms Hemrajani and Mr Chehadé) to vote on the issue.
- (d) The Co-Chairs then sent out an email stating that, as a broad majority had been in favor of removing the contentious provision, the provision was removed from the Final Proposal.
- (e) I have been unable to find “*Broad Majority*” in the Charter, only “*Full Consensus*” and “*Consensus*”, from which follows anything else is “*No Consensus*”.
- (f) The now Really Final Proposal was then transmitted to the Charting Organizations, without any period of Public Comment, nor waiting for updates to the existing Minority Statements or new Minority Statements being submitted, which was to be done within 48 hours.

I renew my Objection against this exclusionary process.<sup>4</sup>

6. The entire proposal has been cobbled together in extreme haste.

We (the representative Members of the CCWG) have been subjected to an arbitrary, self-imposed and entirely unrealistic timetable and deadline.

7. Regrettably, the Final Proposal bears the fruit of this extreme haste.

It is overly complex, hard to understand even by many of the members and participants of the CCWG Accountability themselves. During the telephone conference on 2016-02-23<sup>5</sup> it took 22 minutes just to give a summary of the issue at hand.

8. The **drastic** shortening of public comment periods is another example of the apparently intentional exclusivity of the process.

Even if the previous fatal flaws did not exist, this would, in itself, be fatal to the legitimacy of the CCWG process and the Final Proposal.

Fortunately the Final Proposal, if any, can still be subjected to a proper public comment period.

---

<sup>3</sup> <https://community.icann.org/pages/viewpage.action?pageId=50823968>, last accessed 2016-02-24

<sup>4</sup> I renew my Objection to the previous “Draft Recommendations” from 2015-06-03, the “Draft Proposal” from 2015-07-30 and the “Third Draft Proposal” from 2015-12-02 and incorporate them by reference herein.

<sup>5</sup> 5a to 5f on this page

9. I submit that the Final Proposal simply adds additional layers of bureaucracy without achieving much, if anything.
10. The IANA transition involves novel and unsettled questions that may impact the interests of a wide array of entities. This includes both the public and private sector and engages both domestic US and international interests.

The CCWG Accountability should be result driven and provide its considered views on the important issues presented by the transition in a more reasoned and full discussion instead of rushing to produce something to meet a self-imposed deadline for which there is simply no justification.

11. Repeatedly the NTIA found it necessary to advise, and did so in no uncertain terms, that the CCWG was not meeting the terms of reference set by the NTIA.

I submit that the Final Proposal still does not meet these.

12. I note Minority Statements by the Appointed Members Olga Cavalli (GAC), Tijani Ben Jemaa (ALAC), Izumi Okutani (ASO), and Robin Gross (GNSO) and join Ms Gross' Minority Statement.

I need to point out that the Charter foresees Minority Statements only in cases of disagreement. One Appointed Member of each Chartering Organization disagreeing is **not** a small minority.

It follows that the Final Proposal does **not** have Consensus.

- 16 I **strongly** urge ccTLD Managers to reject this Final Proposal and the NTIA not to accept it as is.
- 17 I submit this Minority Statement to be added to the Final Proposal as required by the Charter.

- 18 Eberhard W Lisse

19 **Minority Statement by Olga Cavalli**

20 **CCWG-Accountability Member, GAC**

21 Dear co-chairs,

22 After many months of hard work, CCWG has delivered a final proposal to be accepted by the community and then submitted to the ICANN board and NTIA. The negotiations leading to the delivery of this proposal have been very intense, and sometimes disappointing. More specifically, the attempts of some stakeholders to take advantage of the IANA transition in order to reduce the ability of governments to be part of the – to be enhanced – community, have jeopardized the success of the overall process, and more broadly, have put at risk our trust in what has brought us all here in the first place: the multi-stakeholder approach.

23 **The role of governments in the multi-stakeholder community**

24 The idea that governments threaten the multi-stakeholder community or benefit from a “special status” in the current ICANN structure is a misconception:

- Governments only have an advisory role in ICANN, through the Governmental Advisory Committee (GAC), whereas other constituencies exercise a decisional role, for instance through the drafting of policy recommendations.
- Governments do not participate in the ICANN Nominating Committee (NomCom) for the selection of ICANN’s leadership positions in the Board, ccNSO, GNSO and ALAC, unlike other AC/SOs within ICANN.
- Governments do not participate to the ICANN board, whereas all other AC/SOs can elect members of the board, directly and through the Nominating Committee. GAC can only appoint a non-voting liaison to the board.
- The ICANN board can easily reject GAC advice, even if the advice was approved without any formal objection. If “the ICANN board determines to take an action that is not consistent with the Governmental Advisory Committee advice” and fails to “find a mutually acceptable solution” (an obligation which does not only apply to GAC advice<sup>6</sup>), then the only obligation of the board is to “state in its final decision the reasons why the Governmental Advisory Committee advice was not followed”<sup>7</sup>. On the other hand, a PDP approved by 66% of GNSO can only be rejected by a 2/3 majority of the board<sup>8</sup>.

25 On the contrary, we believe that governments are an essential part of the community:

- GAC is the most geographically diverse entity in the community. This element should not be underestimated, given that the internationalization of ICANN has been a recurring issue since its inception in 1998.
- Governments bring a unique perspective on public policy issues and remain the most legitimate stakeholders when it comes to protecting public interest.

---

<sup>6</sup> *ICANN Bylaws, Annex B, Section 15.b*: “The Board shall adopt the ccNSO Recommendation unless by a vote of more than 66% the Board determines that such policy is not in the best interest of the ICANN community or of ICANN. (...)The Council shall discuss the Board Statement with the Board within thirty days after the Board Statement is submitted to the Council. The Board shall determine the method (e.g., by teleconference, e-mail, or otherwise) by which the Council and Board shall discuss the Board Statement. The discussions shall be held in good faith and in a timely and efficient manner, to find a mutually acceptable solution.”

<sup>7</sup> *ICANN Bylaws, Article XI, Section 2*.

<sup>8</sup> *ICANN Bylaws, Annex A, Section 9*: “Any PDP Recommendations approved by a GNSO Supermajority Vote shall be adopted by the Board unless, by a vote of more than two-thirds (2/3) of the Board, the Board determines that such policy is not in the best interests of the ICANN community or ICANN.”

- An ICANN with no or very little governmental involvement would be even more subject to a risk of capture by special interests or narrow corporate interests.

26 Proposed solutions to the so-called Stress-Test 18 leading to changes in Recommendation 1, 2 and 11

27 In particular, we are extremely disappointed by and object to the latest “compromise” solution regarding Stress Test 18-related issues, which led to changes in Recommendations 1, 2 and 11.

28 According to the “CCWG-Accountability Supplemental Final Proposal on Work Stream 1 Recommendations”, Stress Test 18 “considers a scenario where ICANN’s GAC would amend its operating procedures to change from consensus decisions (no objections) to majority voting for advice to the ICANN Board”. In this scenario, GAC would therefore align its decision-making process to what is already the rule for ALAC, GNSO and CCNSO. However, some CCWG participants seem to believe that preventing GAC from adopting the decision making process used by other stakeholders is necessary to make ICANN more accountable.

29 Many rationales were circulated to justify Stress Test 18-related measures, including ones that involved NTIA. However, the proposed solutions to the issues raised by Stress Test 18 were never part of the initial conditions required for the acceptance of the IANA transition by NTIA. In March 2014, when NTIA announced the transition, four principles were singled out:

- Support and enhance the multi-stakeholder model;
- Maintain the security, stability, and resiliency of the Internet DNS;
- Meet the needs and expectation of the global customers and partners of the IANA services;
- Maintain the openness of the Internet.

30 In its press release, NTIA also stated it would “not accept a proposal that replaces the NTIA role with a government-led or an inter-governmental organization solution”. To our knowledge, the current ICANN structure does not qualify as a government-led organization, especially since the governments only have an advisory role, through the Governmental Advisory Committee. Therefore, status quo would meet the NTIA requirements.

31 Despite the strong concerns of many governments regarding the proposed solutions to Stress Test 18, and their doubts about the impact of such solutions on ICANN’s accountability, **GAC has agreed to a consensus package** during the Dublin meeting, as reflected in the Dublin GAC Communiqué, **showing its willingness to reach a compromise** in order to achieve the IANA transition. This compromise was based, inter alia, on a 2/3 threshold for the ICANN board to reject GAC advice and on the preservation of GAC’s autonomy in defining consensus.

32 Recommendation 11 of the 3rd CCWG report proposed a very narrow definition of consensus, as “general agreement in the absence of any formal objection”, which represented a major shift from the principles agreed in the GAC Dublin communiqué, therefore triggering the rejection of Recommendation 11 by some GAC members. However, the 3rd draft report proposed a 2/3 threshold for the board to reject GAC consensus advice, aligned with the GAC Dublin Communiqué.

33 The “compromise” solution proposed in the “CCWG-Accountability Supplemental Final Proposal on Work Stream 1 Recommendations” published in February is as follows:

- Maintain a very narrow definition of consensus as “the absence of any formal objection”;
- Set the threshold for board rejection of GAC full consensus advice at 60% instead of 2/3;

- Limit the ability of GAC to participate in the empowered community mechanisms if they aim at challenging the board’s implementation of GAC advice – this proposal has never been discussed in CCWG before, and hardly relates to the initial issues raised by Stress Test 18.
- 34 We fail to understand how these new proposals address the concerns expressed by many GAC members in the public comment period, for instance relatively to the ability of one government to block a draft advice approved by an overwhelming majority of governments. Even though consensus should remain the GAC’s ultimate objective, the requirement to reach full consensus for each and every issue considered might lead, in some cases, to paralysis. Any hypothetical advice reflecting less than full consensus (including 100% minus one - which in our view would be basically as representative as full consensus) could indeed be dismissed by a simple majority vote of the board. As a result, the ability of GAC to participate to a discussion considered as relevant by most of its members would be very limited and decisions could theoretically be made without any significant GAC input. To prevent this, we believe governments shall not be bound by one single rule of decision-making, particularly if potentially controversial topics are to be considered
- 35 We note that GAC is once again asked to lower its ability to be involved in the post-IANA transition ICANN. Regarding the ability of GAC to participate in the empowered community mechanisms, we believe such a decision should be carefully reviewed and should not be imposed under pressure in a very short timeframe. More specifically:
- We do not understand why the “two bites at the apple” problem should only apply to GAC, and not to all SO/ACs which could participate in a community power challenging the board’s implementation of their advice or policy recommendation.
  - It is GAC’s sole responsibility to determine if it wishes to participate in a decisional capacity to the community mechanisms.
  - It would be contradictory to limit GAC’s ability to participate to the community powers only to those cases involving public policy / legal aspects, while preventing GAC to participate to community powers involving the board’s implementation of its advice.
- 36 Governments have shown impressive flexibility and tried to reach a compromise in many ways, as reflected in the Dublin GAC communiqué. However, only the demands of part of the community representatives were met, at the expense of GAC; therefore, rather than “compromise”, “winner takes all” would actually be a more accurate description of what is proposed in the CCWG-Accountability Supplemental Final Proposal on Work Stream 1 Recommendations.
- 37 Olga Cavalli

39 **Minority Statement by Tijani BEN JEMAA**

40 **CCWG-Accountability Member, ALAC**

41 As a CCWG-Accountability member, I would like to make this minority statement regarding Recommendation 2 (Adjusting the threshold of support to exercise the community powers) and Recommendation 6 (Human Rights):

42 **Rec 2, Para 73:**

43 With 5 SO/ACs composing the empowered community, we are told that we don't represent the whole Internet community. With less, our representativeness will be seriously affected. So, reducing the threshold in case of the community becomes composed of less than 5 SO/ACs is not acceptable, not only because of the representativeness, but also because we will exercise the community powers with only 2 SO/ACs supporting the decision for most of them. Less than 5 SO/ACs will make the whole accountability process to be reviewed.

44 **Rec 6:**

45 I express my concern that in the proposed text, it is not made clear that the ICANN obligation to respect Human Rights covers the issues included in the ICANN mission only and not be expended to cover other aspects such as the content.

46 Tijani BEN JEMAA

47 **Minority Statement by Izumi Okutani**

48 **CCWG-Accountability Member, ASO**

49 The ASO notes that the Internet Numbering Community is not relying on the CCWG-ACCT WS1 proposal to fulfill our expectations of ICANN accountability. Instead we will rely primarily on a contractual agreement (or “SLA”) between the RIRs and ICANN, as defined within the CRISP and ICG proposals, to provide the required accountability mechanisms.

50 In order to serve this purpose, the proposed SLA must be in place at the time of the IANA Transition. However, the agreement contains “condition precedent” language such that, even if it is signed immediately, it will only come into effect when ICANN is actually released from its related duties under the NTIA contract.

51 Negotiation of the Numbers Community SLA is nearly complete, and we expect to reach agreement in the near future. We propose to then promptly sign the agreed SLA with ICANN, in the same timeframe as implementation of the CCWG recommendations. By having both components in place at that time, we will be satisfied that all ICANN accountability matters are properly resolved.

52 Best Regards,

53 Izumi on behalf of the ASO

54 **Minority Statement by Robin Gross**

55 **CCWG-Accountability Member, GNSO**

56 **Dissenting Opinion of Individual Member Robin Gross on the Issue of GAC Over-Empowerment, Marginalization of Supporting Organizations**

57 While the majority of recommendations included in the CCWG-Accountability Report for Work Stream 1 mark significant and laudable improvements for ICANN's accountability processes, the proposal remains flawed in one important respect: it would allow for fundamental changes to the nature of ICANN's Governmental Advisory Committee (GAC) by endorsing its inclusion in the Empowered Community as a Decisional Participant. If the GAC chooses to become a Decisional Participant, it would transform its traditional function in ICANN from an "advisory" role to a "decisional" role over ICANN's policies, operations, and corporate governance matters. Additionally, the proposal raises the threshold in ICANN's bylaws for its Board to refuse to follow GAC consensus advice, in a separate concession to the GAC that has enhanced its power in ICANN's corporate structure relative to the other Advisory Committees and Supporting Organizations.

58 The proposal to elevate the GAC is a mistake for a number of different reasons.

59 The first concern is the opaque nature of the GAC. GAC is under no obligation to be transparent or bottom-up in its deliberations nor its operation. It has no obligation nor practice of upholding ICANN's legal duty under its bylaws and articles to act openly, transparently, and in a bottom-up multi-stakeholder manner. Empowering a nontransparent constituent body in such a way risks conflicting with other provisions in ICANN's articles and bylaws which promise open, transparent, equitable, and bottom-up decision making and operations as ICANN carries out its duty and mission.

60 The second concern is that empowering the GAC goes against the express wishes of the majority of the ICANN community. Specifically, when previously proposed in 2014, the community overwhelmingly rejected increasing the Board threshold required to reject GAC advice, yet that is exactly what this proposal does.<sup>9</sup> Similar objections were voiced in public comments to the various CCWG-Accountability proposals, which raised significant concerns about the threshold for Board rejection of GAC advice. For many concerned commentators, the distinction between a Board threshold of 50%-60%-66% is a "distinction without a difference", because it is the underlying principle at stake of limiting governmental control over the Internet via ICANN. A positive element of the CCWG-Accountability proposal is that it provides greater certainty and clarity regarding the definition of GAC's deferential "consensus advice". However the community should not be forced to concede greater power to GAC over ICANN's governance in exchange for that needed clarity and certainty over the kind of GAC advice requiring deferential Board treatment. It is a "trade-off" the community should not have to make for ICANN accountability improvements and a timely IANA transition to be able to go forward.

61 Third, GAC participation in the Empowered Community is controversial in the ICANN community and within the GAC itself. Providing the GAC an equal vote to the Supporting Organizations and the At Large Advisory Committee over ICANN's governance would grant the GAC new, greatly enhanced authority in ICANN's decision-making process and governance structure. While the "GAC carve-out" which disallows GAC from voting on board decisions taken as a result of GAC consensus advice, is an improvement in a narrow and specific instance, it does not address the underlying problem of providing national governments with a decisional role over ICANN's governance. Nor would it limit the ability of GAC to participate in decisions to remove board

---

<sup>9</sup> <https://www.icann.org/public-comments/bylaws-amend-gac-advice-2014-08-15-en>

- members, reject budgets and strategic plans, decide IANA separation questions, or any of the other new community powers granted to the Empowered Community under this proposal.
- 62 Importantly, GAC has not stated that it wants this fundamental change in its role or that it wants this increase in power over ICANN's Board. On the contrary, GAC stated it could not come to consensus on those controversial recommendations in the CCWG proposal. Unfortunately, a small minority of vocal GAC representatives participating in the CCWG-Accountability discussions took advantage of the community's desire for a speedy IANA transition and were able to hold the accountability reform process hostage in order to obtain greater power over ICANN's governance than what GAC has under ICANN's existing corporate structure.
- 63 Finally, enhancing the power of governments in ICANN puts U.S. support for the transition in jeopardy. If the U.S. Congress or NTIA objects to this proposal, it is dead on arrival. The U.S. Congress and NTIA have sent a number of clear signals that governmental influence should not be expanded in the IANA transition process.<sup>10</sup> By proposing to increase the influence of governments over ICANN as CCWG-Accountability has done, it invites rejection from precisely the parties who must sign-off on it and places the entire transition at risk.
- 64 The CCWG-Accountability proposal includes a number of important and long over-due accountability reforms including improvements to ICANN's Independent Review Process (IRP), Reconsideration Request process, board removal rights, and a noteworthy bylaws commitment to respect human rights in ICANN's operation, among other truly laudable accountability reform measures. However, the long-term harm to a free and open Internet from the proposal's shifting the traditional balance of power over ICANN in favor of governments and away from the Supporting Organizations and the private sector is a monumental mistake.

---

<sup>10</sup> At ICANN #51 in Los Angeles 2014, U.S. Secretary of Commerce Penny Pritzker stated that the U.S. would oppose at every turn "proposals to put governments in charge of Internet governance". Also, U.S. Senator John Thune and U.S. Senator Marco Rubio, letter to Dr. Stephen Crocker, Chairman ICANN Board of Directors, July 31, 2014, <https://www.icann.org/en/system/files/correspondence/thune-rubio-to-crocker-31jul14-en.pdf> (emphasis added):

"First, ICANN must prevent governments from exercising undue influence over Internet governance. In April we led 33 Senators in a letter to NTIA regarding the IANA transition. We wrote that "[r]eplacing NTIA's role with another governmental organization would be disastrous and we would vigorously oppose such a plan. ICANN should reduce the chances of governments inappropriately inserting themselves into apolitical governance matters. Some ideas to accomplish this include: not permitting representatives of governments to sit on ICANN's Board, limiting government participation to advisory roles, such as through the Government Advisory Committee (GAC), and amending ICANN's bylaws to only allow receipt of GAC advice if that advice is proffered by consensus. *The IANA transition should not provide an opportunity for governments to increase their influence.*"

# Appendix B: Charter

<b>Resolutions adopting the charter:</b>	Title:	
	Ref # & Link:	
<b>Section II: Problem Statement, Goals &amp; Objectives and Scope</b>		
<i>Problem Statement</i>		
The National Telecommunications and Information Administration (NTIA) has requested		

that ICANN “convene a multistakeholder process to develop a plan to transition the U.S. government stewardship role” with regard to the IANA Functions and related root zone management. In making its announcement, the NTIA specified that the transition proposal must have broad community support and meet the following principles:

- Support and enhance the multistakeholder model
- Maintain the security, stability, and resiliency of the Internet DNS
- Meet the needs and expectation of the global customers and partners of the IANA services
- Maintain the openness of the Internet.

NTIA also specified that it would not accept a proposal that replaces the NTIA role with a government-led or an intergovernmental organization solution.

During discussions around the transition process, the community raised the broader topic of the impact of the change on ICANN's accountability given its historical contractual relationship with the United States and NTIA. Accountability in this context is defined, according to the [NETmundial multistakeholder statement](#), as the existence of mechanisms for independent checks and balances as well as for review and redress.

The concerns raised during these discussions around the transition process indicate that the existing ICANN accountability mechanisms do not yet meet stakeholder expectations. Recent statements made by various stakeholders suggest that current accountability mechanisms need to be reviewed and, if need be, improved, amended, replaced, or supplemented with new mechanisms (see for instance ATRT recommendations) in light of the changing historic contractual relationship with the U.S. Government. Considering that the NTIA has stressed that it is expecting community consensus regarding the transition, a failure to meet stakeholder expectations with regards to accountability may create a situation where NTIA does not accept the IANA transition proposal as meeting its conditions. Thus reviewing ICANN's accountability mechanisms was considered to be crucial for the transition process.

### *Goals and Objectives*

The CCWG-Accountability is expected to deliver proposals that would enhance ICANN's accountability towards all stakeholders.

The term stakeholder should be considered for the CCWG-Accountability in its wider acceptance, for instance by relying on the definition provided by the [European Framework for Quality Management \(EFQM\)](#): a person, group or organization that has a direct or indirect stake or interest in the organization because it can either affect the organization or be affected by it. This includes but is not limited to all ICANN SOs and ACs.

The goal is for the transition proposal regarding the IANA functions to be communicated to NTIA in a timeframe which is consistent with the expiration date of the current IANA Functions Contract, which is set at 30th September 2015. The CCWG-Accountability will therefore work as expeditiously as possible to identify those mechanisms that must be in place or committed to before the IANA Stewardship Transition in light of the changing historical contractual relationship with the U.S. Government (Work Stream 1) and those mechanisms for which a timeline for implementation may extend beyond the IANA

## Stewardship Transition (Work Stream 2).

In order to facilitate evaluation and adoption of its proposals, the CCWG-Accountability is expected to provide a detailed description on how its proposals would provide an adequate level of resistance to contingencies (“stress tests”), within the scope of each Work Stream.

Further, Work Stream 1 may identify issues that are important and relevant to the IANA stewardship transition but cannot be addressed within this time frame, in which case, there must be mechanisms or other guarantees that can ensure that the work would be completed in a timely manner as soon as possible after the transition.

## *Scope*

The CCWG-Accountability will investigate accountability mechanisms regarding all of the functions provided by ICANN.

In the discussions around the accountability process, the CCWG-Accountability will proceed with two Work Streams:

- **Work Stream 1:** focused on mechanisms enhancing ICANN accountability that must be in place or committed to within the time frame of the IANA Stewardship Transition;
- **Work Stream 2:** focused on addressing accountability topics for which a timeline for developing solutions and full implementation may extend beyond the IANA Stewardship Transition.

The CCWG-Accountability will allocate issues to Work Stream 1 and Work Stream 2. Some issues may span both Work Streams.

Suggested questions to be considered as part of Work Stream 1 include, but are not limited to:

- What would be the impact of NTIA’s transition of the IANA Functions Contract in ensuring ICANN’s accountability and what potential accountability concerns could this cause?
- What enhancements or reforms are required to be implemented or committed to before the NTIA Stewardship Transition?
- If the implementation of enhancements or reforms are to be deferred, how can the community be assured they will be implemented?
- How will these enhancements or reforms be stress-tested?
- What enhancements or reforms must be committed to before the NTIA Stewardship Transition, but could be implemented after.
- How will these enhancements or reforms be stress-tested?
- Suggested questions to be considered as part of Work Stream 2 include, but are not limited to:
- What enhancements or reforms can be addressed after the NTIA Stewardship Transition?
- If there are enhancements or reforms that can be addressed after NTIA disengages, what new or existing processes ensure they will be addressed and implemented?

- How will these enhancement or reforms be stress-tested?
- Suggested questions to be considered as part of both Work Stream 1 and 2 include, but are not limited to:
- What mechanisms are needed to ensure ICANN’s accountability to the multi-stakeholder community once NTIA has disengaged from its stewardship role?
- What enhancements or reforms are needed to ICANN’s existing accountability mechanisms?
- What new accountability reforms or mechanisms are needed?
- If accountability enhancements and reforms are made through changes to ICANN’s Articles of Incorporation or By-Laws, how can the community be assured that those changes will be permanent, or not subject to unilateral amendment by the ICANN Board at a later date?

Other topics within scope of the work of the CCWG-Accountability include, but are not limited to [ATRT2 Recommendation 9, and more specifically 9.2.](#)

**Link with scope of Cross Community Working Group (CWG) to Develop an IANA Stewardship Transition Proposal on Naming Related Functions, and other groups developing the IANA Stewardship Transition proposal:**

This process on Enhancing ICANN Accountability is taking place alongside a parallel and related process on the transition of the stewardship of the IANA functions through the CWG to Develop an IANA Stewardship Transition Proposal on Naming Related Functions (hereinafter CWG-Stewardship). The CWG-Stewardship’s scope is focused on the arrangements required for the continuance of IANA functions in an accountable and widely accepted manner after the expiry of the IANA Functions Contract. Accountability for the administration of the IANA functions (i.e., implementation and operational accountability) is not within the scope of the CCWG-Accountability as it is being dealt with by the CWG-Stewardship. Nevertheless, the two processes are interrelated and interdependent and should appropriately coordinate their work.

Other groups’ (i.e. the numbers and protocol parameters communities, as outlined in the ICG Request for Proposals) proposals are intended to cover accountability issues related to the IANA Stewardship Transition, as well as issues already being considered by RIRs and IETF communities related in their respective areas in their engagement with ICANN. These issues are outside of scope of the CCWG-Accountability. The CCWG-Accountability will communicate with these groups to ensure that the CCWG-Accountability does not cover issues going beyond its scope.

**Section III: Deliverables, Timeframes, and Reporting**

***Deliverables***

In working towards its deliverables, the CCWG-Accountability will, as a first step, establish and adopt a high-level work plan and tentative associated schedule, which should be publicly available. Both work plan and associated schedule, should take into account and be on activities under Work Stream 1 and Work Stream 2, and align the timelines for Work Stream 1 with the CWG-Stewardship and ICG timelines. In addition, the work plan and schedule should include time frames and methods for public

consultation and expected date for submission of Draft Proposal(s) and Final Proposal(s) and revisions thereof for Work Stream 1 and 2, and should establish an expected date for submission of a Board Reports. In those cases where there are incompatibilities, these should be informed to the CWG-Stewardship and/or ICG and discuss ways to address the incompatibilities.

In the course of its work the CCWG-Accountability should update and refine its work plan and schedule regularly, and make the amended work plan and associated schedule publicly available.

The following non-exhaustive list of areas of work shall guide the working group in establishing a work plan. The CCWG-Accountability may add additional tasks at its sole discretion:

- Review of the guidelines given in this charter
- A definition/description of what differentiates a Work Stream 1 issue from a Work Stream 2 issue
- Identify which issues to go into Work Stream 1 and which issue to go into Work Stream 2
- Provide timeline of key dates and target date of proposal(s) for each Work Stream
- Review of existing accountability mechanisms, including a review of their efficiency based on prior work such as ATRT reviews and proposals for changes, enhancements, and additional mechanisms
- Identification of contingencies to be considered in the stress tests
- Analysis of core issues based on the current situation analysis, in relation to the CCWG-Accountability's goal and the IANA Stewardship Transition
- Identification of priorities to focus work on such issues with highest potential to enhance ICANN's accountability
- Review and analyze statements, responses and questions provided by the U.S. Department of Commerce
- Review of possible solutions for each Work Stream including stress tests against identified contingencies. The CCWG-Accountability should consider the following methodology for stress tests
  - Analysis of potential weaknesses and risks
  - Analysis existing remedies and their robustness
  - Definition of additional remedies or modification of existing remedies
  - Description how the proposed solutions would mitigate the risk of contingencies or protect the organization against such contingencies
  - CCWG-Accountability must structure its work to ensure that stress tests can be (i) designed (ii) carried out and (iii) its results being analyzed timely before the transition.

Examples of individual items to be looked at may include:

- Affirmation of Commitments (see <https://www.icann.org/resources/pages/affirmation-of-commitments-2009-09-30-en>)
- Expert Panel (ASEP) as one basis for its discussions
- 2013 Report of the Accountability & Transparency Review Team (see <https://www.icann.org/en/about/aoc-review/atrt/final-recommendations-31dec13->

[en.pdf](#))

- Operation and Viability of current Reconsiderations process
- Operation and Viability of the CEP (cooperative engagement process) within the Independent Review
- Independent Review Process (IRP) criteria
- Possible solutions including
- Input received in relation to solutions as part of earlier public comment periods (see <https://www.icann.org/en/system/files/files/proposed-solutions-25aug14-en.pdf>)
- Input received in CCWG-Accountability comment periods

### ***Reporting***

The co-chairs of the CCWG-Accountability will brief the chartering organizations on a regular basis as well as their representatives on the ICG (particularly in relation to Work Stream 1).

## **Section IV: Membership, Staffing and Organization**

### ***Membership Criteria***

Membership in the CCWG-Accountability, and in sub-working groups should these be created, is open to members appointed by the chartering organizations. To facilitate scheduling meetings and to minimize workloads for individual members, it is highly recommended that individual members participate in only one sub-working group, should sub-working groups be created. Each of the chartering organizations shall appoint a minimum of 2 and a maximum of 5 members to the working group in accordance with their own rules and procedures. Best efforts should be made to ensure that individual members:

- Have sufficient expertise to participate in the applicable subject matter (see for example <https://www.icann.org/resources/pages/enhancing-accountability-faqs-2014-08-22-en#12> for areas identified for expertise);
- Commit to actively participate in the activities of the CCWG-Accountability on an ongoing and long-term basis; and
- Where appropriate, solicit and communicate the views and concerns of individuals in the organization that appoints them.

In appointing their members, the chartering organizations should note that the CCWG-Accountability's decision-making methodologies require that CCWG-Accountability members act by consensus, and that polling will only be used in rare instances and with the recognition that such polls do not constitute votes.

Chartering organizations are encouraged to use open and inclusive processes when selecting their members for this CCWG-Accountability. Best efforts should also be made to ensure that the CCWG-Accountability and any sub-working groups, if created, have representation from each of ICANN's five regions.

In addition, the CCWG-Accountability will be open to any interested person as a participant. Participants may be from a chartering organization, from a stakeholder group not represented in the CCWG-Accountability, or may be self-appointed. Participants will be able to actively participate in and attend all CCWG-Accountability meetings, work groups and sub-work groups. However, should there be a need for a consensus call or decision, such consensus call or decision will be limited to CCWG-Accountability members appointed by the chartering organizations.

All members and participants will be listed on the CCWG-Accountability's Wiki. The mailing list of CCWG-Accountability will be publicly archived. All members and participants in this process are required to submit a Statement of Interest (SOI) following the procedures of their chartering organization or, where that is not applicable the GNSO procedures may be followed or alternatively a statement should be provided which at a minimum should include name, whether the participant is representing a certain organization or company as part of his/her participation in this effort, areas of specific interest in relation to this effort, material relationship with other parties affected by ICANN and primary country of residence.

Volunteer co-chairs appointed by the chartering organizations, should a chartering organization decide to appoint a co-chair to the CCWG-Accountability, will preside over CCWG-Accountability deliberations and ensure that the process is bottom-up, consensus-based and has balanced multistakeholder participation. ICANN is expected to provide day-to-day project administration and secretariat support and, upon request of the CCWG-Accountability co-chairs, professional project facilitators or expert assistance.

In addition to the working relationship between groups developing the IANA Stewardship Transition proposal which is detailed in a subsequent section, the CCWG-Accountability will include a liaison from the ICANN Board, who would be an active member of the CCWG-Accountability, bringing the voice of the Board and Board experience to activities and deliberations. The CCWG-Accountability will also include an ICANN Staff representative to provide input into the deliberations and who is able to participate in this effort in the same way as other members of the CCWG-Accountability. Should there be a need for any consensus call(s), neither the Board liaison nor the Staff representative would participate in such a consensus call.

### ***Group Formation, Dependencies and Dissolution***

Each of the chartering organizations shall appoint members to the CCWG-Accountability in accordance with their own rules and procedures.

### ***Working Relationship With the ICG, the CWG, and Other Groups Developing the IANA Stewardship Transition Proposal***

The co-chairs of the CCWG-Accountability will discuss and determine, along with representatives of the ICG, the CWG-Stewardship, and other groups developing the IANA Stewardship proposal, the most appropriate method of sharing information and communicating progress and outcomes, particularly in relation to Work Stream 1. This could, for example, be done through regular Chairs calls. In particular, the co-chairs will agree the method by which the final Work Stream 1 deliverable of the CCWG-

Accountability, the “Enhanced ICANN Accountability Related to the IANA Stewardship Transition Proposal” will be provided from the CCWG-Accountability to the ICG and CWG-Stewardship. The delivery of this Work Stream 1 Proposal is expected to occur following approval of the ICANN Board as outlined in Section V of this charter (see also <https://www.icann.org/resources/board-material/resolutions-2014-10-16-en#2.d>).

### *Expert Advisors*

In addition to input from the community, the CCWG-Accountability is expected to solicit and consider the input from the up to seven Advisors selected by the [Public Experts Group \(PEG\)](#) to provide independent advice, research and identify best practices, at an early stage of its deliberations. In addition to input that is specifically solicited by the CCWG-Accountability, the CCWG-Accountability is also expected to give due consideration to any additional advice or input that the Advisors provide as part of the CCWG-Accountability deliberations. The Advisors are expected to contribute to the dialogue similar to other CCWG-Accountability participants. However, should there be a need for any consensus call(s), the Advisors would not participate in such a call.

In addition to the advisors selected by the PEG, the CCWG-Accountability may also identify additional advisors or experts to contribute to its deliberations in a similar manner as the Advisors selected by the PEG. Should additional costs be involved in obtaining input from additional advisors or experts, prior approval must be obtained from ICANN. Such a request for approval should at a minimum include the rationale for selecting additional advisors or experts as well as expected costs.

The CCWG-Accountability should integrate one Accountability and Transparency Review Team (ATRT) past participant to bring perspective and avoid duplication of work. Should there be a need for any consensus call(s), the ATRT Expert would not participate in such a consensus call (unless the ATRT Expert is also selected as a member by one of the chartering organizations).

### *Staffing and Resources*

The ICANN Staff assigned to the CCWG-Accountability will fully support the work of the CCWG-Accountability as requested by the co-chairs, including meeting support, document drafting, editing and distribution and other substantive contributions when deemed appropriate by the CCWG-Accountability. ICANN will provide access to relevant experts and professional facilitators as requested by the CCWG-Accountability Chairs. ICANN staff, in a coordinated effort with the CCWG-Accountability, will also ensure that there is adequate outreach to ensure that the global multistakeholder community is aware of and encouraged to participate in the work of the CCWG-Accountability.

Staff assignments to the Working Group: ICANN will provide sufficient staff support to support the activities of the CCWG-Accountability.

The CCWG-Accountability is encouraged to identify any additional resources beyond the staff assigned to the group it may need at the earliest opportunity to ensure that such resources can be identified and planned for.

## Section V: Rules of Engagement

### *DECISION-MAKING METHODOLOGIES*

In developing its Proposal(s), work plan and any other reports, the CCWG-Accountability shall seek to act by consensus. Consensus calls should always make best efforts to involve all members (the CCWG-Accountability or sub-working group). The Chair(s) shall be responsible for designating each position as having one of the following designations:

- a) Full Consensus - a position where no minority disagrees; identified by an absence of objection
- b) Consensus – a position where a small minority disagrees, but most agree

In the absence of Full Consensus, the Chair(s) should allow for the submission of minority viewpoint(s) and these, along with the consensus view, shall be included in the report.

In a rare case, the chair(s) may decide that the use of a poll is reasonable to assess the level of support for a recommendation. However, care should be taken in using polls that they do not become votes, as there are often disagreements about the meanings of the poll questions or of the poll results.

Any member who disagrees with the consensus-level designation made by the Chair(s), or believes that his/her contributions are being systematically ignored or discounted should first discuss the circumstances with the relevant sub-group chair or the CCWG-Accountability co-chairs. In the event that the matter cannot be resolved satisfactorily, the group member should request an opportunity to discuss the situation with the Chairs of the chartering organizations or their designated representatives.

#### **SO and AC support for the Draft Proposal(s)**

Following submission of the Draft Proposal(s), each of the chartering organizations shall, in accordance with their own rules and procedures, review and discuss the Draft Proposal(s) and decide whether to adopt the recommendations contained in it. The chairs of the chartering organizations shall notify the co-chairs of the WG of the result of the deliberations as soon as feasible.

#### **Supplemental Draft Proposal**

In the event that one or more of the participating SO's or AC's do(es) not adopt one or more of the recommendation(s) contained in the Draft Proposal(s), the Co-Chairs of the CCWG-Accountability shall be notified accordingly. This notification shall include at a minimum the reasons for the lack of support and a suggested alternative that would be acceptable, if any. The CCWG-Accountability may, at its discretion, reconsider, post for public comments and/or submit to the chartering organizations a Supplemental Draft Proposal, which takes into accounting the concerns raised.

Following submission of the Supplemental Draft Proposal, the chartering organizations shall discuss and decide in accordance with its own rules and procedures whether to adopt the recommendations contained in the Supplemental Draft Proposal. The Chairs of the chartering organizations shall notify the Co-Chairs of the CCWG-Accountability of

the result of the deliberations as soon as feasible.

### **Submission Board Report**

After receiving the notifications from all chartering organizations as described above, the Co-Chairs of the CCWG-Accountability shall, within 10 working days after receiving the last notification, submit to the Chair of the ICANN Board of Directors and Chairs of all the chartering organizations the CCWG-Accountability Board Report, which shall include at a minimum:

- a) The (Supplemental) Proposal as adopted by the CCWG-Accountability; and
- b) The notifications of the decisions from the chartering organizations
- c) Documentation of the process that was followed, including, but not limited to documenting the process of building consensus within the CCWG-Accountability and public consultations.

In the event one or more of the chartering organizations do(es) not support (parts of) the (Supplemental) Proposal(s), the Board Report shall also clearly indicate the part(s) of the (Supplemental) Final Proposal(s) which are fully supported and the parts which not, and which of the chartering organizations dissents, to the extent this is feasible.

Board consideration and interaction with CCWG-Accountability and chartering organizations

It is assumed that after submission of the Board Report, the ICANN Board of Directors will consider the Proposal(s) contained in this Report in accordance with the process outlined in its resolution of 16 October 2014 (see <https://www.icann.org/resources/board-material/resolutions-2014-10-16-en#2.d>):

*Resolved (2014.10.16.17), the Board commits to following the following principles when considering the Cross Community Working Group Recommendations on Enhancing ICANN Accountability and Governance:*

- 1. These principles apply to consensus-based recommendations from the Cross Community Working Group on Enhancing ICANN Accountability and Governance.*
- 2. If the Board believes it is not in the global public interest to implement a recommendation from the Cross Community Working Group on Enhancing ICANN Accountability and Governance (CCWG Recommendation), it must initiate a dialogue with the CCWG. A determination that it is not in the global public interest to implement a CCWG Recommendation requires a 2/3 majority of the Board.*
- 3. The Board must provide detailed rationale to accompany the initiation of dialogue. The Board shall agree with the CCWG the method (e.g., by teleconference, email or otherwise) by which the dialogue will occur. The discussions shall be held in good faith and in a timely and efficient manner, to find a mutually acceptable solution.*
- 4. The CCWG will have an opportunity to address the Board's concerns and report back to the Board on further deliberations regarding the Board's concerns. The CCWG shall discuss the Board's concerns within 30 days of the Board's initiation of the dialogue.*
- 5. If a recommendation is modified through the CCWG, it is returned back to the Board for further consideration. The CCWG is to provide detailed rationale on*

*how the modification addresses the concerns raised by the Board.*

6. *If, after modification, the Board still believes the CCWG Recommendation is not in the global public interest to implement the CCWG Recommendation, the Board may send the item back to the CCWG for further consideration, again requiring a 2/3 vote of the Board for that action. Detailed rationale for the Board's action is again required. In the event the Board determines not to accept a modification, then the Board shall not be entitled to set a solution on the issue addressed by the recommendation until such time as CCWG and the Board reach agreement.*

Before submitting a modified recommendation to the ICANN Board of Directors, as envisioned under 5. of the Board resolution, the CCWG-Accountability will submit a Draft Supplemental Board Report to the chartering organizations containing:

- a) The modified recommendations, and associated detailed rationale,
- b) The Board decision, and associated detailed rationale
- c) The recommendation as contained in the Board Report

Following submission of the Draft Supplemental Board Report, the chartering organizations shall discuss and decide in accordance with their own rules and procedures whether to adopt the modified recommendations contained in the report. The Chairs of the chartering organizations shall notify the co-chairs of the CCWG-Accountability of the result of the deliberations as soon as feasible.

After receiving the notifications from all chartering organizations, the co-Chairs of the CCWG-Accountability shall, within 10 working days after receiving the last notification, submit to the Chair of the ICANN Board of Directors and Chairs of all the chartering organizations the CCWG-Accountability Supplemental Board Report, which shall include at a minimum:

- a) The modified recommendations, and associated detailed rationale.
- b) The notifications of the decisions from the chartering organizations.
- c) Documentation of the process that was followed, including, but not limited to documenting the process of building consensus within the CCWG-Accountability and consultations with the chartering organizations.

If, in accordance with 6., the Board determines not to accept a modified recommendation, the CCWG-Accountability shall follow the procedure regarding the Supplemental Board Report, as just described, to reach agreement with the Board.

## ***MODIFICATION OF THE CHARTER***

In the event this charter does not provide guidance and/or the impact of the charter is unreasonable for conducting the business of the CCWG-Accountability, the co-chairs have the authority to determine the proper actions. Such action may, for example, consist of a modification to the Charter in order to address the omission or its unreasonable impact, in which case the Co-Chairs may propose such modification to the chartering organizations. A modification shall only be effective after adoption of the amended Charter by all chartering organizations, in accordance with their own rules and procedures.

### ***PROBLEM/ISSUE ESCALATION & RESOLUTION PROCESSES***

All participants are expected to abide by the [ICANN Expected Standards of Behavior](#).

The co-chairs are empowered to restrict the participation of someone who seriously disrupts the working group. Generally, the participant should first be warned privately, and then warned publicly before such a restriction is put into place; in extreme circumstances, this requirement may be bypassed. This restriction is subject to the right of appeal as outlined above.

In the event that no consensus is reached by the CCWG-Accountability, the co-chairs of the CCWG-Accountability will submit a Report to the chartering organizations. In this Report the co-chairs shall document the issues that are considered contentious, the process that was followed and will include suggestions to mitigate prevention of consensus. If, after implementation of the mitigating measures consensus can still not be reached, co-chairs shall prepare a Final Report documenting the processes followed, including requesting suggestions for mitigating the issues that are preventing consensus from the chartering organizations. The Final Report will be submitted to the ICANN Board and the chartering organizations requesting closure of the CCWG-Accountability by the chartering organizations.

### ***CLOSURE & WORKING GROUP SELF-ASSESSMENT***

The CCWG-Accountability will consult with their chartering organizations to determine when it can consider its work completed. The CCWG-Accountability and any sub-working groups shall be dissolved upon receipt of the notification of the Chairs of the chartering organizations or their designated representatives.

# Appendix C – Background & Methodology

---

This section includes an overview of the Enhancing ICANN Accountability process, and its foundation in the IANA Stewardship Transition.

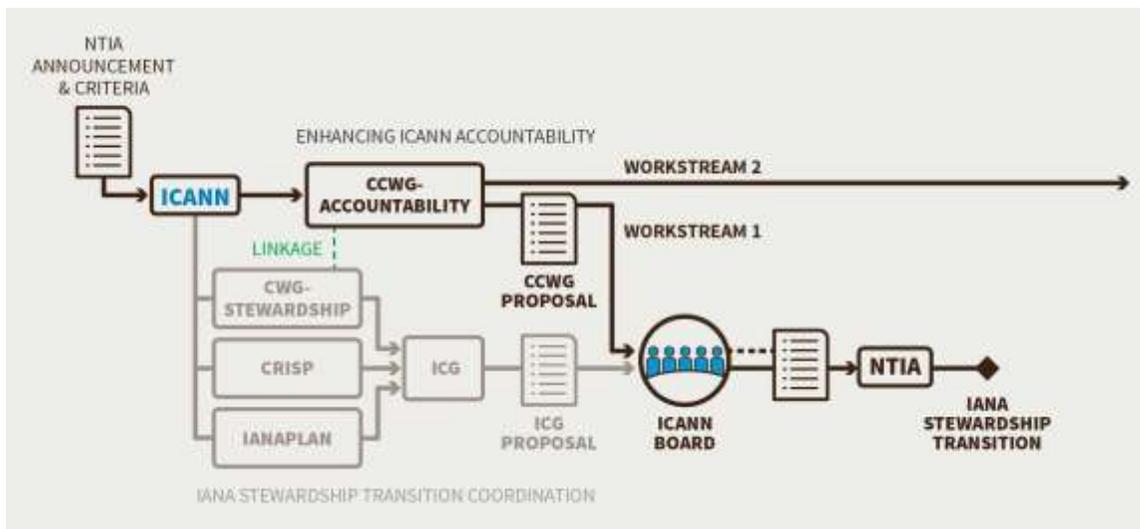

## Background On The IANA Stewardship Transition

- 1 On 14 March 2014 the National Telecommunications and Information Administration (NTIA) announced its intent to transition its stewardship of the Internet Assigned Numbers Authority (IANA) functions and related root zone management to the global multistakeholder community. NTIA asked ICANN to convene a multistakeholder process to develop a proposal for the transition.
- 2 In making its announcement, NTIA specified that the transition proposal must have broad community support and meet the following principles:
  - Support and enhance the multistakeholder model;
  - Maintain the security, stability, and resiliency of the Internet DNS;
  - Meet the needs and expectation of the global customers and partners of the IANA services;
  - Maintain the openness of the Internet.
- 3 NTIA also specified that it would not accept a proposal that replaces the NTIA role with a government-led or an intergovernmental organization solution.
- 4 The IANA Stewardship Transition Coordination Group (ICG) was formed in July 2014 to assemble and deliver through the ICANN Board to NTIA a transition proposal consistent with the key principles outlined in the NTIA announcement. The ICG is made up of 30 individuals representing 13 communities of both direct and indirect stakeholders of the IANA functions. Direct stakeholders are "direct customers" of the IANA functions, e.g. top-level domain registry operators, while indirect stakeholders are all those who benefit from performance of the IANA functions, e.g., businesses and end users.
- 5 In September 2014, the ICG published a Request for Proposals to the three communities. The three operational communities with direct operational or service relationships with the IANA functions i.e. Domain Names, Number Resources and Protocol Parameters were asked to provide a formal response to the ICG regarding its community's use of the IANA functions, its existing, pre-transition arrangements, proposed post-transition oversight and accountability arrangements, and any anticipated transition implications.
- 6 Each of the three operational communities formed working groups to develop a proposal:
  - **Domain Names:** Cross Community Working Group to Develop an IANA Stewardship Transition Proposal on Naming Related Functions (CWG-Stewardship)
  - **Number Resources:** Consolidated Regional Internet Registries IANA Stewardship Proposal Team (CRISP Team); and

- **Protocol Parameters:** IANAPLAN Working Group (IANAPLAN WG)
- 7 In January 2015, the ICG received a proposal from the Protocol Parameters community and a proposal from the Numbering Resources community; the Domain Names community finalized its proposal for the ICG in June 2015.
  - 8 Following submissions from the three communities, the ICG assessed the respective outputs and assembling a complete proposal for the transition. Following a 30-day public comment period that ended on September 8 2015, the ICG received more than 150 comments from a wide variety of stakeholders all over the world. The majority of the comments expressed support for the proposal. In some cases that support was qualified by suggestions, questions, and criticism that the ICG is working hard to synthesize and address as appropriate.
  - 9 Following discussions at ICANN54 in Dublin in October 2015, the ICG announced that it finalized the IANA Stewardship Transition Proposal, with one exception of the conditionality between the CWG-Stewardship portion of the proposal and the ICANN-level accountability mechanisms currently under development in the CCWG-Accountability. Before sending this proposal to the NTIA via the ICANN Board, the ICG will secure confirmation from the CWG-Stewardship that its accountability requirements have been met.

## Introduction To The Enhancing ICANN Accountability Process

- 10 As initial discussions of the IANA Stewardship Transition were taking place, the ICANN community raised the broader topic of the impact of the transition on ICANN's current accountability mechanisms. From this dialogue, the Enhancing ICANN Accountability process was developed to propose reforms that would see ICANN realize a level of accountability to the global multistakeholder community that is satisfactory in the absence of its historical contractual relationship with the U.S. Government. This contractual relationship has been perceived as a backstop with regard to ICANN's organization-wide accountability since 1998.
- 11 Informed by community discussions held in March 2014 at ICANN's public meeting in Singapore, ICANN published a proposed process on Enhancing ICANN Accountability, with an opportunity for public dialogue and community feedback from 6 May – 27 June 2014, in addition to the comments received during the dedicated Enhancing ICANN Accountability session held on 26 June 2014 at the ICANN 50 meeting in London. The comments related to the development of the process were considered in the refinement of the second iteration of the process published on 14 August 2014. In response to community requests for additional time to review proposals and post questions and comments, ICANN provided an additional 21-day comment period from 6-27 September 2014.
- 12 The final Revised Enhancing ICANN Accountability: Process and Next Steps includes considering how ICANN's broader accountability mechanisms should be strengthened in light of the transition, including a review of existing accountability mechanisms such as those within the ICANN Bylaws and the Affirmation of Commitments.

## Formation of the CCWG-Accountability

- 13 Following public comment periods and discussions on accountability, the Cross Community Working Group on Enhancing ICANN Accountability (CCWG-Accountability) was convened, designed and approved by a Drafting Team composed of five ICANN community groups. Further information, including document drafts and meeting transcripts of the Drafting Team that developed the CCWG-Accountability Charter (see Appendix B), is available on the CCWG-Accountability Wiki site.
- 14 The CCWG-Accountability Charter was circulated for adoption on 3 November. Since then, the following organizations have adopted the Charter:
  - Generic Names Supporting Organization (GNSO) on 13 November 2014
  - At-Large Advisory Committee (ALAC) on 18 November 2014
  - Country Code Names Supporting Organization (ccNSO) on 20 November 2014
  - Governmental Advisory Committee (GAC) on 8 December 2014
  - Address Supporting Organization (ASO) on 9 December 2014
  - Security and Stability Advisory Committee (SSAC) on 6 July 2015

## Composition of the CCWG-Accountability

The CCWG-Accountability consists of 201 people, organized as 28 members, appointed by and accountable to the CCWG-Accountability chartering organizations, 173 participants, who participate as individuals, and 109 mailing list observers. Each of the Chartering Organizations may appoint a minimum of 2 and a maximum of 5 members to the working group in accordance with their own rules and procedures.

15 **THE CCWG-ACCOUNTABILITY ALSO INCLUDES:**

- 1 ICANN Board liaison who brings the voice of the Board and Board experience to activities and deliberations;
  - 1 ICANN staff representative who provides input into the deliberations;
  - 1 former ATRT member who serves as a liaison and brings perspective and ensures that there is no duplication of work;
  - ICG members who participate in the CCWG-Accountability, including 2 who serve as liaisons between the two groups.
- 16 Seven Advisors have also been appointed by a Public Experts Group (PEG) to contribute research and advice, and to bring perspectives on global best practices to enrich the CCWG-Accountability discussion, all while engaging with a broader network of accountability experts from around the world.
- 17 The CCWG-Accountability is open to all: anyone interested in the work of the CCWG-Accountability can join as a participant or observer. Participants may be from a chartering organization, from a stakeholder group or organization not represented in the CCWG-Accountability or currently active within ICANN, or self-appointed. For those who are merely interested to monitor the CCWG-Accountability conversations, there is the possibility to sign up as a mailing list "observer" which offers read-only access to the mailing list.
- 18 The group first met in December 2014 and has held weekly meetings since. It operates in a transparent environment: its mailing-lists discussions, meeting archives, drafts and correspondence are documented on a [public wiki space](#).

19 **Work Streams**

- 20 Per the CCWG-Accountability Charter, the work of the CCWG-Accountability would proceed in two Work Streams defined as follows:
- **Work Stream 1:** focused on mechanisms enhancing ICANN accountability that must be in place or committed to within the time frame of the IANA Stewardship Transition
  - **Work Stream 2:** focused on addressing accountability topics for which a timeline for developing solutions and full implementation may extend beyond the IANA Stewardship Transition

## Methodology

- 21 This section describes the methodology through which the CCWG-Accountability developed and completed the Work Stream 1 proposal.

22 **Defining Requirements for Work Stream 1**

- 23 The primary goal of the CCWG-Accountability is to deliver proposals that would enhance ICANN's accountability towards all stakeholders. The first step in achieving this goal was to understand and describe the status quo. To do this efficiently, the CCWG-Accountability established four initial Work Areas:

- **Work Area 1:** Existing Accountability Mechanisms (including the Affirmation of Commitments reviews on accountability)
- **Work Area 2:** Review Input from Public Comment and Categorize Items into Work Streams 1 & 2 (Work Stream 1 & Work Stream 2)
- **Work Area 3:** Review Issues Identified by CWG-Stewardship
- **Work Area 4:** Identify Contingencies (especially in relation to Work Stream 1)

24 The four areas were populated with volunteer CCWG-Accountability members and participants who had dedicated mailing lists and wiki spaces to advance their work.

### 25 **Work Area 1: Inventory of Existing Accountability Mechanisms**

26 One of the first deliverables within the CCWG-Accountability was an inventory of existing accountability mechanisms on 15 December 2014, delivered just one week after the CCWG-Accountability first met. The inventory was the starting point of CCWG-Accountability's discussions, about which ICANN accountability mechanisms should be enhanced to address the risks the group had identified, and where gaps would remain and the group would need to develop new mechanisms to mitigate against those risks.

### 27 **Work Area 2: Assessment of Comments to Date**

28 Another area of initial CCWG-Accountability work focused on a review of the collection of comments received during the development of the Enhancing ICANN Accountability process and assessed whether they were issues to address as part of Work Stream 1 or Work Stream 2. The group categorized the comments based on the following rationale:

- Work Stream 1 is designated for accountability enhancement mechanisms that must be in place or committed to, before IANA transition occurs.
- Work Stream 1 mechanisms are those that, when in place or committed to, would provide the community with confidence that any accountability mechanism that would further enhance ICANN's accountability would be implemented if it had consensus support from the community, even if it were to encounter ICANN management resistance or if it were against the interest of ICANN as a corporate entity.
- All other consensus items could be in Work Stream 2, provided the mechanisms in Work Stream 1 are adequate to force implementation of Work Stream 2 items despite resistance from ICANN management and Board.

29 In addition to categorizing the comments, the ATRT Expert reviewed the comments and noted, where relevant, a reference to ATRT recommendations. Work Area 2 was complete as of 15 January 2015.

### 30 **Work Area 3: Interrelation with the CWG-Stewardship Work**

31 The CCWG-Accountability also reviewed the accountability elements identified by the CWG-Stewardship. In light of the clear linkage between the works of the two groups, the CWG-Stewardship and CCWG-Accountability Co-Chairs agreed that it would be valuable for the CWG-Stewardship to provide the CCWG-Accountability with a list of issues it identified during its

deliberations where the work of both groups may overlap. A robust collaboration was built between the two groups including leadership coordination call and exchange of letters.

32 In January 2015, the CCWG-Accountability extensively discussed the CWG-Stewardship list of issues, offered input and indicated that these avenues of work would be one of the focuses of CCWG-Accountability attention.

33 While the work was completed in March 2015, the collaboration was maintained throughout the end of their respective mandates.

#### 34 **Work Area 4: Stress Test and Contingencies Work Party**

35 A final area of focus was on the identification the main stress tests and contingencies that the CCWG-Accountability would use to test the proposed mechanisms and solutions, once elaborated.

36 The goal of this group was to identify the main contingencies that CCWG-Accountability should use to test proposed mechanisms and solutions once they are elaborated. The group defined contingencies as consisting of:

- An event (threat) to the IANA Functions Contract;
- Its consequence, such as creating significant interference with existing policy or the policy development processes; and
- What contingency plan, if any, is known to exist.

37 21 broad scenarios were initially identified, including for example, the impact of financial crisis in the domain name industry, capture by one or more stakeholders, and termination of the Affirmation of Commitments. A full list is available from the Work Area 4 webpage.

38 The group also received inputs from the ICANN Board Risk Committee on enterprise-wide risks identified within ICANN, as an input to its work. Furthermore, details of strategic risks that ICANN may face are identified in "ICANN Strategic Plan for fiscal years 2016-2020".

39 This work continues through the **Stress Tests Work Party (ST-WP)**: During the Istanbul Meeting of the CCWG, bundled the stress testing into 5 Categories (Financial Crisis or Insolvency, Failure to meet Operational Obligations, Legal / Legislative Actions, Failure in Accountability and Failure in Accountability to External Stakeholders) ; Post Istanbul, the ST-WP continued with regular review of the existing Stress Tests and continued with its identification of stress tests and their application. In reviewing the first public comment, there were an additional nine stress tests identified and included in the 2nd draft for public comment. Section 10 of this proposal details the 'to date' and ongoing work of the Stress Test Work Party.

#### 40 **Restructuring into Work Parties**

41 The Frankfurt face-to-face meeting on 19-20 January 2015 was a key turning point for the CCWG-Accountability: the group moved from an assessment phase into a development phase. As part of this development phase, the CCWG-Accountability mapped out Work Stream 1 requirements leading to a restructure of the group into Work Parties.

42 Work Party 1 and Work Party 2 were formed following the Frankfurt meeting in January 2015:

- Work Party 1: Community Empowerment (WP1) was formed to consider proposed is considering powers for the community to hold ICANN to account, and to develop a consensus on the most appropriate mechanisms to allow the community to exercise these

powers. WP1 will set out the necessary changes that would be required (e.g. Bylaws changes) to deliver these. Powers and mechanisms were defined as follows:

- Powers are actions the community should be able to take to maintain and improve ICANN's accountability;
  - Mechanisms are the structures or processes by which the community exercises its powers.
- Work Party 2: Review and Redress (WP2) was tasked with considering enhancements to existing accountability mechanisms and the creation of new accountability mechanisms to allow for review and redress for those affected by ICANN's failure to carry out its mission statement, and to hold ICANN accountable for carrying out its mission in compliance with agreed-upon standards. Work Party 2 articulated the following principles to guide its work:
    - Ensure that ICANN actions relate to issues that are within its stated mission and require ICANN to act consistent with clearly articulated principles;
    - Ensure that the ICANN Board can be held to its Bylaws;
    - Ensure that ICANN carries out its mission consistent with a binding statement of values/principles;
    - Prevent scope/mission creep through bylaws changes, policy, policy implementation, contracts and/or other mechanisms.
- 43 Work Party 3 Emerging Issues (WP3) was formed in July 2015 and tasked with reviewing the feedback received in the first public comment period (May-June 2015) with regards to issues flagged by the community as not being already addressed by the discussions and the draft proposal published by the CCWG-Accountability. Three topics were identified as emerging from feedback after the first public comment period:
- Enhancement of SO/AC accountability as the first draft document was perceived to be centered in Board accountability only.
  - Enhancement of Staff accountability so that the mechanisms being discussed might also be applicable to Staff's action or inaction.
  - Enhancement of diversity within ICANN and especially with regards to that of the newly created bodies being proposed.
- 44 Work Party 4 Human Rights (WP4) was created in August 2015 following extensive discussions within the CCWG-Accountability on inclusion of a potential Human Rights commitment into ICANN's Mission and Bylaws.
- 45 Work Party – IRP Implementation Oversight Team (WP-IOT) began its activities in January 2016. The Team responsible for reviewing the outcome produced by the legal counsel on IRP and to report back to the CCWG-Accountability. Its activities will be maintained as the group moves to Work Stream 2. It is composed of CCWG-Accountability experts in the field as well as representatives from the CCWG-Accountability's legal counsel and ICANN.
- 46 In addition, a Stress Test 18 Work Party (ST18-WP) was convened in November 2015 to draft consensus text on a proposed Bylaw to address Stress Test 18 (regarding the ICANN Board's consideration of advice from the Government Advisory Committee (GAC)). See Annex 11 – Board Obligations with regards to Governmental Advisory Committee Advice (Stress Test 18) for more information.

47 All Work Parties operated in a transparent environment, conducting their work on publicly archived mailing lists, on recorded calls and documenting progress and drafts on a [public wiki](#). Conclusions reached by Work Parties were confirmed by the full CCWG-Accountability.

## 48 **Building Blocks**

49 In February 2015, the CCWG-Accountability identified four building blocks that would form the accountability mechanisms required to improve accountability.

### 50 **Drawing a state analogy:**

- Empowered community refers to the powers that allow the community i.e. the people to take action should ICANN breach the principles.
- Principles form the Mission, Commitments and Core Values of the organization i.e. the Constitution.
- ICANN Board represents the executive entity the community may act against, as appropriate.
- Independent Review Mechanisms, i.e. the judiciary, confers the power to review and provide redress, as needed.

51 The accountability framework was compared to a cookbook populated with recipes for which the CCWG-Accountability would need to identify ingredients. A distinction was made between triggered actions i.e. triggered by the community and non-triggered i.e. part of a normal ICANN processes. The CCWG-Accountability developed a set of criteria to frame discussions.

52 From its building blocks, the CCWG-Accountability defined requirements that it established as a roadmap to follow during its discussions. The 12 recommendations embody the requirements.

## **Legal Advice**

53 The CCWG-Accountability engaged two law firms to receive expertise on feasibility of its proposed frameworks and mechanisms, Adler & Colvin and Sidley Austin LLP. The legal advice was key to the CCWG-Accountability in formulating its recommendations.

54 The CCWG-Accountability Legal Subteam's rules of engagement and working methodologies are described in Appendix C.

55 After a successful first phase lead by the Legal Subteam, and in response to the need for increased agility in the interaction between the external lawyers and the working parties, it was decided that the Legal Subteam should be dissolved in order to provide a more agile and direct interaction with the independent counsel. Rules of engagement changed: the Co-Chairs are in charge of certifying the assignments for the lawyers, but the rest of the general procedural rules stand and all interactions with counsel continue to be recorded on the [public wiki](#).

## **Definitions & Scoping**

56 The CCWG-Accountability scoped out and elaborated a problem statement along with definitions to help refine its understanding of the task it was entrusted with. The group endeavored to produce a definition of what accountability is, listed transparency, consultation, review mechanisms and redress mechanisms as criteria of accountability mechanisms.

- 57 As a general concept, the group proposed that accountability encompassed processes whereby an actor answers to others for the effects on them of its actions and omissions. For the CCWG-Accountability, then, accountability involves the processes whereby ICANN answers to its stakeholders for the impacts on those stakeholders of ICANN's decisions, policies and programs.
- 58 The group proposed that accountability is comprised four dimensions:
- 1) **Transparency** means that an actor (ICANN) is answerable to its stakeholders by being open and visible to them.
  - 2) **Consultation** means that the actor (ICANN) continually takes input from and explains its positions to the stakeholders.
  - 3) **Review** means that the actor's actions, policies and programs are subject to outside monitoring and evaluation.
  - 4) **Redress** means that the accountable actor makes compensations for any harms of its actions and omissions, for example, by means of policy changes, institutional reforms, resignations, financial reparations, etc.
- 59 Independence and checks and balances were identified as two key qualities of any accountability mechanism. The group defined "checks and balances mechanisms" as a series of mechanisms put in place to adequately address the concerns from the various interested parties in the discussion and decision process, as well as to ensure that the decision is made in the interest of all stakeholders. The group investigated two different non-exclusive views in order to assess independence: independence of persons participating in the decision process, and independence of a specific accountability mechanism with regards to other mechanisms.
- 60 The group flagged to whom should ICANN be accountable as an important component, and assembled a list of stakeholders which distinguished between affected parties and parties affecting ICANN. The following principles were agreed to guide the activities of the CCWG-Accountability:
- ICANN accountability requires that it comply with its own rules and processes (part of "due process", as a quality of fairness and justice);
  - ICANN accountability requires compliance with applicable legislation, in jurisdictions where it operates;
  - ICANN should be accountable to achieving certain levels of performance as well as security;
  - ICANN should be accountable to ensure that its decisions are for the benefit of the public, not just in the interests of a particular set of stakeholders or ICANN the organization.

# Appendix D – Engagement and Participation Summaries: Documenting Public Consultations

---

- 1 Throughout the development of its Work Stream 1 Recommendations, the CCWG-Accountability has sought feedback, confirmations and input from the Internet’s global multistakeholder community. The channels through which consultation was conducted include (but are not limited to):
  - Organizing and providing engagement sessions at ICANN meetings
  - Relaying regular updates to Supporting Organizations and Advisory Committees through membership representation
  - Holding multi-lingual webinars
  - Posting versions of the Work Stream 1 Recommendations for public comment (described in more depth below)
- 2 This outreach plan was carefully developed to ensure that the work to enhance ICANN’s accountability was being adequately considered by the entire ICANN community. In addition, the CCWG-Accountability posted blogs, communiqués and multilingual videos to document its progress and establish resources for further engagement.
- 3 The CCWG-Accountability organized two public comment periods that were key in defining and refining its Work Stream 1 recommendations:
  - **First Public Comment Period (4 May-12 June 2015)**

The CCWG-Accountability requested community feedback on its Initial Draft Proposal for Public Comment of the enhancements to ICANN’s accountability it had identified as essential or necessary to take place or be committed to before the IANA Stewardship Transition to help improve its proposal and inform next steps. A set of [focused questions](#) were provided to help guide the feedback the CCWG-Accountability would need for next steps.

    - Contributions received in response to this call for input can be read [here](#).
    - A staff summary of the comments received can be found [here](#).
  - **Second Public Comment Period (3 August-12 September 2015)**

Similar to the first Public Comment Period, the second call for input was released to seek confirmation of the CCWG-Accountability’s Work Stream 1 Recommendations and identify levels of support and any outstanding concerns with the mechanisms developed. Framing questions and a summary of changes between the first and second reports were provided to facilitate community’s reading of the report.

    - Contributions received in response to this call for input can be read [here](#).
    - Work Party and staff summaries of this second call for input can be read [here](#).

- **Third Public Comment Period (30 November-21 December 2015)**

The CCWG-Accountability sought the six Chartering Organizations' support for their Work Stream 1 recommendations in this Draft Proposal. Although relaying comments through a Chartering Organization was the recommended approach, individuals were also welcome to submit comments separately. A survey was issued to frame the input received and established the level of support for each recommendation. Comments and suggestions were also encouraged. Similar to the Second Public Comment, summaries of changes between the first and second reports were provided to facilitate community's reading of the report.

- Contributions received in response to this call for input can be read [here](#).
- Work Party and staff summaries of this third call for input can be read [here](#).

Following the release of the [staff report](#) and the [summary of public comments](#), the CCWG-Accountability determined that the majority of revisions needed to the Third Draft Report would relate to specificities of implementation rather than content. As such, the group determined that an additional public comment period would not be necessary before approval by the Chartering Organizations.

To incorporate necessary changes, the CCWG-Accountability developed a "Supplemental" Final Report, developed through an open and transparent process. This Supplemental Final Report was distributed on 23 February 2016, and is to be considered by the six Chartering Organizations for approval and submission to the ICANN Board.

## Appendix D -- Engagement and Participation Statistics: Summary

Statistics as of 9 February 2016

### CCWG-Accountability

<b>Members/Participants:</b>	<b>200</b>

## Inventory of Existing ICANN Accountability Mechanisms

### ICANN Bylaws and Bylaws-Mandated Redress Mechanisms

ICANN Bylaws specifically provide four avenues for review:

- **Reconsideration Process (Art. IV, Sec. 2):** mechanism to challenge staff action taken against ICANN policies, or Board actions taken without consideration of material information or based upon false or inaccurate information.
- **Independent Review Process (IRP) (Art. IV, Sec. 3):** allows for claims that the ICANN Board acted in a manner inconsistent with its Bylaws or Articles of Incorporation to be considered by an independent panel of neutrals.
- **Organizational Reviews (Art. IV, Sec. 4):** As required by the Bylaws, periodic reviews of the performance and operation of each Supporting Organization, each Advisory Committee (other than the Governmental Advisory Committee), and the Nominating Committee are organized to determine whether that organization has a continuing purpose in the ICANN structure, and, if so, whether any change in structure or operations is desirable to improve its effectiveness. These regular reviews allow an examination of the continuing efficacy of ICANN's component entities.
- **Office of the Ombudsman (Art. V):** reviews claims of unfairness by ICANN or its constituent entities. The Ombudsman framework is consistent with international standards. Office of Ombudsman publishes on an annual basis a consolidated analysis of the year's complaints and resolutions, appropriately dealing with confidentiality obligations and concerns.

### Policy Consideration Requirements: Bylaws-Based Advisory Mechanisms

Bylaws define ICANN's relationships to its component entities, including its Supporting Organizations (GNSO, ccNSO, and ASO) and Advisory Committees (SSAC, GAC, ALAC, and RSSAC). The Bylaws include detailed requirements for how the Board considers community-developed policies and receives advice. Some of these relationships are further defined through more detailed documentation, such as the Memorandum of Understanding with the Address Supporting Organization.

### Affirmation Of Commitments

Signed with the United States Department of Commerce (DoC) on 30 September 2009, the Affirmation of Commitments contains joint commitments relating to ICANN's technical coordination role of the Internet Domain Name System. The commitments uphold the multi-stakeholder model, commit to operate in a transparent manner and in the global public interest, and, among other things, to undertake community-led, regular reviews relating to accountability and transparency as well as on three other

fundamental organizational objectives. More information about the Accountability and Transparency Reviews are outlined below.

## Headquarters

ICANN, as a California Not-for-Profit Public Benefit Corporation, is obligated to follow the laws of the State of California. ICANN is also subject to both California and U.S. laws and regulations regarding ICANN's tax-exempt, public benefit status, which each require ICANN to act in furtherance of its stated public benefit purposes. These laws, as well as the laws of other places where ICANN has a presence, carry with them obligations. For example, under law, all ICANN Directors hold a fiduciary duty to act in the best interests of ICANN, and not for their own personal (or business) benefit. ICANN has the ability to sue and be sued for its actions and to be held responsible in a court of proper jurisdiction for its dealings with the global community.

## Accountability and Transparency Review Teams 1 and 2 Recommendations

Periodic assessments of ICANN's progress toward ensuring accountability, transparency and the interests of global Internet users are undertaken by community-led Review Teams. The first accountability and transparency review, conducted in 2010 by the Accountability and Transparency Review Team 1 (ATRT1), resulted in a set of recommendations. A second review was launched in 2013 - in compliance with the Affirmation of Commitments timeframe. Pursuant to the Affirmation of Commitments, the Second Accountability and Transparency Review Team (ATRT2) assessed the extent to which the ICANN board and staff implemented the recommendations arising of the ATRT1, in addition to the core scope, and issued a set of recommendations.

## Contractual Requirements

ICANN enters into a variety of contractual arrangements through which it takes on obligations. While meeting these requirements are a matter of contractual compliance for ICANN, at times the contracts also include broader accountability requirements as well. Some of these contracts include:

- The IANA Functions Contract with the NTIA, which incorporates, for example, a customer complaint resolution process at c.2.9.2.g as well as requirements for how ICANN is to consider delegation requests for ccLTDs (C.2.9.2.c) and gTLDs (C2.9.2.d).
- Registry Agreements and Registrar Accreditation Agreements (see <https://www.icann.org/resources/pages/agreements-policies-2012-02-25-en> and <https://www.icann.org/resources/pages/registries/registries-agreements-en>) Through these agreements, there are escalation paths set out in the event of disagreement between ICANN and the Registry or Registrar, in each case leading to the ultimate reference to arbitration if needed
  - Both Registry and Registrar Contracts include a requirement to follow “Consensus Policies”, which are policies developed through the ICANN multistakeholder process and approved with high thresholds of support. Most commercial contracts do not include the ability to insert new

obligations in this way, and so the requirements on the ICANN Board and the ICANN community in developing and approving these policies are high and must be followed.

- The consensus policies may only cover specific issues that are specified within the agreements, and may not touch on other specific areas (such as pricing terms). Historically, this has been referred to as the “picket fence” around where ICANN could mandate registry and registrar compliance with obligations that are not specifically included within the contracts.
- Detailed topics subject to "Consensus Policy" are defined in the gTLD Registry and Registrar Agreements.

## **ICANN Board of Directors Documentation**

Documents relating to the Board of Directors include briefing materials, resolutions, preliminary reports and minutes. Since 2010, the ICANN Board has provided a rationale for its decisions, which are published in both Resolutions and Minutes. All resolutions of the Board are tracked in a searchable tool, with information on how the mandate within each resolution was achieved. The Board also makes public how it addresses the advice it receives from the Advisory Committees, with both a GAC Register of Advice as well as the new Advice tracking tool.

## **General ICANN Operational Information**

Financial information includes an annual budgeting process developed with community input, the posting of quarterly financial reports (following the practice of listed companies), as well as the annual posting of ICANN's Audited Financial Statements, and the annual Form 990 tax filing. For tracking of ICANN's operational activities, information about current projects across the organization is posted. ICANN also maintains the Documentary Information Disclosure Policy (DIDP) for members of the public to request the release of information within ICANN that is not already publicly available.

## **ICANN Board Selection Process**

The selection of voting Board Directors occurs through different community processes. The Nominating Committee appoints eight Directors, ICANN's Supporting Organizations appoint six Directors (specifically, the Address Supporting Organization the Country-Code Names Supporting Organization (ccNSO) and the Generic Names Supporting Organization (GNSO) each appoint two Directors), and the At-Large Community appoints one Director. Directors serve staggered terms enabling some annual renewal of the Board. Mechanisms for the removal of Directors and Non-Voting liaisons are described in ICANN Bylaws. The President and CEO of ICANN, who is appointed by the Board, also serves a Board member.

# Appendix E: Work Area 2 Outcome

---

## Input Gathered from the Community: Required Community Powers

As indicated in Section 2, the CCWG-Accountability reviewed the collection of public comments received during the development of the Enhancing ICANN Accountability process and categorized them as Work Stream 1 and Work Stream 2. Work Stream 1 mechanisms were defined as those that, when in place or committed to, would provide the community with confidence that any accountability mechanisms necessary to enhance ICANN's accountability within the timeframe of the IANA Stewardship Transition would be implemented if it had consensus support from the community, even if it were to encounter ICANN management resistance or if it were against the interest of ICANN as a corporate entity.

### The mechanisms were divided into three sections:

1. **Mechanisms giving the ICANN community ultimate authority over the ICANN corporation:** Most of these were initially designated as Work Stream 1, since community Members need the leverage of the IANA Stewardship Transition to obtain these Bylaws changes.
2. **Mechanisms to restrict actions of the ICANN Board of Directors and management of the ICANN corporation:** Most of these were initially designated as Work Stream 2, since the Members could reverse ICANN Board or management decisions if Members are empowered in Work Stream 1 (see 1 above).
3. **Mechanisms to prescribe actions of the ICANN corporation:** Most of these were initially designated as Work Stream 2, since the Members could reverse ICANN Board or management decisions if Members are empowered in Work Stream 1 (above). For example, a bottom-up consensus process to change ICANN bylaws might be rejected by the ICANN Board, but the Members could then reverse that decision and force the change.

In addition, the CWG-Stewardship co-Chairs detailed, in a correspondence dated 15 April 2015, the expectations from their group with regards to CCWG-Accountability Work Stream 1 recommendations. These expectations are:

- **ICANN budget:** The CWG supports the ability for the community to “veto” a budget;
- **Community empowerment mechanisms:** The CWG-Stewardship will be relying on the community empowerment and accountability mechanisms that the CCWG-Accountability is currently considering and developing as a part of Work Stream 1. In particular, mechanisms such as: the ability to review ICANN Board decisions relating to periodic or ad-hoc reviews of the IANA functions undertake through the IANA Review Function (PRF or possibly IRF); the ability to approve or reject board decisions on PRF as well as the related creation of a stakeholder

community / member group in order ensure the ability to trigger these kinds of abilities;

- **Review and redress mechanisms:** The CWG-Stewardship would like to have the assurance that an IANA Periodic Review (or related ad-hoc review) could be incorporated as part of the Affirmation of Commitments mandated reviews integration into ICANN's Bylaws.
- **Appeal mechanisms (especially with regard to ccTLD related issues):** The CWG-Stewardship recommends that the CCWG-Accountability be mindful of the recommendations of the CWG-Stewardship in relation to an appeals mechanism for ccTLDs in delegation and re-delegation. The CWG-Stewardship has conducted a survey among the ccTLDs as part of the work of our Design Team B, and the results led to a recommendation which notes that ccTLDs may decide to develop their own appeals mechanism regarding re/delegation at a later date (post-transition). As such, any appeal mechanism developed by the CCWG-Accountability should not cover ccTLD delegation / re-delegation issues as these are expected to be developed by the ccTLD community through the appropriate processes. However, the CWG-Stewardship does want to emphasize the importance and need for an appeal mechanism to cover any other issues that may involve IANA, and notes that this is option is expected to be specifically called out as one of the possible escalation mechanisms<sup>1</sup> in the draft transition proposal.

---

<sup>1</sup> As a note of clarification, the CWG-Stewardship has been referring previously to this appeals mechanism as IAP (Independent Appeals Panel) but understands that the CCWG-Accountability is referring to this mechanism as Independent Review Mechanism (IRP), which would also include the option for appeal. As such the CWG-Stewardship will be updating its references.

# Appendix F – Legal Counsel

---

- 1 The CCWG-Accountability engaged two external law firms to provide advice and counsel on their Work Stream 1 Recommendations.
  - **Adler & Colvin** is the primary source of advice on California corporate governance and nonprofit corporate law, unincorporated association law, and charitable trust law.
  - **Sidley Austin LLP** advises on corporate governance, international law and jurisdiction issues, alternate dispute resolution issues, antitrust, and other topics as deemed appropriate. Sidley Austin serves as the coordinating law firm.
- 2 During initial engagement, the CCWG-Accountability created a Legal Subteam to coordinate the work of the firms. Methodology of the Legal Subteam can be found below for full reference.
- 3 Following the release of the Initial Draft Report in May 2015, the Legal Subteam was disbanded and the relationship with the law firms was redesigned. Moving forward, the CCWG-Accountability Co-Chairs, not the Legal Subteam, were designated as direct points of contact with the firms and given the authority to review and certify legal requests from the group. This new method of engagement allowed for more direct consultation between the leadership and improved ability to track costs.
- 4 All legal requests and responses are [documented](#) on the CCWG-Accountability Wiki.

## Rules of Engagement

- 5 The Legal Subteam put together the following set of rules of engagement to frame the legal counsel's work and cooperation between law firms.
- 6 **Law firms' coordination**
- 7 Sidley Austin will be the coordinating firm. Both firms are expected to work on the different issues assigned to them but Sidley Austin will coordinate how the complementary and collaborative work will be developed by the firms. It is of the essence for the success of the group to avoid having duplicate work that may impact in duplicate billable hours.
- 8 Private coordination meetings between lawyers would be acceptable and desirable. Information should flow freely between law firms.
- 9 **Legal advice**
- 10 While recognizing that Sidley Austin will be coordinating the work of both law firms with the aim of having a harmonized voice, law firms should state any differing views they may have on any particular issue where this difference happens. Furthermore, should this difference in views happen, each law firm will be required to provide the rationale for its differing view.
- 11 During face-to-face meetings/calls, high-level legal advice should come in real time in reply to anyone raising a question within the Charter's scope.

- 12 Lawyers' involvement with Work Parties of the CCWG-Accountability is key as it is the Work Parties that are building the proposals that will be subject to public comment. Therefore, the Legal Subteam and the law firms should be able to provide these Work Parties with the tools they need to build feasible and legally viable proposals.
- 13 The law firms analyzed different templates of powers and mechanisms and provided advice on whether those powers and mechanisms are legally viable in the first place and if not, which would be the alternatives. The law firms have also advised on how these mechanisms and powers may be implemented in a holistic view of the accountability enhancement process.

## Legal Subteam Methodology

- 14 When the Legal Subteam was active, the following methodology and working methods applied:

### 15 **Legal Subteam and law firms' coordination**

- 16 Law firms report to the CCWG-Accountability and receive instructions from the Legal Executive Subteam only. Legal Executive Subteam Members include: León Sánchez (lead); Athina Fragkouli; Robin Gross; David McAuley; Sabine Meyer; Edward Morris; Greg Shatan and Samantha Eisner (support).
- 17 Should there be the need for a call between the available members of the Legal Executive Subteam and any of the law firms in order to address urgent matters without the ability to setup a public call, it will always be required to provide proper debrief to the open list in a timely fashion. This method will be exceptional.
- 18 A single mailing list will be used. Legal Subteam members who are not listed in the Legal Executive Subteam have viewing rights to help streamline communications. Posting privileges should carry request privileges.
- 19 The mailing list remains open to any observers.
- 20 Activities and requests will be documented on the [dedicated CCWG-Accountability wiki page](#).

### 21 **Mailing list**

- 22 All formal requests, including follow-up clarifications, are made in writing and communicated through the public mailing list [ccwg-accountability5@icann.org](mailto:ccwg-accountability5@icann.org) ([Public archives](#)).

### 23 **Conference calls**

- 24 All weekly calls are to be recorded, transcribed and archived in the [public CCWG-Accountability wiki](#).
- 25 Legal Subteam and law firms coordination call will be held on Wednesdays: 14:00-15:00 UTC  
Legal Subteam only - 15:00-16:00 UTC  
Legal Subteam and lawyers.
- 26 Calls are open to anyone.

27 **Requests for advice**

- 28 No individual outside the Legal Executive Subteam should send requests to law firms.
- 29 Law firms are to alert the Legal Executive Subteam of any requests made by individuals outside the Legal Executive Subteam.
- 30 Only tasks assigned by memorandum will be subject for lawyers work. It is important that both law firms continue to follow the calls of the CCWG-Accountability and the discussion in the mailing lists as there might be important topics or questions raised over the different discussions that might provide context to the assignments made by the Legal Subteam.
- 31 Questions will continue to be gathered and compiled in a single document by the Legal Subteam to keep track of the different concerns and questions raised within the larger group and they will be triaged in order to then be assigned formally to the lawyers.
- 32 On each assignment, the Legal Subteam will do its best effort to provide as much context as possible to better guide the lawyers on the needs that the particular assignment is trying to address.
- 33 Requests for legal advice should be numbered consecutively for reference purposes.
- 34 All requests are archived in [the public CCWG-Accountability wiki](#).

# Appendix G – Legal Documents

---

- 1 In their role as counsel to the CCWG-Accountability the law firms Sidley Austin and Adler & Colvin have provided a number of memoranda, charts, and legal reviews of report text. In this Appendix, the group presents key advice – presented in documents, emails, and on audio during CCWG-Accountability meetings – that was essential in the process of producing the Final Report and each of its interim draft iterations. These are presented below in a compiled version from each of the prior drafts.
- 2 There were over one hundred requests for advice submitted to the CCWG-Accountability’s Legal Counsel, all of which were mapped in a table on the [public CCWG-Accountability wiki](#).

## Key Advice – Final Report (18 February 2016)

- [Indemnification and Advancement of Expenses](#) – 10 February 2016

- [Legal Scoping Document](#) – 19 March 2014

# Appendix H – Bylaws Drafting Process & Implementation Timeline

- 1 The CCWG-Accountability views the oversight of Work Stream 1 implementation as a key obligation of the group. The final Work Stream 1 accountability changes will have to be implemented or committed to before the IANA Stewardship Transition can occur. Implementation efforts are being coordinated through ICANN, with several concurrent tracks, some of which will require multiple public comment periods.
- 2 The implementation plan of the CCWG-Accountability Draft Proposal on Work Stream 1 Recommendations is outlined in this section.

## Timeline

- 3 A detailed IANA Stewardship Transition and Enhancing ICANN Accountability timeline is available [here](#).
- 4 To ensure timely implementation, the CCWG-Accountability has initiated a Bylaws drafting process (in coordination with ICANN) to incorporate the requirements of the CCWG-Accountability proposal into the ICANN Bylaws. This includes incorporating the Affirmation of Commitments reviews and the CWG-Stewardship dependencies, as appropriate. Once a draft of the ICANN Bylaws is completed, it will be posted for public comment. ICANN Board approval and adoption of the Bylaws will take place after the public comment process has been completed and after the National Telecommunications and Information Administration completes its review of the proposals.

- 5 It is expected that the National Telecommunications and Information Administration will complete its review process in approximately 60-90 days. The adoption of the ICANN Bylaws is expected to occur shortly after completion of this review.

## Implementation Plan

- 6 A significant number of CCWG-Accountability Work Stream 1 recommendations involve updating the ICANN Bylaws. With exception of enhancements to the Independent Review Process,<sup>1</sup> most of the Work Stream 1 recommendations will be implemented through changes to the ICANN Bylaws.
- 7 As a result, the CCWG-Accountability and ICANN have developed a Bylaws drafting process based on the following requirements:
  - All final decisions about Bylaws proposed to the ICANN Board would be approved by the CCWG-Accountability and/or the relevant CCWG-Accountability subgroup.
  - The CCWG-Accountability's decisions and those of its subgroups would be informed by external legal advice.
  - ICANN legal staff provides legal advice to the ICANN Board.
  - The drafting process will be based on a collaborative effort between the CCWG-Accountability's legal counsel, ICANN legal staff, and the CCWG-Accountability.

## Bylaw Drafting Process

1. Specifications for revised Bylaws will be developed based on the CCWG-Accountability's final proposal.
2. The CCWG-Accountability will be responsible for approving the specification and initiating the Bylaws drafting process.
3. Initial Bylaws drafting and refining based on the specification will be undertaken by ICANN legal staff in collaboration with the CCWG-Accountability's legal counsel.
4. For initial draft review, the relevant CCWG-Accountability subgroup, supported by both ICANN legal staff and the CCWG-Accountability's legal counsel, will review the draft to ensure it meets the specification and intent of the CCWG-Accountability. The CCWG-Accountability subgroup will be responsible for approving the review.
5. The CCWG-Accountability's legal counsel will conduct a review to assess compliance with the specification and ensure the absence of any unintended consequences. ICANN legal staff may also review.
6. The CCWG-Accountability subgroup will review the advice and will make adjustments as necessary. The draft Bylaws and advice will be shared with the CCWG-Accountability and with the ICANN Board.

---

<sup>1</sup> Operationalization of the Independent Review Process enhancements beyond the relevant Bylaw changes will include selecting panelists, establishing the secretariat for the panel, and defining the rules of procedure.

7. The full CCWG-Accountability members and participants will be responsible for deciding on any conflict of interpretation, and will be responsible for approving the Bylaw change for inclusion in a proposal that the draft be presented for public comment. In the situation where there is a conflict of interpretation, the full CCWG-Accountability will send the draft Bylaw back to the CCWG-Accountability subgroup and legal counsel for further refinement.
8. The ICANN Board has final approval of the Bylaws, using its community-focused processes including a public comment period.

# Affirmation of Commitments

---

1. This document constitutes an Affirmation of Commitments (Affirmation) by the United States Department of Commerce ("DOC") and the Internet Corporation for Assigned Names and Numbers ("ICANN"), a not-for-profit corporation. In recognition of the conclusion of the Joint Project Agreement and to institutionalize and memorialize the technical coordination of the Internet's domain name and addressing system (DNS)<sup>1</sup>, globally by a private sector led organization, the parties agree as follows:
2. The Internet is a transformative technology that will continue to empower people around the globe, spur innovation, facilitate trade and commerce, and enable the free and unfettered flow of information. One of the elements of the Internet's success is a highly decentralized network that enables and encourages decision-making at a local level. Notwithstanding this decentralization, global technical coordination of the Internet's underlying infrastructure - the DNS - is required to ensure interoperability.
3. This document affirms key commitments by DOC and ICANN, including commitments to: (a) ensure that decisions made related to the global technical coordination of the DNS are made in the public interest and are accountable and transparent; (b) preserve the security, stability and resiliency of the DNS; (c) promote competition, consumer trust, and consumer choice in the DNS marketplace; and (d) facilitate international participation in DNS technical coordination.
4. DOC affirms its commitment to a multi-stakeholder, private sector led, bottom-up policy development model for DNS technical coordination that acts for the benefit of global Internet users. A private coordinating process, the outcomes of which reflect the public interest, is best able to flexibly meet the changing needs of the Internet and of Internet users. ICANN and DOC recognize that there is a group of participants that engage in ICANN's processes to a greater extent than Internet users generally. To ensure that its decisions are in the public interest, and not just the interests of a particular set of stakeholders, ICANN commits to perform and publish analyses of the positive and negative effects of its decisions on the public, including any financial impact on the public, and the positive or negative impact (if any) on the systemic security, stability and resiliency of the DNS.
5. DOC recognizes the importance of global Internet users being able to use the Internet in their local languages and character sets, and endorses the rapid introduction of internationalized country code top level domain names (ccTLDs), provided related security, stability and resiliency issues are first addressed. Nothing in this document is an expression of support by DOC of any specific plan or proposal for the implementation of new generic top level domain names (gTLDs) or is an expression by DOC of a view that the potential consumer benefits of new gTLDs outweigh the potential costs.

---

<sup>1</sup> For the purposes of this Affirmation the Internet's domain name and addressing system (DNS) is defined as: domain names; Internet protocol addresses and autonomous system numbers; protocol port and parameter numbers. ICANN coordinates these identifiers at the overall level, consistent with its mission.

6. DOC also affirms the United States Government's commitment to ongoing participation in ICANN's Governmental Advisory Committee (GAC). DOC recognizes the important role of the GAC with respect to ICANN decision-making and execution of tasks and of the effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the Internet DNS.

7. ICANN commits to adhere to transparent and accountable budgeting processes, fact-based policy development, cross-community deliberations, and responsive consultation procedures that provide detailed explanations of the basis for decisions, including how comments have influenced the development of policy consideration, and to publish each year an annual report that sets out ICANN's progress against ICANN's bylaws, responsibilities, and strategic and operating plans. In addition, ICANN commits to provide a thorough and reasoned explanation of decisions taken, the rationale thereof and the sources of data and information on which ICANN relied.

8. ICANN affirms its commitments to: (a) maintain the capacity and ability to coordinate the Internet DNS at the overall level and to work for the maintenance of a single, interoperable Internet; (b) remain a not for profit corporation, headquartered in the United States of America with offices around the world to meet the needs of a global community; and (c) to operate as a multi-stakeholder, private sector led organization with input from the public, for whose benefit ICANN shall in all events act. ICANN is a private organization and nothing in this Affirmation should be construed as control by any one entity.

9. Recognizing that ICANN will evolve and adapt to fulfill its limited, but important technical mission of coordinating the DNS, ICANN further commits to take the following specific actions together with ongoing commitment reviews specified below:

9.1 Ensuring accountability, transparency and the interests of global Internet users: ICANN commits to maintain and improve robust mechanisms for public input, accountability, and transparency so as to ensure that the outcomes of its decision-making will reflect the public interest and be accountable to all stakeholders by: (a) continually assessing and improving ICANN Board of Directors (Board) governance which shall include an ongoing evaluation of Board performance, the Board selection process, the extent to which Board composition meets ICANN's present and future needs, and the consideration of an appeal mechanism for Board decisions; (b) assessing the role and effectiveness of the GAC and its interaction with the Board and making recommendations for improvement to ensure effective consideration by ICANN of GAC input on the public policy aspects of the technical coordination of the DNS; (c) continually assessing and improving the processes by which ICANN receives public input (including adequate explanation of decisions taken and the rationale thereof); (d) continually assessing the extent to which ICANN's decisions are embraced, supported and accepted by the public and the Internet community; and (e) assessing the policy development process to facilitate enhanced cross community deliberations, and effective and timely policy development. ICANN will organize a review of its execution of the above commitments no less frequently than every three years, with the first such review concluding no later than December 31, 2010. The review will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair

of the GAC, the Chair of the Board of ICANN, the Assistant Secretary for Communications and Information of the DOC, representatives of the relevant ICANN Advisory Committees and Supporting Organizations and independent experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the Chair of the Board of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations. Each of the foregoing reviews shall consider the extent to which the assessments and actions undertaken by ICANN have been successful in ensuring that ICANN is acting transparently, is accountable for its decision-making, and acts in the public interest. Integral to the foregoing reviews will be assessments of the extent to which the Board and staff have implemented the recommendations arising out of the other commitment reviews enumerated below.

9.2 Preserving security, stability and resiliency: ICANN has developed a plan to enhance the operational stability, reliability, resiliency, security, and global interoperability of the DNS, which will be regularly updated by ICANN to reflect emerging threats to the DNS. ICANN will organize a review of its execution of the above commitments no less frequently than every three years. The first such review shall commence one year from the effective date of this Affirmation. Particular attention will be paid to: (a) security, stability and resiliency matters, both physical and network, relating to the secure and stable coordination of the Internet DNS; (b) ensuring appropriate contingency planning; and (c) maintaining clear processes. Each of the reviews conducted under this section will assess the extent to which ICANN has successfully implemented the security plan, the effectiveness of the plan to deal with actual and potential challenges and threats, and the extent to which the security plan is sufficiently robust to meet future challenges and threats to the security, stability and resiliency of the Internet DNS, consistent with ICANN's limited technical mission. The review will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, and independent experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the CEO of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations.

9.3 Promoting competition, consumer trust, and consumer choice: ICANN will ensure that as it contemplates expanding the top-level domain space, the various issues that are involved (including competition, consumer protection, security, stability and resiliency, malicious abuse issues, sovereignty concerns, and rights protection) will be adequately addressed prior to implementation. If and when new gTLDs (whether in ASCII or other language character sets) have been in operation for one year, ICANN will organize a review that will examine the extent to which the introduction or expansion of gTLDs has promoted competition, consumer trust and consumer choice, as well as effectiveness of (a) the application and evaluation process, and (b) safeguards put in place to mitigate

issues involved in the introduction or expansion. ICANN will organize a further review of its execution of the above commitments two years after the first review, and then no less frequently than every four years. The reviews will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, and independent experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the CEO of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations.

9.3.1 ICANN additionally commits to enforcing its existing policy relating to WHOIS, subject to applicable laws. Such existing policy requires that ICANN implement measures to maintain timely, unrestricted and public access to accurate and complete WHOIS information, including registrant, technical, billing, and administrative contact information. One year from the effective date of this document and then no less frequently than every three years thereafter, ICANN will organize a review of WHOIS policy and its implementation to assess the extent to which WHOIS policy is effective and its implementation meets the legitimate needs of law enforcement and promotes consumer trust. The review will be performed by volunteer community members and the review team will be constituted and published for public comment, and will include the following (or their designated nominees): the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, as well as experts, and representatives of the global law enforcement community, and global privacy experts. Composition of the review team will be agreed jointly by the Chair of the GAC (in consultation with GAC members) and the CEO of ICANN. Resulting recommendations of the reviews will be provided to the Board and posted for public comment. The Board will take action within six months of receipt of the recommendations.

10. To facilitate transparency and openness in ICANN's deliberations and operations, the terms and output of each of the reviews will be published for public comment. Each review team will consider such public comment and amend the review as it deems appropriate before it issues its final report to the Board.

11. The DOC enters into this Affirmation of Commitments pursuant to its authority under 15 U.S.C. 1512 and 47 U.S.C. 902. ICANN commits to this Affirmation according to its Articles of Incorporation and its Bylaws. This agreement will become effective October 1, 2009. The agreement is intended to be long-standing, but may be amended at any time by mutual consent of the parties. Any party may terminate this Affirmation of Commitments by providing 120 days written notice to the other party. This Affirmation contemplates no transfer of funds between the parties. In the event this Affirmation of Commitments is terminated, each party shall be solely responsible for the payment of any expenses it has incurred. All obligations of the DOC under this Affirmation of Commitments are subject to the availability of funds.

FOR THE NATIONAL

# Glossary

---

See also <https://www.icann.org/resources/pages/glossary-2014-02-03-en>.

<b>ADVISORY COMMITTEE (AC)</b>	<p>An Advisory Committee (“AC”) is a formal advisory body made up of representatives from the Internet community to advise ICANN on a particular issue or policy area. Several Advisory Committees are mandated by the ICANN Bylaws and others may be created as needed. Advisory Committees currently have no legal authority to act for ICANN, but report their findings and make recommendations to the ICANN Board.</p> <p>See also: <a href="https://www.icann.org/resources/pages/governance/bylaws-en/#XI">https://www.icann.org/resources/pages/governance/bylaws-en/#XI</a>.</p>
<b>AFFIRMATION OF COMMITMENTS (AoC)</b>	<p>The Affirmation of Commitments (“AoC”) is the 2009 agreement between ICANN and the NTIA under which ICANN reaffirmed its commitment to accountability and transparency, DNS security and stability, competition and consumer choice, international participation, periodic community reviews, and related activities. As part of the IANA Stewardship Transition, ICANN’s commitments under the AoC and the AoC Reviews will be incorporated into the ICANN Bylaws, and the AoC itself will be terminated.</p>
<b>AFFIRMATION OF COMMITMENTS REVIEWS (AoC REVIEWS)</b>	<p>The AoC Reviews are periodic community reviews required under the AoC to assess and report on ICANN's progress toward 1) ensuring accountability and transparency (see ATR below), 2) preserving security, stability and resiliency of the DNS, 3) promoting competition, consumer trust and consumer choice, and 4) enforcing WHOIS policy. As part of the IANA Stewardship Transition, the AoC Reviews will be incorporated into the ICANN Bylaws.</p>
<b>AT-LARGE ADVISORY COMMITTEE (ALAC)</b>	<p>The At-Large Advisory Committee (“ALAC”) is a body within the ICANN structure responsible for considering and providing advice on the activities of ICANN as they relate to the interests of individual Internet users (the "At-Large" community). Following the IANA Stewardship Transition, ALAC will participate as a Decisional Participant in the Empowered Community.</p> <p>See also: <a href="http://www.atlarge.icann.org/">http://www.atlarge.icann.org/</a>.</p>
<b>ADDRESS SUPPORTING ORGANIZATION</b>	<p>The Address Supporting Organization (“ASO”) advises the ICANN Board of Directors on policy issues relating to the allocation and management of IP addresses. Following the IANA Stewardship Transition, the ASO</p>

<p><b>(ASO)</b></p>	<p>will participate as a Decisional Participant in the Empowered Community.</p> <p>See also: <a href="https://aso.icann.org/">https://aso.icann.org/</a>.</p>
<p><b>ACCOUNTABILITY AND TRANSPARENCY REVIEW (ATR)</b></p>	<p>The Accountability and Transparency Review (“ATR”) is a periodic review required under the AoC to assess and report on ICANN’s progress toward ensuring accountability and transparency and to provide recommendations to enhance accountability and transparency activities throughout ICANN. As part of the IANA Stewardship Transition, the ATR and the other AoC Reviews will be incorporated into the ICANN Bylaws.</p>
<p><b>ACCOUNTABILITY AND TRANSPARENCY REVIEW TEAM (ATRT)</b></p>	<p>Each Accountability and Transparency Review is carried out by an Accountability and Transparency Review Team (“ATRT”).</p>
<p><b>BOARD GOVERNANCE COMMITTEE (BGC)</b></p>	<p>The Board Governance Committee (“BGC”) is an ICANN Board committee currently responsible for conducting periodic evaluations of the performance of the ICANN Board and each of its members.</p>
<p><b>BOTTOM-UP PROCESS</b></p>	<p>A fundamental principle of ICANN’s decision-making process is that policy analysis and decisions progress from a stakeholder level (made up of directly affected parties, Internet users, companies and anyone else who wishes to participate in the process) to the ICANN Board level. This “bottom-up process” provides the opportunity for open and equal participation at all levels, as practical and possible.</p>
<p><b>COUNTRY-CODE NAMES SUPPORTING ORGANIZATION (ccNSO)</b></p>	<p>The Country-Code Names Supporting Organization (“ccNSO”) is a body within the ICANN structure created for and by ccTLD managers. The ccNSO provides a forum for ccTLD managers to meet and discuss topical issues of concern to ccTLDs from a global perspective. The ccNSO provides a platform to nurture consensus, technical cooperation and skill building among ccTLDs and facilitates the development of voluntary best practices for ccTLD managers. It is also responsible for developing and recommending global policies to the ICANN Board for a limited set of issues relating to ccTLDs, such as the introduction of Internationalized Domain Name ccTLDs (“IDN ccTLDs”). Membership in the ccNSO is open to all ccTLD managers responsible for managing an International Organization for Standardization (“ISO”) 3166 ccTLD. Following the IANA Stewardship Transition, the ccNSO will participate as a Decisional Participant in the Empowered Community.</p>

	See also: <a href="http://ccnso.icann.org/">http://ccnso.icann.org/</a> .
<b>COUNTRY CODE TOP-LEVEL DOMAIN (ccTLD)</b>	A country code top-level domain (“ccTLD”) is an Internet top-level domain generally used or reserved for a country, a sovereign state, or a dependent territory.  See also: <a href="http://www.iana.org/cctld/cctld.htm">http://www.iana.org/cctld/cctld.htm</a> .
<b>CROSS COMMUNITY WORKING GROUP ON ENHANCING ICANN ACCOUNTABILITY (CCWG-ACCOUNTABILITY)</b>	The Cross Community Working Group on Enhancing ICANN Accountability (“CCWG-Accountability”) was convened to design a proposal that ensures that ICANN's accountability and transparency commitments to the global Internet community are maintained and enhanced following the transition of the U.S. Government’s stewardship of the IANA functions.  See also: <a href="https://community.icann.org/display/acctcrosscomm/CCWG+on+Enhancing+ICANN+Accountability">https://community.icann.org/display/acctcrosscomm/CCWG+on+Enhancing+ICANN+Accountability</a> .
<b>COMMUNITY POWERS</b>	As part of the IANA Stewardship Transition, the following seven Community Powers will be vested in the Empowered Community, through Fundamental Bylaws, to enable the multi-stakeholder Internet community to hold ICANN accountable for its actions (or failure to act): <ul style="list-style-type: none"> <li>• The power to reject ICANN budgets, IANA budgets or ICANN strategic/operating plans;</li> <li>• The power to reject changes to ICANN's Standard Bylaws;</li> <li>• The power to approve changes to ICANN's Fundamental Bylaws or Articles of Incorporation, and to approve ICANN's sale or other disposition of all or substantially all of ICANN's assets;</li> <li>• The power to appoint and remove individual ICANN Board Directors;</li> <li>• The power to recall the entire ICANN Board of Directors;</li> <li>• The power to launch a binding community IRP or a non-binding Request for Reconsideration; and</li> <li>• The power to reject ICANN Board decisions relating to reviews of the IANA functions, including the triggering of any PTI separation process for the IANA naming functions.</li> </ul>
<b>COOPERATIVE ENGAGEMENT PROCESS</b>	As specified in Article IV, Section 3, of the ICANN Bylaws, prior to initiating an IRP, the complainant is urged to enter into a period of cooperative engagement with ICANN for the purpose of resolving or narrowing the issues that are contemplated to be brought before the IRP Panel. It is contemplated that this “cooperative engagement process” will be initiated prior to the requesting party incurring any costs in the

	<p>preparation of a request for independent review. Cooperative engagement is expected to be between ICANN and the requesting party, without the participation of legal counsel.</p> <p>See also: <a href="https://www.icann.org/en/system/files/files/cep-11apr13-en.pdf">https://www.icann.org/en/system/files/files/cep-11apr13-en.pdf</a>.</p>
<b>CONSENSUS</b>	<p>Consensus is a form of decision-making employed by various SOs within ICANN. The method for establishing whether a “consensus” has been reached may differ among SOs. For example, the following method is used in the GNSO:</p> <p>“Full consensus” - when no one in the group speaks against the recommendation in its last readings. This is also sometimes referred to as Unanimous Consensus.</p> <p>“Consensus” - when only a small minority disagrees, but most agree.</p> <p>When the GAC provides consensus advice to the ICANN Board this is understood to mean the practice of adopting decisions by general agreement in the absence of any formal objection.</p>
<b>CONSOLIDATED RIR IANA STEWARDSHIP PROPOSAL (CRISP) TEAM</b>	<p>The Consolidated RIR IANA Stewardship Proposal (“CRISP”) Team was established by the Internet number community through the RIRs to produce a proposal for IANA activities related to the allocation of blocks of Internet Number Resources, the IANA Number Registries, administration of the special-purpose "IN-ADDR.ARPA" and "IP6.ARPA" DNS zones, and other related registry management tasks.</p> <p>See also: <a href="https://www.nro.net/nro-and-internet-governance/iana-oversight/consolidated-rir-iana-stewardship-proposal-team-crisp-team">https://www.nro.net/nro-and-internet-governance/iana-oversight/consolidated-rir-iana-stewardship-proposal-team-crisp-team</a>.</p>
<b>CONSTITUENCY GROUP</b>	<p>A Constituency Group is a group of stakeholders united around a particular common interest or perspective.</p>
<b>CUSTOMER STANDING COMMITTEE (CSC)</b>	<p>As part of the IANA Stewardship Transition, a Customer Standing Committee (“CSC”) will be established to perform the operational oversight previously performed by the NTIA as it relates to the monitoring of performance of the IANA naming functions. The CSC structure will be set forth in ICANN’s Fundamental Bylaws.</p>
<b>CROSS COMMUNITY WORKING GROUP TO DEVELOP AN IANA STEWARDSHIP TRANSITION PROPOSAL ON NAMING RELATED</b>	<p>The Cross Community Working Group to Develop an IANA Stewardship Transition Proposal on Naming Related Functions (“CWG-Stewardship”) was convened to produce a consolidated transition proposal for the elements of the IANA Stewardship Transition that directly affect the Internet naming community.</p> <p>See also: <a href="https://community.icann.org/x/37fhAg">https://community.icann.org/x/37fhAg</a>.</p>

<b>FUNCTIONS (CWG- STEWARDSHIP)</b>	
<b>DECISIONAL PARTICIPANTS</b>	<p>Following the IANA Stewardship Transition, the following five ICANN SOs and ACs will participate as the Decisional Participants in the Empowered Community: ALAC, ASO, ccNSO, GNSO and GAC (if the GAC chooses to do so). The Empowered Community will act at the direction of its Decisional Participants to exercise and enforce the Community Powers vested in the multi-stakeholder Internet community as part of the transition of the NTIA's stewardship of the IANA functions. The GAC, however, will not be able to participate as a decision-maker in the Empowered Community's exercise of a Community Power to challenge a decision by the ICANN Board to implement GAC consensus advice. In such cases, the GAC will still be able to participate in an advisory capacity in the other aspects of the escalation process, but not as a decision-maker.</p>
<b>DIRECTORS</b>	<p>ICANN's Board Directors are natural persons who direct the activities and affairs of ICANN as a California nonprofit public benefit corporation and have fiduciary duties with respect to exercise of corporate power. Directors are distinguished from observers and liaisons, who can attend ICANN Board meetings but cannot vote.</p> <p>See also: <a href="https://www.icann.org/resources/pages/governance/bylaws-en/#VI">https://www.icann.org/resources/pages/governance/bylaws-en/#VI</a>.</p>
<b>DOCUMENTARY INFORMATION DISCLOSURE POLICY (DIDP)</b>	<p>ICANN's Documentary Information Disclosure Policy ("DIDP") is intended to ensure that information contained in documents concerning ICANN's operational activities, and within ICANN's possession, custody, or control, is made available to the public unless there is a compelling reason for confidentiality. A principal element of ICANN's approach to transparency and information disclosure is the identification of a comprehensive set of materials that ICANN makes available on its website as a matter of course.</p>
<b>DOMAIN NAME SYSTEM (DNS)</b>	<p>The Domain Name System ("DNS") helps users find their way around the Internet. Every computer on the Internet has a unique address – just like a telephone number – which is a rather complicated string of numbers. It is called its IP address. IP addresses are hard to remember. The DNS makes using the Internet easier by allowing a familiar string of letters (the "domain name") to be used instead of the arcane IP address. So instead of typing 207.151.159.3, you can type www.internic.net. It is a mnemonic device that makes addresses easier to remember.</p>
<b>EMPOWERED COMMUNITY</b>	<p>The Empowered Community will be formed as a California unincorporated association through the ICANN Bylaws and will have the power as the sole designator under California law to appoint and remove individual Directors or to recall the entire Board of Directors and take</p>

	<p>other action as directed by the community to enforce Community Powers. The Empowered Community and the rules by which it will be governed will be constituted in ICANN's Fundamental Bylaws.</p>
<p><b>ICANN FIVE-YEAR OPERATING PLAN</b></p>	<p>ICANN's <a href="#">Five-Year Operating Plan</a> is a means of planning and executing portfolios of ICANN activities that align with the strategic objectives and goals articulated in ICANN's Five-Year <a href="#">Strategic Plan</a>. This operating plan links strategic objectives and goals with ICANN's Annual Operating Plan and Budget, setting out planned outcomes (key success factors), means of measuring progress (key performance indicators), operational risks, dependencies and resources needed to accomplish goals.</p>
<p><b>ICANN FIVE-YEAR STRATEGIC PLAN</b></p>	<p>ICANN's Five-Year Strategic Plan articulates ICANN's vision and long-term strategic goals, which are developed through a collaborative, bottom-up, multistakeholder process.</p>
<p><b>FUNDAMENTAL BYLAWS</b></p>	<p>As part of the IANA Stewardship Transition, ICANN's Bylaws will be classified as either Standard Bylaws or Fundamental Bylaws. The Fundamental Bylaws will be those Bylaws that are integral to ICANN's organization, purpose and accountability to the global Internet community. As such, the threshold of Board approval required for changes to Fundamental Bylaws will be higher than that required for changes to Standard Bylaws. If the ICANN Board proposes any change to the Fundamental Bylaws, the proposal will require approval from three-fourths (3/4) of all of the Directors on the Board and the affirmative consent of the Empowered Community in order for the change to take legal effect.</p>
<p><b>GOVERNMENTAL ADVISORY COMMITTEE (GAC)</b></p>	<p>The Governmental Advisory Committee ("GAC") is an Advisory Committee comprising appointed representatives of national governments, multi-national governmental organizations and treaty organizations, and distinct economies. Its function is to advise the ICANN Board on matters of concern to governments. The GAC operates as a forum for the discussion of government interests and concerns, including consumer interests. As an Advisory Committee, the GAC currently has no legal authority to act for ICANN, but reports its findings and recommendations to the ICANN Board. Following the IANA Stewardship Transition, the GAC will participate as a Decisional Participant in the Empowered Community if it chooses to do so, except in instances where the Empowered Community exercises a Community Power to challenge a decision by the ICANN Board to implement GAC consensus advice.</p> <p>See also:  <a href="https://gacweb.icann.org/display/gacweb/Governmental+Advisory+Committee">https://gacweb.icann.org/display/gacweb/Governmental+Advisory+Committee</a></p>

<b>GENERIC NAMES SUPPORTING ORGANIZATION (GNSO)</b>	<p>The Generic Names Supporting Organization (“GNSO”) is the successor to the responsibilities of the Domain Name Supporting Organization (“DNSO”) that relate to the generic top-level domains. The GNSO has six constituencies, as follows: the commercial and business constituency, the gTLD registry constituency, the Internet service provider constituency, the non-commercial users constituency, the registrar’s constituency, and the IP constituency. Following the IANA Stewardship Transition, the GNSO will participate as a Decisional Participant in the Empowered Community.</p> <p>See also: <a href="http://gns0.icann.org/en/">http://gns0.icann.org/en/</a>.</p>
<b>GENERIC TOP-LEVEL DOMAIN (gTLD)</b>	<p>A generic top-level domain (“gTLD”) is one of the categories of TLDs maintained by the IANA department of ICANN for use in the Domain Name System of the Internet. It is visible to Internet users as the suffix at the end of a domain name.</p>
<b>INTERNET ASSIGNED NUMBERS AUTHORITY (IANA)</b>	<p>ICANN has been performing the Internet Assigned Numbers Authority (“IANA”) functions on behalf of the global Internet community since 1998. The IANA functions include the maintenance of the registry of technical Internet protocol parameters, the administration of certain responsibilities associated with Internet DNS root zone, and the allocation of Internet numbering resources. See also: <a href="http://www.iana.org/">http://www.iana.org/</a>.</p>
<b>IANA FUNCTIONS BUDGET</b>	<p>The IANA Functions Budget is currently part of ICANN’s Annual Operating Plan and Budget. As part of the IANA Stewardship Transition, the IANA Functions Budget will be prepared and considered as a separate ICANN budget.</p>
<b>IANA FUNCTIONS CONTRACT</b>	<p>As part of the IANA Stewardship Transition, ICANN will enter into an IANA Functions Contract including a Statement of Work with PTI pursuant to which PTI will perform the IANA naming functions.</p>
<b>IANA FUNCTION REVIEW (IFR)</b>	<p>Following the IANA Stewardship Transition, periodic IANA Function Reviews (“IFRs”) of the performance of the IANA naming functions against the contractual requirements set forth in the IANA Functions Contract and Statement of Work will be carried out by an IANA Function Review Team. The procedures of IFRs will be set forth in ICANN’s Fundamental Bylaws.</p>
<b>IANA STEWARDSHIP TRANSITION</b>	<p>ICANN has been performing the IANA functions under contract with the NTIA. In March 2014, the NTIA announced its intent to transition the NTIA’s stewardship of the IANA functions to the global Internet community (the “IANA Stewardship Transition”) and requested proposals from the ICANN multistakeholder community for that transition.</p>

<p><b>IANA STEWARDSHIP TRANSITION COORDINATION GROUP (ICG)</b></p>	<p>The IANA Stewardship Transition Coordination Group (“ICG”) was formed to coordinate the development of a proposal among the communities affected by the transition of NTIA’s stewardship of the IANA functions. The creation of the ICG was initiated and facilitated by ICANN, and the membership of the ICG has been defined by the Internet communities participating in it. The group’s sole deliverable is a proposal to the NTIA recommending a transition plan of NTIA’s stewardship of the IANA functions to the global Internet community, consistent with the key principles outlined in the NTIA announcement on March 14, 2014.</p> <p>See also: <a href="https://www.icann.org/en/stewardship/">https://www.icann.org/en/stewardship/</a>.</p>
<p><b>IANAPLAN WORKING GROUP</b></p>	<p>The IETF established the IANAPLAN Working Group to produce a proposal for the transition of the NTIA’s stewardship of the IANA functions related to maintaining the codes and numbers contained in a variety of Internet protocols developed by the IETF.</p> <p>See also: <a href="http://www.ietf.org/iana-transition.html">http://www.ietf.org/iana-transition.html</a>.</p>
<p><b>INTERNET CORPORATION FOR ASSIGNED NAMES AND NUMBERS (ICANN)</b></p>	<p>The Internet Corporation for Assigned Names and Numbers (“ICANN”) is a California nonprofit public benefit corporation that operates internationally and has responsibility for IP address space allocation, protocol identifier assignment, generic (gTLD) and country code (ccTLD) Top-Level Domain name system management, and root server system management functions. ICANN has been performing the IANA functions under contract with the NTIA; however, in March 2014, the NTIA announced its intent to transition the NTIA’s stewardship of the IANA functions and requested proposals from the ICANN multistakeholder community for that transition.</p> <p>As a private-public partnership, ICANN is dedicated to preserving the operational stability of the Internet; to promoting competition in the registration of domain names; to achieving broad representation of global Internet communities; and to coordinating the development and implementation of policies consistent with its Mission through bottom-up, consensus-based, multistakeholder processes.</p> <p>See also: <a href="https://www.icann.org/">https://www.icann.org/</a>.</p>
<p><b>ICANN ANNUAL OPERATING PLAN AND BUDGET</b></p>	<p>ICANN’s Annual Operating Plan and Budget currently includes the IANA Functions Budget. As part of the IANA Stewardship Transition, the IANA Functions Budget will be prepared and considered as a separate ICANN budget.</p>

<b>ICANN ARTICLES OF INCORPORATION</b>	<p>ICANN's Articles of Incorporation are the instrument under which ICANN was incorporated as a California nonprofit public benefit corporation. They define fundamental aspects of ICANN's organization and purpose and are ICANN's highest-level governing document. As such, following the IANA Stewardship Transition, the threshold of Board and Empowered Community approval required for changes to ICANN's Articles of Incorporation will be the same as that required for changes to Fundamental Bylaws.</p>
<b>ICANN BYLAWS</b>	<p>Subject to ICANN's Articles of Incorporation and applicable law, ICANN's Bylaws define the framework and rules for governance and operations within ICANN. As part of the IANA Stewardship Transition, ICANN's Bylaws will be classified as either Standard Bylaws or Fundamental Bylaws. The threshold of Board approval required for changes to the Fundamental Bylaws will be higher than the threshold of approval required for changes to the Standard Bylaws, and any proposed changes to Fundamental Bylaws will also require the approval of the Empowered Community for the change to take legal effect. Following Board approval of a change to the Standard Bylaws, the Empowered Community will have an opportunity to reject the change before it takes legal effect. Public consultations will be required on all proposed changes to ICANN Bylaws (Standard or Fundamental).</p>
<b>COMMUNITY FORUM</b>	<p>Following the IANA Stewardship Transition, to exercise and enforce Community Powers, the Empowered Community will first need to satisfy the appropriate escalation process for the particular Community Power. A Community Forum for interested stakeholders will be a component of the escalation process for the Community Powers (except with respect to the power to appoint Directors and the power to remove certain individual Directors). This discussion phase will provide a forum for the petitioning Decisional Participant(s) to share the rationale for, and answer questions about, the proposed use of a Community Power, and the discussion and information sharing among interested stakeholders will help the Empowered Community reach well-considered conclusions about exercising its new powers.</p>
<b>INTERNET ENGINEERING TASK FORCE (IETF)</b>	<p>The Internet Engineering Task Force ("IETF") is a large open international community of network designers, operators, vendors, and researchers concerned with the evolution of the Internet architecture and the smooth operation of the Internet. It is open to any interested individual. The IETF develops Internet standards and in particular the standards related to the Internet Protocol Suite (TCP/IP).</p> <p>See also: <a href="https://www.ietf.org/">https://www.ietf.org/</a></p>
<b>INDEPENDENT REVIEW PROCESS</b>	<p>ICANN's Independent Review Process ("IRP") is an appeals process that provides for independent third-party review of ICANN Board actions or inaction alleged by an affected party to be inconsistent with ICANN's</p>

<b>(IRP)</b>	Articles of Incorporation or Bylaws. As part of the IANA Stewardship Transition, the existing IRP will be strengthened to ensure that it is more accessible and transparent, and the scope of the IRP will be expanded to include claims relating to ICANN staff actions/inaction, certain PTI actions/inaction, expert panel decisions and DIDP decisions. The IRP Panel will also hear claims initiated by the Empowered Community with respect to matters reserved to the Empowered Community in ICANN's Articles of Incorporation or Bylaws. IRP Panel decisions will be binding and enforceable in any court that recognizes international arbitration results. These enhancements to the IRP will be set forth in ICANN's Fundamental Bylaws.
<b>INDEPENDENT REVIEW PROCESS PANEL (IRP PANEL)</b>	The Independent Review Process Panel ("IRP Panel") is an independent standing judicial/arbitral panel charged with reviewing and resolving claims brought by affected parties through the IRP.
<b>INTERNET PROTOCOL (IP)</b>	Internet Protocol ("IP") is the communications protocol underlying the Internet, which allows networks of devices to communicate over a variety of physical links. Each device or service on the Internet has at least one IP address that uniquely identifies it from other devices or services on the Internet. An IP address is the numerical address and DNS naming uses user-friendly names to locate the devices and services.
<b>MULTI-STAKEHOLDER APPROACH</b>	<p>The "multistakeholder approach" is an organizational framework or structure for governance and policymaking which aims to bring together all stakeholders to collaborate and participate in the dialogue, decision-making and implementation of solutions to identified problems or goals.</p> <p>The multistakeholder approach at ICANN is comprised of a diverse set of stakeholders with an interest in Internet numbering, naming and protocols from around the world who have organized into various Supporting Organizations, Constituent Groups and Advisory Committees, and agree to operate in an open, bottom-up, consensus-driven, and transparent manner.</p>
<b>NETMUNDIAL PRINCIPLES</b>	<p>The NETmundial meeting, which took place in Sao Paulo, Brazil on 23-24 April 2014, was the first multistakeholder-designed event to focus on the future of Internet governance. NETmundial identified a set of common principles and important values that contribute to an inclusive, multistakeholder, effective, legitimate, and evolving Internet governance framework, and recognized that the Internet is a global resource which should be managed in the public interest.</p> <p>See also: <a href="http://netmundial.br/wp-content/uploads/2014/04/NETmundial-Multistakeholder-Document.pdf">http://netmundial.br/wp-content/uploads/2014/04/NETmundial-Multistakeholder-Document.pdf</a>.</p>

<b>NOMINATING COMMITTEE (NOMCOM)</b>	<p>The Nominating Committee (“NomCom”) is an independent ICANN committee tasked with selecting eight members of the ICANN Board of Directors, five members of the ALAC, three members of the GNSO, and three members of the ccNSO.</p> <p>See also: <a href="https://www.icann.org/resources/pages/nomcom-2013-12-13-en">https://www.icann.org/resources/pages/nomcom-2013-12-13-en</a>.</p>
<b>U.S. DEPARTMENT OF COMMERCE NATIONAL TELECOMMUNICATIONS AND INFORMATION ADMINISTRATION (NTIA)</b>	<p>The U.S. Department of Commerce National Telecommunications and Information Administration (“NTIA”) is the Executive Branch agency that is principally responsible for advising the President of the United States on telecommunications and information policy issues. NTIA maintains a contract with ICANN for the technical coordination of the Internet's domain name and addressing system. In March 2014, NTIA announced its intent to transition out of its contractual role with respect to the IANA functions and requested proposals from the ICANN multistakeholder community for that transition.</p> <p>See also: <a href="http://www.ntia.doc.gov/">http://www.ntia.doc.gov/</a>.</p>
<b>OMBUDSMAN</b>	<p>The ICANN Ombudsman investigates and addresses complaints brought by members of the ICANN community who believe that the ICANN Board, staff or an ICANN constituent body has treated them unfairly. The Ombudsman must maintain neutrality and independence and facilitate fair, impartial and timely resolution of community complaints . See also: <a href="https://www.icann.org/resources/pages/accountability/ombudsman-en">https://www.icann.org/resources/pages/accountability/ombudsman-en</a>.</p>
<b>POLICY DEVELOPMENT PROCESS (PDP)</b>	<p>The Policy Development Process (“PDP”) is a set of formal steps, as defined in the ICANN Bylaws, to guide the initiation, internal and external review, timing and approval of policies needed to coordinate the global Internet's system of unique identifiers.</p>
<b>POST-TRANSITION IANA ENTITY (PTI)</b>	<p>As part of the IANA Stewardship Transition, a new Post-Transition IANA entity (“PTI”) will be created to provide the IANA functions after the transition of oversight responsibilities from the NTIA. PTI will take the form of a California nonprofit public benefit corporation, and ICANN will be its sole member. PTI’s governance structure will be set forth in ICANN’s Fundamental Bylaws.</p>
<b>PRIVATE SECTOR</b>	<p>The “private sector” includes businesses, not-for-profit bodies, individual persons, non-governmental organizations, civil society and academic institutions.</p>
<b>REGIONAL AT-LARGE ORGANIZATIONS</b>	<p>The At-Large community is structured into five Regional At-Large Organizations (“RALOs”). These organizations serve as the communication forum and coordination point to promote and assure the</p>

<b>(RALOs)</b>	participation of regional Internet user communities within ICANN activities as well as enhance knowledge and capacity building.
<b>RECONSIDERATION PROCESS</b>	The Reconsideration Process is an internal ICANN appeals mechanism through which affected parties may request that certain actions or inaction of the ICANN Board of Directors or staff be submitted to the ICANN Board for review or reconsideration. As part of the IANA Stewardship Transition, there will be several enhancements to the Reconsideration Process including expanding the scope of permissible Requests for Reconsideration and extending the time period during which an affected party may file a Request for Reconsideration .
<b>REGISTRAR</b>	Domain names ending with .aero, .biz, .com, .coop, .info, .museum, .name, .net, .org, and .pro can be registered through many different companies (known as "registrars") that compete with one another. A listing of the registrars that have been accredited by ICANN appears in the Directory of ICANN-Accredited Registrars( <a href="https://www.icann.org/registrar-reports/accredited-list.html">https://www.icann.org/registrar-reports/accredited-list.html</a> ).
<b>REGISTRY</b>	A "registry" is the authoritative, master database of all domain names registered in each Top-Level Domain. The registry operator keeps the master database and also generates the "zone file" which allows computers to route Internet traffic to and from TLDs anywhere in the world. Internet users don't interact directly with the registry operator; users can register names in TLDs including .biz, .com, .info, .net, .name, .org by using an ICANN-accredited registrar.
<b>REVIEW MECHANISM</b>	A "review mechanism" is a process to assess how a decision or policy is being put in place. ICANN has a series of review mechanisms mandated in its Bylaws to ensure its accountability and transparency.
<b>REGIONAL INTERNET REGISTRY (RIR)</b>	There are currently five Regional Internet Registries ("RIRs"): AfriNIC, APNIC, ARIN, LACNIC and RIPE NCC. These not-for-profit organizations are responsible for distributing and managing IP addresses on a regional level to Internet service providers and local registries.
<b>ROOT SERVERS</b>	The "root servers" contain the IP addresses of all the TLD registries – both the global registries such as .com, .org, etc. and the 244 country-specific registries such as .fr (France), .cn (China), etc. This is critical information. If the information is not 100% correct or if it is ambiguous, it might not be possible to locate a key registry on the Internet. In DNS parlance, the information must be unique and authentic.
<b>ROOT SERVER SYSTEM</b>	The Root Server System Advisory Committee ("RSSAC") advises the ICANN community and the ICANN Board on matters relating to the

<b>ADVISORY COMMITTEE (RSSAC)</b>	<p>operation, administration, security, and integrity of the Internet's root server system.</p> <p>See also: <a href="https://www.icann.org/resources/pages/rssac-4c-2012-02-25-en">https://www.icann.org/resources/pages/rssac-4c-2012-02-25-en</a>.</p>
<b>ROOT ZONE</b>	<p>The “root zone” is the central directory for the DNS, which is a key component in translating readable host names into numeric IP addresses.</p> <p>See also: <a href="http://www.iana.org/domains/root/files">www.iana.org/domains/root/files</a>.</p>
<b>SEPARATION PROCESS</b>	<p>A “separation process” means any process pursuant to which PTI may or will cease to perform the IANA naming functions under the IANA Functions Contract.</p>
<b>SPECIAL IFR</b>	<p>Following the IANA Stewardship Transition, Special IFRs may be initiated outside of the cycle for regular periodic IFRs to address certain deficiencies or issues relating to the performance of the IANA naming functions when the prescribed escalation mechanisms have been exhausted. The procedures for Special IFRs will be set forth in ICANN’s Fundamental Bylaws.</p>
<b>SUPPORTING ORGANIZATIONS (SOs)</b>	<p>The Supporting Organizations (“SOs”) are the three specialized policy developments bodies that currently provide the ICANN Board of Directors with policy recommendations on issues relating to domain names (GNSO and ccNSO) and IP addresses (ASO).</p>
<b>SPONSOR</b>	<p>A Sponsor is an organization which is delegated some defined ongoing policy-formulation authority regarding the manner in which a particular sponsored TLD is operated. The sponsored TLD has a charter, which defines the purpose for which the sponsored TLD has been created and will be operated. The Sponsor is responsible for developing policies on the delegated topics so that the TLD is operated for the benefit of a defined group of stakeholders, known as the Sponsored TLD Community, that are most directly interested in the operation of the TLD. The Sponsor also is responsible for selecting the registry operator and to varying degrees for establishing the roles played by registrars and their relationship with the registry operator. The Sponsor must exercise its delegated authority according to fairness standards and in a manner that is representative of the Sponsored TLD Community.</p>
<b>SECURITY AND STABILITY ADVISORY COMMITTEE (SSAC)</b>	<p>The Security and Stability Advisory Committee (“SSAC”) is the President's standing committee on the security and stability of the Internet's naming and address allocation systems. Their charter includes a focus on risk analysis and auditing. SSAC consists of approximately 20 technical experts from industry and academia as well as operators of</p>

	<p>Internet root servers, registrars, and TLD registries.</p> <p>See also: <a href="https://www.icann.org/groups/ssac">https://www.icann.org/groups/ssac</a>.</p>
<b>STAKEHOLDER</b>	<p>A “stakeholder” is any individual or group affected by the actions of ICANN. Stakeholders at ICANN include ccTLD registries; gTLD registries and registrars; regional Internet registries who manage the regional distribution of Internet number resources including IP address and Autonomous System Numbers; the thirteen root name server operators; commercial interests, including those representing large and small businesses, intellectual property interests and providers of Internet and other communications services; non-commercial interests, including non-commercial users and not-for-profit organizations; governmental interests, including national governments, multi-national governmental organizations and treaty organizations, and distinct economies; technical experts from industry and academia; and Internet users worldwide.</p>
<b>STAKEHOLDER GROUPS</b>	<p>ICANN “stakeholder groups” represent a wide variety of individuals that compose the ICANN community. Stakeholder groups function as caucuses and are intended to facilitate the creation of new constituencies as well as self-growth and expansion.</p>
<b>STANDARD BYLAWS</b>	<p>As part of the IANA Stewardship Transition, ICANN’s Bylaws will be classified as either Standard Bylaws or Fundamental Bylaws. The threshold of Board approval required for changes to Fundamental Bylaws will be higher than that required for changes to Standard Bylaws. If the ICANN Board proposes any change to the Standard Bylaws, the proposal will require approval from two-thirds (2/3) of all of the Directors on the Board. Following Board approval, the Empowered Community will have an opportunity to reject a change to the Standard Bylaws before the change takes legal effect.</p>
<b>STRESS TEST</b>	<p>A “stress test” is a simulation exercise where a set of plausible, but not necessarily probable, hypothetical scenarios are used to gauge how certain events will affect a system, product, company or industry. Stress tests have been used to analyze how certain ICANN and DNS ecosystem risks or contingencies can be mitigated by applying the accountability mechanisms available to the CCWG-Accountability.</p>
<b>TOP-LEVEL DOMAIN (TLD)</b>	<p>Top-Level Domains (“TLDs”) are the names at the top of the DNS naming hierarchy. They appear in domain names as the string of letters following the last (rightmost) “.”, such as “net” in “www.example.net”. The administrator for a TLD controls what second-level names are recognized in that TLD. The administrators of the “root domain” or “root zone” control what TLDs are recognized by the DNS. Commonly used TLDs include .com, .net, .edu, .jp, .de, etc.</p>

<b>WORK STREAMS (WS)</b>	CCWG-Accountability Work Stream 1 (WS1) has focused on mechanisms to enhance ICANN accountability that must be in place or committed to within the time frame of the IANA Stewardship Transition. Work Stream 2 (WS2) is focused on addressing accountability topics for which a timeline for developing solutions and full implementation may extend beyond the IANA Stewardship Transition.
------------------------------	---

# Appendix K – Co-Chairs’ Special Appreciation of Staff and Rapporteur Efforts

---

- 1 Developing the CCWG-Accountability Work Stream 1 Recommendations has been an unprecedented effort by the whole multistakeholder community. While we are proud of the tremendous, high-quality contributions and stamina dedicated by the volunteers, we would like to take this opportunity to give particular credit to a group of highly motivated, dedicated, patient and friendly individuals, without whom we could not have achieved the finalization of our report: *ICANN support Staff and CCWG Rapporteurs.*
  
- 2 **Thanks to our core Staff team:**
  - Brenda Brewer,
  - Alice Jansen,
  - Grace Abuhamad,
  - Hillary Jett,
  - Bernard Turcotte,
  - Adam Peake, and
  - Karen Mulberry.
  
- 3 **Thanks to the Rapporteurs:**
  - Becky Burr,
  - Cheryl Langdon Orr,
  - Steve DelBianco, and
  - Jordan Carter.
  
- 4 Also, we have benefited from flawless meeting support, always accommodating graciously our last minute requests. Thanks to Nancy Lupiano and the meetings team.
  
- 5 We are also grateful for the support and advice we received to prepare communications and correspondences from ICANN Communications department, as well as the outstanding graphics prepared by XPLANE.
  
- 6 From the daunting task of taking notes across hundreds of meeting hours to drafting to the incorporation of the various comments, Staff did all the heavy lifting across our four reports, as well as during and after the three public comment periods. They lived up to the very high transparency standards and always managed to deliver quality outcomes in the short times available. They have embodied the notion of accountability every minute. Beyond our appreciation of their efforts, we actually admired the skills, dedication and commitment from

Bernard Turcotte, Alice Jansen, Grace Abuhamad, Brenda Brewer, Hillary Jett, Karen Mulberry and Adam Peake. This appreciation also extends to the writers and other support teams who provided extra support during stretch times.

- 7 Finally, it is worth mentioning that beyond skills, beyond professional commitment, Work Stream 1 has been a wonderful team effort. Not only has our support Staff gained our deepest respect and appreciation, but they have also earned our trust and friendship, which we consider to be the greatest asset of all for the work that remains ahead of us.
- 8 León Sanchez, Thomas Rickert and Mathieu Weill
- 9 CCWG Accountability Co-chairs

# Stewardship of IANA Functions Transitions to Global Internet Community as Contract with U.S. Government Ends

1 October 2016

In addition to the U.N. six languages, this content is also available in:

**Português** (</en/announcements/details/stewardship-of-iana-functions-transitions-to-global-internet-community-as-contract-with-us-government-ends-1-10-2016-pt>)

Today, 1 October 2016, the contract between the Internet Corporation for Assigned Names and Numbers (ICANN) and the United States Department of Commerce National Telecommunications and Information Administration (NTIA), to perform the Internet Assigned Numbers Authority (IANA) functions, has officially expired (<http://www.ntia.doc.gov/press-release/2016/statement-assistant-secretary-strickling-iana-functions-contract>). This historic moment marks the transition of the coordination and management of the Internet's unique identifiers to the private-sector, a process that has been committed to and underway since 1998.

"This transition was envisioned 18 years ago, yet it was the tireless work of the global Internet community, which drafted the final proposal, that made this a reality," said ICANN Board Chair Stephen D. Crocker. "This community validated the multistakeholder model of Internet governance. It has shown that a governance model defined by the inclusion of all voices, including business, academics, technical experts, civil society, governments and many others is the best way to assure that the Internet of tomorrow remains as free, open and accessible as the Internet of today."

Internet users will see no change or difference in their experience online as a result of the stewardship transition.

In managing the coordination of the Internet's unique identifiers, ICANN plays a small but significant role in the Internet's ecosystem. For more than 15 years, ICANN has worked in concert with other technical bodies such as the Internet Engineering Task Force, the Regional Internet Registries, top-level domain registries and registrars, and many others.

The final chapter of the privatization process began in 2014, when NTIA asked ICANN to convene the global multistakeholder community, which is made up of private-sector representatives, technical experts, academics, civil society, governments and individual Internet end users, to come together and formulate proposals to both replace NTIA's historic stewardship role and enhance ICANN's accountability mechanisms.

The package of proposals developed by the global community met the strict criteria (<http://www.ntia.doc.gov/press-release/2016/iana-stewardship-transition-proposal-meets-criteria-complete-privatization>) established by NTIA in its March 2014 announcement. Since their submission to NTIA, ICANN and its various stakeholder groups have worked tirelessly to ensure that all the necessary implementation tasks (</news/announcement-3-2016-08-12-en>) have been completed, so the IANA functions contract could expire on 30 September 2016.

ICANN  
News

Subscribe  
(<https://subscribe.icann.>

The proposals reinforce ICANN's existing multistakeholder model and are also aimed at enhancing ICANN's accountability. The improvements include empowering the global Internet community to have direct recourse if they disagree with decisions made by ICANN the organization or the Board.

The IANA stewardship transition is a testament to the tireless work of the global community, and a validation of the multistakeholder model that frames that community.

# TLD Application Process FAQs

---

**We add/revise material on this page frequently. If you have visited here before, please reload/refresh this page.**

(Please note that in some cases the questions in the following FAQs have been edited to generalize them or otherwise to provide information of greater general interest.)

## **FAQ #1: What is the process for obtaining information about how to apply to sponsor or operate a new TLD?**

ICANN will make various information for applicants available on its web site. The information can be accessed through the web page at <<http://www.icann.org/tlds/tld-application-process.htm>>. This information will include various explanatory materials as well as application forms.

If you have a question before 3 October 2000 about the TLD application process that, after carefully reviewing the posted materials, you feel has not yet been answered, you may submit that question by e-mail to [tld-applications@icann.org](mailto:tld-applications@icann.org). To help provide all applicants with equitable access to information about the process as they prepare their applications, it is ICANN's practice to respond to questions about applications during the application period **only** when they are submitted **in writing**. Please do not attempt to get additional information by calling or visiting our offices.

We will periodically review the questions submitted and, if a response is appropriate, we will post the question (or an edited version of it, if we feel that would be more informative) along with our responses on this web page. Please watch this web page to see any response to your question. We will not be replying separately to e-mail inquiries.

We may also create and publish other FAQs on this page as we become aware of points that should be clarified.

Please note that any question that you submit to [tld-applications@icann.org](mailto:tld-applications@icann.org) is subject to being published verbatim on this web page. If you do not wish to publish an idea you have to the world, you should not include it in your question.

**IMPORTANT NOTE:** Those seeking information about the possibility of registering domain names within an existing or to-be-created TLD should direct their questions to [icann@icann.org](mailto:icann@icann.org). **Questions of this character should not be sent to the tld-applications mailbox.**

**FAQ #2: My TLD concept is complicated, and I feel I need to meet with ICANN to explain it. How do I do that?**

After the close of the application period on 2 October 2000, ICANN staff will be evaluating all of the applications received. This process will involve not only reviewing what has been submitted, but also consulting with technical, financial, business, and legal experts and gathering additional information that may be pertinent to the application.

As needed, after the application period is concluded the ICANN staff may gather additional information by sending applicants e-mails asking for the information, by conducting telephone or in-person interviews with applicants, by attending (possibly with ICANN-retained experts) presentations by applicants or their experts, or by other means. These inquiries will be initiated by the ICANN staff; if you feel a presentation to ICANN is necessary to properly present your proposal you should suggest that in your written application.

**FAQ #3:**

**(A) I represent a fairly large ISP & newly forming open source registrars' group that is also interested in possibly creating a new TLD. How do I know what TLD is being spoken for? The US\$ 50,000 application fee is not a problem, but I don't want to waste it on a TLD that already has been dealt with or is being processed.**

**(B) Recently I'm drawing an Chinese DNS standard and require information about DNS, especially TLDs. As I know, ICANN issued new TLDs recently during the meeting in Yokohama, and I want to know what are these new TLDs.**

In Yokohama, the ICANN Board adopted a policy that will allow the introduction of new TLDs, which will probably become operational

next year. However, **no particular TLDs were approved in Yokohama**. The TLDs that are presently in effect are described in the "[Present Structure of the Domain-Name System](#)" section of the "[Introduction of New Top-Level Domains](#)" document published in advance of the Yokohama meeting.

**FAQ #4: Will the date I submit my application matter if multiple candidates apply for the same name(s)? Do applicants who submit their applications earlier get priority with everything else equal?**

You must submit your complete application to ICANN by the 2 October 2000 deadline. If you do so, the date on which you submit your application will not affect the selection process. In other words, the date you apply makes no difference (as long as you get your application in on time).

**FAQ #5: Is it correct to assume that new TLDs to be considered by ICANN may utilize non-ASCII characters in both the name of the TLD and in name components ("labels") hierarchically below it?**

No. Domain names are used as identifiers in a variety of protocols and applications that conform to them. These protocols expect the identifiers they use to conform to a very narrow definition, which has been established in the Internet for over 25 years. Use of names that do not conform to the narrowest of the rules and conventions is known to cause operability and interoperability problems. The format is described in several places, most importantly section 3 of [RFC 1034](#) and section 2.1 of [RFC 1123](#) (both full Internet Standards).

Specifically, applications expect domain names that are composed only of the letters A to Z (interpreted in a case-independent fashion), digits, hyphens, and the period, all coded according to the rules of the "ASCII" character set (the "basic version" character coding specified in ISO 646). The period is used only to separate name components (called "labels" in the DNS). Labels may not start or end with a hyphen or be more than 63 characters in length; top-level domain names (i.e. the rightmost label in a name) may not start with a digit.

At this time, ICANN will only establish top-level domains having names that comply with the above format. Registries will be expected similarly to follow that format for the names they register.

The [Internationalized Domain Name \(IDN\) Working Group](#) of the [Internet Engineering Task Force \(IETF\)](#) is charged with specifying the requirements for internationalized access to domain names and a standards track protocol and encodings, based on those requirements, which will adequately respond to applications

restrictions. When IDN's work is complete, the above name-formation requirements might be modified.

See [FAQ #9](#) and [FAQ #36](#) for related information.

**FAQ #6: Will applications submitted after 2 October 2000 (around December or early next year) be considered?**

The current activity (in calling for proposals to sponsor or operate new TLDs) is part of a "proof of concept" program in which various ideas for new TLDs will be tested in actual practice. The plan is to introduce a limited number of new TLDs in a measured and responsible manner and then to evaluate how the introduction fared.

To be included in this proof-of-concept program, applications must be received by 2 October 2000. Based on evaluation of how things proceed, next steps will be decided, and later applications might then be accepted.

**FAQ #7: How can I arrange for ICANN to send me a hard copy of the application form?**

You can't. Applications will consist primarily of comprehensive technical, business, and policy proposals prepared by or for the applicant. There will also be various forms to be submitted, which are scheduled to be available on the ICANN web site on 15 August 2000. Once these are available, you should print them, fill them out, and submit them as part of your overall application.

**FAQ #8: In some jurisdictions, it is a long process to authorise a not-for-profit corporation. Will ICANN accept an application for which the temporary applicant is an ordinary corporation with the intent to convert it to a not-for-profit corp? Such an authorisation may be conditional upon the conversion prior to fully implementing the registry.**

The appropriate course in this situation depends on whether the to-be-formed not-for-profit corporation is proposed to be a sponsoring organization (the usual case), the registry operator, or both.

A proposed sponsoring organization need not actually be formed at the time that the application is made. The application for a sponsored TLD can be made by those proposing to form the sponsoring organization. Of course, formation must be complete before the organization enters a TLD sponsorship agreement with ICANN. Ordinarily, ICANN's decision to delegate to a sponsoring organization will be made based partly on the characteristics of the proposed organization, and that organization should be the one that will serve as the sponsoring organization throughout the period of the requested delegation.

In contrast, the registry operator's proposal should be submitted by an existing organization. As with sponsoring organizations, ICANN's decision to delegate to a registry operator will be made based partly on the characteristics of the operator. The proposed operator should be the one that is proposed for the entire period of the requested delegation.

See [FAQ #12](#) for related information.

**FAQ #9: If a restricted TLD were to be the subject of an application, would ICANN accept a TLD name in ASCII letters which are conversions from another symbolic system to Roman letters?**

A TLD name must conform to format requirements summarized in [FAQ #5](#). Provided it does, it can be a transliteration having meaning in another symbolic system. For example, .san (transliterated from Japanese) would be acceptable as the name of a TLD for personal-use domain names.

**FAQ #10: Will there at any time be the opportunity to secure an extended window to lodge an application or the possibility of securing some sort of option over the right to lodge an application? The very short time frame within which to lodge applications is short.**

The current application process is part of a "proof of concept" program that is intended to involve introduction of only a limited number of new TLDs. In recognition of the limited recent experience in introducing new TLDs, the program is meant to allow the Internet community to evaluate possible additions and enhancements to the DNS and possible methods of implementing them. After these initial introductions, decisions can be made about evolution of the DNS (including new TLDs) based on the experience gained. While it would not be appropriate to prejudge those decisions, they may involve seeking additional applications in the future.

**FAQ #11: One might think that all applicants must be not-for-profit organizations. Is this understanding correct?**

No. Depending on the type of TLD being proposed (sponsored or unsponsored), the applicant will be either a sponsoring organization or a registry operator. For discussions of the role of each, see the [Sponsored and Unsponsored TLDs section of the New TLD Application Process Overview](#) document and [criteria 7 in the Criteria for Assessing TLD Proposals](#) document. Each organization should have characteristics (not-for-profit, for-profit, etc.) appropriate to its role within the overall context of the proposal.

**FAQ #12: Can multiple organizations make an application to sponsor a TLD?**

Yes, in the situation where the sponsoring organization is not yet formed. See, for example, [item A1 on the Sponsored TLD Application Transmittal Form](#) and [Instruction I9.2](#). In all other situations, there should be only a single applicant. For related information, see [FAQ #8](#).

**FAQ #13: I have the question about paying the US\$50,000 fee. If the application is not granted, is ICANN giving the US\$50,000 back?**

No. The fee is only an application fee, in exchange for which ICANN will review your application. ICANN will keep your fee even if it does not grant your application.

There is only one situation in which your application fee might be returned. If you claim your application contains confidential information and ICANN disagrees, ICANN will delete the information before reviewing your application on the merits. In this situation, you will be offered the opportunity to withdraw the application and obtain a refund of the US\$50,000 application fee. See [section I of the Statement of Requested Confidential Treatment of Materials Submitted](#) for details.

**FAQ #14: If the application is granted by ICANN, is ICANN keeping the fee?**

Yes. Applications will be granted only after review and evaluation by ICANN. The fee is designed to defray ICANN's costs associated with processing and evaluating the applications, and follow-up.

Please note that ICANN recovers its costs of operation from domain-name and IP-address registries and registrars. Those preparing Registry Operator Proposals should [factor their share \(if the application is accepted\) of ICANN's cost-recovery needs into their business model](#).

**FAQ #15: Why is the application fee so high? Aren't you going to prevent non-profit TLD registry proposals by requiring such a steep application fee?**

As a small non-profit organization, ICANN must conduct its activities so they are essentially self-funding, on the principle of cost-recovery. For example, the accreditation process for .com, .net, and .org registrars is funded through application and accreditation fees paid by those registrars. Likewise, the new-TLD-application process must be self-funding. This process will include very intensive review and analysis of applications on many levels (including technical, financial, legal, etc.). The application fee was set at a level intended to cover all

of ICANN's costs related to the process. It would not be justifiable to require existing registries and registrars to subsidize the process.

In establishing the fee, ICANN's Board was concerned that the application fee might discourage some applications for special-purpose restricted TLDs. However, a multi-tiered fee structure would mean that some applicants would subsidize the application-review costs of others. This would be particularly unfair because of difficulties in distinguishing between for-profit and non-profit proposals in the global context. Accordingly, a single, cost-recovery-based application fee has been adopted for this year's new-TLD-application process.

**FAQ #16: ICANN states clearly its intention to create competition among gTLD registries as it did with registrars. Will ICANN grant an application for a new registry for an existing gTLD like .com, .net, or .org?**

No. The current program involves the evaluation of applications to sponsor or operate "[new TLDs](#)," not existing ones. As stated in the [New TLD Application Process Overview](#) document, "The adopted policy calls for submission of proposals to sponsor or operate new TLDs by interested persons and organizations." There is no intent to upset arrangements for existing TLDs through this program.

**FAQ #17: My group is dissatisfied with the operation of the two-letter ccTLD that has been assigned to our country. We would like to apply to operate a registry for that ccTLD. Should we submit an application under the New TLD program?**

No. The [New TLD Application Process](#) involves establishing new TLDs, not changing the delegation of existing ones. Applications in the New TLD program should not seek TLD strings that match [alpha-2 codes on the ISO 3166-1 list](#).

See [FAQ #21](#) and [FAQ #24](#) for related information.

**FAQ #18: If we go through all the effort to apply for a top level domain, who owns it? What could potentially happen to change ownership?**

Top-level domains are established for the benefit of the Internet community. Their operation is delegated to particular organizations based on a showing that doing so is in the best interests of the Internet community. An operator does not "own" a top-level domain. As noted in [RFC 1591](#) (written by Jon Postel in 1994 and entitled "Domain Name System Structure and Delegation"): "Concerns about 'rights' and 'ownership' of domains are inappropriate. It is appropriate to be concerned about 'responsibilities' and 'service' to the community."

It is anticipated that TLD registry agreements will provide that, if a registry operator fails to meet its service obligations, the agreement may be terminated. In their proposals, sponsoring organizations and registry operators should state the term they are suggesting and explain why they believe that term would best serve the interest of the Internet community. See, for example, [item D13.2.10 of the Registry Operator's Proposal](#).

See [FAQ #39](#) for similar information concerning sponsored TLDs.

**FAQ #19: Is the non-refundable US\$ 50,000 application fee per TLD or per idea? In other words, if I apply for multiple TLD strings is that one or many applications?**

It is US\$ 50,000 *per application*. [Section VIII of the New TLD Application Instructions](#) discusses the circumstances in which a single application can propose multiple TLD strings.

**FAQ #20: I am planning to submit an application to ICANN for a new TLD. I would like to submit my application in writing. What address should I send my application to?**

This information is provided in [item I22 of the New TLD Application Instructions](#). Persons considering submitting an application are urged to carefully review that document as well as the instructions stated in the applications. Failure to follow all of the instructions can lead to denial of your application.

**FAQ #21: Will an application which accidentally proposes a TLD that is an alpha-3 code on the ISO-3166-1 list fail?**

As stated in [FAQ #17](#), applications in the New TLD program should not seek TLD strings that match [alpha-2 codes on the ISO 3166-1 list](#). There is no similar, automatic disqualification on alpha-3 codes on the ISO 3166-1 list.

See [FAQ #24](#) for a follow-up question.

**FAQ #22: What is the procedure in the event of duplicate submission of a domain name by different parties? Which party would get preference? Would the fee be non-refundable for the party that is not selected?**

Applications to sponsor or operate a TLD will be evaluated according to the [Criteria for Assessing TLD Proposals](#), under which all aspects of the proposal (operational, financial, technical, etc.) will be considered. The particular TLD string requested is only one of many factors in the evaluation. Clearly, the same TLD cannot be established for both proposals; differences between the applications

would be considered according to the criteria. The fee paid by a non-selected applicant would not be refundable.

**FAQ #23: Will two (or more) parties that apply for a TLD in related fields or that propose identical plans be asked to negotiate to present a joint proposal?**

Although it is possible that negotiations toward a joint proposal would be urged depending on the circumstances, applicants should not assume that ICANN will request or require such negotiations.

Applicants should consider discussing their proposals with other interested members of the community before submitting them.

**FAQ #24: [FAQ #21](#) states that there is no "automatic disqualification" of applications proposing TLD labels that are alpha-3 codes on ISO 3166-1 list. Is this the correct even if a [ccTLD has been established for the corresponding alpha-2 code on the ISO 3166-1 list](#)?**

Yes, it is correct that there is no automatic disqualification. Please take note, however, of [consideration 4\(b\) in the Criteria for Assessing TLD Proposals](#), which states:

- b. Is the proposed TLD semantically "far" from existing TLDs, so that confusion is avoided? (For example, TLD labels suggesting similar meanings might be more easily confused.) Is it phonetically distinct from existing TLDs? Meanings and pronunciations in different languages may be relevant to these inquiries.

In this context, "existing TLDs" includes ccTLDs that have been established.

**FAQ #25: We are an established not-for-profit institute that wishes to sponsor a chartered TLD. However, we feel that the eventual formation of an international sponsoring organization would be best for this chartered TLD. We would therefore like to propose our institute as the sponsoring organization pro tem, with a well-defined schedule for the establishment of the international sponsoring organization (as negotiated with ICANN). Would such a proposal be acceptable to ICANN?**

Assuming that a proposal qualifies in other respects, the fact that the proposed sponsoring organization has not yet been formed should not disqualify the proposal. As noted in [section 1\(c\)\(i\) of the New TLD Application Process Overview](#), "Where the proposed sponsoring organization has not yet been formed, the submission may be made by the organizers of that organization." Thus, it would be appropriate to have a proposal under which your not-for-profit institute would propose to establish the international sponsoring organization. If you

wish your proposal to be evaluated based on the appropriateness of the to-be-formed international organization (rather than the institute) as sponsor, we recommend that your proposal include plans to form the organization before completion of any contract negotiations with ICANN. The proposed organization could be affiliated initially with your institute, with a spin-off scheduled for a later time.

In submitting your application, you should check the box in [item A1 of the Sponsored TLD Application Transmittal Form](#) next to "Organization(s) or person(s) proposing to form the sponsoring organization (check this item only if the sponsoring organization has not yet been formed)." [Section I of the Sponsoring Organization's Proposal](#) should be completed to give the information for the sponsoring organization that is proposed (i.e. the one to be formed).

**FAQ #26: Will existing ICANN-accredited registrars for .com, .net, and .org be able to act as registrars in the new TLDs?**

The type of channels used for registrations in a TLD is only one of many factors that will be considered in determining whether to select a proposal for negotiations toward possible establishment of a TLD. For a discussion of some relevant factors that may pertain to the considerations raised by your question, see [Criteria for Assessing TLD Proposals](#), and particularly "[the enhancement of competition for registration services](#)" (factor 3).

See [FAQ #38](#) for related information.

**FAQ #27: Can the floppy diskette requirement be expanded to allow softcopy submission on CD?**

Yes, it can. Thanks for the great suggestion! We have already changed the documents to make this change.

See [FAQ #40](#) for related information.

**FAQ #28: Can you provide any estimate on the timing for the "proof of concept" phase for new TLDs, and when the next opportunity to propose TLDs after this initial phase will be?**

There is not yet any date that has been scheduled for a "next round," and at present we have no predictions as to the schedule. In the current round of applications, applicants are [requested to describe the value of their proposals as proofs of concept](#). [Item E30 of the Description of TLD Policies](#) requests suggestions for how the results of the introduction being proposed should be evaluated. Once a decision is made on the evaluation procedure to be used for TLDs introduced in the current round, the timing of future steps should become clearer.

See [FAQ #54](#) for related information.

**FAQ #29: We would like to provide an Executive Summary of our TLD proposal (perhaps 1 to 3 pages in length) that describes the motivation and overall goals of the TLD. Where should such a summary be placed in the application? Perhaps as a cover letter?**

We suggest that you attach it to your [Description of TLD Policies](#). Before item E1 on your description, you should type in a statement such as "An Executive Summary of this proposal is attached."

Materials that you wish ICANN to consider in support of your application should be included in the body of your application materials (i.e. your transmittal form, the Sponsoring Organization's Proposal, the Registry Operator's Proposal, the Description of TLD Policies, the fitness disclosures, or the Statement of Requested Confidential Treatment) or as a referenced attachment, not in an unreferenced, separate cover letter.

**FAQ #30: [Item \(c\) under factor 8 of the Criteria for Assessing TLD Proposals](#) states that when evaluating proposals ICANN will examine: "c. Has the proponent considered intellectual property interests or otherwise designed protections for third-party interests?" What types of intellectual-property protections should be included?**

Applicants should propose measures they believe are appropriate to protect intellectual property and other third-party interests. The types of protections that are appropriate will depend, to some extent, on the nature of the TLD and other circumstances. Applicants should anticipate that one of the topics of [public comments on their proposals](#) will be the appropriateness of the protections they propose.

In preparing their proposals, applicants may wish to consult the materials prepared by the ICANN DNSO Intellectual Property Constituency (IPC) and [posted on the IPC website](#). These are the views of the IPC only.

**FAQ #31: What TLDs are already established?**

Presently, there are seven traditional "generic" TLDs (.com, .edu, .gov, .int, .mil, .net, and .org), nearly 250 [two-character "country-code" TLDs](#), and one infrastructure TLD (.arpa).

For a more detailed description of the present TLDs, see the [detailed topic paper on TLDs](#) prepared in advance of the ICANN Yokohama meeting.

**FAQ #32: I'm investigating the possibility of two companies (parent companies) with complimentary capabilities forming a jointly held**

**company (joint venture) to operate a new non-sponsored TLD registry. The joint venture would not have any operational experience and history. Am I correct in assuming that the Registry Operator's Proposal should describe the data and history for the two parent companies? Also, will ICANN consider the application if the joint venture is not yet established when the application is sent?**

A [Registry Operator's Proposal](#) must be submitted by a proposed registry operator that is in existence (i.e. has already been formed) at the time the proposal is signed and submitted. Note that the proposed registry operator should be an organization, such as a corporation, having the ability to enter legally binding contracts.

The Registry Operator's Proposal should describe the capabilities of the entity proposed actually to serve as registry operator. In the circumstances you describe, that could be done by describing the data and history of the parent companies and by providing documentation that the parent companies are firmly committed to transferring their relevant operational units to the newly formed entity.

### **FAQ #33: How do I pay the application fee?**

When they were first posted, the instructions required that the non-refundable application fee be paid by check. That is still the payment method we prefer that you use. However, for the convenience of those that may have difficulty in obtaining a check drawn on a United States bank, we have decided to permit payment by wire transfer. In either case, because your application will only be considered once we are satisfied you have fully paid the application fee, it is vital that you follow the payment instructions **exactly**:

- If you choose to pay by check, with your application you must send a check, drawn on a United States bank and **payable to the Internet Corporation for Assigned Names and Numbers (ICANN)**, in the amount of 50,000 United States dollars.
- If you choose to pay by wire transfer, you must arrange for the wire transfer to be sent to ICANN at the following account:

Internet Corporation for Assigned Names and  
Numbers

Account number 09141-04900

Routing indicator 121000358

Bank of America Branch 0914

4754 Admiralty Way

Marina del Rey, CA 90292 USA

Telephone +1/310/247-2080

We must receive wire transfers **at least five business days before we receive your application** and **you must include a wire transfer receipt or other document identifying the wire transfer with your application.**

See [FAQ #57](#) for related information.

**FAQ #34: Where can I obtain a list of the parties that previously submitted a letter of interest and brief proposal to operate/sponsor a new gTLD?**

For a list of expressions of interest received in the period leading up to the ICANN meeting in Yokohama, [click here](#).

See [FAQ #49](#) for related information.

**FAQ #35: Can I propose to act as both the registry operator also a registrar?**

Applicants should describe the marketing channels they are proposing. See [item D13.2.4 of the Registry Operator's Proposal](#). A proposal to act as both registry operator and registrar is not forbidden, though that feature may affect how your proposal is evaluated. In formulating recommendations for the ICANN Board, the ICANN staff currently intends to consider at least the factors stated in the [Criteria for Assessing TLD Proposals](#), including [factor 3](#): "The enhancement of competition for registration services."

**FAQ #36: In your response to [FAQ #5](#), regarding the use of non-ASCII characters in a TLD string, you stated, "top-level domain names... may not start with a digit." Having conducted research into this specific area, we have proven (just by the adoption of simple policies that can be applied at the registry level) that it is possible to operate a TLD with a digit as the first character while maintaining the stable operation of the DNS, and we believe that a proposal of this sort "[might increase the utility of the DNS](#)." Can the no-beginning-digit statement of [FAQ #5](#) be relaxed?**

Not at this time. It is important to Internet stability that DNS names conform to the relatively narrow format rules and conventions stated in the RFCs because, among other things, application developers have relied on those format rules and conventions in designing, implementing, and testing software that handles DNS names. Although the statements in [RFC 1034](#) and section 2.1 of [RFC 1123](#) (cited in the response to [FAQ #5](#)) might, standing alone, be subject to differing interpretations, subsequent RFCs have interpreted those RFCs to prohibit TLD labels starting with digits. See [RFC 2396](#), pages 13-14 (August 1998); [RFC 1738](#), page 6 (December 1994). At least one of these RFCs has been available to software developers for over five years.

If the no-first-digit requirement for TLD labels is to be relaxed, it should be done through the IETF, which developed the documents articulating the requirement.

**FAQ #37: It has been rumored that there is a financial backing requirement of \$10,000,000. Can you please clarify these details? If not \$10,000,000, what is the specific requirement?**

There is no specific, fixed amount of firmly committed capital required. The level of capital will depend on the nature of the overall proposal. The Registry Operator's Proposal submitted with the application should contain a detailed analysis of capital requirements and demonstrate firm commitments for that capital. See Items [D13.2.5](#), [D13.2.13](#), and [D13.4.4](#). As noted under [factor 9 of the Criteria for Assessing TLD Proposals](#):

The ICANN staff intends to place significant emphasis on the completeness of the proposals and the extent to which they demonstrate that the applicant has a thorough understanding of what is involved, has carefully thought through all relevant issues, has realistically assessed the business, financial, technical, operational, and marketing requirements for implementing the proposal, has procured firm commitments for all necessary resources, and has formulated sound business and technical plans for executing the proposal.

**FAQ #38: Is ICANN planning on establishing a general registrar accreditation process for all the new TLDs?**

As noted in [Item E4 of the Description of TLD Policies](#), an applicant for the operation or sponsorship of a new TLD should propose policies for selection of, and competition among, registrars concerning the TLD. That policy can include use of ICANN's accreditation program for the .com, .net, and .org or some alternative mechanism. Please refer to [FAQ #26](#) for a discussion of the effect the proposed policies may have on evaluation of the application.

**FAQ #39: In the case of a sponsored and restricted TLD where policy formulation is granted by ICANN, under which conditions may this delegation be revoked? Are there precedents? What appeal mechanisms exist?**

The conditions for revocation of the delegation of policy-formulation responsibility for a sponsored and restricted TLD would be set forth in an agreement between ICANN and the sponsoring organization (likely including a charter for the TLD). In general, violations by the sponsoring organization of the agreed conditions for the delegation,

or a determination that the charter is no longer appropriate to the needs of the Internet community and should be revised or rescinded, could lead to revocation of the delegation. The terms of agreements will be discussed in negotiations after initial selections are made in November.

As [noted in the Detailed Topic Paper prepared for the Yokohama meeting](#), in many respects the sponsorship paradigm is a generalization of the concepts underlying appointment of managers for ccTLDs under existing ccTLD delegation policy. The current policies in that regard are set forth in [ICP-1](#).

ICANN decisions are subject to review by the ICANN Board under [ICANN's reconsideration policy](#). One topic of the negotiations will be other "appeal" mechanisms.

**FAQ #40: Assuming that the required HTML-format electronic copy of the specified parts of the application is for posting on the web site for public review, are other formats acceptable as long as they fulfill the same purpose of being publicly readable? Would you allow for PDF as an alternative/supplement to be posted on the site?**

Applicants must provide electronic copies of the specified portions of their applications in both HTML format and a common word-processing format. See Items [17](#) and [110](#) of the New TLD Application Instructions. Applicants may, if they choose, also submit those portions of their applications in PDF format. ICANN staff will decide whether to post the PDF format in addition to the HTML format once all the applications are received.

See [FAQ #60](#) and [FAQ #73](#) for related information.

**FAQ #41: How many hard (i.e. paper) copies of the application should be submitted?**

A single copy is sufficient.

**FAQ #42: We are planning to propose a sponsored, restricted TLD. We propose that the sponsoring organization be responsible for making policies, assessing individual applications, informing the registry operator which applications meet the TLD's requirements and should be registered, providing customer support, and carrying out marketing. The sponsoring organization will be the profit center and the registry operator will be paid fees by the sponsor and receive an equity interest in the sponsor. Does this structure meet the structural requirements for running a TLD or do we have to place the marketing, advertising, and other operational functions in the hands of the registry operator?**

The configuration of the proposed structure is up to the applicant. Please note, however, that sponsoring organizations are intended to allow participation of the affected segments of the relevant communities. As [stated in the New TLD Application Process Overview](#):

The extent to which certain policy-formulation responsibilities are appropriately delegated to a sponsoring organization will depend upon the characteristics of the organization that may make such delegation appropriate. These characteristics may include the mechanisms the organization proposes to use to formulate policies, its mission, who will be permitted to participate and in what way, and the degree and type of accountability to the community it will serve (to the extent these are necessary and appropriate). The Sponsoring Organization's Proposal provides an opportunity to provide information on these characteristics.

**FAQ #43: What period should the pro-forma financials included in the registry operator's business plan cover?**

The registry operator's business plan required by [Item D13.2 of the Registry Operator's Proposal](#), as well as the pro-form financial projections required by [Item D13.3](#), should cover the entire term of registry agreement being proposed (see [Item D13.2.10](#)), but in any event need not be presented for more than four years. As noted in [Item D13.3](#), the pro-forma projections should be broken down into periods no longer than quarterly.

**FAQ #44: In [Item D13.2.5 of the Registry Operator's Proposal](#) you ask for projections of demand for registry services in the proposed new TLD "for at least 10%, 50%, and 90% confidence levels." What does this mean?**

Proposed registry operators are requested to provide at least three estimates of the demand for registry services. One estimate (the 50% confidence estimate) should express the projection of demand that the registry operator concludes is equally likely to be exceeded as to be not met. The other two estimates (the 90% and 10% confidence estimates) should be nine times as likely to be exceeded as to be not met, and vice versa.

**FAQ #45: The application transmittal forms (e.g., Items [A13-A15](#) and [B12-B14](#)) limit ICANN's liabilities to the applicant unless and until the application is selected for negotiations, those negotiations are successfully concluded, and formal, written agreements are entered. What about the applicant's liabilities to ICANN? For example, the persons proposing to form a sponsoring organization may fail to successfully**

**organize the sponsoring organisation (broad based, etc.) even though they may have started negotiations with ICANN. Would they be liable to ICANN (other than for the US\$50,000 non-refundable application fee)?**

The applicants must abide by the various obligations and certifications (concerning, as one example, truthful and complete disclosure) stated in the application materials. Assuming they do so, neither a sponsoring organization, its organizers, nor a registry operator incurs any monetary liability to ICANN by submitting the application, beyond the US\$50,000 non-refundable application fee. In particular, submitting an application does not subject the applicants to liability for failing to properly form a sponsoring organization even though negotiations are commenced.

In the event that, after negotiations, formal written agreements are reached, those agreements will specify the obligations of the selected sponsoring organizations and registry operators to ICANN. Sponsoring organizations must be formed before agreements with them will be entered.

**FAQ #46: Regarding the the Registry-Registrar Protocol (RRP) used in the .com, .net, and .org TLDs and described in [RFC2832](#):**

**(A) Will new registries have open, unrestricted access to the RRP for use and future modification, without the requirement of a license from Network Solutions, Inc.?**

**(B) If a license will be required, will such license require a license fee and allow the future modification of the RRP, including the creation of derivative works?**

**(C) Does Network Solutions Registry claim intellectual property rights in the RRP as described in RFC 2832, or any other basic functionality necessary for the efficient interface between registries and registrars utilizing the RRP?**

**(D) Will Network Solutions cooperate with a formal IETF process to create a permanent open and peer reviewed standard?**

Questions (A), (B), and (C) involve legal issues, about which you should consult your lawyer. Please note the following two items in that connection:

a. The RRP is described in [RFC 2832](#), which contains the following statement:

"Copyright (C) The Internet Society (2000). All Rights Reserved.

"This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this paragraph are included on all such copies and derivative works. However, this document itself may not be modified in any way, such as by removing the copyright notice or references to the Internet Society or other Internet organizations, except as needed for the purpose of developing Internet standards in which case the procedures for copyrights defined in the Internet Standards process must be followed, or as required to translate it into languages other than English.

"The limited permissions granted above are perpetual and will not be revoked by the Internet Society or its successors or assigns."

b. NSI Registry is [offering its RRP software development kits as open source software](#) under the terms of the [GNU Lesser General Public License](#).

On Question (D), please note that Scott Hollenbeck of NSI Registry has submitted an [Internet Draft on "Generic Registry-Registrar Protocol Requirements"](#) (**New: Now in version 5**). Members of the Internet community wishing to contribute in this area should [contact Mr. Hollenbeck](#).

#### **FAQ #47: What are the acceptable lengths (number of characters) for TLD labels?**

Ordinarily, TLD labels (e.g., "com") that are proposed for the new TLD program should be between three and sixty-three characters long, inclusive.

Two-letter codes must be available for establishing ccTLDs according to the policy set forth in [ICP-1](#). Under that policy, ccTLDs are established with two-letter codes that appear on the [ISO 3166-1 list](#). To avoid the possibility of future name collision, proposals for two-letter TLDs will not be accepted in the new TLD program unless the [ISO 3166 Maintenance Agency](#) has indicated that the proposed two-letter code will not be placed on the ISO 3166-1 list in a way that would be incompatible with the proposal. Compatibility could be

demonstrated, for example, for a proposed TLD not meeting the alpha-2 code format used in the ISO 3166-1 list (e.g., "a1") or where the Maintenance Agency has reserved the proposed code, in a manner compatible for the proposed usage under the new TLD program, for stated "particular applications" including Internet TLD usage (this includes reservations for all usages).

Under current practice of the Internet Assigned Numbers Authority, one-letter codes are reserved from assignment to allow for future DNS extensibility.

See [FAQ #56](#) for related information.

**FAQ #48: Will ICANN require that current second-level-domain-name holders in .com, .net, and .org be given an opportunity to register their names before the general public?**

Applicants should propose mechanisms to deal with start-up issues for the proposed TLD in a way that takes account of the rights and expectations of existing domain-name holders, trademark owners, and others. [See Item E15 in the Description of TLD Policies](#). At this stage of the new TLD program, there is no fixed set of required mechanisms in this regard, such as giving a preferential opportunity for registration in the proposed TLD to domain-name holders in the existing TLDs. [One factor that will be considered in evaluating proposals](#) is the adequacy of the proposed mechanisms for allocation of names during the start-up phase of the proposed TLD.

**FAQ #49: Where can a sponsoring organization obtain a list of registry operators?**

We are not aware of any comprehensive list of organizations seeking to become registry operators. However, you might review the [expressions of interest that ICANN received before its Yokohama meeting in July 2000](#).

**FAQ #50: How many unrestricted TLDs and how many restricted TLDs will ICANN be approving?**

At its 16 July 2000 meeting in Yokohama, the ICANN Board [adopted a recommendation](#), which was made by ICANN's Domain Name Supporting Organization, to introduce new TLDs in the next several months in a measured and responsible manner. The exact number of TLDs that will be introduced will depend on the character of the proposals received. The mix of restricted and unrestricted TLDs will also depend on the character of the proposals.

**FAQ #51: What is the current amount that NSI Registry pays for each domain name in the registry? Will the fee structure be the same for new**

## TLDs?

ICANN's operating costs are supported by the name registries and registrars and the address registries according to formulas established through a budget process that includes discussions among those entities. For the 2000-2001 fiscal year, .com, .net, and .org registrars are contributing US\$2,140,000 and NSI Registry is contributing US\$250,000. The exact arrangements for new TLDs are not yet established, but they will be expected to contribute a fair share of ICANN's cost-recovery needs.

### **FAQ #52: What guidance can you provide on independent but related registry submissions that seek to solve a common problem, specifically where there is a cross subsidy from one registry to the other?**

If there are multiple registries, multiple applications (with multiple application fees) should be submitted. See [Instruction I30](#). The applications should note their relationship to each other, and should take account of the subsidy (for example, in the [pro forma financial projections](#)).

### **FAQ #53: [Item D13.2.15 of the Registry Operator's Proposal](#) asks for a detailed description of plans for dealing with the possibility of registry failure. Does this refer to system failure, business failure, or both?**

It refers to all types of failures from any cause, including business failures, system failures, natural disasters, and sabotage.

### **FAQ #54: If our TLD application is not accepted, what becomes of our application? I understand that the \$50,000 is non-refundable, but does the application remain active for the second round of TLD applications?**

As stated in [FAQ #28](#), plans for any subsequent rounds of TLD introductions will not be made until evaluation of the present "proof of concept" round. It is likely that, if there are subsequent rounds, there will be revisions in the program based on experience in the first round. This will likely require submission of new application materials. As to the non-refundable application fee, please note that it "is only an application fee to obtain consideration of *this* application." See Items [A7](#) and [B6](#) of the transmittal forms.

### **FAQ #55: The [Registry Operator's Proposal](#) asks for the Dun & Bradstreet D-U-N-S Numbers (if any) of the operator and certain subcontractors. What is a D-U-N-S Number?**

Information about D-U-N-S Numbers is [available on the Dun & Bradstreet web site](#). Although any existing D-U-N-S number(s) should be given in the application, you need not obtain a D-U-N-S Number to apply.

**FAQ #56:** According to [FAQ #47](#), two-character TLDs must be available for ccTLDs. However, it is not clear as to whether or not a two-character TLD can be proposed if it in fact has not been assigned a country. Can a two-character TLD can be established if it is not currently on the ISO 3166-1 list?

Generally, no. A two-character code will be considered only if (a) it is not presently on the [ISO 3166-1 list](#) and (b) the [ISO 3166 Maintenance Agency](#) has indicated that the code will not be added to the list in the future for any purpose that is incompatible with the use you propose for the code.

**FAQ #57:** Please confirm my understanding that if payment of the non-refundable application fee is made by check, payment is timely if it is received by ICANN on 2 October. I.e. that the five-day requirement applies solely to wire transactions.

If you pay by check drawn on a United States bank and payable to the Internet Corporation for Assigned Names and Numbers (ICANN) in the amount of 50,000 United States dollars (see [Item 18.1 of the Instructions](#)), then your payment will be timely if the check is received at ICANN's offices by 2 October. If you choose to pay by wire transfer, your wire transfer must be received at least five business days before we receive your application and you must include a wire transfer receipt or other document identifying the wire transfer with your application (which must be received by 2 October).

**FAQ #58:** [Item C18.2 of the Sponsoring Organization's Proposal](#) indicates that ICANN will accept an application for a sponsored TLD where there is not yet a finalized contract between the sponsor and the registry operator, if the sponsoring organization submits proposed terms for a contract (i.e. at least a detailed term sheet) with the registry operator for provision of registry services, proof of commitment from the registry operator for provision of services under those proposed terms, and a notation of the estimated date of entry into the contract. What do you mean by "proof of commitment from the registry operator"? Isn't the signed copy of the Registry Operator's Proposal sufficient proof?

An example of sufficient proof of commitment by the registry operator would be a signed letter of intent stating the proposed terms for the contract. The signed Registry Operator's Proposal is not necessarily sufficient because it may not indicate the registry operator's willingness to enter into a contract on the proposed terms.

**FAQ #59:** I am confused as to the meaning of a sponsored vs. unsponsored TLD. Please describe the difference between the two and what ICANN's involvement in the policy making process would be in each case.

For a description of the differences between sponsored and unsponsored TLDs, please see [section 1\(b\) of the New TLD Application Process Overview](#).

**FAQ #60: [Item C1 of the Sponsoring Organization's Proposal](#) states that the following documents should be attached to the proposal: articles of incorporation, association, etc.; bylaws or any similar organizational document; list of persons presently on the supervising Board of the organization (or to be initially on the Board); and their resumes. Because we were established long ago, we do not have these in electronic form. Is it acceptable to attach hard copy documents instead, with a brief summary in the electronic version?**

Because we expect to post these materials for public review and comment, they should be submitted in electronic form.

See [FAQ #40](#) and [FAQ #73](#) for related information.

**FAQ #61: [Item D15.2.4 of the Registry Operator's Proposal](#) asks about interface and user authentication in the zone generation process. If the zone file generation process is automated and user intervention is not required, what interface and user authentication is referred to?**

If your registry systems design does not contemplate user intervention in any circumstances please note this and explain how operations ordinarily done with user intervention (e.g., emergency updates) are accomplished.

**FAQ #62: [Item D15.2.3 of the Registry Operator's Proposal](#) asks about the reporting capabilities of the registry database. Are you looking for the native reporting capabilities of the proposed database? Or are you looking for reporting capabilities that can be added on top of the database? What types of reports? Financial, technical? Please be more specific.**

Item D15.2.3's reference to database reporting capabilities is directed to the reporting capabilities of the registry database system as it will be implemented. Please explain what reporting capabilities will be implemented in the overall system you employ. This includes financial, technical, operational, and any other type of report you anticipate will be available. Your response should be as specific as possible.

**FAQ #63: Do you anticipate granting any extensions of the time to submit applications beyond 2 October?**

No, we do not.

**FAQ #64: Our sponsoring organisation and the registry operator are based in different countries. We plan to send the two parts of the proposal**

**separately to ICANN, although the proposals will be clearly labelled as being component parts of the same proposal. Is this acceptable to ICANN?**

Yes. Please be sure each proposal clearly designates the connection to the other proposal.

**FAQ #65: At what time on October 2, 2000 does the application process conclude? Since this is a Monday does this mean that all applications need to be received by the previous Friday, September 29, 2000? At what time do your offices close?**

[Item I24 of the Instructions](#) states:

I24. The complete application, including all forms, attachments, and accompanying materials, along with the check for the non-refundable application fee (or wire-transfer documentation), must be received by ICANN at its office in Marina del Rey during the period beginning 5 September and ending 2 October 2000. All materials must be received before 5:00 pm, California time, on 2 October 2000.

Lately we have been receiving many questions that are answered in the instructions, the application forms, these FAQs, and the other materials we have posted. This indicates that some persons are considering applying without carefully reading all the materials. Failure to **fully understand** and **follow exactly** all the instructions in all the materials may result in your application being denied.

**FAQ #66: [Item E7 in the Description of TLD Policies](#) talks about policies on data privacy, escrow and Whois service. What is "escrow" service?**

For background on escrow requirements, please see [Section II.I of the .com, .net, and .org Registrar Accreditation Agreement](#) and [Section 7 of the ICANN-Network Solutions Registry Agreement](#).

**FAQ #67: In completing [Item E9 of the Description of TLD Policies](#), regarding "Services and Pricing", is it obligatory to specify how much would be charged, or will a description of the guiding principles behind a tariff structure be sufficient?**

There are no absolute requirements on this, but the ICANN staff has indicated that specificity and completeness will be positive factors in the evaluation process. See [Factor 9 of the Criteria for Assessing TLD Proposals](#). Please note that pricing levels will ordinarily be important to formulate your [Business Capabilities and Plan](#) and [pro-forma financial projections](#). See [Item D13.2.12 of the Registry Operator's Proposal](#). If your pricing formula is not pegged to a specific value (such as a system in which overall registry costs are

divided equally among all registrants), please describe exactly the formula and in connection with your pro-forma financial projections give projections of the resulting pricing.

**FAQ #68: Is it appropriate to include references to pricing in [Item C18.2 of the Sponsoring Organization's Proposal](#), which refers to "proposed terms for a contract with the registry operator", or is this area reserved for direct discussion between ICANN and the Registry Operator?**

Ordinarily, the proposed terms for a contract between the sponsoring organization and the registry operator should cover the services the registry operator will provide and the terms on which they will be provided.

**FAQ #69: [Item A3 in the Sponsored TLD Application Transmittal From](#) asks for "copies of documents demonstrating the authority (of the person signing the application)". What type of documents are you expecting? Is an officer or employee of the sponsoring organization sufficient?**

If the person is not a top officer of the organization (Chair, etc.), you should submit a Board resolution (certified by the secretary or similar officer) authorizing the application. A top officer may simply state that she or he has authority to make the application.

**FAQ #70: I am located in the Southern California area. May I hand deliver my application to ICANN at its Marina del Rey office or do I have to send my application by mail or courier as stated in [Item I22 of the Instructions](#)?**

You may mail your application, have a messenger deliver it to our offices, or act as the messenger yourself. The deadline is 5:00 pm California time. Please note that we will not discuss your application in any way with you on 2 October.

**FAQ #71: What level of detail is necessary for the pro-forma financial projections required by [Item D13.3 of the Registry Operator's Proposal](#)? Are the following categories sufficient levels of detail: personnel costs, research and development, marketing expenses, general administrative expenses exclusive of salaries?**

The level of detail is ultimately up to the organization preparing the Registry Operator's Proposal. In reviewing the proposals, however, ICANN will place significant emphasis on their completeness and the extent to which they demonstrate that the applicant has a thorough understanding of what is involved, has carefully thought through all relevant issues, has realistically assessed the business, financial, technical, operational, and marketing requirements for implementing the proposal, has procured firm commitments for all necessary resources, and has formulated sound business and technical plans

for executing the proposal. These characteristics are more likely to be demonstrated by specific pro-forma financial projections, based on clearly articulated assumptions, than by general ones.

**FAQ #72: We are submitting our proposal with a letter of intent from our subcontractor for the registry operations/data center. Is it acceptable to submit a complete detailed document of their operations no later than Wednesday, 4 October? The additional document is in the final stages of completion for that section of the proposal.**

[Item 24 of the New TLD Application Instructions](#) states:

I24. The complete application, including all forms, attachments, and accompanying materials, along with the check for the non-refundable application fee (or wire-transfer documentation), must be received by ICANN at its office in Marina del Rey during the period beginning 5 September and ending 2 October 2000. All materials must be received before 5:00 pm, California time, on 2 October 2000.

Only the following materials will be accepted after the 5:00 pm (California time) 2 October 2000 deadline: (a) notification of a material change in circumstances (b) withdrawal of the application, and (c) items requested by ICANN. (Please note the completion after the deadline of documentation required as part of the application does not constitute a "material change in circumstances".) If you submit your application on 2 October without some element of documentation, ICANN will consider the application without that element. If the element is required by the application materials (such as [Item D15.3\(c\) of the Registry Operator's Proposal](#), which requires a comprehensive technical proposal from certain subcontractors), omission of that element may reflect negatively on the application.

**FAQ #73: I understand application must be in both hard copy and electronic format. For attachments such as lengthy shareholder's agreements from participating organizations --- can they be scanned and submitted as jpeg or tiff or must they be submitted in Word format?**

The portions of the application specified in Items [17](#) and [110](#) of the New TLD Application Instructions must be submitted in both hard copy (paper) form and electronic form on one or more 3 ½" floppy diskettes (IBM high density) or on a CD-ROM in a common word-processing format and in HTML format. (MS Word is acceptable for the word-processing format.) Accompanying materials requested in these portions (such as the articles of incorporation, association, etc. sought by [Item C1 of the Sponsoring Organization's Proposal](#)) must be submitted in HTML and word-processing format.

See [FAQ #40](#) and [FAQ #60](#) for related information.

# Report on TLD Applications: Application of the August 15 Criteria to Each Category or Group (9 November 2000)

## B. APPLICATION OF THE AUGUST 15 CRITERIA TO EACH CATEGORY OR GROUP

The evaluation team applied the August 15 Criteria to all of the applications on a group-by-group basis. The evaluation of each individual application is contained in Appendix B.

### 1. General-Purpose TLDs

#### a. General Group

The fourteen applications that could best be described as "general" are set forth in the following table:

Applicant	Strings Requested
Abacus America, Inc.	.biz, .cool, .fam, .inc, .xxx
Affinity Internet, Inc.	.biz, .ebiz, .firm, .inc
Afilias, LLC	.info, .site, .web
Commercial Connect, LLC	.mall, .shop, .svc
Diebold Incorporated	.cash, .global, .secure
Dubai Technology, Electronic Commerce and Media Free Zone Authority	.dubai, .go
Eastern Communications Company Limited	.firm, .game, .inc, .info, .ltd, .news, .shop, .store, .tour
iDomains, Inc.	.biz, .ebiz, .ecom
Image Online Design, Inc. (dba Web Registry)	.web
JVTeam, LLC	.biz

KDD Internet Solutions Co., Ltd.	.biz, .home
Name.Space	.ads, .agency, .aids, .air, .antiques, .art, .artists, .auction, .audio, .bbs, .books, .café, .cam, .card, .cars, .center, .city, .channel, .church, .club, .commerce, .computers, .consulting, .design, .digital, .direct, .dtv, .dvd, .factory, .fashion, .festival, .fiction, .film, .films, .foundation, .free, .fun, .fund, .funds, .gallery, .games, .gay, .graphics, .group, .guide, .hotel, .help, .history, .index, .insurance, .jazz, .jobs, .lab, .mad, .mag, .magic, .mail, .market, .media, .men, .monitor, .movie, .music, .news, .now, .nyc, .one, .online, .opera, .page, .partners, .people, .planet, .politics, .power, .productions, .projects, .properties, .radio, .records, .school, .service, .sex, .shoes, .shop, .show, .security, .society, .sound, .shareware, .site, .software, .solutions, .soup, .space, .sports, .star, .studios, .sucks, .systems, .tech, .temple, .theatre, .time, .times, .toys, .trade, .travel, .voice, .war, .watch, .weather,

	.women, .world, .writer, .zine, .zone
NeuStar, Inc.	.dot, .info, .site, .spot, .surf, .web
Rathbawn Computers Limited	.africa, .llc, .sansansan.sex, .three33, .wap, .xxx

Threshold Review

As a threshold matter, the evaluation team applied the first and the last of the August 15 Criteria to these applications. Early consideration of these criteria was thought necessary to promote efficient review and evaluation of the application pool, to understand the fundamentals of the applications, and to ascertain what additional steps were appropriate for further review. The first criteria, maintaining the Internet's stability, generally requires applications to "demonstrate specific and well-thought-out plans, backed by ample, firmly committed resources, to operate in a manner that preserves the Internet's continuing stability." The last criteria places significant emphasis on the completeness of the applications and the extent to which the applications demonstrate that the applicant has a thorough understanding of, and has carefully thought through, all relevant issues, has realistically assessed the business, financial, technical, operations, and marketing requirements for implementing the application, has procured firm commitments for all necessary resources, and has formulated sound business and technical plans for executing the application. Especially for applications seeking this type of string where a poorly managed or failed registry could have significant commercial or other consequences, the potential effects on stability and the demonstration of the resources necessary to manage a large global unrestricted registry seem critical preconditions to the grant of an application, especially in this "proof of concept" stage.

The applications were reviewed for completeness and demonstrated soundness and feasibility from technical and business-process perspectives, as required by the first and last criteria. The business/financial team and the technical team identified those applications that in their judgment did not demonstrate<sup>2</sup> realistic business, financial, technical, and operational plans or sufficient resources based on the factors described in Part II.B.2. or from a technical or business-process perspective did not, in the judgment of the evaluation team, demonstrate these factors as persuasively as other proposals for the same or similar TLD string.

As a result of this review, the evaluation team concluded that the following applications merited further review:

Applicant	Strings Requested	Preferred String
Afilias, LLC	.info, .site, .web	.web

Diebold Incorporated	.cash, .global, .secure	[not apparent from application]
iDomains, Inc.	.biz, .ebiz, .ecom	.biz
Image Online Design, Inc.	.web	.web
JVTeam, LLC	.biz	.biz
KDD Internet Solutions Co., Ltd.	.biz, .home	.biz
NeuStar, Inc.	.dot, .info, .site, .spot, .surf, .web	.web

The technical team concluded that some of the applications assigned to this group did not merit further review because they did not demonstrate realistic technical and operational plans on various grounds. Some of the applications did not demonstrate relevant technical expertise. Some applications did not demonstrate the technical ability to operate a TLD targeting a large group of potential registrants and end users with high reliability. In others, the proposed technical plan did not support the proposed business plan in one or more areas, including under-specification of total capacity, projected growth rate, startup period, fault tolerance, or security. A summary of the conclusions of the technical team with respect to each of these applications is set forth in Appendix B.

The business/financial team concluded that some of the other applications assigned to the general group did not merit further review because they did not demonstrate realistic business or financial plans on various grounds. Several of the applicants submitted an incomplete or weak business plan. Some of the applicants had little or no relevant business or registry/database/Internet experience. Many of these applications did not demonstrate that the operator had sufficient capital and resources, or would commit sufficient capital or resources, to meet the forecasted requirements. In others, the marketing plan and promotion strategy did not appear reasonable and well thought out for the TLD(s) requested and lacked detail. A summary of the conclusions of the business/financial team with respect to each of these applications is set forth in Appendix B.

Again, we emphasize here that these judgments were comparative. A decision not to proceed past the initial threshold examination of any particular application was not necessarily a judgment that either the applicant or its proposal had no merit, or could never qualify under other circumstances. At this "proof of concept" stage, the evaluation process was focused on identifying a finite, relatively small number of strong applications that could serve the purpose of this effort -- to authorize the inclusion in the root server system of a relatively small number of diverse TLD strings in a way that allowed the Internet community to evaluate the effects (if any) on the DNS of additional TLDs and that would minimize to the extent possible any possible disruption of or instability in the DNS as a result of the addition of multiple new TLDs.

### *Note about Image Online Design*

Both the business/financial team and the technical team each independently concluded after the threshold review that the application from Image Online Design, Inc. did not justify further evaluation. However, because of the large number of favorable comments in the ICANN Public Comment Forum, the ICANN staff requested that the evaluation team examine Image Online Design's application more closely in the evaluation process.

Operation of a large registry will require substantial technical and managerial resources. A failure of a new TLD to service the global community of registrars and registrants could fatally damage its reputation and the likelihood of its successful adoption by the public, and therefore its ability to be a vigorous competitor with .com. It could also seriously damage public confidence in new TLDs that could be introduced in the future.

Image Online Design proposes to operate a very large registry that will compete directly with .com. Currently, Image Online Design's registry operation is very modest (20,000 names) and, not being part of the DNS root, experiences little traffic.

In its application, Image Online Design identified the need for a staff of approximately 70 during its first year of operation. (Although this staff size is larger than other large domain applicants proposed, this appears to be because Image Online Design will act as both registry and registrar initially.) Image Online Design identified only three employees who would form the core competency team of the expanded company. Only one of the "core" employees has technical experience. The principal experience of the other two, the CEO and the COO, is in the operation of auto dealerships; their experience in technical management and operations comes from their experience at Image Online Design's currently modest registry operation. Image Online Design's proposal describes a hiring plan to fill other executive positions. Its proposed staffing plan for other personnel is premised on recruiting from colleges located in the vicinity of San Luis Obispo, California. In contrast, other applicants explicitly identified mature, capable teams and large pools of managerial and technical talent to draw upon. Image Online Design proposes to support both registry and registrar functions during the first year,<sup>3</sup> including during the start-up period. It has proposed no demand throttling mechanism to control initial load from the expected "land rush" during this period.

In the judgment of the technical team, the small pool of talent available to Image Online Design is a very serious deficiency in Image Online Design's proposal. Given the lack of identified technical and management resources, the technical evaluation team concluded that there is a very significant risk that Image Online Design will not be able to react quickly to unpredictable surges in demand, especially during the critical startup period. A failure to service a global customer base on a 24x7 basis, particularly during the initial startup period, could fatally damage the reputation of the new TLD.

The business/financial team concluded that there were significant deficiencies in the business plan submitted by Image Online Design, particularly compared to other applications in this group. First, Image Online Design expects to obtain a 15 to 23 percent market share of all new registrations in the very first quarter of operation, even with additional competition from other new top-level domains. It assumes one third of these applications will be for prepaid registrations of five to ten year increments at a combined registry/registrar price of \$35 per name per year. This combination creates a very large influx of money to finance operations, with Image Online Design's cash balance increasing from \$450,000 to \$37.4 million in three months at the 50 percent confidence level, which is 83 times larger. The need for this influx presumably is the motivation for Image Online Design's insistence on being the sole registrar during startup. Nonetheless, the business/technical team does not believe these projections are realistic. Second, according to the pro-forma financial statements, Image Online Design will act as the registry and the sole registrar for the entire first year. Even by the end of the fourth year, after other registrants have been permitted to compete for three years, Image Online Design estimates that it will still obtain a 30 percent registrar market share within the TLD, and that it will do so with a \$20.00 registrar markup. This is inconsistent with experience in .com, .net and .org.

Despite this new competition, moreover, Image Online Design anticipates maintaining its \$15 registry price throughout the forecast period. This is at least two and a half times the registry prices anticipated by others in this category. This higher price is likely to deter registrars and potential registrants. In addition, with any new venture there are always many unknown factors that will occur. For this category, becoming a viable competitor within the existing structure is key. Holding only \$450,000 is a significantly weaker capital position than the capital positions of the other applicants. Finally, based upon its historical experience, Image Online Design has not demonstrated the ability to grow, even when performing other services such as web hosting and design. Overall, the other applications in this group are significantly more realistic and would result in much more viable competition for the .com registry.

#### *Note about Diebold*

Because Diebold Corporation's request for confidential treatment of large portions of its application was not resolved until after the end of the threshold review, its application also proceeded to the second review. When Diebold and the ICANN staff were unable to reach agreement on its request for confidential treatment, Diebold elected to withdraw significant portions of its application, including its pro forma financial statements.

Viewed in the light of this withdrawal, there were many serious issues identified in Diebold's application. In the judgment of the technical team, the Diebold proposal, when compared with the other proposals in this group, provided virtually no information about the organization that would actually operate the registry. Specifically, the proposal lacked information on how the Diebold

technical team would be staffed, resumes of the principal managers, where registry operation would fit in the Diebold organization, and how additional software would be provided. This lack of information made it difficult for the technical team to assess how the registry operator would deal with surprises not anticipated in Diebold's business plan.

The business/financial team concluded that Diebold's application did not include a thorough analysis of the target market or a detailed marketing plan. The application did not provide a sufficient rationale for the estimated demand or the resources to meet that demand. Without such details, Diebold's application was not complete enough to demonstrate an understanding of what is involved in operating a registry business. The business/financial team concluded that Diebold's application was not as strong as the other applications that merited further review.

#### *Note about NeuStar*

NeuStar, Inc. and Melbourne IT are associated with a number of applications for new TLDs as members of JVTeam. JVTeam submitted proposals for the .biz TLD, as well as the .per TLD. In addition, NeuStar submitted a separate application for the .web TLD. After receipt of NeuStar's application, ICANN asked NeuStar to identify the proposed registry operator and, if not NeuStar, to provide the information about the proposed registry operator required in the Registry Operator's Proposal. In answer to the question, NeuStar stated that it is "fully capable and unconstrained from operating the registry and in delivering all that is included in the .web proposal." In its answer, NeuStar also indicated its preference, if awarded .web, to implement and operate the TLD with full support from JVTeam, which it suggested would be accomplished by the assignment of the registry operator's agreement to JVTeam after the award. The evaluation team evaluated NeuStar's application with the understanding that JVTeam would, on some basis, be involved in the operation of the registry, as indicated throughout NeuStar's application.

Subsequently, on November 8, 2000, NeuStar sent a letter to ICANN informing ICANN that NeuStar would not assign or subcontract the operations of the registry to JVTeam. During the short period of time between ICANN's receipt of NeuStar's letter and the posting of this report, the evaluation team has attempted, to the extent possible, to re-evaluate the application with NeuStar as the registry operator without any participation by JVTeam or Melbourne IT.

The evaluation team concluded that lack of participation by Melbourne IT may negatively affect NeuStar's application. Some specific concerns identified by the team are included in the summary of NeuStar's application found in Appendix B. However, given the short period of time since the receipt of NeuStar's letter and given the difficulty of extracting Melbourne IT's participation and contribution from NeuStar's application, the evaluation team is, at this juncture, unable to completely assess that impact. Work on this analysis is continuing.

## Comparison

Having applied the first and last of the August 15 Criteria to these applications as a threshold matter, the evaluation team evaluated how each of the August 15 Criteria should be applied to proposals for these TLDs in light of the diversity in purpose and targeted markets reflected in the categorization. The evaluation team concluded that the August 15 Criteria apply as follows:

August 15 Criteria	Application to General Group
The need to maintain the Internet's stability	Generally applies
The extent to which selection of the proposal would lead to an effective "proof of concept" concerning the introduction of top-level domains in the future	Applies primarily with respect to the process of introducing a large top-level domain and to the issue of the effectiveness of inter-TLD competition for general-purpose TLDs
The enhancement of competition for registration services	Generally applies
The enhancement of the utility of the DNS	Applies primarily with respect to appropriateness of the TLD label, avoidance of confusion of TLDs, and the extent to which the TLD will aid users
The extent to which the proposal would meet previously unmet types of needs	Generally does not apply to the introduction of a large top-level domain
The extent to which the proposal would enhance the diversity of the DNS and of registration services generally	Generally applies
The evaluation of delegation of policy-formulation functions for special-purpose TLDs to appropriate organizations	Generally does not apply
Appropriate protections of rights of others in connection with the operation of the TLD	Generally applies
The completeness of the proposals submitted and the extent to which they demonstrate realistic business, financial, technical, and	Generally applies

operational plans and sound analysis of market needs	
--	--

Stability, enhancement of competition, proof of concept and enhancement of diversity seem particularly relevant to analysis of these TLDs.

*Stability*

The threshold review concluded that all of the applicants, except Image Online Design and Diebold, presented proposals that appear to provide for stable operation of the proposed TLD. For the reasons summarized above, the proposals presented by Image Online Design and Diebold do not address significant stability concerns, potentially leading to early registry disruption or failure. These events in a large TLD, if they transpired, would significantly impair DNS stability.

*Enhancement of Competition and Proof of Concept*

The market will be the ultimate arbiter of the competitive merit of any new TLD. The evaluation of whether proposals for a new TLD will enhance competition for registration services, therefore, should focus on the realistic prospects of the proposed TLD and registry for effectively competing with other TLDs and registries and should include such factors as the adequacy of marketing and promotion plans, the competitiveness of the proposed services, pricing and service levels with other TLDs and operators having significant market share, and restrictions on accredited registrars.

Introduction of a new general purpose TLD is a concept to be tested, as is the effectiveness and character of inter-TLD competition between .com and newly introduced TLDs. In general, market mechanisms that support competition and consumer choice should, where possible, drive the management of the DNS. See *United States Department of Commerce White Paper*, at <<http://www.icann.org/general/white-paper-05jun98.htm/Principle2>>. One of ICANN's core principles is the encouragement of competition at both the registry and the registrar level. Because of the limited number of new TLDs to be introduced at this time, it is appropriate to make a preliminary evaluation of competitive "proof of concept."

In order to have a realistic prospect of effectively competing with .com (which as of September, 2000 contains approximately 20 million domain names and appears to continue to grow at an exponential rate) and to provide an effective proof of concept, a general purpose TLD applicant must realistically assess the business, financial, technical, operational, and marketing requirements for implementing the proposal and procure firm commitments for necessary resources. Some of the significant factors in evaluating whether these TLDs have a realistic prospect of competing with other TLDs and registries having significant market share are summarized in the following table:

--	--	--	--	--

Applicant	Expected Cumulative Number of Registrations (Year 4)	Capital Investment	Registry Operator's Marketing Budget (Year 1 - 4)	Number of Registry Operator Employees (Year 4)
iDomains, Inc. (.biz)	12.0M	\$1.0M	\$29.2M	35
JVTeam, LLC (.biz)	3.85M	\$72.5M	\$28.0M	68
KDD Internet Solutions Co., Ltd. (.biz)	21.1M	\$8.4M	Not apparent from application	43
Diebold Incorporated (.cash, etc.)	No response <sup>4</sup>	No response	No response	No response
Afilias, LLC (.web)	16.2M	\$4.8M	\$76.7M	69
Image Online Design, Inc. (.web)	3.8M	\$450K	\$103.1M	184
NeuStar, Inc. (.web)	11.1M	\$46.3M	\$35.4M	122

As the table indicates, wide variations exist among these applicants, including among those seeking the same TLD (.biz or .web). Expected demand<sup>5</sup> in year 4 for a .biz TLD ranges from 3.85 million to 21.1 million registrants and for a .web TLD from 3.8 million to 16.2 million. In comparison, at the end of September, 2000, .com had approximately 20 million registrations. If those applicants forecasting a smaller demand for a general purpose TLD like .biz or .web are correct, these general TLDs may provide less effective competition to .com than would a general TLD with a larger market demand.

Among those applicants forecasting a larger demand, the initial equity investment also varies widely. Some of the variations may be explained in part because some applicants propose leveraging existing infrastructure, including outsource partners, while others must build the infrastructure.

Even accounting for the stated reasons for the variations in investment levels, the table indicates that applicants like JVTeam, Afilias and NeuStar appear willing to devote significant resources to operate a large TLD to effectively compete with .com.

Due to the widely varying number of registrations and capital investment, the potential rate of return also varies widely. The rate of return can generally be determined by comparing the initial capital investment with the estimated future cash flow. In this situation, the applicants were not asked to provide a lengthy cash flow projection. Consequently, a representative comparison cannot be reasonably made. This is especially true because many of the applicants anticipate several years of investment prior to becoming profitable. Nevertheless, the data provided in the application does provide some indication about the potential return. The table below outlines (i) the cumulative net income for the years one through four, (ii) the capital investment and (iii) the ratio of cumulative net income to capital investment of each of the applicants (except Diebold, which withdrew its pro forma financial statements).

Applicant	Cumulative Net Income (Years 1-4)	Capital Investment	Cumulative Net Income/Capital Investment
iDomains, Inc. (.biz)	38.50M <sup>6</sup>	1.0M	3,850%
JVTeam, LLC (.biz)	-88.97M <sup>7</sup>	72.5M	-123%
KDD Internet Solutions Co., Ltd. (.biz)	22.80M	8.4M	271%
Afilias, LLC (.web)	-12.80M	4.8M	-267%
Image Online Design, Inc. (.web)	53.30M	0.45M	11,844%
NeuStar, Inc. (.web)	-58.00M <sup>8</sup>	46.3M	-125%

Generally, the lower the capital investment, the greater the potential return and vice versa. Two applicants, iDomains and Image Online Design, are not planning on investing significant capital into the new venture. Consequently, the ratio of cumulative net income to capital investment is extremely high. Alternatively, the JVTeam and NeuStar applications are anticipating investing significant sums, thereby requiring a greater number of periods to recoup their investment.

Another factor promoting effective competition with .com is enhanced service content, particularly with respect to the registry interface protocol. Many applicants proposed changes to the current registry/registrar protocol (RRP) developed by Verisign. Generally, the primary changes suggested by the applicants relate to model and content. The current RRP might be referred to as a "thin" protocol in which the registry is provided with the bare minimum of information required to perform its function and the registrars retain full

information on registrants. In particular, the Whois service is provided by the registrars. Many applicants proposed various "thick" registry protocols where the registry would be the repository for most or all of the registrant data. There are several potential advantages to this approach: the Whois function is centralized and can be better managed, the stored data takes advantage of the registry's more robust storage structure, and registrar facilities are simplified, enabling broader registrar-level competition.

The second type of change raised by applicants suggesting changes to the current RRP relates to the type of information that might be stored. Many applicants propose that the registry interface protocol be extended to include additional information beyond the bare minimum required to support registration. Such information might include directory information, business category, keywords and so forth. Many applicants in fact proposed to develop an extensible protocol (sometimes based on extensible markup language or XML) to support essentially unlimited extension to the content definition.

The following table summarizes the service offerings of the applicants with respect to the registry interface protocol:

Applicant	Registry Interface Protocol
Afilias, LLC	"Thick", extensible registry protocol with augmented information storage
Diebold Incorporated	Not applicable (combined registrar/registry)
iDomains, Inc.	"Thick" registry protocol
Image Online Design, Inc.	"Thin" proprietary protocol migrating to current RRP
JVTeam, LLC	"Thick", extensible protocol with augmented information storage
KDD Internet Solutions Co., Ltd.	"Thin" protocol using current RRP
NeuStar, Inc.	"Thick", extensible protocol with augmented information storage

In order for any new TLD to be attractive to consumers as an alternative to .com, to provide effective proof of concept, and to provide a realistic prospect of meeting unmet needs, proposed pricing and service levels must be competitive with other TLDs and operators having significant market share. The following table summarizes the applicants' proposed pricing and service levels:

Applicant	Price	SRS Availability	Time to Confirm	Time to Reliance	Capacity

Afilias, LLC	\$5.75 per year (2 year commitment) (less volume rebates)	99.90%	400 msec	5 minutes	230 tps
Diebold Incorporated	\$10.00 per year	99.863%	4 seconds	6 hours	133 tps
iDomains, Inc.	\$5.45 per year	99.00%	1 second	6 hours	Unspecified
Image Online Design, Inc.	\$35 (\$20 to Registrar + \$15 to Registry)	99.99%	Unspecified	5 minutes	28.6 tps
JVTeam, LLC	\$3.75 - \$5.30 per year (volume discounts)	99.95%	500 msec	5 minutes	350 tps
KDD Internet Solutions Co., Ltd.	\$9.00 in 1st quarter; \$8.00 in 2nd quarter; \$7.00 in 3rd quarter; \$6.00 thereafter	99.40%	5 seconds	12-24 hours	2000 tps
NeuStar, Inc.	\$3.75 - \$5.30 per year (volume discounts)	99.95%	500 msec	5 minutes	350 tps

All of the applicants, except Image Online Design, propose a price of \$10.00 per year or less (some significantly less) for registrations. The current price of Verisign Global Registry, the registry operator of .com, is \$6.00 per year. The proposed pricing by Afilias, iDomains, JVTeam and NeuStar is under \$6.00 per year (and can go down to \$3.75) and the proposed pricing by KDD (by the end of the first year) matches the current Verisign price. Image Online Design's long-term price on the registry level is more than 2.5 times the initial pricing proposed by most of the applicants in this group.

The table above summarizes four measures of service provided by the registry, although other measures can be evaluated. Availability applies to the shared registry service (SRS). All applicants recognized that DNS service must be provided by a constellation of servers. "Time to Confirm" is the time required from posting for the registry to confirm that the name has been registered. "Time

to Reliance" refers to the time required for the mapping to be updated in the zone files of the DNS. Many applicants consider that near-instant update is an important function, and the technical team concurs. Capacity is in terms of SRS transactions per second. All applicants listed in the table predict a high level of SRS availability, though the proposals submitted do not permit a reliable assessment of what levels of availability are actually achievable. With the exception of iDomains, all proposals project an acceptable level of availability.

A related issue for evaluation of a large, general TLD (which goes not only to effective competition with .com but also goes to an effective proof of concept) is the manner in which the applicants propose to handle the probable initial surge of registrants, especially with the potential for pre-registration. Intertwined with any initial surge is the issue of fairness to registrants and registrars. While this is not strictly a technical question, the solution may incorporate a technical approach because the initial surge may overwhelm one or more registry systems (SRS, Whois, Billing and Collection). The table below summarizes the approaches offered:

Applicant	Surge	Fairness
Afilias, LLC	Batch Processing	Random Selection
Diebold Incorporated	Declining Price	First Come First Served
iDomains, Inc.	Batch Processing	Random Selection
Image Online Design, Inc.	Direct Processing	First Come First Served
JVTeam, LLC	Batch Processing	Random Selection
KDD Internet Solutions Co., Ltd.	Direct Processing	First Come First Served
NeuStar, Inc.	Batch Processing	Random Selection

Direct processing is an approach whereby the registry provides sufficient capacity to capably process the maximum surge. Applicants that used this approach also processed the requests on a "first come, first served" basis. In contrast, the batch approach requires the registrars to provide requests periodically (for example, once per day) as a batch transfer. Requests are then processed as a batch using a random selection approach. The Diebold declining price approach establishes a higher initial price for names as a means of dampening demand.

Another competitive issue considered in evaluating the proposals is whether the proposals restrict the ability of accredited registrars to offer registration services within the TLD. The following table summarizes restrictions contained in these applications:

Applicant	Restrictions on Accredited Registrars
-----------	---------------------------------------

Afilias, LLC	No restrictions
Diebold Incorporated	Diebold will operate as sole registrar
iDomains, Inc.	No restrictions
Image Online Design, Inc.	Image Online Design will be the only registrar for the first year. In its pro forma financial statements, Image Online Design assumes that it will process 100% of all registrations in the first year; 80% for the next 6 months; 70% for the next 6 months; 60% for the next 6 months; 50% for the next 6 months; 40% for the next 9 months; and 30% thereafter. <sup>9</sup>
JVTeam, LLC	No restrictions
KDD Internet Solutions Co., Ltd.	No restrictions
NeuStar, Inc.	No restrictions

Both Diebold and, during its initial year, Image Online Design do not allow other registrars to process applications for the TLD. During the period of restriction, neither applicant provides other, effective mechanisms for providing competitive choices to domain-name holders seeking to register within the TLD. In addition, failure to use other accredited registrars may adversely impact effective marketing of the TLD to the public by eliminating marketing efforts by other accredited registrars and reduce the ability of the new TLD to provide an effective competitive alternative to .com.

### *Enhancement of Diversity*

Enhancement of diversity is the other of the August 15 Criteria that seems particularly relevant to analysis of these proposals. Evaluation of whether these proposed TLDs enhance diversity encompasses several inquiries, including diversity in business models and of geographic locations. In addition, some of the factors identified in the August 15 Criteria in connection with effective proof of concept largely overlap the diversity evaluation. Some of the significant factors in evaluating whether the proposed TLDs enhances diversity are summarized in the following table:

Applicant	Location	Ownership	Outsource Partner	Revenue Model
Afilias, LLC	New York, NY	The 19 members of	Tucows, Inc. (Canada)	Subscription-based revenue

		Afilias are existing registrars, based in 8 countries		model with a rebate based on volume
Diebold Incorporated	Canton, OH	Publicly held US corporation	None	Subscription-based revenue model
iDomains, Inc.	Bethlehem, PA	Privately-held US corporation	CORE (back-end subcontractor) (international consortium)	Subscription-based revenue model
Image Online Design, Inc.	San Luis Obispo, CA	Privately-held US corporation	GST Telecom (subcontractor of physical facilities for registry data center) (US) & UltraDNS (subcontractor for DNS Zone propagation) (US)	Subscription-based revenue model
JVTeam, LLC	Washington, D.C.	NeuStar, Inc. (US) & Melbourne IT (Australia)	None	Subscription-based revenue model with volume discounts
KDD Internet Solutions Co., Ltd.	Tokyo, Japan	Publicly held Japanese corporation	Verisign (primary in Phase 1 and secondary in Phase 2)	Subscription-based revenue model
NeuStar, Inc.	Washington, D.C.	Privately-held US corporation	None	Subscription-based revenue model with volume discounts

All of the applicants in this group, except KDD Internet Solutions, are based in the United States. KDD Internet Solutions is based in Tokyo, which would enhance diversity of geographic location of operators of large TLDs. However, KDD's choice of Verisign as its outsource partner somewhat counterbalances this diversity because of the current delegation of the .com registry to Verisign. KDD's application describes Verisign's role as "primary" in Phase 1 and

"secondary" in Phase 2, but KDD's pro forma financial statements at the 50% confidence level show the revenue to Verisign increasing from ¥152 million in year 1 to ¥14.1 billion in year 6. The ¥14.1 billion in year 6 represents 89% of KDD's total costs. This suggests that, rather than becoming secondary, Verisign's role will remain significant.

Diversity of geography in ownership is also a relevant inquiry. Afilias' members are headquartered in Canada, Germany, India, Japan, Sweden, Switzerland, the United Kingdom and the United States. Sixty-five percent of Afilias' members have offices in North America, 53% in Europe, 26% in Asia and the Pacific Rim, 5% in Australia and 5% in the Middle East. One of two members in JVTeam is Melbourne IT, an Australian company.

Diversity of geography is also present in some of the outsource partners: Afilias' outsource partner is Tucows, a Canadian company, and iDomains' outsource partner is CORE, an international consortium based in Geneva, Switzerland of 72 member registrars in 20 countries and four continents.

All of the applicants have a subscription-based revenue model, although both JVTeam and NeuStar offer volume discounts that could bring their price down to \$3.75. Afilias anticipates offering a rebate to its registrars based on volume in year 3, which if included in Afilias' price would bring the price somewhat below \$5.00 per year by year five.

There is also a variety of organizational models among the applicants with various applicants being privately-held companies, publicly-held companies, and joint ventures. One unusual model is Afilias. Afilias currently consists of 19 ICANN accredited registrars committed to forming a large, open and diverse organization with no single company having a controlling interest. Afilias' responses to questions state that the original membership criteria for joining the consortium were minimal, that all accredited registrars were offered the opportunity to join, and that as many as nine other ICANN accredited registrars expressed differing levels of interest in joining. Afilias further states that one of its founding premises is to ensure to the fullest possible extent that a new general TLD not be owned, controlled by or benefit only a few large businesses, but instead be controlled by a geographically diverse group of ICANN accredited registrars. The structure of the operating documents tend to support Afilias' claim of openness and diversity.

Pursuant to the Afilias Operating Agreement, the original 19 members of Afilias are and will remain the only Class A Unit members of the limited liability company. The Operating Agreement, however, allows qualified registrars to participate in an annual subscription program under which they are afforded the opportunity to purchase Class B Units of Afilias. The criteria for qualified registrars, the number of units for each annual program and other mechanisms for the subscription program are determined by the Class A Unit members. The Operating Agreement envisions, over time, that the Class B Unit members will control a maximum of 60% of Afilias and the Class A Unit members will control a

minimum of 40% of Afilias. This potential ownership arrangement also provides the basis for allocation of net income and loss: a maximum 60% allocation will go to Class B Unit members and a minimum of 40% will go to Class A Unit members. Afilias defends this permanent allocation by pointing out that it will voluntarily give up majority control and allow non-founding members to reap the majority of the potential rewards, while guaranteeing the founding members' return based on their risk of investment.

Another interesting provision of the Operating Agreement provides that no member can own more than 11% of Afilias. This limitation of ownership appears to promote a diverse membership base, while recognizing the potential for consolidation in the industry at the registrar level. Another feature of the Afilias structure is the annual rebate program whereby 25% of the company's profits are distributed to all registrars registering the new TLD domain names. The rebate program is claimed to be a way for non-member registrars (as well as member registrars) to share in the economic profits of the company. The non-member registrars do not share the risk of any potential loss.

Although one of the members of Afilias is Verisign, which on its face does not appear to enhance diversity or competition, depending upon how the operating agreement is implemented in practice, Afilias' subscription program could offer an opportunity for many other applicants to participate at the ownership level in a TLD awarded to Afilias. Limitations on ownership and potential control allocation to non-founding members tend to offset the negative effect Verisign's involvement may have on diversity or competition level analysis.

#### *Enhancement of Utility of the DNS*

Enhancement of the utility of the DNS is another of the August 15 Criteria relevant to these applications. These applications for general, open TLDs appear to sensibly add to existing DNS hierarchy, do not appear to create or add confusion to the existing DNS hierarchy, and are semantically far enough from existing TLDs to avoid confusion.

#### *Protection of Rights of Others*

Protection of the rights of others is another of the August 15 Criteria relevant to analysis of these proposals. In order to protect the rights of others, a general purpose TLD applicant should propose a well-thought-out plan for the allocation of domain names, especially during the initial rush for registrations, and provide adequate protections to stakeholders and third parties. Some of the significant factors of a well-thought-out plan include (1) whether the applicant provides for a "sunrise period"; (2) the adoption of dispute resolution procedures; (3) considerations for third party intellectual property protections; (4) Whois service mechanisms; and (5) policies to discourage abusive registration practices.

As mentioned in the June 13, 2000 report for the ICANN Yokohama Meeting Topic: Introduction of New Top Level Domains found at

<<http://icann.org/yokohama/new-tld-topic.htm>> (the "June 13 Report"), a consensus exists that varying degrees of intellectual property protection is necessary during the start up phase of new TLDs. Furthermore, TLDs focusing primarily on commercial uses should afford greater protections than TLDs focusing on non-commercial uses. The general purpose category focuses on commercial use and presents the greatest risk of intellectual property violations. In general, these proposals provide basic methods for protecting and enforcing infringed rights (i.e. status quo) and offer limited extra protections. If one or more of the applicants in this group is accepted, the evaluation team recommends that further clarification and direction as to these protections be required.

The proposals in this group provide differing approaches for the protection of the rights of others, summarized as follows:

#### Sunrise Period

Afflias, iDomains and Diebold propose a sunrise period for registrations. The sunrise period programs for Afilias and iDomains are very similar and generally provide for a 90-day announcement period followed by a 30- to 60-day registration period, and concluding with a 30-day evaluation period. Sunrise registration will be available for trademark and service mark registrations which are effective and issued prior to October 2, 2000. Diebold, on the other hand, envisions a straight 90-day sunrise period during which trademark and service mark holders can register if they provide written documentation with proof of the holder's right covering the previous 12-month period.

For various reasons, the remaining applicants do not propose a sunrise period. JVTeam, KDD and Neustar, however, expressly state they will adopt a sunrise period if required by ICANN. Image Online Design proposes no sunrise period. Image Online Design and KDD will register domains on a strict first-come, first-served basis during the start-up phase.

#### Dispute Resolution Policy

All of the applicants propose to adopt the UDRP for dispute resolution. JVTeam and Neustar propose to modify the UDRP by allocating a daybreak implementation, which is not well defined in the application. (Afilias further intends to require binding, non-appealable arbitration for all disputes between it and its registrars.)

#### Third Party Intellectual Property Protections

None of the applicants propose extensive new protections. JVTeam and Neustar propose a fee-based intellectual property notification service: parties that register their marks with the registry will be notified if a registrant applies for the mark as a domain name. This is only a notification service, and neither JVTeam or Neustar will refuse the registration of the mark. iDomains will not pre-screen

applicants but, during the sunrise period only, will require registrants to demonstrate ownership of a validly registered trademark.

### Whois Services

JVTeam, Neustar and Diebold will make the Whois service publicly available and iDomains will provide an interactive web page and a port 43 Whois "fat" service allowing free public query-based access. Afilias will allow free public access to its registry level Whois database while KDD and Image Online intend to maintain the current level of Whois services.

### Measures Against Abusive Registrations

Diebold commits to suspending registrations based on false contact data, but does not provide for third party challenge mechanisms. Image Online proposes a 14-day blackout period prior to entering the root to allow trademark holders to scan registered names and challenge registrations. The domain name would then be put on hold until resolution of the dispute. All of the applicants will rely on UDRP and additional mechanisms to police abusive registrations. In addition, iDomains' application states that it requires a two year pre-payment for registration to facilitate compliance with trademark and cybersquatting legislation. The JVTeam and Neustar proposals require only a self certification and forces the review burden on the registrars. JVTeam and iDomains provide limited registration restrictions requiring registrants for the .biz (or similar) TLDs to certify in one form or another that they are devoted to business/e-commerce activities.

### Recommendations

In view of the submissions of multiple applications in this group that present strong proposals under the August 15 Criteria, the team believes that the Board could responsibly select a limited number of applications from this group. Selections should be made based on assessment of each proposal under a combination of the August 15 Criteria, as discussed above.

---

### **Footnotes:**

2. We emphasize again that the evaluation at this stage was based solely on the applications themselves, and the material and information contained therein. Thus, the use of the word "demonstrate," which is intended to reflect the fact that these judgments were made on the basis of the applications, and not on extra-application facts or information.

3. In answer to a question from ICANN after submission of Image Online Design's application, Image Online Design states that "the period when external

registrars are unable to process .Web registrations be as short as possible" [sic]. It also states that it has accelerated development of its RRP implementation in order to shorten the period of time during which "external" registrars are unable to process registrations and expects to begin a test bed within 30 to 60 days after entry into the root server. However, none of these statements are consistent with its application, and no necessary adjustments to its application were submitted. Image Online Design did not identify a different time period than the first year during which it would be the only registrar. Moreover, an attempt to so significantly revise a registry so soon after launch would be a serious stability problem.

4. Since Diebold and the ICANN staff were unable to reach agreement on its request for confidential treatment, Diebold elected to withdraw significant portions of its application, including its pro forma financial statements.

5. The applicants in this group were asked about their assumptions on expected demand. Of those applicants requesting more than one string, iDomains' estimate is based on being granted .biz; KDD's estimate is based on receiving both .biz and .home; and Afilias' estimate is based on .web. In addition, the applicants were asked about their assumptions regarding other potential new TLDs. JVTeam responded that it assumed the introduction of additional general-purpose TLDs and multiple business TLDs over time. NeuStar responded that it assumed the introduction in subsequent rounds of other new open TLDs every 12 months after the introduction of .web.

6. Earnings before Interest and Taxes.

7. Earnings before Interest and Taxes.

8. Earnings before Interest and Taxes.

9. In answer to a question from ICANN after submission of Image Online Design's application, Image Online Design states that "the period when external registrars are unable to process .Web registrations be as short as possible" [sic]. It also states that it has accelerated development of its RRP implementation in order to shorten the period of time during which "external" registrars are unable to process registrations and expects to begin a test bed within 30 to 60 days after entry into the root server. However, none of these statements are consistent with its application, and no necessary adjustments to its application were submitted. Image Online Design did not identify a different time period than the first year during which it would be the only registrar. Moreover, an attempt to so significantly revise a registry so soon after launch would be a serious stability problem.

# Scribe's Notes

## ICANN Board Meeting - November 16, 2000 - Los Angeles, California

---

ICANN Board Meeting November 16, 2000 – Los Angeles, California

I. Introduction - Dyson

II. Agenda - Roberts

- A. Audit Committee
- B. At-Large Study
- C. Staff Officers
- D. Report from GAC.
- E. Housekeeping
- F. Kraaijenbrink: Need report from Ad Hoc Committee.

III. Audit Committee - Wilson

A. Committee: Crew, Davidson, Wilson

B. Closing the books for 2000. Engaged KPMG as auditors.

C. KPMG engaged to audit ICANN. Financials posted on website. Found only one material misstatement. Concerned about ccTLD situation; need more evidence there. Statement of activities detailing revenue and expenses. Restrictions from donors are noted on financial report. Statement of cash flows. Required disclosures – accounting policies and procedures, footnotes re larger balances, property/plant/equipment, debt.

1. Work needs to be done to establish segregation of duties. Easier as more people added.

D. Fockler: Statement of cash flows. Was there an error where one number purportedly from last year was actually this year?

1. One adjustment made to reflect liability that should have been in 1999 versus 2000. So we adjusted the beginning balance of net assets.

E. Note: No disagreements with management. Management and auditors both determined to find the right answers.

F. Wilson: Standard representations, from Board to auditors and vice versa all in order?

1. Right. Nothing unusual.

G. Cerf: What if ccTLD revenue situation isn't resolved promptly? Impact on our non-profit status?

1. Mainly impacts ability to fund operations, rather than any particular disclosures.

H. Wilson: Committee was reviewing work of management in documenting financial control policies. Reviewed risk management and insurance coverage. Recommend use of KPMG for fiscal year 2001.

I. Cerf: Directors and officers liability? What amounts?

1. Wilson: Evaluation considered these issues. Committee believes current insurance is appropriate.

J. Roberts: Audit has been conducted and statements have been published in accordance with accounting policies. Our duties are fulfilled. No action required at this time.

IV. At Large Membership Study

A. [link: [draft resolution presented](#)]

B. Abril i Abril: Not convinced that this procedure will bring us to the necessary point re study. But have no better approach. So this is best for now.

C. Cerf: Begin a discussion of what steps to take next?

D. Roberts: Staff expects further Board input.

E. McLaughlin: Read resolution.

F. Fitzsimmons: Establish timetable for next steps. Should try to accelerate this process

G. Wilson: It's important to do this. But first, need staff report on which to comment. Can't set a deadline yet.

H. Motion to adopt. Carries unanimously.

V. Annual election of staff officers.

**A.** Roberts: Month-to-month relationship with consulting committee resulted in the Board not reviewing performance on a month-to-month basis.

1. So normal procedure of CEO review has not occurred.

**B.** Touton: President has recommended continuation of officers.

1. [link: [resolution presented](#)]

2. Note: Same resolution as last year.

3. Dyson: Looks like a formality, and to some extent it is. Board has not discussed this formally. But unanimous sentiment that staff is doing a great job under tough conditions. In that sense, this is more than a formality.

4. Cerf: Adopt all resolutions.

5. Carries unanimously.

## **VI.** New TLDs

**A.** Recusals:

1. Crew - relationship with Melbourne IT, though not with their registrar or TLD activities, with which I have had no involvement, nor with any other applicant

2. Abril i Abril - have not participated in prior discussion re TLDs; serve as advisor to one applicant

3. Davidson - Company has expressed support for one applicant.

4. Blokzijl – firm was technical advisor to an applicant.

5. Cerf – Board members have fairly thin reasons for escaping. We'll find some other way to get this done.

**B.** Touton: Narrow question is selection of applications for negotiation between ICANN and applicants of contractual agreements. Agreements intended to be completed by end of year. Have heard from applicants. Proceed in order of groups and categories, as in comments yesterday.

1. General purpose TLDs. Staff recommendation that a few ("one or more") such TLDs be responsibly selected for negotiation as part of proof of concept. Board should discuss pros and cons. Board can ask staff for information if wanted.

**C.** Fockler: Have been preparing a basket of diverse applications to meet needs of Internet community. Rearranging some applicants within categories based on what I've learned. Thinking about size of basket in each category. Also have to think about diversity (geographic and other). What about that approach – making only tentative decisions initially.

1. Cerf: Endorse that basic strategy. Should find a set of proposals we consider strong, viable, likely to succeed. See what all those are, then make final choices for negotiation.

2. Dyson: To carry this forward, I'd like to suggest a few names to get the discussion going.

- JVTeam is a strong candidate – international, strong technical / experience. Seems the clearest established player.
- .biz and .inc would create something other than first-come-first-served. Competition based on some characteristic other than price; higher fees, perhaps other services.

- Leaves .web out. But looking for compelling reasons to select applicants, rather than choosing anyone who can fit.

3. Cerf: Don't disagree with those suggestions.

- The .biz and .inc fees would create exclusivity. Interesting idea.

- IOD's .web is interesting because it has been in operation for some time. Is their operation compatible with registrar protocols? Not inclined to exclude them from list of potential candidates.

4. Touton: Image Online Design has been operating outside the standard root; has been pointed to by a number of alternate roots over the last few years. 18,000 registrations to date, a bit of a surge. System as currently operating is proprietary, single-registrar. IOD proposed to be the sole registrar for a year, dropping to 60% with implementation of a shared registration system. Don't recall whether protocol perfectly matched the NSI Registry. Proposed to charge \$35/year for each registration during the first year. Under competitive registrar model, would charge registry fee of \$15 per registrant.

5. JD: Affinity was atypical. Did not move forward because this application did not provide much detail re future plans. And Affinity proposed to screen "is a business" but not "is a 'good' business" which might not be what we were hoping for.

- Cerf: There are ways to figure out if someone is a business. Dun & Bradstreet listings.

- Stuck in the middle. Affinity wasn't completely open, nor did Affinity give a stamp of approval. Could be confusing.

- Touton: What specifically does Affinity intend to screen?
6. Kyong: One TLD per proposal?
    - Dyson: No agreement there.
    - Kyong: Some proposals include large numbers of TLD strings. We approve a proposal, including all the proposed strings? Or we approve a TLD string, and most suitable proposal for that string is then selected.
      - Dyson: We should consider name.space. But having a couple TLDs in a single registry is part of the diverse business models we intend to facilitate. Discuss this in the context of a particular proposal.
      - Kyong: So we discuss all TLD strings from an applicant?
      - Kraaijenbrink: We asked applicants which string each would favor. Markings with asterisks in staff reports indicate this.
        - Kyong: Should consider how many strings is reasonable this time?
        - Kraaijenbrink: Would favor two strings in each category. In General, perhaps .biz and .web. Then look for applicant with best proposal for each. That's how I approach this process.
  7. Fitzsimmons: We'll have to return to this time and time again. It's easy to expand. But we committed as a Board to a limited proof of concept. Received specific advise on this from the Names Council. Multiple strings per applicant? No, because we committed to a limited proof of concept. Expect other rounds in the future. Also consider our capacity. Staff's ability to negotiate and monitor contracts within the next 6-12 months.
    - Touton: Indicated in Yokohama that staff was concerned that large number of TLDs would threaten success of proof of concept. Learn to walk before trying to run. Current target date of Dec 31 for finalization of agreements. Might have to relax the schedule if many new TLDs approved. That might be inconsistent with "proof of concept" which means doing this in a few rounds.
    - Cerf: Trying to create competitive registries and registrars. Endorse a plan for no more than one TLD per applicant. Shouldn't accept all of the applicants; need a sense of how many are viable.
      - Fockler: Suggest the basket approach. My basket started with a capacity of nine or ten, subject to change. And do need to be clear about specific TLD strings.
      - Dyson: We can argue forever about overall plans, but still have to make choices. Shouldn't make too many decisions in advance. Notion of a single registry with a single registrar might not be out of hand in a world of competitive TLDs.
      - Cerf: Failure of either registrar or registry would put at risk the whole TLD at risk under a single-registrar/single-registry model.
      - Wilson: Iterative process. Shouldn't lock ourselves in.
      - Kraaijenbrink: We'll make a decision to delegate a TLD string, which yields a registry. But expansion of that registry to another string would require a further application to the Board.
      - Touton: Most applicants intend their string proposals to be alternatives.
      - Kraaijenbrink: We manage strings. We must indicate which specific strings to be added. Especially so in the proof-of-concept phase.
  8. Roberts: Diversity encouraged in the applicants is intended partly to facilitate international competition, while others create new facilities. Want to decide whether or not to create such new spaces.
  9. Fockler: Let's be clear to staff in our directions about specific applications.
  10. Kyong: Recommend one TLD string per accepted proposal. Must decide on size of basket, and number of proposals to be accepted in each category. Otherwise, we'll be here all night.
  11. Cerf: Categorization was a bit ad hoc. And don't want to say "only x from this category" before we look carefully at specific proposals. Let's decide which applicants seem to have the best proposals.
  12. Cohen: Agree with Vint. Should decide which applications are strongest. Categorization was for organizational purposes, and Board understands the difficulty of this process.
  13. Schink: Categorizations helpful in reviewing proposals (yesterday), but not for selecting proposals. Should select proposals that are technically sound.
  14. Fockler: Hope we establish a principle that we're just setting these proposals into a tentative basket. That we'll stop and rethink our choices if we get to have ten or more.
  15. Roberts: Go through the list.

- Cerf: Yes, let's press on with what we began before. For example, IOD proposal which lacked provision for multiple registrars at outset.

- Touton: We only discussed these applications halfway. Need to finish Affinity and IOD.

16. Dyson: Avoidance of cybersquatting is of benefit to the Internet but maybe not directly to consumers.

17. Fitzsimmons: One of primary criteria is competition. Some other applications are more aggressive in providing competition with .com. I like restriction on price. But this .biz proposal seems unlikely to compete as well with .com. Also others have more aggressive marketing plans. JVTeam and Neustar have plans to aggressively compete with .COM on a short timeframe.

18. Fockler: Put JVTeam's .biz in the basket?

- Cerf: Let's not make decisions. Just tentative.

- Dyson: Agreed.

19. Cohen: This is clearly the right approach.

20. Schink: Let's not be influenced by the categorizations.

21. Cerf: If two applicants want .biz, we'll choose from them later.

22. Touton: OK, .biz is in the basket. (No opposition.)

D. Touton: More on Image Online Design. Public and staff comments encouraged IODesign to accelerate timetable for making their multiple-registrar systems available sooner, perhaps in as little as 30 to 60 days. Question of whether such an amendment is in order after the application is submitted. NSI's experience suggests this may be harder and more time consuming than IOD now suggests. Also, questions of financing levels – no commitment of using all available credit lines for this business, as principals also available in an auto dealership which may require credit.

1. Fitzsimmons: Affilias and Neustar seem more serious about opening the market and providing competition with .com.

2. Cerf: Impressed by Affilias, with shared registry and 19 registrars. Comfortable with Affilias in the tentative basket.

3. Roberts: Values of Affilias are consistent with my community. Tucows as a real-time registry is intriguing.

4. Dyson: NSI Registrar is a member of Affilias. Are NSI Registrar and Registry separate? Will they be?

- Touton: NSI last year received a four-year registry agreement, renewable for another four years if they divested the registrar and registry businesses by May 2001. They seem to intend to comply with that to get the four year intention. Expect significant separation of ownership shortly.

- Dyson: Even so, NSI registrar a big player. Affilias's co-op status is appealing because it's different. But it doesn't foster competition in the sense that we've created a competitive market only to see cooperatives formed. Would need some strong and binding language to prevent, say, NSI from changing its charter to buy half or some such. Gives me a queasy feeling

- Touton: Sympathize with much of what you say. This "Nominet cooperative model" is neutral, allows smaller companies to get involved in the registry business. Affilias was open to all accredited registrars, and it is ICANN which accredited NSI Registrar. Board could select Affilias contingent on certain changes to make Affilias more like Nominet.

- Cerf: And Affilias continues to be open to additional participants. Reluctant to set arbitrary conditions; don't want to micromanage. Should let business models play themselves out. This seems a pretty good arrangement.

- Dyson: Affilias is open. Not sure that enhances Affilias's quality.

- Murai: Competing with .com requires technical ability. Need to emphasize this, or competition can't exist.

- Cerf: Can't have competition among incompetents. A collection of registrars might well want to assure themselves that their registry works properly. Registrars will invent new features to attract registrants, but all registrars need a reliable registry. And this registry is separate from the one run by NSI.

- Touton: Tucows to be the registry, based on experience as "sub-registry" for .com et al.

- Cerf: Put this in the basket.

- Fitzsimmons: Had Esther's concerns when I read through the Executive Summary. But ownership structure seems appropriate. Have seen similar models work. Tucows is a strong choice. Can put this in the basket for now.

- Touton: Affilias into basket.

5. Touton: IODesign a small company with limited resources. They anticipated a period of exclusivity, especially during land rush period, to collect \$35/domain to fund growth of business. Performance numbers about the same. But Affilias and Neustar offer thicker higher-service registry that IOD doesn't initially plan to implement.

- Cerf: Internal oscillation. Have some sympathy for IODesign as pioneers. But concerned about viability of the proposition. Sounds like this only works for them if they're combined registrar/registry. But we primarily want registry proposals. That they "might" be able to get a protocol developed is troubling; software can take longer to develop than anyone expects. Getting multiple registrars in place could be a significant hurdle. Causes me to hesitate.

- Roberts: Ambler deserves credit for work done. But the economic model proposed is exactly what NSF did with NSI six years ago. The absence of competition in the proposal troubles me.

- Pisanty: Separating IOD's registry from registrar, size of technical team, finances – all being corrected on the fly. Trying to adjust to perceived needs rather than having a stable well-thought-out plan.

- Touton: Evaluation team tried to focus on application. Board can place greater weight on revisions, or even request revisions. But some revisions may so fundamentally change the business model as to be of great concern. Proposal may become incoherent as a result of some kinds of changes.

- Dyson: All else equal, favor the little guy. But IOD's business model seems unrealistic to me. Has loyal customers, but how will that work at \$35 a head if other options are available.

- Kraaijenbrink: IOD goes against everything we've worked on the last two years – they join registrar and registry, and they have a high price. Amazed to see this application submitted.

6. Dyson: Discuss name.space. Some free speech strings. Those who want .sucks domains probably have good reasons. We do believe in providing namespace for a variety of purposes.

- Cerf: What about the technical aspects of the proposal? Who runs the registry? What software? Assets and resources? Business model troubles me.

- JD: Financial statement looked at all TLD strings jointly. Marketing plan was a paragraph. Too few details about rollout, human resources. Big picture comments only.

- Kraaijenbrink: Problem is that they want to add 100 TLD strings. But we have to select a "limited number" of strings.

- Touton: Name.space yesterday sent us a note, saying they'll engage Andersen Consulting, have mirror and backup facilities, etc.

- Dyson: We can negotiate with them. Their suggestion of cross-subsidizing makes some sense.

- Touton: Name.space's note doesn't mention intellectual property protections.

- Cerf: Reluctant to allocate more than one TLD to any applicant.

- Dyson: .sucks is a good counterpoint to commercial sites like .biz, .shop, etc.

- Cerf: Why do you need multiple strings to operate .sucks? Proposition remains uncertain. And we've been surprised to learn that strings seemingly of no value in fact have significant value.

- Dyson: Proposals outsourcing to NSI or Tucows are stricken?

- Cerf: One TLD string per applicant. Could conceivably assign multiple strings to a single registry (resulting from different applicants).

- Fockler: When we have tentative selections, we'll look at the matrix and see how this works out.

- Dyson: But who will fund free speech? Not governments. Name.space is commercial but supports freedom of speech. See examples of pornography. Commerce and freedom of speech can go hand in hand.

- Fockler: Sounds like a focused future proposal in this area would be well-received, and Esther could market it.

- Fitzsimmons: Don't associate .soup, .toys, etc. with freedom of speech. Our agenda shouldn't be to specifically request or encourage free speech. If such an application comes along and it meets other criteria, then we'll consider it.

- Cerf: Proposal from name.space is to run a commercial operation with a variety of TLDs (.sucks being one of them). But shouldn't judge the proposal based on indication of applicant to support freedom of speech. Determining factor is whether their operation is viable and will function.

- Wilson: Create a parallel basket, and put name.space in it.

- Dyson: Ask Name.Space what their preferred strings were?
- Fockler: Tried to do that yesterday, but couldn't get a concise answer from them.
- Dyson: Could instruct staff to negotiate on those terms.
- Cerf: Categorization is not dispositive for decisions today.
- McLaughlin: Had hoped that applicants would respond to evaluations, and Name.space did. Advise taking a hard look at Name.space's letter to Touton, which substantially changes the application.

#### VII. GAC Report

- A. Roberts: Intro of Paul Twomey and GAC
- B. Twomey: [link: [communiqué presented](http://cyber.law.harvard.edu/icann/la2000/archive/gac-communique.htm) - <http://cyber.law.harvard.edu/icann/la2000/archive/gac-communique.htm>]
- C. [link: [Communication re new TLDs presented](http://cyber.law.harvard.edu/icann/la2000/archive/gac-tlds.html) - <http://cyber.law.harvard.edu/icann/la2000/archive/gac-tlds.html>]
- D. Questions
  1. Cerf: GAC appreciates the technical side effects of introducing new character sets into DNS? Must be clear that ICANN is not responsible for technical standards; that's IETF's job. GAC would be misguided to look to ICANN on this subject, but GAC could participate in IETF process.
    - A number of member states have asked WIPO to study the question of protections for a range of names that do not currently receive protection (place names, personal names, etc.). Basic point is to clarify state of IP protection on these names.
  2. Blokzijl: Focused on second-level domains. What about third-level domains?
    - Still thinking about it.
  3. Fockler: Interesting to watch language evolve.
  4. Roberts: Some ccTLDs have chosen an economic model that looks like "worldwide commercial."
    - Serious jurisdictional issues here.
    - Cerf: Don't want to repeat the US situation of congress passing laws that don't apply to itself.

#### VIII. Further Discussion of New TLDs – Personal Group of General Purpose TLDs

- A. Kraaijenbrink: .name is strong and has international support.
  1. General agreement.
- B. Cerf: Recommend including JVC & Sarnoff
  1. Dyson: Agree.
  2. Fockler: Agree. We're talking about .iii here.
  3. Touton: Sense a feeling that it should go into basket.
- C. Dyson: Would like to discuss .pid.
  1. Cerf: Numbers to the left of the .pid?
  2. Had classified .pid as "message routing." There's a domain name server that provides an IP address. At that IP address, there's a server that does something useful. DADA would serve only the registry function. "The final step" (server running at that IP) is left up to the registrars.
  3. Dyson: Creates a nice competitive world for many kinds of forwarding services?
    - Would be done at registrar level. Hard to evaluate this from the proposals.
    - Dyson: But it will rely on competition.
    - Roberts: Proposes real-time indirect addressing, without any testbed. And none of existing accredited registrars have anything remotely like this.
  4. Cerf: Could be tested in a SLD rather than being granted a TLD?
    - Dyson: Some such tests already done by others.
  5. Cerf: Feels incomplete.
  6. Neuhauser: Technical description was not one of the stronger statements.
  7. JD: Hybrid business plan. But the other two personal applications you've already selected are stronger.
    - Dyson: Focus on Italy. Or world? Credible as a world player?
    - JD: Unclear.
  8. Kraaijenbrink: Not developed enough yet. Consider it at some point in the future. These ideas are to be tested.
  9. Cerf: This could be straightforward to implement, depending on how you envision it. Registry doesn't have to care what service runs at the destination IP.

**10.** Murai: Concerned with adding new semantics to gTLD space. Should not overload the DNS. DNS is the only distributed global database on the Internet so far. So while we can think of many ways of using it, we shouldn't overuse it. Shouldn't try too much at once.

**11.** Pisanty: Agree with Murai. Did not feel that enough protection in place against hoarding. Dispute resolution procedures may be inadequate. Risk of registration of entire white pages is troubling.

**12.** \$18 million of startup funding.

**D.** Touton: Other entrants from Personal Group?

**1.** Touton: Telnic dedicated primarily to Voice Over IP applications, although not associated with telephone numbers.

- Cerf: Helpful to be able to call someone via DNS even if no way to enter the alpha strings.

- Kraaijenbrink: If we award .tel now, we'd block future uses of .tel. Letters from ITU and IETF suggest that we shouldn't take a decision on .tel at this time.

- Schink: .tel is premature at this time.

**2.** No Telnic in basket.

**IX.** General Purpose TLDS – Restricted Content Group

**A.** Touton: Present here are .kids and .xxx.

**B.** Fockler: Looked at this category and the next together. These are the challenges of a restricted group. Would like to see one, but would end up with one in the next group (Restricted Commercial).

**C.** Kraaijenbrink: Not convinced that .xxx would protect children. But impressed by .KIDS Domain. Would put that into basket, but with a proviso that their structure for registry policy must be both transparent and strict.

**D.** Dyson: We shouldn't promise this in the first place. And this would be more than we can deliver. Creating .kids domain sends a message that you can rely on DNS for content restrictions. Problematic if we then can't deliver.

**E.** Kraaijenbrink: Only facilitates, doesn't promise. Worth considering.

**F.** Cerf: Can't oppose doing something for kids. But Parry Aftab speaks eloquently against this. And other ways to achieve the same objective – portals, with online use limited to sites linked by the portal. So end up disinclined to do this.

**G.** Kyong: Agree with Dyson.

**H.** Dyson: Rely on a filter? Questions of effectiveness.

**I.** Kraaijenbrink: Browsers have integrated features to do this. But if we're expanding the namespace, I believe this could be helpful.

**J.** Roberts: These applications would be "roadmaps to content." Content of this TLD involves social values difficult to take a position on.

**1.** Kraaijenbrink: Would form a trust among these information suppliers, and back it up with contracts between registrant, registrar, registry. Point to content but not regulate content. Responsibility of registrant to assure that content is appropriate.

**K.** Cerf: Fiduciary responsibility to be careful here.

**L.** Wilson: This is in my parallel basket.

**M.** Fitzsimmons: .KIDS is best in class. This may make sense on a long-term basis. But can't place it in a proof-of-concept batch for reasons already mentioned.

**N.** Touton: GAC may be able to provide helpful advice here.

**X.** General Purpose TLDs – Restricted Commercial Group

**A.** Touton: Candidates in this group?

**B.** Cerf: .fin sounds better after suggestion of forming a sponsoring organization.

**C.** Dyson: Like .fin because it doesn't seem too earth-shaking. Not sure where it fits in with central banks, etc. Who defines who's a bank and who isn't? Relevant national regulations.

**D.** Fockler: RegistryPro proposal seemed able to test restricted TLD concept without much harm, etc.

**1.** Kraaijenbrink: Agree.

**2.** Fitzsimmons: Agree.

**3.** Dyson: Agree.

**E.** Kraaijenbrink: Understood .fin to request "shelving" for later decision.

**F.** Schink: Propose .travel.

**1.** Schink: Much online interest in travel. Need more trust in making reservations, etc. TLD

could be a safe haven here.

2. McLaughlin: Staff struggled with how to evaluate these two (.travel and .fin). Hard to know how to interpret the opposition. Had hoped not to receive opposition. Concerned that perhaps not enough consensus-building done in advance. Understand that tight timeframe made this hard, and relevant communities are huge. But haven't been able to give Board much information about representativeness of these two. Board could say "authorize negotiations with one or both of these, pending show of further support from community."

3. Cerf: Certainly true for .fin. But understood the IATA representative to say that millions of people supported them.

- McLaughlin: Convinced that IATA is serious about satisfying the relevant community. But these are difficult decisions, and we didn't think we were well-equipped to decide here.

4. Dyson: Employees of organizations don't always identify with their employers. Just as companies may not represent their workers, IATA is a trade association that may not share the interests of its members. Industry is in transition, and IATA may not represent the interests of all its members. We're not here to do everything that might make sense if we fully investigate it; we're choosing proof-of-concept domains that don't have these kinds of problems.

5. Wilson: Turbulence in the industry makes it premature to assign .travel.

6. Schink: Does Dyson's comment apply to all international organizations, or just IATA?

- Dyson: Mostly concerned about IATA.

7. Cohen: Trying to identify the strong applications that have to do with proof of concept. Maybe we'll be able to accept this at some point in the future, but it doesn't fit the model for what we're doing now. That should be the end of its consideration.

**G.** Wilson: Look at .LAW?

1. Cohen: Yes, it fits the proof of concept model. Should look at it.

2. Kraaijenbrink: .LAW might be redundant with .PRO. And .LAW is US-oriented; things are different elsewhere.

3. Neuhauser: Modest technical plans to suit a modest scale of registration. No particular objections, but small starting point. Own software, not yet tested in a large way. Among the weaker applications from a technical perspective. But could take a risk with it – a weaker application doing more modest things, but probably an acceptable risk on balance.

- Cerf: The .MD software?

- Yes.

4. Not clear that any US or non-US bar association involved at all. If anyone will give out a .LAW address, these seem natural sources of support.

- Touton: Similar criticism against RegistryPro.

- But they'll seek certification and work with bar associations.

5. Some challenges with .LAW are well-solved in .PRO's application. RegistryPro application has a detailed plan for how to make determinations re who is a lawyer, etc. But .LAW application says only "have made a proposal to American Bar Association and have continuing discussions." Presents some problems from a staff standpoint. At least RegistryPro's plan is more detailed.

- Cerf: Will not exclude anyone from future considerations. Should move on to next alternative.

6. Wilson: Understand reservations. But this is attractive to me because it creates immediate competition with .PRO. And .LAW would have educational institutions, court reporters, etc. An interesting vertical cut.

7. Cerf: Put this in your basket?

**XI.** Special-Purpose TLDs

**A.** .Museum

1. Touton: In the basket.

**B.** Dyson: .AIR.

1. Kyong: How can we give out .AIR? (Seems like a public resource or something?) Too big. Give .AIRLINES or .AIRPLANES instead?

2. Cerf: If the string were more precise, less concern here? A reasonable proposal except for this concern that "AIR" is too generic a word.

3. Kraaijenbrink: A good proposal for a specific sector.

4. Kyong: Would go along with that if the staff negotiates for a more specific string.

5. Kraaijenbrink: We could think of a more generic term? ".AERO"

6. Pisanty: Fewer questions here about representativeness.
- C. Cerf: .CO-OP**
1. Cerf: Term is international. Many members. Looks good.
  2. Schink: Support this if properly administered by an international body.
  3. Pisanty: Policy to be set internationally. That's good. But does this proposal get us into tricky trademark problems?
  4. Kraaijenbrink: Difference between .co-op and .coop? Which should we delegate? (Both requested.) Agree with Pisanty that Board of the TLD administrator should be international. Also, note that co-ops less and less important in Europe.
  5. McLaughlin: Proposed registry operator located in UK – Poptel.
  6. Touton: Into basket.
- D. Schink: .HEALTH**
1. Kraaijenbrink: Oppose .HEALTH at this time. Its registry policy is not yet clear. Similar problem to .kids. Trying to control content through agreements with registrants. Support the idea, but further development necessary before we can delegate this.
  2. Cerf: Respect WHO. But don't understand how they'd achieve their objective (quality information about health) with mechanisms proposed. Pursue this idea at a later date.
  3. Touton: No consensus to put it in the basket.
- E. Pisanty: Let's discuss .UNION.**
1. Kraaijenbrink: Same reservations as .HEALTH.
  2. Dyson: Favor .UNION but want to make sure it works with others.
  3. Fockler: Need international scope and further consultations and support. Should condition negotiations on this.
  4. Kyong: Representativeness of this organization (or organizations) in question on international scope.
  5. Schink: Understand concerns. Want to check whether we have opportunity to ask GAC for guidance here.
  6. Cerf: Like the idea of going through our basket to request GAC comment.
  7. McLaughlin: Note that ICFTU not a governmental organization. Not proposing to exclude unions that aren't members of their federation. Questions of definition (is a company-owned union a union?).
  8. Pisanty: This is an organization of union-confederations, not of unions themselves.
  9. Touton: Put it in basket? Some no's. Put it on Linda's list?
- XII. New Services TLDs – Telephony-Related Group, Message Routing, and Other Group**
- A. Cerf: Re phone numbers, ITU wants phone numbers only in certain portions of DNS space. Need to think carefully about this to avoid problems including potential hijacking.**
1. Touton: Group One does not put a forward-facing telephone number in the DNS address. Lawyer said these domains could be used for telephone devices. And numbers coincidentally the same as telephone numbers could be registered, but that didn't make these telephone numbers.
- B. Wilson: Look for strongest new-services related applicant, then decide? That might affect our approach to the ITU's comments.**
1. Cerf: Yes, we'll definitely go back through the basket.
- C. Kraaijenbrink: SRI International (.GEO)**
1. Cerf: Questions of protocols used by .GEO proposal.
  2. Dyson: A heavyweight, specific way of organizing the world by geography. They're asking for a public resource position to manage everything managed by geography. But is SRI the appropriate body to be doing this task, which perhaps should be worldwide? They're trying to be the central repository. And any privacy issues? Only distributes data that is put in there, so maybe no concern?
    - McLaughlin: Clear to SRI is build a way of referencing geographic information. Other efforts possible. Don't see this as a monopoly, and anticipate some additions. Re privacy, have some ideas and plans, and an advisory body.
  3. Murai: Concept has been discussed in various contexts beyond DNS. Could be provided via DNS using other information within DNS. Still need to discuss this with IETF, IAB, GIS experts, others. Now is not the time to do this.
  4. Cerf: Agreed that there are other ways to do this. But if this isn't irrevocable, we could at least look at the experiment. Difficulty of building reverse-lookup table makes this proposal

appealing.

5. Murai: Not confident that this should be done via the namespace as a gTLD.

6. Cerf: Other technologies might be more efficient for searching the database. But this won't be damaging. And if this does pose a problem, we could readily tell SRI "don't do that because it hurts the 'net.'"

7. McLaughlin: Does this interfere with other proposals?

- Murai: No.

- Cerf: Sufficient interest in this to let the experiment go forward?

8. Roberts: Proponents have invested technical effort, funds in this effort.

9. Fockler: Sounds like we could learn a lot from this, so I'd put this in my basket.

10. Fitzsimmons: One of most intriguing entries. Can understand concerns about scalability.

Favor this only if acceptance is subsequent to technical reviews, perhaps even ongoing at a few designated points in the future.

11. Dyson: Put it in the basket last. Cool to have, but not inherently necessary. Could be accomplished just as well without its own TLD.

12. Fitzsimmons: May learn a lot from the resulting other uses as a result of .GEO.

13. Touton: In basket.

**D. Cohen: Group One**

1. Cerf: Received conflicting information about the nature of the numbers.

2. Touton: "... the fact that a number may register a name coincidentally to a phone number has no more significance than in any other TLD." Suggests no restrictions to prevent telephone numbers from being registered.

- Wilson: If that's our main concern, could we make this something to negotiate? (i.e. Group One to block phone number registrations?)

3. Cerf: Registration with intention of using the string like a phone number is what causes the problem.

- Touton: Projected revenue of 80% from telephones is of some concern.

- Dyson: They said that their domains are convenient to use from a telephone.

4. Cerf: In light of uncertainty here, shouldn't approve a telephony-related TLD.

**E. Nokia**

1. Kraaijenbrink: Need more substance in the proposal. Don't favor this as yet.

**XIII. Moving forward**

**A. Roberts:** Comment on where we are. We've progressively promoted applications to subsequent rounds. This is the fourth round. Let's call what we just finished the semi-final round. Now we need to promote the semifinalists to a final list for instructions to staff for limited, controlled introduction.

- Wilson: Fine, so long as we preserve diversity. Must not have all finalists from the same country, of same size, etc.

- Roberts: Agree. We've been keeping track of this.

**B. Review of List**

1. Fockler and Dyson: Review .UNION? It was close.

2. Cerf: There are many that some of us might want to add.

3. Touton: Anything to remove? Remember, we can't accept everyone in this first round.

4. Cerf: Want to assure that the applications we choose this time have a good possibility of being successful.

**C. Touton:** What should go into final selection?

1. Cerf: Don't want to take anything out of that list?

2. Dyson: It is a broad and diverse list. Have questions about one or two. Overall, it does what we intend. A good selection of a broad and wide-ranging applicants. Nothing that's "other-centric" (i.e. non-US-centric).

3. Everyone comfortable with JVTeam's position on the list?

- Yes.

- Cerf: JVTeam seems to have three. Not prepared to vote for all three.

- Touton: Which to take out?

**D. Touton:** Review of list

1. Confirmation that "everyone OK" with each?

- Uncertainty on .AIR/.AERO. Change to .AERO only.

- Murai: .GEO could be accommodated in any namespace.
  - Touton: Note that this is the third JVTeam proposal on the list.
  - Dyson: Replace it with Name.space!
  - Touton: Delete it for this proof-of-concept round?
  - Murai: They can continue to operate without a TLD.
2. Wilson: Geographic regions?
    - Additions of geog information to list.
  3. Touton: Specify particular TLDs, or leave it up to staff for negotiations?
    - Kraaijenbrink: Must delegate strings. For Affilias, .web. For Global Name Registry, .name. Must be specific.
    - Cerf: Agree with ultimate goal of assigning only one string. Should review secondary lists too.
    - Fockler: Thought we chose .web and .name, respectively, already. Could have conflicts when we revisit others, though.
  4. Wilson: Did not understand that putting items in the basket meant assigning .web to Affilias.
  5. Roberts: Find .iii unacceptable as a string for TLD space. It's unpronounceable. It has no mnemonic value. It's confusing. It says nothing about meaning.
    - Kraaijenbrink: But it is a joint venture between Sarnoff and JVTeam. Maybe they'd be happy with .per instead? That was JVTeam's request.
    - Touton: The three-letter abbreviation for Peru is PER. GAC has advised against delegating the three-character strings that correspond to country-codes.
    - Cerf: So where are we, if .per is untenable?
    - Roberts: Would delete .iii from the list.
    - Kraaijenbrink: Have eight viable proposals. Ready to make decisions.
  6. Cerf: Still interested in Wilson's list.
  7. Dyson: How serious is the .per country-code problem? Lots of such problems?
    - Touton: Approximately 240 such problems.
    - Dyson: Other choices?
    - Touton: .idi, some others.
    - McLaughlin: Could resolve this with some back-and-forth?
- E.** Dyson: .UNION? Name.Space?
- F.** Wilson: .KIDS? .LAW? Name.Space?
- G.** Schink: These are just private lists? Or a fallback solution?
1. Touton: Want to take a second look at these.
- H.** Kraaijenbrink: Might buy .KIDS, but not Name.Space, not .LAW? There's consensus to add little more.
- I.** Cerf: Still interested in IOD. But if rest of Board disagrees, I'll stop. They're worked with .WEB for some time. To assign that to someone else given that they're actually functioning makes me uneasy.
1. Wilson: Agree with Vint.
  2. Could grant Afilias .info or .site instead?
    - From responses to questions to Afilias: "Afilias believes .web is most likely to succeed as a viable and immediate alternative to the current gTLDs, and thus would most successfully constitute a true proof-of-concept. ... would strive to make its operation of either the .web, .info, or .site TLD a success."
  3. Cerf: Concerned about trademarks?
    - Touton: No US trademark right in .web.
  4. Fitzsimmons: Appreciate risk taken. But have to be careful of preregistration. The wrong decision here might set up the wrong incentives and precedents, encouraging people to set up registries in advance of applying to ICANN.
    - Touton: This sometimes happens with port numbers, etc. It's an activity to be discouraged.
  5. Broad consensus with respect to any of the five additional TLDs? Name.Space, IODesign, .UNION, .KIDS, .LAW.
    - McLaughlin: Determination of who's a union? An independent body. Reviewed comment forum, and there were no union organizations opposing the application. AFL-CIO favored this. Board must decide how representative the comments in favor were.
    - Cohen: This is a good proof-of-concept. Technically sound. Representative.

- Kraaijenbrink: Don't know if it's representative. Don't know registration policy. It might be delegated in the future, but not in this batch.

- Touton: Board members who haven't spoken on this subject? Show of hands? Five favor addition to main list. Five against. No consensus.

**J. Review of applications – straw polls**

1. JVTeam (.biz): All in favor, but Murai abstains
2. Afilias (.web): Eight in favor. Three abstentions.
3. Global Name Registry (.name): Consensus.
4. Sarnoff/JVTeam (.iii): Six in favor. Dyson: Change string?
5. RegistryPro (.pro): Consensus.
6. MDMA (.museum): Consensus.
7. SITA (.aero): Consensus.
8. NCBA (.coop): Consensus, with two abstentions.

**K. Touton: Change the string for Sarnoff/JVTeam (.iii) to increase support?**

1. Wilson: Yes. But not sure it's our job to suggest the string.
2. Touton: Say "get one string, require approval of Board before execution of agreement."
  - Wilson: Yes, but Board shouldn't delegate approval.
  - Propose ".idi, .iii, .one, or some other string." Section E2 of Sarnoff/JVTeam proposal.
  - Dyson: .ONE seems OK?

- Sims: Application has changed dramatically since it was made. String is apparently not acceptable to a number of members of the Board. Application actually only requested ".i."

Accordingly, Board might postpone this application to a later date.

3. Touton: Support .iii proposal in basket?

- Little support. Remove from basket.

4. Cerf: Why we changed our minds? Would love to find something else, but want the applicant to find it, not for us to do so.

- Dyson: Sure. Let's negotiate with them on the subject of the specific string.

- Cerf: But proposal has not even been reported to us as a combined proposal. Take Sims's comment to be a caution that we haven't seen a proposal from the joint group.

5. Touton: A one-page sheet was distributed yesterday re how to combine the two extensive proposals.

- Cerf: Would like to keep them on the list, but subsequent to negotiation that we approve.

6. Kraaijenbrink: How many votes to have? How many recounts? First time, six for it. Now, two for it. Isn't it out of order now to have another vote?

- Cerf: We didn't vote on my specific proposal, to remand the string decision to negotiation.

Should vote on that.

7. Touton: Straw poll on Sarnoff/JV Team, for negotiation of TLD string.

- Wilson: Is this within our procedures?

- Sims: This would raise at least some claims re sticking to process.

- Touton: Agree. The joining of two applications may not be thought fair either. Other applicants may complain that they weren't permitted to change their application after submitting it.

- Straw poll: No one in favor.

**XIV. Resolution?**

**A. Touton: Any director not prepared to vote for a resolution selecting these proposals with these strings?**

**B. Sims: String before the board for the Afilias application is .web, not .info or .site or anything else. Let there be no confusion here.**

**C. Roberts: As I recall it, discussion to get Afilias into the basket considered .web.**

1. Cerf: Continue to be concerned about assigning .web to Afilias. Would be more comfortable if we assigned them a different string and reserved .web.

2. Kraaijenbrink: Have discussed and considered the Afilias proposal on .web. We should award them .web, knowing that IOD has been in operation as an alternative root with .web for some time. Fully aware of what we're doing here.

3. Fockler: Would be comfortable with voting on the whole package.

4. Roberts: Support for changing the string restriction?

5. Touton: Straw poll for continuing to include Afilias with .web?

6. Sims: Board's decision must be a consensus decision. Just want to be careful.

7. Cerf: Board support for reserving .web and awarding Afilias .info?
  8. Sims: Afilias with the .web string is currently on the list. How many directors want to leave it on the list as it is? Six. How many are opposed to having Afilias awarded .web? Three. Rest abstain. Is that consensus?
  9. Sims: Award .info to Afilias (instead of .web)? Eight in favor. Two opposed. More of a consensus.
  10. Cerf: Recommend that Afilias be awarded .info.
  11. Schink: Do this for every applicant?
    - Sims: No, this is the only one that was a close call.
  12. Sims: Afilias on the list with .info? Nine in favor. Consensus.
    - Note that Afilias proposed this is an alternative – E2, paragraph 3.
- XV.** Logistical notes: Please be quiet during and after the vote. Logistical meeting afterwards.
- XVI.** Resolution
- A. [Resolution read and presented] [link: <http://www.icann.org/minutes/prelim-report-16nov00.htm#SelectionofNewTLDProposals>]
  - B. Move to accept resolutions read.
  - C. Unanimously accepted.
- XVII.** Other Business
- A. Proposed resolution: Thanks to departing directors. [link]
  - B. Crew: Thanks to stakeholders for never ignoring us.
  - C. Dyson: Increasing diversity on Board is important and valuable. Sad to leave. Looking forward to staying in touch.
  - D. Roberts: Vote? All in favor. Passes unanimously.
- XVIII.** Motion to Adjourn
- XIX.** Ad-Hoc Group - Kraaijenbrink
- A. Should keep Comment Forum up until March. Report to be prepared well in advance of next Board meeting so that public comments can be reported at the next Board Meeting.
- XX.** Status of ccTLD Negotiations? - Abril
- A. Roberts: Working on it. Staff will have a report to Board via email within a week.
- XXI.** Meetings - Roberts
- A. March 10-13 (Saturday through Tuesday) in Melbourne.
  - B. Crew: Will start working on that shortly. Will be happy to welcome everyone. I'll be on host committee. Other events nearby.
  - C. Stockholm, Sweden – June 1-4, 2001 – prior to, same venue as INET 2001, Stockholm Conference Center.
- XXII.** Other notes
- A. InfoDev fellows, please see McLaughlin.
- XXIII.** Motion to Adjourn Board Meeting
- A. All in favor.

# **New gTLD Draft Applicant Guidebook: Analysis of Public Comment**

## **I. INTRODUCTION AND EXECUTIVE SUMMARY**

### **Background**

Since it was founded in 1998, one of ICANN's key mandates has been to create competition in the domain name market. In addition, the Joint Project Agreement that ICANN has with the U.S. Department of Commerce says: "ICANN shall maintain and build on processes to ensure that competition, consumer interests, and Internet DNS stability and security issues are identified and considered in TLD management decisions, including the consideration and implementation of new TLDs."

The policy making process in the ICANN model is driven by people from around the world. Those discussions have involved representatives of governments, individuals, civil society, the technology community, business, and trademark lawyers. The consensus they came to, through discussions at the Generic Names Supporting Organization (GNSO), one of the many groups that coordinate global policy in ICANN, was that new gTLDs were needed and could be introduced.

The current new gTLDs project has been in the study and planning stages for more than 3 years. See <http://gnso.icann.org/issues/new-gtlds/>. Its origin goes back even further – to the first two rounds of top-level domain applications held in 2000 and 2003. Those rounds were used to shape the current process.

In June 2008 the ICANN Board adopted the GNSO policy to introduce new gTLDs and directed staff to continue to further develop and complete a detailed implementation plan, continue communication with the community on the work, and provide the Board with a final version of the implementation proposals for the Board and community to approve before the new gTLD introduction process is launched.

In October 2008, a Draft Applicant Guidebook, with six explanatory memoranda was released and a consultation period of 76 days was held on the first draft. In addition to the comment period, there have been face to face consultations held at ICANN meetings and special consultations. Over 300 comments were received via the written public comment process and hundreds more via face to face discussion at ICANN meetings and other events.

### **Overview of the Analysis**

ICANN conducts numerous public comment periods. They can be found here: <http://www.icann.org/en/public-comment/>.

In 2008 more than 50 comment periods were held. This process shapes policy direction and effects change to important technical, contract, and policy implementation documents. While ICANN relies heavily on this process, many have suggested that it is often difficult to understand how comments have shaped outcomes and if not, why not.

For the first comment period, ICANN has introduced a detailed analysis of comments received so far. The comments were divided into thirteen major categories and then subdivided into sub-categories. An analysis was written to address issues raised in the categories and sub-categories. The analysis identifies commenters and provides a summary of issues with which commenters are associated, and then provides an explanation of the proposed position regarding the issues raised. Therefore, each category is divided into the following sections:

- A summary of the key points made in that category,
- A summary of the analysis where a synopsis of comments and sources is listed,
- A listing of the issues raised by that set of comments,
- An analysis balancing the issues raised by the comments,
- A proposed position that is reflected in the Applicant Guidebook for additional discussion.

### **Issues Requiring More Discussion to Address Concerns**

The following overarching issues need more examination and discussion before they can be changed in a future draft Guidebook. They remain unchanged in this version of the Guidebook. This does NOT imply that the concerns expressed have not been understood or are being disregarded; it only indicates that these matters require more substantive discussion before changes to the Guidebook can be made.

Those issues are:

#### **a. Security and Stability**

##### Scaling

While there is always opportunity for more study, the concern regarding security abuses scaling with more TLDs is ultimately better dealt with through pragmatic implementation approaches than a set of predictions around which many would disagree.

Many clearly feel more work is needed on implementation of registrant protection and end user confusion, and these questions need to be raised again. Are there implementable and practical mechanisms to avoid the need for purely defensive registrations at the second level? Is there such a need in an expanded name space? Can registry or registrar mechanisms be put in place to make new gTLDs desirable from both a confusion avoidance and protection viewpoint? ICANN staff will be actively soliciting feedback on these topics over the next 60 days, and share with the community options for improvements in these areas in the next several months.

In addition, given that the near coincident changes planned for introduction into the root zone - IPv6 records, DNSSEC, IDNs, and new TLDs – have not been analyzed for their combined impact on root zone operations, the ICANN Board has requested the Security and Stability Advisory Committee and Root Server System Advisory Committee to jointly conduct a study analyzing the impact to security and stability within the DNS root server system of these proposed implementations. The study will address the capacity of the root server system to cope with a stressing range of technical challenges and operational demands that might emerge as part of the implementation of proposed changes.

## **b. Malicious Conduct**

### Abuse

Several commenters expressed concern that expanding the number of TLDs would also expand malicious behavior on the Internet.

One approach to addressing this would be to conduct a study (really a forecast) of expected behaviors with an expanded TLD name space.

Many clearly feel more work is needed on implementation of registrant protection and end user confusion, and these questions need to be raised again. Is there such a need in an expanded name space? Can registry or registrar mechanisms be put in place to make new gTLDs desirable from both a confusion avoidance and protection viewpoint? ICANN staff will be actively soliciting feedback on these topics over the next 60 days, and will share with the community options for improvements in these areas in the next several months.

## **c. Trademark Protection**

Many comments noted that an issue of concern was trademark protection and particularly protection from what they saw as frivolous and expensive defensive registrations at the second level, both at the registry start-up time and on an ongoing basis. Are there implementable, practical mechanisms to avoid the need for purely defensive registrations at the second level?

ICANN intends to conduct a series of discussions with all relevant parties relating to proposed enhanced protections for trademark holders. ICANN is also in discussions with several Intellectual Property organizations around the world to coordinate setting up several conferences to propose some additional solutions to these issues.

If additional trademark protection mechanisms are agreed upon and included in the new gTLD implementation, the aim would be to reduce costs to trademark holders, and increase and build more confidence in protection measures.

## **d. Demand/Economic Analysis**

Many comments indicated that ICANN should commission an economic analysis of the effect of increasing the number of gTLDs before proceeding. ICANN will release a study on the dynamics of the domain system in broad as well as a study specifically related to the impact of increase in gTLDs in the near future. ICANN will post that study for public comment and discussion prior to the next iteration of the Draft Applicant Guidebook.

## **Major Changes in the Draft Applicant Guidebook**

This draft of the Guidebook has changed in many ways that clarify language and expand on concepts. These changes are outlined in the Analysis and reflected in the red-lined revised version of the Guidebook posted with the Analysis. In addition, the major areas of change are outlined below.

### **a. Compliance**

ICANN will revise the audit rights provision in the agreement included as part of the updated Applicant Guidebook to more closely align with the provisions in the current Registry Agreement, which cover compliance with the fee arrangements, monthly reporting specifications and technical and functional specifications. The scope of ICANN's audit rights will be clarified and limited to cover only the covenants of Registry Operator.

For Registry Operators who are repeatedly problematic, ICANN can bring action in front of an arbitrator and request the award of punitive damages. In addition, ICANN will clarify in the proposed Registry Agreement that ICANN may request that an arbitrator sanction the Registry Operator for noncompliance issues, including operational sanctions such as an order temporarily restricting a registry operator's right to sell new registrations if appropriate.

#### **b. Registry/Registrar Separation**

The revised Guidebook includes a limited lifting of restrictions on registry-registrar cross-ownership that could include the following:

- Maintain separation between the registry and registrar functions (with separate data escrow and customer interface);
- Registries continue to use only ICANN-accredited registrars;
- Registries should not discriminate among registrars;
- With a limited exception, a registrar should not sell domain services of an affiliated registry (this limit may be up to a threshold of 100,000 domain names, although the registrar may continue to manage its existing base once the threshold is met)
- Reasonable notice should be provided before any pricing changes are made on domain renewals.

This model would support small, targeted registries (including community-based applicants or single-entity TLDs), and recognizes that limited cross-ownership may provide economic benefit and competitive benefit in the domain name market.

#### **c. Financial Considerations**

##### Annual Registry Fee

It is proposed to reduce the gTLD annual registry fee base amount (not minimum) to \$25,000 per year (\$6,250 per quarter). For registries with 50,000 or fewer second-level registrations, no further fee would be charged. For registries with more than 50,000 registrations, the registry would pay \$0.25 per transaction-year. This approach better accommodates a diversity of registry models, registries in start-up phase, and smaller community registries, while ensuring reasonably expected future costs can be covered by the fees. Volume registries will pay total fees in line with current ICANN registry contracts. The proposed gTLD Evaluation Fee remains \$185,000. No additional cost estimates or policy decisions indicate that the fee should be altered. However, the cost estimates will continue to be evaluated as the launch date approaches. If any significant cost estimates are altered due to more information becoming available, then the fee could be adjusted accordingly.

#### **d. Geographical Names**

The Draft Applicant Guidebook is amended to make it easier to identify the different elements of geographic names.

It has also been amended to reflect that a country or territory name in any language will require evidence of support, or non-objection from the relevant government or public authority.

The definition of meaningful representation is also amended to take out the reference to official languages.

The requirements of the letter of support will be augmented. In addition to demonstrating an understanding of the string being requested and what it will be used for, the letter should also reflect that the string is being sought through the gTLD process and the applicant is willing to accept the conditions under which the string will be available, i.e. sign a contract with ICANN, abide by consensus policies, pay fees etc.

ICANN intends to hold further consultations with the Governmental Advisory Committee, ccNSO and others to discuss these issues.

#### **e. Last Resort Contention Resolutions: Auctions**

Auctions are intended to be the mechanism of last resort for contention resolution.

Proceeds from auctions will be returned to the community via a foundation that has a clear mission and a transparent way to allocate funds for projects that are of interest to the greater Internet community. One use of funds would be to sustain registry operations for a temporary period in the case of registry failure. Other uses include outreach and education and DNS stability/security projects.

#### **f. General Communications and Timeline**

The proposed timeline that estimated the launch of the application round in September 2009 is under reconsideration. It will depend on the resolution of the overarching issues raised by the community in response to the initial draft Applicant Guidebook. There will be a third draft version of the Guidebook. It is unlikely that the application round will open before December 2009.

It is very important to take the time to resolve the overarching issues raised as a result of the publication of the first draft Guidebook. DNS stability, user protection and trademark rights must not be undermined by the introduction of new TLDs. It is equally important to continue to refine other community issues within the process and complete as much implementation work as possible so that when the overarching issues are resolved the new gTLD process will be robust and timely and effectively be able to commence. In that regard, the community will see several activities going forward while the overarching issues are addressed. For example, ICANN will continue to work on locating panels that will evaluate aspects of the applications. A communications program that will focus on communicating existing proposals for the application process as well as informing the community about changes will commence immediately.

## **II. GENERAL COMMUNICATIONS AND TIMELINE**

### **Summary of Key Points**

- There was strong commentary from a variety of sources concerned that the timeline for the launch is too aggressive considering there are overarching questions remaining.
- A third draft version of the Applicant Guidebook will be necessary to provide sufficient time to address a set of overarching concerns raised in the public commentary.
- Other program elements are being pursued so that when the remaining questions are resolved, a robust, effective, timely process will be in place ready to launch.
- A comprehensive communication plan is being implemented presently.

### **Summary of Input**

#### **Program language**

The new gTLD process should be addressed in other languages and the consultation period of 45 days is too short. *A. Al-Zoman, SaudiNIC (2 Dec. 2008); J. Shea, APTLD (15 Dec. 2008).*

Language Barrier: the whole process (including consultations, documentations, forms, communications, people involved) is done in English. Non English speaking communities would be put in behind because of this. *A. Al-Zoman, SaudiNIC (2 Dec. 2008).*

#### **Timelines - four months communications period; launch; next round announcement**

Demand Media supports the introduction of new gTLDs, the timely review of public comments, prompt issue of the final version, and swift progress to the bid submission stage. Recommends that the four month global communication phase begin with the publication of the revised Applicant Guidebook in February 2009. *Demand Media (17 Dec. 2008).*

The four-month awareness campaign for new gTLDs should be brought in earlier so application process can begin earlier. *Cairo Public Forum (6 Nov 2008).* Move Guidebook awareness campaign forward to January 2009. *Cairo Public Forum (6 Nov 2008).* The Global Awareness campaign should begin after the New Year in January 2009 to avoid needlessly holding up applicants that are prepared and ready to submit their applications on the given day in Q2 2009, as anticipated in the timeline. *R. Andruff (20 Nov. 2008).*

We urge the ICANN Board to not delay new gTLD application process in order to make changes to the Guidebook. *Cairo Public Forum (6 Nov 2008).*

The provision stating that ICANN will begin the next application round within one year of the close of the application submission period for this round is too vague and conditional in light of the GNSO Implementation Guideline recommendation. The intent was that at the beginning of the first round there would be a definite announcement of the start of the second round. *C. Gomes (18 Nov. 2008).*

## **Global awareness, further consultation and information availability**

ICANN should organize regional and sub-regional workshops to raise the awareness of the gTLD launch. *F. Purcell, Ministry of Communications and Information Technology* (6 Nov. 2008)

Publication of a revised, more detailed schedule of events/milestones prior to application opening: with only seven or eight months to go before application opens, certainty over the pre-launch timetable would be to the advantage of many. A timeline that is regularly updated showing all the steps in the process such as when the second Draft Applicant Guidebook is due, when comment periods open and close, what events the ICANN team have planned, key events in the Communication Campaign, would be useful. *S. Metalitz (IPC, COA)*.

ICANN should commit to use best efforts to raise awareness of and support solutions to the acceptance issues created by use of outdated length parameters or other erroneous formatting criteria. *RyC*.

There should be significant time between application rounds. *INTERNET COMMERCE COALITION* (15 Dec. 2008)

## **Issues**

The community feedback in relation to the New gTLD Program communications and timeline can be categorized in 3 different levels: (1) Program language; (2) Timelines, including: four months communications period; launch; next round announcement; and (3) Global awareness, further consultation and information availability.

### **Program Language**

Why is the New gTLD Program mainly in English? Why is ICANN not making the New gTLD program available in other languages giving an unfair advantage to English speaking applicants?

Why is the Public comment period only 45 days?

### **Timelines - Four Months Communications Period; Launch; Next Round Announcement**

Why does ICANN not start the 4 months communications period now to prevent further delays in the timeline?

Can ICANN announce the exact date the next round of applications will start?

### **Global Awareness, Further Consultation and Information Availability**

What will ICANN do to increase awareness from a global perspective?

Can ICANN provide a detailed timeline from now to launch, including all additional public comment periods?

## **Proposed Position (for this version of the Guidebook)**

### **Program Language**

ICANN has considered the development of a multilingual Program, nevertheless, it has reached a conclusion that the first application round should be in English due to the cost and time it would take to develop a truly multilingual Program. ICANN is making informational materials available in the 6 United Nations Languages (in alignment with Policy implementation guideline O). A multilingual Program is under consideration for future rounds.

### **Timelines - Four Months Communications Period; Launch; Next Round**

The four months window between the publication of the final applicant guidebook and beginning of the application round is reflected in the GNSO in the implementation guideline E:

“The application submission date will be at least four months after the issue of the Request for Proposal and ICANN will promote the opening of the application round.”

The terminology “4 months communications campaign” has generated some misunderstandings and led to erroneous conclusions the 4 months are the only outreach activity ICANN plans on doing. ICANN communications campaign has been going on since the Policy approval with the intent to increase awareness about the New gTLD Program around the world.

The 4 months between final applicant guidebook and application round proposed by ICANN are specific activities being developed with the intent to explain in details the application process around the world. ICANN believes this step important considering the evolving process and changes of the applicant guidebook from now to final version.

The proposed timeline is under reconsideration and will depend on the resolution of the overarching issues raised by the community in response to the proposed draft applicant guidebook. ICANN staff is committed to a timely resolution of these overarching issues through further evaluation and consultations with the community and experts.

It is very important to take the time appropriate to resolve the overarching issues raised as a result of the publication of the first draft Guidebook. DNS stability, user protection and property rights cannot be deleterious way by the introduction of new TLDs. In order to do that, it is certain that ICANN will publish a third draft version of the Applicant Guidebook. That is because there will be substantial change between the second and third version of the Guidebook and that change should be made available for public comment. The requirement for a third version of the Guidebook means that the first applications cannot be taken until December 2009 at the earliest.

It is equally important to press other issues through to resolution and complete implementation work in these areas so that when the overarching issues are resolved, the new gTLD process will be robust, timely and effective. In that regard, the community will see several activities going forward while the overarching issues are addressed. For example, ICANN will continue to work to locate panels that will evaluate aspects of the applications. The time required to locate adequate resources for these tasks is uncertain.

ICANN intends to announce the timeline for the second New gTLD applicant round when the final applicant guidebook is published. At this point, ICANN cannot make a precise calculation when the second round can begin without first finalizing the retention of the panels, finalizing several of the processing steps and analyzing different potential issues regarding pending application.

## **Global Awareness, Further Consultation and Information Availability**

ICANN is updating the calendar of global consultations and outreach activities for 2009. These activities include, for example, events specially developed for the ICANN Meetings, additional consultations with ICANN supporting organizations, participation in events with the Intellectual Property and business leaders, governments, technical community, registries and registrars, and consumer organizations.

ICANN also plans to improve the quality and availability of online information through the ICANN website.

### **Analysis**

#### **Program Language**

ICANN received few comments regarding the fact that the new gTLD Program is mainly in English, although some informational materials have been available in 6 UN languages. The issue comes mainly from regions that are non-English speaking and the overall concern is that English speaking applicants have an unfair advantage.

The Public Comment period is only 45 days and this is not enough time for the global audiences to prepare a response.

#### **Timelines - Four Months Communications Period; Launch; Next Round**

ICANN has received comments urging the launch not to be delayed and suggesting shortening the 4 months communications campaign or starting it earlier in order to expedite the launch.

There was also strong commentary from a variety of sources voicing concern that the timeline for the launch is too aggressive considering there are many unanswered questions ICANN still needs to address and the global current economic crisis.

A few indicated that ICANN needs to announce a precise date for the second round when the information about the first round is available.

## **Global Awareness, Further Consultation and Information Availability**

ICANN has been conducting and participating in a series of outreach and consultation activities with the community. Some of the activities to date include the Public Forum during the ICANN Cairo meeting, clarification and update meetings with the GNSO, ccNSO, GAC, RYC, and Registrars. ICANN will continue to consult with the Community to address the few overarching issues. A schedule of events will be made available to the community via ICANN website in March.

### **III. APPLICATION PROCESS**

#### **A. APPLICATION PROCESS: GENERAL REQUIREMENTS**

##### **Summary of Key Points**

- The Guidebook will be updated to clearly indicate which parts of the application submissions will be held confidential. Essentially, answers to all financial questions and a portion of the security plan will not be published.
- The “stated purpose” of the TLD in the application will not be used directly in the evaluation but that information might be useful in resolving formal objections to applied-for strings.
- The documentation requirement for “good standing” will be made more flexible if possible to accommodate different cultures, regions, and business models.
- A limitation on communications between applicants and evaluators is intended to balance the need for the evaluators receiving complete information against the need for a finite, timely process.

##### **Summary of Input**

The proposed new gTLD process forces ICANN to be a regulatory body for the TLD allocations. Hacker suggests that proposed strings be meaningful with regards to purpose. Under Hacker’s proposal, applicants would describe the purpose for the proposed gTLD and justify why the submitted TLD name is necessary in the first place. ICANN should require proposed TLDs to include a well-defined organizational definition. *Hacker* (14 Dec. 2008).

A financial sector gTLD should be implemented from a top down approach to ensure that no unsponsored gTLDs are issued, and that if issued, such gTLDs are managed within an industry and regulatory framework. *FDIC* (15 Dec. 2008).

Given the large amount of sensitive information collected in the application, this needs to be clearly defined. We recommend that ICANN only list the party placing the application and the gTLD that the party is applying for. *DHK* (15 Dec. 2008).

The full and complete application should be posted (subject to the confidentiality protections of Module 6). *Bank of America* (15 Dec. 2008); *FairWinds* (15 Dec. 2008).

What constitutes “proof of good standing,” and how will start-up businesses satisfy this requirement? What happens if governments do not issue such certificates?” *C. Gomes* (18 Nov. 2008).

Why must evaluation requests be made solely through TAS? Why would only one exchange of information be permitted, and why would evaluators not be obliged to request further information or evidence if it is needed? *C. Gomes* (18 Nov. 2008).

## **Issues**

Several comments had to do with providing justification for a TLD application. Should ICANN act as a "regulatory body for the TLD allocations" (taking the organizational structure and purpose into account in deciding which TLDs should be allocated)?

Question 1: Should ICANN take the purpose of the TLD into account when conducting the evaluation of an application?

There were a number of comments asking ICANN to disclose what sections of information would remain confidential and what would be publicly available.

Question 2: When should ICANN differentiate between confidential and public information in the AG?

Question 3: "What constitutes "proof of good standing," and how will start-up businesses satisfy this requirement? What happens if governments do not issue such certificates?" – C. Gomes

Question 4: Why is only one exchange of information allowed during each of Initial Evaluation and Extended Evaluation?

## **Proposed Position (for this version of the Guidebook)**

Question 1: As indicated in the Analysis, ICANN has a technical mandate, not a mandate to act as a reviewer of business plans (i.e., a venture capitalist). As such, ICANN should continue to concentrate its evaluation process on the technical, operational, and financial capabilities of applicants. The stated purpose of the TLD may be taken into account as evidence in support of other areas. A TLD whose registrants are the sausage makers of Europe does not require the same infrastructure as a TLD whose registrants are the sausage eaters of Europe. Also, the purpose may become important if an applied-for string is a trademark that is also a generic word, because the purpose of the TLD may play a role in determining the outcome of an infringement of rights objection. The stated purpose will then also be used in later right ownership disputes, if they occur.

Question 2: The criteria questions in the Draft Applicant Guidebook will be clearly marked as public or confidential for the revised Draft Applicant Guidebook.

Question 3: Recognizing that practices in different regions vary and the requirement for a process that must accommodate governments, start-ups, and well-established entities, the current Guidebook attempts to be flexible regarding the requirements for good standing. ICANN is receiving seeking further guidance from KPMG, a big four accounting firm, on how to provide appropriate flexibility in defining "proof of good standing." Provided ICANN agrees with their analysis, these further details should be included.

Question 4: Based on the Analysis, the limit of one communication for Initial Evaluation and, if necessary, one communication in Extended Evaluation, should be maintained. ICANN has determined it is the proper balancing act in preventing a prolonged review process, while allowing for certain clarifications. It is believed that the questions and criteria are sufficiently straightforward so that a competent application will require no extra communications. The allowance for one communication during Initial Evaluation and one during Extended Evaluation

is meant to balance providing for complete communications and providing a certain end date to the evaluation. In addition, the communication will continue to be made through TAS only. This will provide a standard methodology that will help organize the tasks of evaluators, as well as ensure all communications and actions are captured in an historical record.

## **Analysis**

Question 1 above asks that as ICANN acts as an evaluator of business and marketing plans, whether ICANN should place a value on the intended offerings of an applicant. ICANN has thus far refrained from focusing on these elements and instead has focused on ensuring that applicants are technically, operationally, and financially capable of running a registry. This focus is for the purpose of “preserving and enhancing the operational stability, reliability, security, and global interoperability of the Internet,” which is an element of ICANN’s Core Values. (<http://www.icann.org/en/general/bylaws.htm#I>). The stated purpose of the registry can become important for other reasons during the evaluation process. This might be the case in dispute resolution procedure where the proposed purpose of a TLD can be used to help determine if an applied-for name is a community label or might abuse a registered trademark.

ICANN primarily intends to focus on technical, operational, and financial capabilities. Additionally, the GNSO, in recommendations in its Final Report (<http://gns0.icann.org/issues/new-gtlds/pdp-dec05-fr-part-a-08aug07.htm>), emphasizes the technical and financial capabilities of the applicants, not the intended purpose of the string.

In regards to Question 2, the majority of the application information will be made public. The financial section and one question of the technical section will remain confidential. This will be clearly marked in the evaluation questions and criteria.

The final two questions pertain to both TAS and the evaluation period. For Question 3, the definition of “proof of good standing” should be expanded. How a newly formed entity would be able to provide this information can be discussed (i.e. proof of good standing for the individual entities that make up the new entity). The current definition was derived through discussion with outside consultants, Deloitte and Gilbert & Tobin, as part of a broader scope of work. Work will continue to determine if the current wording can be improved, taking into account the public comments. The test of good standing generally requires some form of official documentation but must make allowances for both start-up entities and well-established firms and take into account variance across different cultures and regions.

Regarding Question 4, the reasoning for only one communication is to meet the objective of establishing an efficient and predictable review process. The ideal situation is that the applicant criteria are absolutely predictable and every applicant is aware of their requirements. The reality is that because ICANN anticipates receiving applications with varying attributes, the criteria cannot be designed in absolute terms. As a result, ICANN chose to avoid creating an ongoing Q&A session where evaluators “coach” an applicant into completing an application correctly. The one communication is a compromise that reduces the bottlenecking issue that would likely exist if an ongoing dialogue was allowed to occur, but does allow for some level of rectification. The requirement to have all communications made strictly through TAS is to ensure that every action and communication is captured in an historical record.

## **B. APPLICATION PROCESS: LIMITED APPLICATION PERIOD**

### **Summary of Key Points**

- Limiting the application round is an effective way to reduce the risk of over-burdening the evaluation process but leads to issues of fairness and potential gaming.
- Therefore, it is not planned to limit applications in the first round.
- Application windows designed to reduce risk of over-burdening the evaluation process raise the same issues but evaluation windows could be used in the event that many times the anticipated number of applications are received.

### **Summary of Input**

Some of the public comments suggested that ICANN follow a limited or phased implementation approach to the new gTLD program. For example, for the first round of the new gTLD process, one commenter suggested that ICANN impose a limit on both the number of applications it will accept and the number of new gTLDs that it will approve (e.g., no more than 100 applications evaluated on a first-come, first-served basis). *Go Daddy* (15 Dec. 2008). Another commenter suggested that ICANN start with processing 50 sponsored or community-based TLDs. *MARQUES* (15 Dec. 2008). Multiple application windows within each TLD round were also proposed as a way of providing a stable timeline and to avoid a “Big Bang effect” leading to resource bottlenecks and delays and uncertainties regarding future rounds. *W. Staub, CORE* (26 Nov. 2008).

Many other commenters suggested that ICANN phase the start of the program, including limiting the initial application period to certain types of applications (e.g., community-based, sponsored, IDN ccTLDs) and assessing some preliminary results before moving forward with a broad launch of the gTLD program.

See, e.g. Open community-based gTLDs first to speed process *PuntoGal* (13 Dec. 2008). Only community-based gTLDs with registrant verification mechanisms should be allowed before better rights protection mechanisms are developed for unrestricted gTLDs. *Rodenbaugh* (16 Dec. 2008). Prioritization system should be announced for orderly review of gTLD applications; it is more important that the application and approval process for new gTLDs be done right than be done fast. *ICA* (16 Dec. 2008) Consider scaling back to only those IDN or geographic-based gTLDs supported by a significant community demand. *U.S. COC* (15 Dec. 2008); *CSC* (15 Dec. 2008) Do a phased rollout of sponsored gTLDs and IDNs first; need to develop more safeguards before broader rollout. *ITT* (15 Dec. 2008) Reconsider and delay program pending more global demand studies, and/or scale back the launch to only “sponsored” community TLDs that have broad support from the affected community. *News Corporation* (16 Dec. 2008); Allowing a round of IDN ccTLDs first would remove bulk of current calls for expansion and allow new gTLD processes to be more thoughtfully developed. *MarkMonitor* (15 Dec. 2008); *P. Tattersfield* (15 Dec. 2008).

While studying economic justification and risks for broader gTLD program, ICANN may proceed with safe, orderly phased rollout of “fast track” country code IDNs and community/sponsored domain names provided that appropriate safeguards are in place. *AT&T* (15 Dec. 2008); *USTA* (15 Dec. 2008); *NAM* (15 Dec. 2008). Expansion of the domain name space should be limited to market differentiated, sponsored (“community-based”) gTLDs. *INTA* (15 Dec. 2008). ICANN

should first focus on IDN TLDs with documented demand from users that employ non-ASCII scripts. If after the IDN TLD launch ICANN can show a strong need for more gTLDs only then should it consider them. *Time Warner* (15 Dec. 2008). Supports fast track ccTLD IDNs introduction but in general while IDNs are promising they need more study before their deployment. *INTERNET COMMERCE COALITION* (15 Dec. 2008)

### **Issues**

The comments suggesting that ICANN first conduct a phased or limited application period for the gTLD program raise the following key questions:

1. Is there a way to fairly limit the application round and thus limit the number of new gTLDs added to the root?
2. Is there a way to divide the rounds into different windows to increase efficiency in evaluating the applications?

### **Proposed Position (for this version of the Guidebook)**

The commenters' suggestions that ICANN conduct phased or limited application periods relates to both the issue of DNS stability – i.e., whether the DNS will scale to handle all of the new gTLDs, how many applications can be processed competently and quickly, and also the issue of fairness, in allowing a certain group to precede all others.

As stated in the DNS Stability section of this summary and analysis, the ICANN Board has requested that SSAC and RSSAC jointly conduct a study that takes into account the combined impact on the DNS of new TLDs (country code and generic), IDNs, IPv6 records, and DNSSEC. The final resolution of the key questions above regarding phased or limited application periods will be informed by the outcome of that study.

The other concern mentioned in comments related to ICANN's ability to process applications in a consistent and efficient manner. ICANN is undertaking preparations for operational readiness as the opening of the application round approaches. Best efforts will be made to ensure that sufficient resources are allocated to the program that anticipates processing several hundred applications but is modeled in a way to scale upwards quickly if necessary.

While limiting the number of applications was carefully considered as an effective way to "guarantee" program robustness, issues of fairness will inevitably arise if a first round is limited to a certain group; whatever group is given preference will enjoy a first-movers advantage. In addition, preference to a certain group may lead to "gaming" activity as applicants attempt to qualify under whatever limiting factors ICANN attempts to introduce.

In summary, there does not appear to be a way to fairly limit rounds and the efficiency gains from a smaller application pool are not a significant enough advantage to alter this position. Pending the outcome of the DNS study, at this time no change is being recommended that would establish a limited application period; the round will not be limited and any and all qualified applications would be accepted.

### **Analysis**

Regarding question 1, ICANN concluded that there does not appear to be a way to fairly limit the number of applications in a round. A first-come, first-served process would encourage the development of automated computer scripts to apply as soon as the application period opens, rewarding those who enter the most applications or those that could write the best script. ICANN concluded that it was preferable to refrain from establishing limits that would encourage such behavior and instead consider any qualified application.

As some of the comments suggested, there are ways to limit an application round – e.g., by brand owners, IDNs, geographical names, non-controversial names, sponsored or community-based names, among others; however, limiting the round in any significant way inevitably raises issues of fairness. Whatever group is allowed to apply first will naturally have an advantage. In addition, limiting rounds to certain groups also creates potential “gaming” incentives and concerns – *i.e.*, applicants taking all steps within their power to qualify under whatever methodology is established. A number of parties isolated IDNs as a candidate for an early application round. However, the same fairness issues exist, as well as the potential for ASCII squatting (registering an IDN TLD in an early round and then attempting to claim the ASCII equivalent in a later round).

Given the difficulty in introducing limited rounds because of fairness issues and the threat of “gaming,” it makes it very difficult to justify limited rounds because of efficiency gains in evaluations.

Regarding question 2, setting up multiple application windows in a single round might create a first-movers advantage similar to what would exist in a limited application round. For the same reasons indicated for not limiting the round, application windows would not be suitable for considering different “types” of applications first or considering applications on a first come, first served basis. ICANN will take measures to allocate adequate resources to handle evaluations in a predictable and efficient manner. However, setting up “evaluation windows” might be a suitable way to address a situation where, say, ten times the number of applications anticipated are received. The evaluations might be broken into sets that are selected by lot. If there are contending applications, then all contenders would be grouped into the same set.

Background Resources: Two previous limited new gTLD rounds have been conducted (2000 - <http://www.icann.org/en/tlds/app-index.htm> and 2003 <http://www.icann.org/en/tlds/stld-apps-19mar04/>) which were used as a “proof of concept.” These rounds lead to the successful addition of 13 new gTLDs into the root. Based on the success of the two “proof of concept” rounds, the GNSO developed the new gTLD Policy Development Plan (<http://gns0.icann.org/issues/new-gtlds/new-gtld-pdp-28mar06.pdf>) and eventually the GNSO Final Report on new gTLDs (Part A: <http://gns0.icann.org/issues/new-gtlds/pdp-dec05-fr-part-a-08aug07.htm> and Part B: <http://gns0.icann.org/issues/new-gtlds/pdp-dec05-fr-part-b-01aug07.htm>).

A cautious, limited expansion of the DNS was warranted to better understand the impact of additions to the root zone. Towards this purpose, an ICANN staff paper on root zone impact of new TLDs was published for public comment in February, 2008 (see <http://icann.org/topics/dns-stability-draft-paper-06feb08.pdf>). The paper came to the conclusion that “there is not currently any evidence to support establishing a limit to how many TLDs can be inserted in the root based on technical stability concerns.” As noted above, ICANN has requested additional study of not only the impact on the DNS of new gTLDs, but also IPv6 records, DNSSEC, IDNs, and new ccTLDs. Further detail can be found in the DNS Stability – Security and Stability paper.

## **IV. FINANCIAL CONSIDERATIONS**

### **Summary of Key Points**

- Significant, thoughtful comment was received regarding the Applicant Guidebook and accompanying explanatory memorandum on Financial Considerations: including proposals of alternative models.
- Annual registry fees are reduced to a \$25,000 base in the revised version of the Applicant Guidebook. The calculation of the variable fee component was simplified to 25 cents a registration.
- Recalculation of processing costs resulted in no change to the \$185,000 processing fee. However, a refund mechanism is clearly defined for applicants that voluntarily exit the process.
- Handling surplus funds, if they occur, is discussed.

### **Summary of Input**

Cost Recovery Basis-Application Evaluation Fee. Considering the fact that the new gTLD process is supposed to be implemented on a cost recovery basis, why is it that an applicant that applies for more than one string is required to pay the same evaluation fee for each application? Otherwise, this will result in applicants for multiple gTLDs subsidizing other applicants' fees. *C. Gomes* (18 Nov. 2008).

Application Evaluation Fee-Impact on Developing Nations. Paying \$185,000 as an application evaluation fee may not be possible for a very large number of businesses and communities living in under-developed and developing countries. ICANN may divide the evaluation fee criteria on the basis of developed, under-developed and developing countries especially in context with a community-based gTLD. This would not only encourage more participation for new gTLDs but will also improve the end-user confidence in ICANN's regarding promoting internet resources. *N. ul Haq, Pakistan Telecommunication Authority* (14 Dec. 2008).

Brand Owner Costs-Defensive Registrations. USTA is concerned about the costs associated with the new gTLD process. They are concerned that brand owners will be forced to defensively register to protect their brands. *USTA* (15 Dec. 2008).

More Transparency Needed. Thank you for explaining the principles and high level estimation approaches that you have used to arrive at the proposed fees. It provided a good high level overview. However, in the name of transparency, I believe the internet community needs more explanation and greater visibility into the actual cost estimations and assumptions behind the application and recurring fees. This is especially important since cost recovery is the principle governing the fees. *A. Martin* (16 Dec. 2008).

Bundled Services Included in Fee Calculation. In determining the 5%, ICANN proposes to include all bundled products or services that may be offered by Registry Operator and include or are offered in conjunction with a domain name registration. This expansive definition goes well beyond any contractual terms with existing registries, and would create an unequal playing field among registry operators. *CentralNIC* (13 Dec. 2008)

Refund Details. Details on refunds are missing from the Applicant Guidebook, and if the community has to wait until the Final version of the Guidebook, it may be too late to comment. *K. Koubaa, Arab World Internet Institute* (8 Nov. 2008).

Fee Level; Deterrence Factor. The RFP presents a reasonably well-detailed case justifying the \$185k Evaluation Fee. We agree that the process is unique and unprecedented, with considerable scope for unexpected costs. In our experience there will almost certainly be unanticipated complexities, therefore, we think it is prudent to have a fee that is high enough to cover these costs. On the balance we think \$185k is an acceptable, one-time fee for serious applicants. We recommend that refunds only be provided in rare cases and that the amount of refund be determined on a case by case basis. *Demand Media* (17 Dec. 2008).

To deter frivolous applications, the gTLD evaluation fee should be higher for non-community-based applications (e.g., \$500,000; do not allow payment by credit card); excess fees can be used to reduce the dispute resolution fee; need to clarify fees relating to dispute resolution and keep low the barriers for filing objections. *Bank of America* (15 Dec. 2008). *SIFMA* (12 Dec. 2008). *G. Kirikos* (24 Nov. 2008).

Fee Structure Transparency. ICANN must articulate a clear rationale for the proposed fee structure as well as a transparent mechanism, that includes community agreement, for the disposition of excess revenues, should there be any, given ICANN's status as a non-profit entity. *U.S. DOC-NTIA* (18 Dec. 2008); *CentralNIC* (13 Dec. 2008). *A. Martin* (16 Dec. 2008); *eCOM-LAC* (8 Dec. 2008); *C. Gomes* (18 Nov. 2008); *SIDN* (10 Dec. 2008) ("cost recovery" goal is not supported by high fees charged which create entry barriers and limit innovation). *J. Neuman* (26 Nov. 2008) (fee/cost recovery issues require explanation). *V. Bertola* (19 Nov. 2008). *D. Younger* (5 Dec. 2008) (cost recovery policy if used needs to be applied uniformly and subject to community consensus; ICANN overfocuses on commercial and its own revenue streams and has not addressed fee and cost concerns of needy and noncommercial applicants or needs of developing world). *Hacker* (14 Dec. 2008) (suggests changes to fee structure). *MARQUES* (15 Dec. 2008). *FairWinds* (15 Dec. 2008); *ANA* (15 Dec. 2008) (how do the fees affect existing gTLD fee structures).

## Issues

There are many comments regarding financial considerations for the new gTLDs. Many comments expressed concerns about the size of the fees, while others expressed satisfaction with the underlying support and methodology for the calculation of the \$185,000 evaluation fee. (Note: all \$ amounts are expressed in US Dollars throughout this document.) Many comments expressed concern with the amount, the structure, and the lack of clear support for the annual registry fee. The comments can be grouped into the following issue areas:

- 1) Fees may be too high. Many comments suggested that both the \$185k Evaluation Fee and the annual registry fee are too high for various reasons such as:
  - Applicants have financial hardships and can't afford the fees (e.g., some in developing nations),
  - Applicant's have a business model that is not aligned with paying such fees. (e.g., community based, not-for-profit, down-stream revenue)
  - Applicant's have applications which are believed to cost less to process than other applications (e.g., applicants who apply for more than one string).
  - Cost estimates are too high.

- Program development costs should not be included especially if already covered in budgets from prior years.
  - Some comments expressed concern with the uncertainty of the amount or even the uncertainty of the possibility of further fees such as registry services review, dispute resolution, and comparative evaluation fees or thought the costs should be included in the \$185k Evaluation Fee.
- 2) Need more support for the fees. Although many comments supported the \$185k evaluation fee amount and the methodology used to determine the evaluation fee, some requested more information on the details of the evaluation fee development. The annual registry fee development was frequently mentioned as not being well supported in the documents provided.
  - 3) Annual registry fee structure is problematic as described. Many comments focused on the challenges of a “% of revenue” structure for the annual registry fee and reiterated that the minimum registry fee level was problematic as well. Others commented that the structure as proposed would be a challenge to registries in the start-up phase, or community registries.
  - 4) Clarify refunds. Many comments expressed the need to know the amounts and methodology of refunds available to applicants. This information was not covered in the initial cost considerations paper.
  - 5) Clarify how surplus funds will be handled. Several comments requested more clarity on how surplus funds, if any, will be handled.

## **Analysis**

### **1) Fees may be too high.**

As described in the cost consideration paper <http://www.icann.org/en/topics/new-gtlds/cost-considerations-23oct08-en.pdf>, the determination of the new gTLD evaluation fee is based upon the following principles:

- The new gTLD implementation should be fully self-funding (costs should not exceed fees; existing ICANN activities regarding technical coordination of names, numbers and other identifiers should not cross-subsidize this new program).
- The new gTLD policy requires a detailed and thorough implementation process to achieve its goals; this process is inherently costly.
- Since this is a new program, it is difficult to predict costs or volumes with certainty. A detailed costing process has been employed, and costs are in line with historical precedent.
- If all cost-related estimates are accurate, there will be no net increase to ICANN’s funds as a result of evaluating new gTLD applications; fees will just equal costs. After some time, there will be a careful assessment on whether the actual costs exceeded the estimates (shortfall) or whether the costs were less than estimated (surplus). If there is a surplus, the excess funds will not be used for ICANN’s general operations, but rather will be handled in accordance with community consultations.
- In addition to the one time evaluation fee, other fees will be paid directly to providers based upon the requirements of certain applications for technical issues or disputes.

- For those new gTLD applicants that are delegated a registry, annual fees will be assessed in accordance with contract terms and the overall ICANN budget process.

Although the evaluation fee, at \$185k, may be burdensome for certain organizations that are considering applying for a new gTLD, the evaluation fee was developed based upon a policy of revenue-cost neutrality, conservatism, and a detailed cost estimating exercise. The impact on a specific applicant or a class of applicant, by policy, is not a factor in the development of the evaluation fee. When specifying the fee, it was also understood that new registries would require additional investment of, at a minimum, \$500k in addition to the application fee to begin registry operations so that, by some measure, the fees are not an unreasonable fraction of the entire investment. It is also anticipated that with time, greater efficiency and greater certainty, evaluation fees would likely be reduced over time. It may make sense for entities to wait until subsequent TLD rounds to make an application.

Some applications may have lower processing costs than others; they may not require extended review; they may not require technical or other reviews, and they may not require much staff or consultant time to answer questions and process the evaluations. Some, such as organizations with multiple strings, may not need discrete applicant evaluations repetitively for each string. Despite all of the possible reasons a particular application may cost less than another application to evaluate, it is difficult, if not impossible, to determine which applications will require more or less resources. Applications fees are set based upon the estimated average cost of all applications based upon principles of fairness and conservatism. Singling out certain applications or types of applications as lower cost than others is contradictory to the principles of fairness and conservatism.

The GNSO policy recommendations allow for different pricing for different applications. Although the evaluation fee is proposed to be \$185k in all cases, individual applicants may pay different amounts due to refunds and due to other fees. Applicants that choose to withdraw an application can pay significantly less. If an application requires dispute resolution or extra technical evaluation, the application may pay significantly more.

ICANN is a not for profit organization and is dedicated to deliver its services as efficiently as possible. ICANN is not established to grow revenue. The \$185k evaluation fee is based upon the estimated costs associated with the new gTLD program. ICANN will continue to evaluate the cost estimates. If further research or adjustments to the evaluation process or cost estimating methodology changes the costs estimated to evaluate the applications, suggested changes to the pricing will be proposed.

If the actual costs for evaluating the applications end up being less than the \$185k Evaluation fee, then the surplus funds will not be used as part of ICANN's general funds. Instead these funds will be distributed in accordance with consultation from the ICANN community.

## 2) Need more support for the fees.

As described in the cost consideration paper, the \$185k evaluation fee was based on detailed analyses of specific tasks and steps needed to be performed during the evaluation. These costs will be described in additional detail in the next version of the cost considerations paper. Key questions that will be addressed include:

- What are the activities that need to be performed for each phase of the application evaluation?
- How are historical costs factored into the development costs?

- What is the impact of the assumptions used for the number of applications?

### 3) Annual registry fee structure is problematic as described.

The initial draft of the Applicant Guidebook posted on 24 October 2008 proposed that annual registry fees for new gTLDs would be the greater of \$75k or a percentage (suggested 5%) of the registry transaction revenue. These initial fees were based upon the general terms and practices with the existing ICANN contracted gTLD registries. Although the annual registry fees are not to be based upon the direct costs to support the new gTLD program or the costs to support gTLD registries in general, the \$75k fee roughly reflects the costs of a half to three quarters full time equivalent staff member or contractor.

The percentage of revenue structure suggested in the first draft of the guidebook was developed to reflect the impact of a registry on ICANN's operations. Thus a registry with large revenue streams could require more of ICANN's resources for support, and a registry with more revenue could more ably support ICANN's operations than a registry with less revenue. The five per cent number was selected based upon the range of fees paid by current gTLD registries.

Going back to ICANN's multi-year financial review in ICANN's Delhi meeting, it has been anticipated that ICANN's future fee structure will create a financial surplus when the new gTLDs are operational. Thus, it was forecasted that fees for existing registries/registrar and new registries/registrar could be reduced in future budget cycles to reduce or eliminate excess surplus. As documented in the Delhi meeting, future financial years were assumed to have fee reductions, but the specific source of that reduction was not determined (registrar, registry, other).

Many of the comments indicated that the size of the proposed new gTLD annual registry fees would, in effect, prevent diverse business models for new gTLDs, and effectively raise the question should some of the future fee reductions be recognized in the start-up phase of these new registries.

Many comments raised concerns with the percentage of revenue structure including:

- How does one determine revenue? Is it the revenue of the subsidiary running the gTLD? Is it the revenue of the entire organization? How does one adjust if unrelated business revenue is included? How does it adjust for premiums charged for other services?
- How does one verify the revenue numbers? How would audit features/rights be established?
- How does one capture revenue from auctions?

Other revenue structures were considered such as that considered in the chart below:

## Fee Structure – Alternatives for Registry Fees

Structure	Description	Advantages	Disadvantages
Flat Fee	One set amount	Simple	High volume (high costs) not captured
Tiered	Stepped fees for levels of transaction	Fairly simple	Unfair within a tier
Percentage	% of registry's revenue, net income, or other measure	Successful registries pay fair share	Revenue difficult to measure
Transactions	Fees charged for each domain contracted (transaction year)	Familiar. Similar to registrar and most registry contracts	Reporting complexity. Fluctuations not predictable.
Hybrid	Transaction fees with a minimum "floor" fee.	Could accommodate traditional and new model registries	
Age	Tiered pricing based upon years established	Allows startups to get established.	Contrary to ICANN's cost basis pricing. Is age fair measure of success
Type of gTLD	Tiered pricing based upon community or open TLD	Reflects historical trends and alliances	Fairness

2/14/2009

2

Based on comments received, the criteria used to evaluate a proposed fee structure should better fit with start-up and community registry needs, encourage diversity of registries, be simpler to determine than a revenue-oriented approach, yet maintain consistency with ICANN's current agreements in terms of overall fee structures. Given that future fee reductions have been forecast by ICANN, one consideration now should be to reduce new gTLD registry fees, while assuring, in general, costs associated with them can be covered.

#### 4) Clarify refunds, amounts and methodology.

The first draft of the new gTLD applicant guidebook, posted on 24 October 2008, mentioned that refunds of a portion of the \$185k evaluation fee could be refunded in certain situations depending on the point in the process at which the withdrawal of an application is made. The draft also mentioned that details would be provided when the application process is launched.

Details of the refund amount and timing are to be posted as part of the next draft of the applicant guidebook. In general, the refunds are roughly based on the principle that all anticipated costs are on expended on an application that is withdrawn before final processing is completed. It is also designed to encourage unsuccessful or problematic applications to be withdrawn. The refunds allow an applicant to withdraw an application any time prior to completion of the evaluation. The amount of the refund will vary depending upon the stage at which the application has been evaluated.

#### 5) Clarity on how surplus funds, if any, will be handled.

In order to comply with the principle of being fully self-funding and avoid cross-subsidy of the new gTLD program by existing ICANN registry or registrar fees, the fees for evaluation are to be segregated and to be used for the new gTLD program only. They are not for general purpose ICANN uses. This requires two important finance actions to ensure compliance with the

revenue-cost neutrality principles as well as adherence to ICANN's principles of accountability and transparency:

- 1) Report on cost accounting. There must be careful cost reporting performed that captures all relevant costs for the new gTLD program. As described in the cost evaluation paper, the \$185k evaluation fee was developed based upon new gTLD development costs initially estimated at \$12.8 million (and assumed to be amortized over the first several hundred applications) plus fixed and variable application evaluation costs, initially estimated at \$100k per application. Each of these costs and the underlying details of the costs are to be captured and presented in an easily understood and reviewable manner.

At some point in the future, currently thought to be in two to three years, the costs will be collected and the new gTLD application round will be deemed closed. The total costs expended will be subtracted from the total of all fees including application and evaluation fees collected by ICANN, less any refunds paid out. This net amount, if positive, will be the new gTLD application round surplus. If negative, the net amount will be the new gTLD application round deficit. If there is a deficit, future rounds will pay a portion of the fee.

- 2) Dispose of surplus. If the net amount from the new gTLD application round is a surplus, the funds will not be contributed to the general ICANN funds. Instead they will be disposed of in a manner consistent with the community's feedback and the policy recommendations. ICANN's multi-stakeholder model for decision making will be employed to ensure that all decisions regarding the underlying guiding principles, amounts, recipients, timing, and manner of disposition of surplus funds, if any, will be handled in accordance with the communities' wishes. Since the amount of any possible surplus is difficult to forecast (other than the current financial forecast of zero), it is hard to determine in advance how such a surplus should be used. Undoubtedly, this would depend in part on the magnitude of any surplus.

### **Proposed Position (for this version of the Guidebook)**

#### 1) Fees may be too high.

##### Retain gTLD Evaluation Fee of \$185k.

The proposed gTLD Evaluation Fee remains \$185k. No additional cost estimates or policy decisions indicate that the fee should be altered. However, the cost estimates will continue to be evaluated as the launch date approaches. If any significant cost estimates are altered due to more information becoming available, then the fee could be adjusted accordingly.

No discounts will be made available in this round of the new gTLDs as there is concern with gaming and possible added complexity in the first round. Discounts may be considered in future gTLD rounds.

##### Reduce gTLD annual registry fee.

Reduce gTLD annual registry fee to base amount (not minimum) to \$25,000 per year (\$6,250 per quarter). For registries with 50,000 or fewer second-level registrations, no further fee would be charged. For registries with more than 50,000 registrations, the registry would pay \$0.25 per transaction-year. This approach better accommodates a diversity of registry models, registries

in start-up phase, and smaller community registries, while ensuring reasonably expected future costs can be covered by the fees. Volume registries will pay total fees in line with current ICANN registry contracts.

No direct support for applicants.

As noted in the cost considerations paper (<http://www.icann.org/en/topics/new-gtlds/cost-considerations-23oct08-en.pdf>) ICANN will not directly subsidize the application processing fee or other fees in the first round. ICANN will endeavor to help applicants with need to identify organizations that may be willing to sponsor or grant funds to such an applicant. A subsidy in the first round would add another layer of complexity along with other first round uncertainties. Additionally, there are potential abuses associated with subsidies that must be anticipated and protected against. These will be explored in preparation for the second round.

2) Need more support for the fees.

As described in the cost consideration paper (<http://www.icann.org/en/topics/new-gtlds/cost-considerations-23oct08-en.pdf>), the \$185k evaluation fee was based upon detailed analyses of specific tasks and steps needed to be performed during the evaluation. These costs will be described in more details in the next version of the cost considerations paper. Key questions that will be addressed include:

- What are the activities that need to be performed for each phase of the application evaluation?
- How are historical costs factored into the development costs?
- What is the impact of the assumptions used for the number of applications?

3) Annual registry fee structure is problematic as described.

The fee in the revised version of the Applicant guidebook is reduced and more direct. If the transactions are less than 50,000, the annual registry fee is proposed to be structured as

- a flat annual fee of \$25,000 (billed at \$6,250 per quarter),

If the transactions are more than 50,000, the annual registry fee is proposed to be structured as

- a flat annual fee of \$25,000 (billed at \$6,250 per quarter, plus
- \$0.25 per transaction-year.

4) Clarify refunds, amounts and methodology.

Depending upon the stage of the application's evaluation processing, refunds for 20%, 35% or 70% of the evaluation fee will be available. Refunds will be made available to applicants whose applications do not proceed through the entire evaluation process. The amount of the refund will be generally based on an amount of the estimated evaluation costs not expected to be spent on the particular application. Any applicant can apply for a refund by submitting a request for a refund along with a request to stop processing the application. Any application that has not been successful is eligible for a 20% refund. The following table summarizes each of the refunds available.

#	Description of Refunds Available to Applicants	Percentage of Evaluation Fee	Amount of Refund	Considerations
1	After public posting of strings	70%	\$130K	Applicants who perceive themselves to face considerable contention or dispute can withdraw at this point. Collect some fee from all applicants to avoid frivolous applications, and cover possible future risks of all applications.
2	After initial evaluation	35%	\$65k	Applicant has failed initial evaluation or has the same considerations as above, and recognizing some significant amount of costs have already been expended.
3	After any later phase of evaluation	20%	\$37k	Applicants who fail extended evaluation or lose may exit at this point without having spent the entire processing fee.

5) Clarity on how surplus funds, if any, will be handled.

1) Report on cost accounting: When the new gTLD round is deemed as closed, as well as periodically throughout the first-round process, all costs will be captured and reported on in a detailed and readily accessible manner. The total costs will be compared to the total fees collected, less any refunds and a report of the deficit or surplus will be posted. The report will be available for the community and will be reviewed by an independent accounting firm. (While most costs will be apparent at the “end” of the round, the full realization of risk costs may take up to three years. An estimated final cost will accompany each report.)

2) Use of surplus, if any: A process will be developed and implemented to engage the community in the disposition of the surplus, if any. This will include likely recipients of the funds as well as clarity on the principles (e.g., application of funds against future rounds), amounts, timing, and manner of disposition of the surplus funds, if any.

**Appendix: Additional Comments on Financial Considerations**

**High Cost of Fees**

Impact on non-profit groups, smaller entities, developing nations. They are also concerned that the proposed (US) \$75,000 registry annual fee is too high for a not-for-profit community registry: “Our proposal would be that community TLDs pay a small percentage of their annual surplus/profit to ICANN – up to a maximum ceiling of (US) \$10,000 per year. Should a community TLD be taken up in large volumes (on a par with strings such as BIZ) then there may be a case for a revision of the annual fee beyond the (US) \$10,000. *dotSCO* (15 Dec. 2008); *dotCYM* (15 Dec. 2008) (fees too high for community bids and fail to address possible bilingual

requirements). *PuntoGal* (13 Dec. 2008). *J. Evans* (12 Dec. 2008). *NIC Mexico* (9 Dec. 2008). *NCUC* (15 Dec. 2008) (fees too high). *M. O'Connor* (14 Dec. 2008) *Lovells* (15 Dec. 2008).

ICANN should look at impact of high fees and other financial requirements on cities. *Connecting.nyc* (15 Dec. 2008). ICANN should consider charging lower fees for smaller registries. *Anonymous*.

Should the fee requirements apply to all types of entities (for-profit and non-profit)? *Y.E. Shazly* (2 Dec. 2008).

There should be reduced fees for non-profits and associations. An association or non-profit prevailing on an objection should be reimbursed its objection costs and attorneys' fees. *ASAE* (10 Dec. 2008) ICANN should clarify whether there is an application fee waiver for humanitarian corporations. *R. Romano* (7 Dec. 2008); *N. ul Haq* (14 Dec. 2008) (adjust fees downward for developing world).

Uses of Fee Money; Flexibility. The new gTLD fees are too high (e.g. annual and application), and ICANN must state how it intends to use the annual fees to protect the stability of the Internet. *RC* (15 Dec. 2008). *MarkMonitor* (15 Dec. 15 2008) (fees are high, should be adjusted for particular circumstances). *Smartcall* (4 Dec. 2008) (allow some flexibility in operation of the application fee to allow entities more opportunity to obtain gTLD). *Arab Team* (15 Dec. 2008). *Lovells* (15 Dec. 2008).

Cost Recovery Justification Needed. Considering the fact that the new gTLD process is supposed to be implemented on a cost recovery basis, why is it that an applicant that applies for more than one string is required to pay the same evaluation fee for each application? It is clear that evaluation of the string itself is going to result in some costs but presumably most of the rest of the application would be identical and require no additional costs at all. It certainly seems reasonable that all applicants pay a proportional share of general evaluation costs to the extent that their applications are mostly unique and it is understandable that it might be impractical to have a different application fee for every applicant, but it would be relatively easy to determine portions of the application fee that could be deducted in cases where no new evaluation activity would be required. Otherwise, this will result in applicants for multiple gTLDs subsidizing other applicants' fees. *C. Gomes* (18 Nov. 2008).

*Microsoft* (Guidebook comments, 15 Dec. 2008) (ICANN should not seek to recover from applicant fees funds to cover new gTLD program developments costs (reported \$12.8 MM); an escrow system should be used for \$60K of the application fee and drawn against, with potential for some refunds; in general excess funds should be refunded to applicants).

Application Evaluation Fee-Annual Fee Impact. On Application fees, "the proposed ICANN fees serve as a significant deterrent to corporations considering whether to apply for a new TLD for their brand. Specifically, the recurring annual fee (the greater of \$75,000, or 5% of the registry transaction revenue) is high, in the light of the probability that corporate owned TLDs may not have large numbers of second level registrations, thereby causing the per domain fee to be significantly higher than currently charged by ICANN." *MarkMonitor* (15 Dec. 2008).

Application Evaluation Fee-Economic Impact. Paying \$185,000 as an application evaluation fee may not be possible for a very large number of businesses and communities living in under-developed and developing countries. ICANN may divide the evaluation fee criteria on the basis of developed, under-developed and developing countries especially in context with a

community-based gTLD. This would not only encourage more participation for new gTLDs but will also improve the end-user confidence in ICANN's regarding promoting internet resources. *N. ul Haq, Pakistan Telecommunication Authority* (14 Dec. 2008).

ICANN should announce in advance if any adult extensions will be permitted, without requiring applicant to pay \$185,000 to find out. *WMI* (13 Dec. 2008). Why not define a fee based on an envelope of domain names which makes it possible for smaller gTLDs to stay in good shape and offer stable and functional services? *ISOC*.

A project to serve a mono-lingual demographic is inherently cheaper under ICANN's draft rules, than a project to serve a multi-lingual demographic. Registry applicants should be permitted to apply for transliterations in IDNs without additional costs. *E. Brunner-Williams. ANA* (15 Dec. 2008) (how do the fees affect existing gTLD fee structures). ICANN should clarify if there is only one \$100 registration fee for each application. *INTA* (15 Dec. 2008). *Grainger* (15 Dec. 2008) (the workings of the \$100 fee for accessing the application system must be clarified).

Fee Impact on Community-Based Applicants. There are concerns that \$185,000 for the application fee is too high for community/city TLD applicants. Closer to (US) \$50,000 would be welcome. *dotSCO* (15 Dec. 2008). See also *NIC Mexico* (9 Dec. 2008). *NCUC* (15 Dec. 2008). *dotCYM* (15 Dec. 2008). *Lovells* (15 Dec. 2008). *Anonymous*.

They are also concerned that the proposed (US) \$75,000 registry annual fee is too high for a not-for-profit community registry.

Our proposal would be that community TLDs pay a small percentage of their annual surplus/profit to ICANN – up to a maximum ceiling of (US) \$10,000 per year. Should a community TLD be taken up in large volumes (on a par with strings such as BIZ) then there may be a case for a revision of the annual fee beyond the (US) \$10,000. *dotSCO* (15 Dec. 2008).

Comment: community-based cityTLDs should pay application fees not more that \$ 50,000 and not more than \$ 10,000 minimum annual fees. *dotberlin* (4 Dec. 2008).

We recognize that the application process to ICANN should be cost based, and that registrars should be contributing annually to ICANN's ongoing costs. However, the purpose of opening up the GTLD space should be to encourage a range of new TLDs that meet a range of community as well as corporate requirements. The initial application fee of \$185,000 plus the annual fee of \$75,000 may be far too high for legitimate, smaller communities (or communities of interest) who would otherwise benefit from their own TLD. ICANN should give consideration on how those community interests could be addressed, either through a discount of those fees or a special grants program for such communities. *ISOC-AU*.

Excessive Fee Impact-Proposed String: Fee Imposition Requiring Applicants to pay an \$185,000 fee for multiple transliterations of a proposed string is unconscionable. Allowing a second entity to secure the rights to a transliteration of a string is contrary to the confusingly similar aspect of the Guidebook. Allowing applicants to have the ASCII string and IDN translations would permit applicants to offer users a full package of services, and promote the stability of the internet. *R. Andruff*.

The \$185,000 application fee should permit application for more than one string (up to five in order of preference). In the alternative, if 1 string is limited per application, then unsuccessful

applicants should be given the option of participating in the second round without submitting a new application fee. *Smartcall* (4 Dec. 2008).

ICANN may consider allowing applicants to apply for up to x (x being a reasonable number like 5 for example) gTLD strings with one application with a mandate to reduce it to one after string contention check. ICANN may charge a "change fee". ICANN may charge "change fee" if such action leads to extra work for ICANN and to discourage frivolous changes. *I. Vachovsky* (16 Nov. 2008).

Multiple fees should not be charged for applications that are basically for one string (e.g. Milano and Milan; fee should not be more than \$50K) *.koln* (15 Dec. 2008).

Brand Owner Costs-Defensive Registrations. USTA is concerned about the costs associated with the new gTLD process. They are concerned that brand owners will be forced to defensively register to protect their brands. *USTA* (15 Dec. 2008). Corporations are concerned about the high application fee of \$185,000 and the \$75,000 annual fee, when they are registered names purely for brand protection purposes-there is also a high cost for those wanting to apply for their brand in multiple languages or for multiple brands in the same industry sector (e.g. brands of cars). *Melbourne IT* (15 Dec. 2008). The \$75,000 annual fee is too high for most brand owners to consider defensive registrations of TLDs, but possible for a large trade union and its membership. *E. Brunner-Williams*.

Closed gTLDs-Lower Fees/Economies of Scale. Reduce the annual fee for a "closed" gTLD for when a trademarked name has been approved, but not yet requested to be in the DNS - e.g. small holding fee \$5000 per year - allow a lower application fee for a "closed" gTLD where the applicant has a trademark on the gTLD string, as costs for reviewing and risk is likely lower. Recommend \$90,000 for "closed" gTLDs - offer a variable annual fee based on the number of approved applicants. E.g. \$75,000 per year if less than 100 new gTLDs, \$50,000 per year (100-200), \$40,000 (200-500), \$30,000 (greater than 500). This is because ICANN will obtain economies of scale with more gTLDs, and the costs of managing compliance for "closed" gTLDs will be lower (as there are no third party registrations at the second level). For "closed" gTLDs - for applicants that apply for multiple names that are trademarks for the same legal entity (e.g. product names), provide a 10% discount on application and annual fees for each additional name, up to a maximum of 50% of all fees. This can be justified as ICANN staff can have a single interface with the applicant for multiple names, and the cost of reviewing multiple applications will be lower as most of the content of each application will be the same except for the string being applied for. - allow a discount for multiple applications for names that have the same meaning in different languages (e.g. travel in Arabic or Chinese). *Melbourne IT* (15 Dec. 2008).

Single enterprise gTLDs. ICANN should adopt a tiered structure for the application, registry and annual fees, and discount fees equitably for single enterprise gTLDs ("seTLD"). Some of the fees have not been justified and seem excessive. Fees should be steeply discounted for multiple applications filed by the same seTLD application; the annual "tax" fee has not been justified and should be heavily discounted for seTLDs due to their narrow use of the registry compared with open, unrestricted gTLD registries (e.g., the .museum registries fee levels seem appropriate). *Client B* (15 Dec. 2008).

The \$185,000 application fee outlined in the Applicant Guidebook is too high. Particularly with regard to transliteration i.e. paying the same fee over again for an approved TLD in a different language. (RA)

The \$75,000 annual registry fee outlined in the Applicant Guidebook is too high (MF, DK, R1, SR, RA, AP, MB, JB, AM, IA, TH)

The \$75,000 annual registry fee: It may have the effect of restricting applicants (MF, DK, R1, SR, AP, IA)

The \$75,000 annual registry fee: the costs will be passed onto consumers (RA, AM, TH)

The \$75,000 annual registry fee: does not account for smaller communities (SR, JB)

If a new registry makes under \$1million it should be waived the annual fees (MF)

Allow non-profits to pay a percentage of the annual registry fee for the first two years of running a new gTLD (TH)  
(See *Cairo Participation Key*)

### **Need Support for Evaluation Fee**

Evaluation Fee Does Not Ensure Fair Consideration. Applicants are required to acknowledge that the initial fee of \$185,000 is paid only "to obtain consideration" of an application. Applicants are not entitled to expect that the \$185,000 fee will buy them even reasoned or fair consideration. *RyC* (6 Dec. 2008).

Transparency: Estimated First Round Applications. ICANN should provide more transparency in how it arrived at the cost estimates and fees in the new gTLD process, as well as its estimates for number of expected applications in the first round. He also recommends that ICANN be consistent in its terminology on "phases", "steps," and "tasks". *A. Martin* (16 Dec. 2008). Thank you for explaining the principles and high level estimation approaches that you have used to arrive at the proposed fees. It provided a good high level overview. However, in the name of transparency, I believe the internet community \*needs more explanation and greater visibility into the actual cost estimations and assumptions\* behind the \*application and recurring fees\*. This is especially important since cost recovery is the principle governing the fees and fairness and transparency seem to be higher priorities than cost-minimization. *A. Martin* (16 Dec. 2008).

Fees need to be reflective of ICANN's true costs. *NeuStar* (15 Dec. 2008).

Expected quantity of applications: Because your cost model depends significantly on this number, can you describe in detail your data points and sources for your 500 applications estimation, especially the "report from a consulting economist" There is some inconsistency and I am slightly confused with your use of the terminology of "phases," "steps," and "tasks." (See Pg 8, "Expected value is determined by estimating the likelihood that each of the 75 steps will actually be executed for the pool of applications, then multiplying that likelihood times the cost."). This leads me to the question: at which of these levels (either phases, steps, or tasks) do you assume and assign probabilities that the application would pass through. For example, did you assume 80% of applications would pass through the Initial Evaluation step, or did you get more granular and assign probabilities at the task level where appropriate? Can you provide the internet community with the full list of tasks, as well as your assumptions with regard to what probabilities you assigned to each task, which you consider predictable? How are efficiencies factored into the accounting of individual tasks or steps? Presumably certain steps would not take the fully estimated time if repeated for all 500 applicants or done in batches? Please

explain. At what points in the application process (and which individual tasks) are you using consultants whose hourly rates are presumably more expensive than those of internal staff? *A. Martin* (16 Dec. 2008).

Cost Basis for Single Company gTLD Registry. This reasoning does not apply to company registries without registrar model, the Charles River Model I, as the TLD operator can define the cost of a registration to be zero, rendering percentages ineffective. However, it also seems inappropriate to have higher charges for large number of second level entries as they will not cause additional work for ICANN. To prevent applicants that wish to copy the .com model from applying for this category, restrictions must be defined. Category C domains have to be registered for free and services associated with C domains may not generate revenue for anyone except the operator. I would like to reiterate our offer of support in working on this important question by whatever means you consider helpful. We can think of no more important part of the guidebook to get correct than this, as without the .org revenue, or the NANPA revenue, the unrestricted "stars" of the 2000 new gTLD round would be economic failures, *M. Faure, CORE.*

Cost Basis-Evaluation Fee: The fees associated with the proposed TLD submission process seem to be the least coherent portion, yet this proposal section has the most justification. The initial submission fee of \$185,000 is one example of the incoherency. The fee is intended to go toward ICANN's operational costs. However, the proposal does not identify which operational costs are currently covered. Are salaries, services, and base overhead currently not being funded? *Hacker* (14 Dec. 2008).

ICANN should provide more details on the costs and fees associated with each type of Extended Application described in 2.2. *NICMexico* (9 Dec. 2008).

ICANN needs to be more specific regarding its fee structure. *BITS.*

### **Need Support for Annual Registry Fee**

Equitable Issues. Why should the new gTLDs pay \$75,000 during their start up periods when the following existing TLDs all pay \$10,000 or less -- .cat, .jobs, .coop. aero, .museum, and .travel? *CentralNIC* (13 Dec. 2008). What is the basis for the fee of the greater of 5% of transaction revenue or \$75,000? Please provide more explanation and detail regarding the principle of having this fee be the same across all new TLDs. Is this to cover only variable costs? How many TLD are assumed to be designated (how many applications make it through the entire process? What type of services are you assuming you will provide? Do you assume you will provide the same level of service that will require same amount of staff labor or technical investment for each type of TLD? Won't some, for example corporate trademark TLDs used for internal purposes, require significantly less work on the part of ICANN? *A. Martin* (16 Dec. 2008). The annual fee is too high (should not be more than \$25K). *.koln* (15 Dec. 2008).

Cost Recovery Analysis. ICANN states that the application fees are calculated on cost recovery only. The 500 applications that ICANN itself estimates to be submitted in the first round, at \$185k per application, will mean a \$ 95M revenue for ICANN. This roughly equals 1000-1500 man years of work (or 300 to 500 man years when consultants are used). First of all, it seems unrealistic to assume that all preparatory work done so far, together with the manpower necessary to evaluate the five hundred applications will take 100 persons ten years, so the goal of "cost recovery only" does not seem to be supported by fees charged. *SIDN* (10

Dec. 2008). *Microsoft* (Guidebook comments, 15 Dec. 2008) (ICANN has not justified the annual \$75K registry “tax” fee).

### **Fee Structure – Annual Registry Fee**

Unequal Impact. In determining the 5%, ICANN proposes to include “all bundled products or services that may be offered by Registry Operator and include or are offered in conjunction with a domain name registration.” This expansive definition goes well beyond any contractual terms with existing registries, and would create an unequal playing field among registry operators. *CentralNIC* (13 Dec. 2008).

ICANN should consider charging lower fees for smaller registries, and should consider a maximum fee in the event that the variable component results in an unexpected windfall to ICANN. In any event, the Guidebook should be revised to clarify that the 5% threshold does not apply to non-domain related registration services or revenue. *MarkMonitor* (15 Dec. 2008).

Clarifications Needed-Cost Recovery and Revenue. Section 6.1 states that the average price of registrations “include all bundled products or services that may be offered by Registry Operator and include or are offered in conjunction with a domain name registration”. 1. Please explain exactly what was meant by ICANN in this statement. 2. Please explain how this relates to ICANN collecting fees from registries as a “cost recovery” mechanism which was cited as the purpose of collecting fees. 3. Please explain how this relates to ICANN as a non-profit organization as opposed to a for-profit revenue sharing arrangement. 4. Please explain why ICANN is not protected with a minimum as it relates to cost recovery. In other words, in most for-profit commercial arrangements, there is EITHER a minimum OR a rev share but not both. It appears that ICANN wants to have “it’s cake and eat it too.” 5. How does this comport with the GAO study on ICANN several years back which talked about ICANN's cost recovery mechanism as opposed to taxation on income? *eECOM-LAC*.

The GNSO policy on new gTLDs recommends that ICANN take a consistent approach to registry fees, but in no way mandates that ICANN impose a one-size-fits-all model. Registry operators strongly reject this model. The proposed mechanism seems to abandon any cost-recovery obligations and, in the end, amounts to a revenue share. *RyC* (6 Dec. 2008).

In addition, ICANN has also not shown why it deserves five percent of any fees generated by services that may be completely unrelated to the domain name registration other than perhaps that they are offered as part of a package. *Neustar* (15 Dec. 2008).

Registry Pricing. Pricing is not a stability or security issue and thus not within the bounds of the picket fence. It is a matter on which each registry is free to agree via contract, but it is not an appropriate matter for Consensus Policy. To the extent registry fees depend upon pricing by registries, there is no justification for calculating such prices on the basis of all bundled products or services. *RyC* (6 Dec. 2008).

### **Fees, as Proposed, are Reasonable**

On the Application fee, Demand Media finds it to be an acceptable, one-time fee for serious applicants. They note that ICANN should spend surplus fees in a way that promotes and assists new gTLDs and reductions in fees for new gTLDs. The RFP presents a reasonably well-detailed case justifying the \$185k Evaluation Fee. We agree that the process is unique and unprecedented, with considerable scope for unexpected costs. In our experience there will

almost certainly be unanticipated complexities, therefore, we think it is prudent to have a fee that is high enough to cover these costs. On the balance we think \$185k is an acceptable, one-time fee for serious applicants. *Demand Media* (17 Dec. 2008).

### **Clarify Refunds—Amounts and Methodology**

Refund Details Needed. Confirming and publishing a complete table of fees including details of refunds as soon as possible *IPC, COA*. Will a refund will be granted if ICANN determines that an applied for string is too similar to a Reserved TLD String [or an existing TLD]. In addition, she asks if it is possible to get a pre-application determination from ICANN on whether a proposed string would be too similar to a Reserved TLD string. *F. Hammersley* (24 Nov. 2008).

Details on refunds are missing from the Applicant Guidebook, and if the community has to wait until the Final version of the Guidebook, it may be too late to comment. *K. Koubaa, Arab World Internet Institute* (8 Nov. 2008).

The statement that refunds may be available to applicants who withdraw at certain stages of the process is too vague. A specific refund policy with guidelines that applicants can be aware of up front would be a very good idea. *C. Gomes* (18 Nov. 2008). ICANN should provide specifics of the refund policy in the next round of RFPs. *CentralNIC* (13 Nov. 2008).

Competing Applications; Withdrawals. If multiple applicants apply for the same gTLD .example, obviously only one applicant can be awarded with the gTLD. Will the other applicants receive a refund or a partial refund or be able to use the application fee to apply for an alternate or different gTLD? *B. Gilbert*.

It is desirable for all parties that an application facing opposition or contention can be withdrawn as gracefully as possible. To achieve this, applicants must be able to apply in a context where the possibility of withdrawal is a reasonable option. They must also be able to withdraw without losing face and without a substantial monetary loss. Negotiations between contenders should be encouraged, and their outcome should not be affected by the financial burden of a failed application. Finally, ICANN should facilitate withdrawal before any money has been spent on evaluation or objections. Full proposal made. *W. Staub, CORE*.

Refund Policy and Speculative Filings. We understand the motivation for those who want the RFP to provide an explicit promise of partial refund, or some form of graceful withdrawal period. In practice, however, any commitment by ICANN of this nature will cause ICANN to be inundated with a very large number of speculative proposals. We recommend that refunds only be provided in rare cases and that the amount of refund be determined on a case by case basis. *Demand Media* (15 Dec. 2008). The Guidebook states that, "ICANN reserves the right to reject any application that ICANN is prohibited from considering for a gTLD under applicable law or policy, in which case any fees submitted in connection with such application will be returned to the applicant." CADNA believes that the application fee itself, if nonrefundable, can deter attempts to register frivolous TLDs. *CADNA* (15 Dec. 2008).

Under 1.5.5, refunds should not be available. Applications for a new gTLD are a serious matter, and shouldn't be a game of trial and error, with refunds if unsuccessful. Section 3's refund policy is very unclear, and in particular seems to leave the door open for full refunds in all cases of refusal. It must be made clear that full refunds should not be the norm by tweaking the language. *G. Kirikos* (24 Nov. 2008).

Clarity on how surplus funds, if any, will be handled.

Articulate a clear rationale for the proposed fee structure as well as a transparent mechanism, that includes community agreement, for the disposition of excess revenues, should there be any, given ICANN's status as a non-profit entity. *US DOC-NTIA* (18 Dec. 2008). Is that already decided that ICANN is going to spend it or can it eventually be used to reduce registration fees for detailed deregistrants in general? *G. Kirikos* (24 Nov. 2008).

Evaluation Process – Financial considerations

Under 1.2.3 (5), Demand Media asks for clarification on funding of on-going operations in the event of registry failure. *Demand Media* (17 Dec. 2008).

**Other Fees**

Please specify if there are any additional costs after passing initial evaluation and clearing all objections (if any), prior to the TLD been added to the root zone. *NIC Mexico* (9 Dec. 2008).

RSTEP Review Fee. What is the basis for a \$50,000 RSTEP review fee? What criteria will be applied to determine whether an applicant will be required to pay additional fees and when will these fees need to be paid? An excessive fee for new registry services will discourage innovation and competition in providing services for registrants, users and the community as a whole. *C. Gomes* (18 Nov. 2008).

The RSEP process supports ICANN's core functions, and should be treated as an integral part of ICANN's operations, and not as an adjunct, pay-as-you-go service. It imposes a fee on innovation, creates a free-rider problem, and to the extent that registries with limited resources (i.e., smaller, community based registries) are the source of innovation, it reduces the likelihood that the community will enjoy the benefit of such innovation. Why do the Registry Operators have to pay for the RSTEP process under the new agreement? *RyC* (6 Dec. 2008).

Will an extended review by the RSTEP entail an additional fee? Is it possible that the RSTEP might not be able to respond in a timely manner? If so, how would applications be prioritized and how would communications with affected applicants occur? *C. Gomes* (18 Nov. 2008).

Extended Evaluations. Why are requests for extended evaluations only allowed in four circumstances? What if ICANN gave applicants the option of extended evaluations in other areas at their expense? *C. Gomes* (18 Nov. 2008).

The objection filing fee. I find it morally wrong to even suggest an objection filing fee. I am of course talking about the rights of those that haven't got the money. Are ICANN telling them that they don't have any rights. Remember that they didn't ask for there rights to be violated. If anything. This fee should be funded by the evaluation fee. If you do not take this into account. Then I'm afraid that you are going see a lot of, later one, lawsuits. *A. Rosenkrans Birkedal* (10 Nov. 2008). Per the draft, in situations where an objector files a protest, both the objector and the applicant must pay a fee to cover the costs of resolution (i.e. "Objection Filing Fees"). Once ICANN resolves the objection, ICANN will refund the fees of the successful party paid. We suggest ICANN clarify how it will handle the requirements for filing fees in situations wherein it consolidates two or more objections. It is not clear if each objector must pay a full fee or if ICANN will divide the Objection Filing Fee equally between the each "consolidated" objector. *BITS*. Requiring the applicant to pay a fee every time a response is filed seems excessive and also could be administratively challenging in terms of paying and collecting fees. Will dispute fees be reduced when objections are consolidated? *C. Gomes* (18 Nov. 2008).

The total sum of the fees should cover all forms of the conflict resolution. Individuals wishing to voice opposition to a TLD should not be required to submit any fees. What is the fee for extended review? (If it's not decided yet, why not, and when will that be decided)? *Anonymous*. ICANN should consider small economies when the dispute fees are finalized. *F. Purcell* (6 Nov. 2008).

### **Processing of Fees**

We do not believe a six figure Evaluation Fee should be payable by credit card. A serious applicant will have the funds on hand to make this payment. *Smartcall* (4 Dec 2008). It is ridiculous that ICANN would even consider payments by credit cards to be acceptable, given the ability of people to do chargebacks months after a transaction. Only irrevocable forms of payments should be allowed, namely wire transfers. *G. Kirikos* (24

## **V. DNS SECURITY AND STABILITY**

### **Summary of Key Points**

- Consideration of issues where the introduction of new TLDs might affect DNS stability and security should continue to be studied.
- This is especially true given the near coincident introduction of new gTLDs, IDNs, DNSSEC and IPv6.
- Strongly associated with these issues to be studied are security-oriented concerns that the introduction of new TLDs will lead to increased instances of malicious behavior.

### **Summary of Input**

Public comments emphasized that ICANN must ensure that introducing a potentially large number of new gTLDs, including internationalized TLDs, will not jeopardize domain name system (DNS) stability and security. They urged that ICANN must assess threats to the DNS from the new gTLD rollout, and also must consider the potential in the future for events such as destabilizing registry failures. Some commenters suggested that ICANN conduct research on DNS stability issues before start of the first gTLD application round. A number of commenters urged ICANN not to move forward with the new gTLD program because of threats to DNS stability and security, and warned that the new program will create a new wave of malicious activity, including spam and phishing.

See *U.S. DOC-NTIA* (18 Dec. 2008) (ICANN must ensure that introducing a potentially large number of new gTLDs, including internationalized TLDs, will not jeopardize DNS stability and security). *ITT* (15 Dec. 2008). *G. Kirikos* (24 Nov. 2008). *Bank of America* (15 Dec. 2008). *P. Tattersfield* (15 Dec. 2008). *SIIA* (15 Dec. 2008). *FairWinds* (15 Dec. 2008). *AT&T* (15 Dec. 2008) (ICANN must assess threats to the DNS from new gTLD rollout and, at a later stage, how it will deal with registry failures). *SIDN* (10 Dec. 2008) (do research on stability issues before start of first application round). *R. Fernandez* (16 Dec. 2008) (ICANN should reject agreement; it removes all certainty and assurance for registrants). *WMI* (13 Dec. 2008). *NAM* (15 Dec. 2008). *SIFMA* (12 Dec. 2008). *Contessa* (11 Dec. 2008). *Microsoft* (Guidebook comments 15 Dec. 2008) (opposes new gTLD introduction, likely to threaten DNS security and stability). *Arab Team* (15 Dec. 2008) (not enough focus on stability and impact on other countries and communities). *L. Parsons* (29 Oct. 2009) (opposes because will increase phishing and confusion); *R. Robertson* (4 Dec. 2008); *D. Buzzard* (31 Oct. 2008).

### **Issues**

The comments addressing DNS stability break down into two main questions:

#### **Scaling: What are the technical scaling issues associated with new TLDs?**

- How can ICANN demonstrate confidence that the name system (root servers, resolvers) will scale to handle new TLDs?
- How large can the root zone be?

#### **Security Impact: Will security-oriented abuses of the DNS systematically increase with an increased number of TLDs and a new set of registry participants?**

- With evident problems in misuses of the existing DNS (squatting, pharming, phishing, malware), will increasing the number of TLDs significantly increase these misuses?
- Has adequate thought been given to the requirements and behavior for new TLD operators?

### **Proposed Position & Analysis (for this version of the Guidebook)**

#### **Scaling**

Proposed Position: The ICANN Board has requested the SSAC and RSSAC to jointly conduct a study analyzing the combined impact to security and stability within the DNS root server system of the proposed implementation of new TLDs (both country code and generic), IDNs, IPv6 records in the root zone, and DNSSEC. The analysis is expected to address the implications of initial implementation of these changes occurring during a short time period. ICANN must ensure that potential changes in the technical management of the root zone and scope of activity at the TLD level within the DNS will not pose significant risks to the security and stability of the system. The study is also expected to address the capacity of the root server system to address a stressing range of technical challenges and operational demands that might emerge as part of the implementation of proposed changes.

Analysis: The public comments' concern about the impact of new gTLDs on the root zone and whether this issue has been studied adequately has been raised against the backdrop of other recent and planned changes to the DNS, all in roughly the same time frame, including: the recent addition (in December 2007) of IPv6 records for authoritative root servers to the root zone, and the planned addition of DNSSEC, IDNs, and new country code TLDs. While a [new gTLD issues paper](#) discussed scaling the root zone, to provide adequate confidence in the technical support for scalability, the simultaneous impact of all of these changes should be considered.

Background resources: In addition to the [new gTLD issues paper](#), the following provides background on ICANN's efforts to understand the potential security and stability impacts of these changes individually:

The RSSAC and SSAC jointly issued an analysis of adding IPv6 records for the authoritative root servers in 2007 (see <http://www.icann.org/committees/security/sac018.pdf> and IANA's report at <http://www.iana.org/reports/2008/root-aaaa-announcement.html>). The addition of IDNs to the root has been the subject of significant advance planning, and an extended real-world testbed (see for example SSAC's report at <http://www.icann.org/committees/security/sac020.pdf>, and IANA's report at <http://www.iana.org/reports/2007/testetal-report-01aug2007.html>). DNSSEC has benefited from extensive root zone test bed experience and been extensively analyzed though not specifically for the all the events proposed to occur in the root zone (see for example <http://www.net.informatik.tu-muenchen.de/~anja/feldmann/papers/dnssec05.pdf>, and the RSTEP report on PIR's DNSSEC implementation at <http://www.icann.org/registries/rsep/rstep-report-pir-dnssec-04jun08.pdf>). Finally, an ICANN staff paper on root zone impact of new TLDs was published for public comment in February, 2008 (see <http://icann.org/topics/dns-stability-draft-paper-06feb08.pdf>).

## Security Impact

Proposed Position: Further comments on the issue of security impact are expected. Many public commenters clearly feel more work is needed on security and particular issues relating to it, including implementation of registrant protection and avoiding end user confusion. These questions should be explored further. For example, are there implementable, practical mechanisms to avoid the need for purely defensive registrations? Can registry or registrar mechanisms be put in place to make new gTLDs desirable from both a confusion and protection viewpoint? While there is always opportunity for more study, the concern regarding security abuses scaling with more TLDs is ultimately better dealt with through pragmatic implementation approaches than a set of predictions around which many would disagree in any event. ICANN staff will be actively soliciting feedback on these topics over the next 60 days, and share with the community options for improvements in these areas in the next several months.

ICANN staff believes that the concerns about security impact are being reasonably assessed in the currently proposed study and are consistent with GNSO policy recommendations and principles and also with ICANN's mission to ensure DNS stability and security. That study will solicit the opinion of the broad DNS technical community. Wide consideration has been taken of a broad range of issues, including: intentional and unintentional confusion at the TLD level; balancing introduction of new business models with compliance mechanisms and assurances of ongoing business stability of new registries; and the intent to create choice and competition. The new gTLD policy development process is focusing on how policies could be implemented that would minimize confusion to end-users, and costly defense to brand holders.

Analysis: The public comments have shown that there are a variety of security-oriented concerns that could be associated with new TLDs. These include:

- Potential confusion of new TLDs with existing, or other new TLDs, either in Latin script or in IDNs. This has been a major focus of the policy development behind both new TLDs in general, and IDNs specifically. Many elements of the implementation plan are designed to specifically address this issue. For example, there are two "stops" in application evaluation process to test that applied for string might result in user confusion due to their similarity with existing or other applied-for strings. There is also a stop to test whether an applied for string might infringe on a trademarked label or inappropriately appropriate a community label. New TLDs for communities, brand holders, industry associations, online communities and unique applications will all be evaluated within an environment intended to be more structured, more predictable, and more protected than today's second-level registrations.
- Possible misbehavior of new registries— through inexperience or other causes. The guidebook criteria for new registry operators are intended to address some of this concern. New registries are asked to complete sections on business and technical capabilities, and there is a particular focus placed on the ongoing continuity of the registry (both in terms of ongoing operations, and in the worst case, continuing to run for a period when business models fail).
- Confusion at the second level. That is, expanding the number of TLDs will expand the number of locales at which abusers of the system could register second-level names intended to dupe end-users. For entities facing both direct cost and possible indirect cost in loss of confidence in a name or brand, this is a pressing matter. Some have studied the costs of brand protection at the second-level. While there is not complete agreement

on the data, the general point is unarguable. There is a substantial amount of resource spent by brand holders and others defending look-alike second level names. While there are no studies to show this would expand with an expanded namespace, it is an important concern.

There have been suggestions that new TLDs would actually aid brand identity, for example see [this article proposing new thinking for global branding on the Internet](#). Many Internet users already pay close attention to the TLD, and look first to it – not the second level name – as the indicator of site validity. A user in France might well first look at .fr sites for those providing most local and linguistic relevance. In a world where there are many generic TLDs, the carefully-protected and rationally-considered TLD suffix could become more relevant than the second-level name for users, leading to less confusion, and ultimately less need for defensive second-level registration.

## **VI. STRING REQUIREMENTS**

### **A. STRING REQUIREMENTS: IDN AND TECHNICAL**

#### **Summary of Key Points**

- The three-character requirement will be the subject of additional community discussion and consultation to determine if a consistent exception can be made for ideographic or other script sets.
- The new IDN specification is not sufficiently mature to adopt the suggestion made by the Unicode Technical Committee (UTC) but progress on the protocol will be monitored with an eye toward updating string requirements in the near term
- The Guidebook asks that applicants take reasonable steps to identify string compatibility issues, not guarantee that all applications are compatible with the applied-for string.

#### **Summary of Input**

String compliance with IDNA technical protocols. The reference to the existing IDNA standard (RFC 3490) should be altered to refer to the new IDNA technical standard, on the presumption that the current standard will be superseded. Language should also be more emphatic that the list of restrictions in the guide is not complete. *UTC* (14 Nov. 2008). Add additional language regarding in-progress IDNA protocol revisions to make it clear that the protocol revision is expected to succeed, but the text is still subject to change. *UTC* (14 Nov. 2008)

Directionality of characters in string. “Must consist entirely of characters with the same directional property” is wrong and should be struck. Valid IDNs according to the in-development revised IDNA protocol would be limited by this restriction. *UTC* (14 Nov. 2008)

Prohibiting mixing characters from different scripts. The language that requires strings be limited to a single script is overly narrow, and does not address scripts deemed “Common” and “Inherited”, which are given to characters that are used within multiple scripts, such as numerals. *UTC* (14 Nov. 2008)

Documenting properties of the string. The language on specifying the language used by the label should be altered to reference BCP 47 rather than ISO 639-1. *UTC* (14 Nov. 2008). The language on specifying the script used by the label should be altered to bring the section “in line with the use of script in 2.1.1.3.2 String Requirements”. *UTC* (14 Nov. 2008). The language on specifying the discrete Unicode code points in the application should be more explicit on the notation used. It should be U+ notation, “for example, for the label “öbb”, the list would be: “U+00F6 U+0062 U+0062”. *UTC* (14 Nov. 2008) The reason for the requirement that the proposed TLD’s pronunciation by supplied is unclear. Very few registrants will be able to supply the pronunciations correctly using the International Phonetic Alphabet, and there are likely to be multiple pronunciations depending on the part of the world. *UTC* (14 Nov. 2008) The requirement to provide an IDN table may mean provide a reference to a table, rather than provide the complete table. The format required of the table is not clear. *UTC* (14 Nov. 2008)

Avoiding string compatibility issues. With respect to making “reasonable efforts” to ensure there are no rendering and operational issues with the selected string, it is not clear what reasonable

efforts are, and it sounds like “this is asking the applicant to change all the program applications that use the domain name, which is clearly impossible.” *UTC* (14 Nov. 2008)

Eligible string preclusions. The requirement for a minimum of three characters does not work for scripts where one character can represent an entity. *W. Tan* (8 Dec. 2008); IDN variant implementation needed for Chinese, Japanese and Korean TLDs. *J. Seng* (8 Dec. 2008). It is not clear why hexadecimal representations of numerals are prohibited. *A. Baumgart* (5 Dec. 2008) Inquiry relating to whether there is a prohibition on new TLDs that commence with the characters of a ccTLD (i.e. .FR blocking .FRANCHISE). *J.C. Vignes*.

## **Issues**

The issues raised in these sections can be narrowed down to:

Regarding the technical requirements for TLD strings, there are questions on unclear language, or suggestions on improvements to the language, with a view to improving the clarity of the document.

Can changes to restrictions be made in order to better match equivalent standards documents?

Can changes be made to reflect the suitability of certain restrictions or obligations?

## **Proposed Position (for this version of the Guidebook)**

String compliance with IDNA technical protocols: ICANN staff will continue to monitor the dynamics of the IDNabis working group, and will continue to consult on the latest status and the viability of the proposed new standard, and identify the likelihood it will be resolved prior to the launch of the first round. If this is still a reasonable prospect then the proposed change of language is appropriate.

Directionality of characters in string. The current language should be retained; however, the comments provided will be re-evaluated should the IDNabis standard be used as the reference standard.

Prohibiting mixing characters from different scripts. The current language is required as ICANN policy is to allow certain exemptions where scripts can be mixed.

Documenting properties of the string. Limit the technical details in the Guidebook on how script and language properties are formally provided, as they are operational details that are better in the scope of IANA Root Zone operational procedures, which are outside the scope of this document. Explain that these are informative properties, not evaluative, and make the phonetic description optional.

Avoiding string compatibility issues. Make the language clearer that “reasonable efforts” means that the applicant make a good faith effort to ensure that common applications do not have unexpected problems caused by the domain.

Eligible string preclusions. Number of characters in a string:

In the initial release of the Applicant gTLD Guidebook ICANN suggested that gTLD strings need to be minimum three (3) characters long.

In return comments have been received representing the fact that for example there are single and two character combinations in the ideographic writing systems that represents the name of cities, concepts and otherwise generic terms. This concern is understandable and additional information is being made available to inform community feedback on the topic. ICANN will also conduct additional consultations on this topic in order to reach a resolution before the launch of the new gTLD round.

In preparation of the initial suggestion of a minimum of 3-chars, ICANN took into consideration various analysis, including the work done by the Reserved Names Working Group:

- Single and two-character U-labels on the top level and second level of a domain name should not be restricted in general. At the top level, requested strings should be analyzed on a case by case basis in the new gTLD process depending on the script and language used in order to determine whether the string should be available for allocation in the DNS. This is notwithstanding the rule that the ISO-3166 list will continue to be reserved and as such all two character ASCII strings (i.e., LDH-labels) will remain reserved at the top level and second level of a domain name, although registries may propose release of two character strings at the second level provided that measures to avoid confusion with any corresponding country codes are implemented. Single and two character labels at the second level should be available for registration, provided they are consistent with the IDN Guidelines. (<http://gnso.icann.org/issues/new-gtlds/final-report-rn-wg-23may07.htm>)

At the same time, considerations need to be made to ensure that also confusion (and not just clashes) with the ISO-3166 list and associated IANA function for allocation of ccTLDs is not jeopardized. Confusability with existing ccTLDs and any future ccTLDs allocated through the IANA function by use of the ISO3166 list was viewed as increasing if strings with less than three character combinations are allowed. Further, avoiding such confusability is not planned for in the gTLD applicant Guidebook and needs to be if the 3-char suggestion is to be changed.

Additional considerations have to do with the concept of character and how to count characters on a global scale. Since the concept of a 'character' can remain hard to define, ICANN decided to go with the definition described at: <http://www.icann.org/en/topics/idn/idn-glossary.htm#C>. As is illustrated there, this creates some complications when moving to Internationalized TLDs due to the reason that in some writing systems, such as the ideograph system, a character can represent an entire concept or word. Specifically, it has not been possible to find a way of counting characters across all languages and scripts that creates an identical concept of numbers, this includes an incapability of counting the characters represented in the U-label, the Unicode code points, or other ways. The only way one can count characters in a unique way for IDNs is by counting the characters in an A-label and the shortest string available as an A-label is seven (7) characters long. It also does not appear that it is the length of the A-label that concerns the community members, although it is the length of the A-label that creates problems for the usability of domain names under such TLDs in various applications software. As such ICANN has determined to count the number of characters in strings that are applied for by counting their immediate code points as identified by Unicode.

While some specific examples of what appears to be reasonable (less than 3-char) strings can be made, for example in the ideographic writing system, it is not straightforward to

define (based on all received feedback so far) a globally implementable rule or set of rules that will identify when a string with less than 3 characters should be allowed. One could imagine that such strings could be allowed by a script by script basis, but a closer look at Unicode, which is the classification of scripts that ICANN is using, shows that there even is an inconsistency within a script as to when less than 3-chars appears to be reasonable. As such, at that time of writing ICANN did not find it possible to select for example some characters from the ideograph system over other writing systems with good reason. And simply going through all (approximately 100.000) characters in Unicode today also did not seem to be a scalable practice.

ICANN will conduct additional consultations as to what categorizes a good set of rules and requirements for when a string of less than 3-characters should be allowed, if such change should be made in the implementation of this program. Simply stating that it should be analyzed on a case by case basis does not provide ICANN with sufficient details of how or based on what such decision should be made. It further does not give enough indication to a potential applicant as to whether their string will pass such case-by-case analysis or not.

## **Analysis**

String compliance with IDNA technical protocols. The comments from UTC suggest that the references to RFC 3490 (the current IDNA standard published in 2003) be replaced in favor of references to the in-progress IDNA standard. The emphasis should be shifted to the revised IDNA standard being at the final stages of standardization and being the more appropriate document to refer to. Whether this is appropriate really comes down to the probability of whether the IDNA standard will be revised by the time the next round opens. The prospect of this varies from month-to-month. The current standard was included in the document as it is a stable reference, and for most cases they will be equally compatible between the current standard, and the new standard.

Directionality of characters in string. The proposed new language improves the section to better match the intent of the restriction, but is predicated on the new IDNA standard revision being adopted. As per the previous section, RFC 3490 is being retained as the reference for the moment, however this may evolve in the future and the restrictions modified accordingly.

Prohibiting mixing characters from different scripts. The proposed new language would prohibit some classes of mixing characters for which exceptions have been made. These are description in Section 3 of the existing IDN guidelines available at <http://www.icann.org/en/topics/idn/idn-guidelines-26apr07.pdf>

Documenting properties of the string. Most of the comments provided by UTC in this section revolve around an enhanced description of the IANA Change Request Template that is employed today, which reads:

- IDN Specific Information
- 10. English translation of string...: test
- 11a. Language of Label (ISO 639-1)...: ru
- 11b. Language of Label (English)....: Russian
- 12a. Script of Label (ISO 15924)....: Cyril
- 12b. Script of Label (English).....: Cyrillic

13. Unicode code points.....: U+0438 U+0441 U+043F U+044B U+0442 U+0430  
U+043D U+0438 U+0435

This section has several purposes:

First, in order to assist in day-to-day handling of delegated top-level domains by ICANN's IANA function, a methodology of generating an English-based reference was devised that can be used as an alternative to either the "A-label" and "U-label" notations for the purposes of dealing with IANA. For example, the IANA code for .испытание is "test:ru-Cyrl". This code indicates the domain means "test", written in "Russian", expressed used "Cyrillic". This code is broken into <meaning>:<bcp47tag>, whereby the meaning is the English meaning (or a similar reference) of the string; and the BCP 47 tag is a reference to an IANA registry of scripts and languages. The BCP 47 registry in turn is based upon two different standards, one for scripts (ISO 15294) and one for languages (ISO 639-1).

Second, in Part 13 the Unicode code points are requested as a simple cross-check. The elements could be automatically derived from the U-label or A-label itself, but because the meaning of the label may not be immediately evident, this provides a cross-check such that IANA can automatically detect transcription errors of the other labels.

Finally, there may be public interest reasons for IANA to classify the strings based upon their script and language properties, for example, an ability to review the root zone database for all of the strings that mean "test", or all the strings that are written in Russian.

Accordingly, the requirements are *informative* as opposed to *evaluative*. When stored in the IANA root zone database, they are considered meta-data that is additional to the central data for a top-level domain, but plays no direct role in processing or evaluation. An additional requirement was suggested by the applicant guidebook for the label, which is to provide a description on pronunciation. This would possibly aid IANA staff in understanding what a label was that a person while performing customer service tasks such as answering enquiries. It was not considered to be a property that is assessed as part of the qualification criteria.

With respect to providing IDN tables, it is the intent of ICANN to obtain the entire IDN table, not just a reference to it; because the goal is for it to be lodged in the IANA Repository of IDN Practices. It is a fair point that the formatting expectation be explained; however it is not clear whether this should be explicit in the document or merely by reference. IANA's website has submission guidelines already, although it is likely to change in the short-to-medium future to a more useful format (specifically, XML rather than HTML formatting). This timing of that is independent of the new TLD programs.

Avoiding string compatibility issues. ICANN staff did not have a strong vision of what specific actions would be considered "reasonable" when developing this requirement, as the provision is designed to detect any problems that can't be fully predicted or articulated in advance. The idea was to have language that could be pointed to in the event there are labels that were an egregious abuse (for example, the triggered properties that could be knowingly used for phishing attacks). It was not envisaged that applicants would need to undertake their domain would work in every browser, rather to make some effort in good faith to ensure there are no reasonably discoverable issues in popular software.

Eligible string preclusions. The restriction on 1- and 2- character top-level domains stems from the current split in ASCII top-level domains. There, two-letter top-level domains are restricted solely for ISO 3166-1 country codes (either current or future). Single letter domains, both in the

top-level and in the second-level within gTLDs, were reserved against possible registration in the early 1990s for possible future expansion purposes.

The guidebook states that for new gTLDs “applied-for strings must be composed of three or more visually distinct letters or characters in the script, as appropriate”. Concern has arisen from communities that use ideographs to express their language that single characters can often denote whole words, and therefore concepts need to be expressed in less than three characters to be practical.

The hexadecimal restriction is designed because most Internet software does not distinguish between IP addresses and domain names. Instead, in most software a generic “Internet address” field is provided which can accept either, and the software must analyze and decide whether it is an IP address or domain name. Hexadecimal is a legitimate method of representing IP addresses, and a domain name that matches a possible IP address would cause confusion and unexpected results.

**Example: Using hexadecimal in an application:**

```
$ ping 0xd04dbc67
PING 0xd04dbc67 (208.77.188.103) 56(84) bytes of data.
64 bytes from 208.77.188.103: icmp_seq=1 ttl=59 time=1.70 ms
```

**B. STRING REQUIREMENTS: RESERVED NAMES**

**Summary of Key Points**

- For the next version of the Applicant Guidebook, no changes will be made to the Reserved Names list, but this position might change after additional consultation.
- Requests by certain rights holders that the reserved names list be augmented to include famous trademarks will also be discussed in additional consultations.

**Summary of Input**

Technical/Infrastructure Names. Create a mechanism that provides for the expansion of the gTLD reserved names list, as appropriate, technical or infrastructure-related names. *U.S. DOC* (18 Dec. 2008). Add the following names to the Reserved Names list: ARPA, IN-ADDR, IP6, and RIR. Develop a process for releasing reserved domains to the appropriate entity. Develop a process for adding or removing names from the Reserved Names list.” IANA-related infrastructure names should be protected at all levels; the reserved names list has omitted significant Internet infrastructure names. *ARIN* (8 Dec. 2008). ICANN should specify criteria for the reserved names list, with transparent justification for each name on list; develop challenge and removal procedures; and clarify if they are reserved in ASCII but not IDN equivalents. *Rodenbaugh* (16 Dec. 2008) (these issues are of special concern to globally famous trademark owners to whom ICANN does not extend Reserved Names protection). ICANN should add other terms commonly found in Internet URLs (e.g. HTTP and HTTPS) to the Reserved Names list. *INTA* (15 Dec. 2008).

Government and NGO Names. On 2.1.1.2, ICANN should not reserve its own names without offering the same opportunity to governments and non-governmental organizations. *NYC* (13

Dec. 2008); AT&T (15 Dec. 2008) (consider the reserved names list concept for country and geographic names).

Trademarks. See citations in Trademark Protection section, under "Top Level Reserved Names List".

Reinstate Protection. "Reinstate the existing protection for Reserved Names." ARIN (8 Dec. 2008).

## **Issues**

There was little direct feedback about the Reserved Names list itself, as presented in Draft Applicant Guidebook, with the exception of a comment from ARIN, which proposed the addition of ARPA, IN-ADDR, IP6, and RIR to the list. Feedback focused on the lack of any provisions for trademark owners. Comments from groups/companies such as Nike, ISOC, and the Internet Commerce Coalition requested the inclusion of trademark names on the Reserved Names list since ICANN was choosing to protect its own interests.

- 1) What type of categories should the Reserved Names list include?
- 2) Should the 2<sup>nd</sup> level Reserved Names schedule in the base agreement be reinstated to what is generally reflected in current agreements?

## **Analysis**

The top-level Reserved Names list, which will prevent applicants from applying for certain names, was created for the new gTLD program based largely on the existing 2<sup>nd</sup> level Reserved Names schedule. This decision was reached as a result of the work conducted by the Reserved Names Working Group (final report available here: <http://gnso.icann.org/issues/new-gtlds/final-report-rn-wg-23may07.htm>), which recommended that existing names on the second or perhaps even third level Reserved Names schedules should be included on the top level list. However, they suggested that additional work should be performed to provide justification for the names or categories of names included on the list. In carrying over the 2<sup>nd</sup> and 3<sup>rd</sup> level Reserved Names schedule to the top level, ICANN has decided upon a conservative approach as it is far more difficult to recover a TLD than it is to block a TLD from being registered in the first place.

ICANN has identified three options:

Option 1: Reduce list to technical and structural terms and have ICANN and its supporting organizations use the standard objection procedures used by others to protect their names, in order to show that there is no preferential treatment.

Option 2: Include technical, structural, and ICANN related names, which would leave the list as it is presented in the Draft AG. Potential additions include the suggestions from ARIN.

Option 3: Include all elements of option 2, but also provide a provision for other entities, like trademark owners and geographical names holders.

Option 1 presents arguably the most defensible position to the general Internet community (i.e. limit the RN list to names that require technical or structural protection). ICANN would demonstrate that it is not placing its interests above other organizations. However, this position is subject to objection from the SOs, ACs, and other entities supporting ICANN. They will likely

contend that not reserving names like RIR, IETF, or GNSO could lead to security concerns via phishing and spoofing if one of these names was obtained by a malicious operator. In addition, if one of the ICANN related entities wished to protect their name against an applicant (for IETF or AFRINIC for instance), they would have to use the very same objection mechanisms that ICANN designed. This has the potential to open up questions of impartiality.

Option 2 presents the status quo (relative to the Draft AG), and thus the most conservative option, since there was only limited feedback on this topic. The external objections to this option will likely be similar to what was received in public comments for the Draft AG. The perceived message being conveyed is that ICANN is protecting its own interests without taking trademark owners and other entities into account. However, as mentioned above, it is far easier to prevent a name from being registered by placing it on a RN list than to recover that name from a registry operator.

Option 3 is dependent upon a solution being developed for rights holders, like trademark owners. ICANN is undertaking significant consultation on this subject to determine what methods of protection will be extended for the protection of rights holders. Please see the separate paper that discusses Brand Protection for further information on this topic.

Regarding the second issue posed above, the principal concern is that existing infrastructure and software is designed to accommodate the existing names on the 2<sup>nd</sup> level schedule. While exact details were slim on what types of technical complications may arise from having something like lacnic.newgtld registered, presumably this may affect registrar software and search/filter functions. However, these issues can likely be addressed by software modifications.

### **Proposed Position (for this version of the Guidebook)**

Issue 1: The recommendation for the revised Applicant Guidebook is Option 2 (the status quo), as the consultative work with the community regarding trademark owners still needs to be undertaken. In addition, going forward, further work should be initiated to determine under what conditions ICANN-related entities should have continued inclusion on the list.

Issue 2: Unless a more compelling technical argument can be produced, the schedule currently included in the base agreement should be left unchanged.

## **VII. GEOGRAPHICAL NAMES**

### **Summary of Key Points**

- The implementation model seeks to achieve the objective of the GNSO to protect against abuse of community labels, and anticipate criticism of governments and possible objections to geographic names,
- The applicant guidebook is amended to:
  - make it easier to identify the different elements of geographic names,
  - reflect that a country or territory name in any language, will require evidence of support,
  - augment the requirements of the letter of support.
- No additional protections for city and abbreviated names were added to the revised Guidebook as those terms are many in number and often have generic connotations.

### **Summary of Input**

The ccNSO states that the Applicant Guidebook lumps together country names, territory names, and other geographical names like sub-national names and city names. *ccNSO* (14 Dec. 2008). The ccNSO suggests a definition for how to distinguish ccTLDs and gTLDs and notes “Until the introduction of IDNs, the number of characters in the TLD is how we have been able to visually separate the two categories. So how do we identify what is a ccTLD in the post- IDN world where we can no longer use that visual mechanism?” *ccNSO* (14 Dec. 2008). The ccNSO believes the current language preempts the ccTLD IDN PDP, by opening up for country names and abbreviations in Latin scripts and in non-Latin scripts that are not yet official languages of the country, to be entered as gTLDs while the ccTLD policies have yet to be developed. *ccNSO* (14 Dec. 2008).

The Applicant Guidebook does not establish a process to authenticate, or for a panel to consider challenges to, governmental statements of support or non-objection that may be presented by applicants. The ISO3166-2 standard is not comprehensive. *NYC* (13 Dec. 2008)

On 2.1.1.4.1, [of the applicant guidebook] the ISO 3166-2 standard is mostly inapplicable to new gTLDs. *NYC* (13 Dec. 2008) The reference to “city name” is too restrictive and should be expanded to include “city name or abbreviation”. *NYC* (13 Dec. 2008). The capital city requirement from the Explanatory Memorandum of 22 October 2008 is not included in the draft Applicant Guidebook. *NYC* (13 Dec. 2008)

The four enumerated grounds for objection do not provide sufficient grounds to safeguard the interests of national, local, and municipal governments in the preservation of geographic terms that apply to them. Suggested costs for dispute resolution will be too onerous for governments. The contention process for geographic names should be specified. Any application for a geographic term should be considered community-based. The right of governments to object should be explicitly stated. *NYC* (13 Dec. 2008). The Geographic Names Panel decision should be posted and communicated to the relevant GAC representative and relevant sub-national government entity. IDN applicants should be required to indicate whether the proposed string corresponds to a geographic term. *NYC* (13 Dec. 2008)

The objection procedure for governments is not clearly defined. It is not clear whether a geographic objection would constitute a “morality and public order objection.” Any fees associated with a government objection should be minimized. *NYC* (13 Dec. 2008)

This comment is on geographic names (particularly state names). Craig writes that he is considering applying for a string that is a State Name, has made inquiries with the relevant state government, and believes it almost impossible to get a letter of approval or non-objection. Craig says that the users and businesses in the state he has contacted have expressed support, and he wonders whether the benefit of the people who live in the state is considered (by ICANN). *D. Craig* (17 Nov. 2008).

Craig also argues that states have State.gov, and can restrict the registration policies in the .GOV space (he also writes that .GOV should be open to other governments to use). He wonders if he can make a case that a string corresponding to a state name, that case & the benefit to the local population should be considered in the evaluation. *D. Craig* (17 Nov. 2008)

The current language in 2.1.1.1 “co-mingles immediate and important issues like gTLD applications for strings that look like country codes, and non-immediate and possibly non-important issues potentially posed by gTLD applications for well-known terms referring to place names which pre-exist all present governments.” *E. Brunner-Williams* (6 Dec. 2008)

The restriction on sub-national or continent names should be removed, section 2.1.1.4 [of the applicant guidebook] should be moved to a secondary materials reference, and ICANN should test for collision with a ccTLD Fast Track string. *E. Brunner-Williams* (6 Dec. 2008)

Demys is requesting clarification in the geographical names process on whether a string is a sub-national place name, on the basis that there appears to be ambiguity. This is important for common abbreviations of sub-national place names. *Demys* (14 Dec. 2008). An example presented is .lancs, a term not found in ISO 3166-2. This is a common abbreviation for Lancashire, and on a less rigid test might be held to “represent” Lancashire. Demys asks how this will be handled in practice. *Demys* (14 Dec. 2008)

Demys also notes that the test of “meaningful representation” applied to country and territory names is not applied to IS3166-2 sub-national place names. *Demys* (14 Dec. 2008). It says in the Draft Module 2 2.1.1.4.1 that in order to apply for city TLD, “documents of support or non-objection from the relevant government(s)” are required and they “should include a signed letter of support or non-objection from the Minister with the portfolio responsible for a domain name administration, ICT, foreign affairs or the Office of the Prime Minister or President of the relevant jurisdiction.” *Interlink*.

If Interlink were to apply for dotTOKYO, do we need the documents from both Ministry of Internal Affairs and Communications and Tokyo Metropolitan Government? Or do we just need Ministry of Internal Affairs and Communications to support our application? *Interlink*.

ICANN should revise this Module to minimize disputes with governments on geographic and country names. *F. Purcell, Ministry of Communications, Information and Technology* (6 Nov. 2008)

This includes a representation of the country or territory name in any of the six official United Nations languages (French, Spanish, Chinese, Arabic, Russian and English) and any of the country or territory's local languages. *Unicode Technical Committee (UTC)* (13 Nov. 2008). It is

quite common for a country or territory to have more than one language, so that needs to be accounted for. *UTC* (13 Nov. 2008).

Applications for any string that represents a subnational place name, such as a county, province, or state. These could be, for example, as listed in the ISO 3166-2 standard. *UTC* (13 Nov. 2008). The ISO 3166-2 standard is not complete, and is not freely available. Including the comma may imply to the reader that it is required, that the sentence is to be read as: "Applications for any string that represents a subnational place name (such as a county, province, or state) listed in the ISO 3166-2 standard." *UTC* (13 Nov. 2008).

Applications for a city name, where the applicant clearly intends to use the gTLD to leverage from the city name. *UTC* (13 Nov. 2008). City names are very ambiguous - look at the number of "Paris" cities that exist. If Paris, Texas gets there first, what happens? Should there be some qualification necessary to disambiguate city names instead? *UTC* (13 Nov. 2008)

We strongly urge ICANN to adhere to GAC principles in general and in particular the following: (a) New gTLDs should respect the sensitivity regarding terms with national, cultural, geographic and religious significance. (b) ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities. *APTLD* (15 Dec. 2008)

A 'geographical term' is terribly broad and thereby offers protection even beyond what I believe the GAC requested. *C. Gomes* (18 Nov. 2008). The GNSO recommended that a dispute process be used and that governments and GAC should have standing to file a dispute. The guidebook indicates that ICANN will ensure that appropriate consideration will be given to government interests. This is contrary to the GNSO recommendation. *C. Gomes* (18 Nov. 2008).

Applicants for a Geo -TLD need to represent on which legal framework their application is based and that the use of the proposed string is not in violation of the legal framework in the country in which the applicant is incorporated. The applicant also needs to represent if and how the relevant government/s and/or public authority/ies have to respond to requests of ICANN on support or non-objection. Additionally, the fees are too high for many cities and countries who may have very small user bases. *dotberlin* (4 Dec. 2008); *J. Evans* (12 Dec. 2008); *Plaid Cymru* (15 Dec. 2008); *PuntoGal* (13 Dec. 2008).

dotSCO raises issues with the geographic considerations in the Guidebook. They note that SCO is not a three-letter code in ISO 3166-2 nor does it clash with a country name on the ISO 3166-1 list. "The difficulty for us, and indeed all other applicants, is that the criteria of a string which could 'represent a sub-national place name' in ISO 3166-2 could potentially catch any string that anyone could think of." *dotSCO* (15 Dec. 2008).

Giving governments control over ccTLD space may stifle competition. *Cairo Public Forum* (6 Nov 08).

Government support concern: ICANN should reverse its adoption of the GAC position on prior approval for any geo-gTLD and revert to the GNSO position providing standard objection rights to governmental entities. Any suggestion that governments have any ability to object to second level geo-domains on any grounds outside the scope of the UDRP should be rejected outright. *ICA* (16 Dec. 2008). Some country names have well-used and general meanings in the English language. Requiring TLDs that are country names to have government support or non-objection

makes it unlikely that certain communities will be able to secure logical TLDs (e.g. china, turkey). Some territory names are geographic indicators for specific products (e.g. champagne), but the government support/non-objection requirement makes it unlikely that producers of such products can secure those corresponding TLDs. Having multiple applicants for the same city name TLD resolve the contention themselves is odd; there are numerous potential applicants for city name TLDs. *INTA* (15 Dec. 2008).

## **Issues**

### **Process**

Can the presentation of geographic names in the guidebook be improved to distinguish between the differing elements, i.e. Country or territory names, sub-national, city names?

- Will there be a process to deal with possible string collisions for strings sought under the IDN ccTLD Fast-Track and new gTLD processes?
- What is the objection procedure, i.e. would an objection regarding a geographic name be considered under 'morality and public order'?
- How does an applicant know what level of government support is required for a geographic name.
- Should the decisions of the Geographic Names Panel be posted and communicated to the relevant GAC and sub-national entity?

### **Country and territory names**

- Will allowing country and territory names in the new gTLD process create confusion between what is a ccTLD and a gTLD?
- Should the number of languages representing a country or territory name be expanded to include all languages.

### **Sub-national names**

- Can there be a clear comprehensive list, for defining sub-national names, such as the ISO 3166-2 list?
- Will the meaningful representation test be applied to sub-national names?
- How will common abbreviations for sub-national names be handled?
- How will abbreviations be considered in the context of geographic names?

### **City names**

- Is the issue of city names ambiguous, where they are shared by multiple cities or may be a generic term?
- Should the city name definition be expanded to include abbreviations?

### **Government interests**

- Is the consideration of government interests, as currently written in the guidebook, contrary to the GNSO recommendation?
- Are the interests of national, local and municipal governments adequately protected through the objection process?

## **Analysis**

### **Process**

Can the presentation of geographic names in the guidebook be improved to distinguish between the differing elements of country and territory names, sub-national names, and city names?

- Yes. The applicant guidebook will be amended to make it easier to identify the different elements of geographic names.

Will there be a process to deal with possible string collisions for strings sought under the IDN ccTLD Fast-Track and new gTLD processes?

- An application for a geographic place name, as described in the applicant guidebook, requires the evidence of support, or non-objection from the relevant government or public authority. There can only be collisions in circumstances where this documentation is provided for applications for a string in both the gTLD and ccTLD fast track process. Secondly, if the evaluation of an application for either an IDN ccTLD or gTLD string is complete before a contending application is lodged, the successfully evaluated TLD will not be removed from the root zone.

What is the objection procedure, i.e. would an objection regarding a geographic name be considered under 'morality and public order'?

- The GNSO policy recommendations intend that government interests in geographic names be protected under community based interests. These protections are described in the guidebook and in answers to other questions below.

How does an applicant know what level of government support is required for a geographic name.

- Discussions among GAC members revealed that there is no one standard that applies across the countries of the world about which level of government support will be required for country, territory, place or city names. It will be the applicant's responsibility to identify which level of government support is required.

Should the decisions of the Geographic Names Panel be posted and communicated to the relevant GAC and sub-national entity?

- The results of the evaluation will be publicly posted on ICANN's website at the conclusion of the Initial Evaluation and will also be available to applicants.

### **Country and territory names**

Will allowing country and territory names in the new gTLD process create confusion between what is a ccTLD and a gTLD?

- The solution offered by the ccNSO to not allow country and territory names in the gTLD process until the outcome of the ccPDP, will mean that country or territory names in ASCII at the top level would not be available before August 2011. In considering the comments received on the issue of country and territory names in the gTLD space, the definition of meaningful representation will be expanded to include a representation of a country or territory name in any language to address the ccNSO's concern that "almost all non-Latin and Latin scripts can be entered as a gTLD without any restriction except that the country in question can object." This amendment, combined with the requirement that the relevant government or public authority provide support or non-objection for an application for a country or territory name, ensures that a government is aware of the application.

Further, to overcome concerns that governments have varying degrees of understanding of ICANN and TLDs, the requirements of the letter of support will be augmented. In addition to demonstrating an understanding of the string being requested and what it will be used for, the letter should also reflect that the string is being sought through the gTLD

process and the applicant is willing to accept the conditions under which the string will be available, i.e. sign a contract with ICANN, abide by consensus policies, pay fees etc.

ICANN has received considerable exposure through the World Summit for the Information Society process, and the more recent annual Internet Governance Forum events. This, combined with the work of the GAC, has resulted in governments having a better understanding of ICANN and the domain name system. Through the communication plan for the implementation of new gTLDs, communication will be targeted at governments to ensure that they are informed about the various elements of the program, and its potential application to governments.

Should the number of languages representing a county or territory name be expanded?

- During the meeting between the ccNSO and the GAC in Cairo, members of the ccNSO raised concerns that country names were not protected in all languages, and this has been reiterated in their comments as well as being raised by the UTC. The Guidebook will be changed to provide protection for country and territory names in all languages. Therefore the guidebook will now reflect that applications for any string that is a meaningful representation of a country or territory name listed in the ISO 3166-1 standard, including a representation of the country or territory name in any language, must be accompanied by documents of support or non-objection from the relevant government or public authority.

### **Sub-national names**

Can there be a clear comprehensive list, for defining sub-national names, such as the “ISO 3166-2 Codes for the representation of names of countries and their subdivisions—Part 2: Country subdivision code” for defining sub-national names?

- In the Explanatory Memorandum for Geographic Names, “place names are considered those that represent a sub-national identifier such as counties, states, regions or provinces”. During discussions with the GAC on the issue of place names, the GAC suggested the ISO 3166-2 list as a possible reference list for identifying sub-national names. The City of New York, Law Department, recommended that the guidebook adopt an additional standard, the United Nations Code for Trade and Transport Locations <http://www.unece.org/cefact/locode/service/location.htm> This list is derived from the ISO 3166-1 and 3166-2 codes, however, as the purpose of the list is to identify trade and transport locations, it goes beyond the scope of geographic names as outlined in the draft applicant guidebook and may lead to confusion among applicants.

It is difficult to develop a list that covers all sub-national names world wide; however, the 3166-2 list is considered the most applicable for the introduction of new gTLDs. The list is intended to be used in conjunction with the ISO 3166-1 list, which was selected by Jon Postel as the basis for ccTLDs, in the knowledge that ISO has a procedure for determining which entities should be and should not be on that list. The ISO 3166-2 list provides an independent and dynamic list of names which is consistent with previous ICANN processes. This list, combined with the applicant’s responsibility to identify if a string represents a place name, and that any application may be subject to objections under GNSO Recommendation 20, under which applications may be rejected based on objections showing substantial opposition from the targeted community, is felt to provide reasonable protection for local and national governments.

Will the meaningful representation test be applied to sub-national names?

- It is not the intention to apply the meaningful representation test regarding sub-national names. Similar to city names, the volume of names will make with this difficult to police. It is considered that the objection process provides an appropriate avenue for recourse.

How will common abbreviations for sub-national names be handled?

- It is difficult to define what is meant by a common abbreviation, and therefore there will be no restrictions imposed on such names as part of the process. It is considered that the objection process provides an appropriate avenue for recourse.

How will abbreviations be considered in the context of geographic names?

- Currently, the definition of meaningful representation of a country or territory name includes a short-form designation of the name of the Territory. This could include three letter country codes such as .AUS for Australia and .AUT for Austria. With regard to sub-national names, and city names, the meaningful representation definition does not apply. However, as any string may be the subject of objection, it is the responsibility of the applicant to research possible meanings for a string, and acquire any support they believe necessary to successfully acquire the string, or at least minimize the likelihood of objection. This is consistent with the approach for community applications.

### **City names**

Should the city name definition be expanded to include abbreviations? Is the issue of city names ambiguous?

- As stated in the Explanatory Memorandum on Geographic Name Applications, city names offer challenges because a city name can be a generic term, and in many cases no city name is unique. Given the infinite number of city names world wide, and duplication, identifying and determining if a name is an abbreviation of a city name would be very difficult. Evidence of support or non-objection will be required for capital cities of the countries or territories on the ISO 3166-1 list, and for city names where an applicant declares that it intends to use the TLD for purposes associated with a city name. It is considered that the objection process provides an appropriate avenue of recourse, for strings that may be considered an abbreviation of a city name.

### **Government interests**

Is the consideration of government interests, as currently written in the guidebook, contrary to the GNSO recommendation? Are the interests of national, local and municipal governments adequately protected through the objection process?

- The GNSO recommendations were intended to provide for protection of government interests in geographical and other community labels through recommendation 20 of the Final Report on New gTLDs: “An application will be rejected if an expert panel determines that there is substantial opposition to it from a significant portion of the community to which the string may be explicitly or implicitly targeted.” The implementation model of this recommendation has provided for protection of these interests through the objection and dispute resolution policy. The GAC raised concerns that this mechanism was inadequate, as many governments were not aware of the ICANN process and would therefore be unlikely to object in a timely manner, if at all. In order to achieve the objective of the GNSO to protect against abuse of community labels, and anticipate criticism of governments and possible objections to geographic names, the evaluation process was designed to require evidence of community support (i.e., government approval or non-objection) at the time of application. The amended process as outlined in the Draft Applicant Guidebook requires the application for certain

geographic labels to provide evidence of support or non-objection from the relevant government or public authority. This demonstration of community support, that may be required during the dispute resolution process is now simply required at the application stage.

**Proposed Position (for this version of the Guidebook)**

The applicant guidebook is reorganized to make it easier to identify the different elements of geographic names.

The draft applicant guidebook is to be amended to reflect that a country or territory name in any language will require evidence of support, or non-objection from the relevant government or public authority:

“applications for any string that is a meaningful representation of a country or territory name listed in the ISO 3166-1 standard, including a representation of the country or territory name in any language.”

The definition of meaningful representation is also amended to take out the reference to official languages:

A string is meaningful if, in any language, it is a) the name of the Territory; or b) a part of the name of the Territory that denotes the Territory in any language; or c) a short-form designation of the name of the Territory.

The requirements of the letter of support will be augmented. In addition to demonstrating an understanding of the string being requested and what it will be used for, the letter should also reflect that the string is being sought through the gTLD process and the applicant is willing to accept the conditions under which the string will be available, i.e. sign a contract with ICANN, abide by consensus policies, pay fees etc.

It is intended to offer to hold consultations with the GAC, ccNSO and others to discuss these issues.

## VIII. APPLICANT EVALUATION

### Summary of Key Points

- Several specific questions are answered on various aspects of the evaluation.
- The role of public comment in the process is discussed and there is updated information in the revised Guidebook describing this.
- ICANN continues independent evaluations of the scoring methodology. There are updates in the revised Guidebook to improve objectivity and repeatability; there will be more changes.

### Summary of Input

This section organizes the summary of responses about Applicant Evaluation into the following categories: *Applicant Information, Scoring, Miscellaneous, and Community-Based*.

#### **Applicant Information**

Submission of Updated Information. Applicants should be permitted to supplement incomplete sections. *MarkMonitor* (Module 1, 15 Dec. 2008). *Bank of America* (15 Dec. 2008) (there should be opportunities to amend substantially complete applications).

Subsidiaries/Affiliates. Under Applicant Review, existing entities should be permitted to set up newly formed subsidiaries or affiliates to serve as the registry. *MarkMonitor* (Module 1, 15 Dec. 2008).

Financial Statements Criteria. The requirement for “audited” financial statements in Section 1.2.3 should be reworded to allow applicants to submit the latest “available” audited financials, due to the delays typically associated with obtaining audited statements, and to submit unaudited financials for the latest period. *MarkMonitor* (Module 1, 15 Dec. 2008). ICANN should clarify how newly-formed applicant entities may comply with the financial statement requirements. *INTA* (15 Dec. 2008); *Microsoft* at 9 (Guidebook comments, 15 Dec. 2008).

Good Standing. The required documents under 1.2.3 for “proof of good standing” are insufficient...Given ICANN's history in certifying registrars that later proved themselves to be shams, higher standards are demanded in order to protect the public. Financial statements of newly formed special-purpose companies will be insufficient to detect iffy applications. *G. Kirikos* (24 Nov. 2008).

There should be a clearer definition of the term “good standing” under 1.2.3. ICANN should explicitly describe how it would vet the government authority, notary public or legal practitioner attesting to the good standing to assure its legitimacy and to assure its veracity. ICANN should identify the types of documents it would accept to validate an applicant’s good standing. *BITS* (15 Dec. 2008).

Public Comments. If an evaluator uses public comment as part of the evaluation under 1.1.3 then the evaluator must validate the accuracy of the submitted comment. *Demand Media* at 2 (Module 1, 17 Dec. 2008). ICANN should make available on its website all public comments submitted, provide Evaluators with all public comments, not just summaries generated by ICANN; and include in the next draft Guidebook examples of the type of matters for which the

public comment process is intended. *Microsoft* (Guidebook comments, 15 Dec. 2008). *INTA* (15 Dec. 2008). Clarifications needed regarding role of public comments. *BITS* at 4-5 (15 Dec. 2008). *MarkMonitor* (15 Dec. 2008). *Bank of America* at 5-6 (15 Dec. 2008) (oppositions should be considered only if made by a person with standing; should not subject applications to informal blogging, informal comments). *SIIA* (15 Dec. 2008). *CADNA* (15 Dec. 2008). *IPC* (15 Dec. 2008). *ANA* (15 Dec. 2008)

## Scoring

“Rights” and Other Clarifications Needed. The questions and criteria on legal rights characterize “rights” broadly. There should be more clarification on the type of rights that must be protected at start-up to score “1”. Question 50 in Evaluation refers to an “attached table of numbers” but the table is omitted. Also, there are discrepancies in scoring in the Attachment of Module 2. *Demand Media* (Module 2, 17 Dec. 2008). Were the criteria and scoring sections on Section 3, Scoring, page A-25, Questions 57 & 58 intentionally left blank? If not, what are the criteria and what are the scoring guidelines? *C. Gomes* (Module 2, 13 Dec. 2008).

Abusive Registrations. Increase the criteria for earning a minimum acceptable score on proposed policies to minimize abusive registrations. *NetChoice* (Module 2, 15 Dec. 2008).

Protection Mechanisms. The scoring system for question 31, page A-11 of Attachment to Module 2 should not turn on the detail provided, but on the characteristics of the mechanisms themselves. Applicants should be evaluated based on criteria such as the likely effectiveness of the mechanisms in preventing abusive registrations; the costs imposed on right holders who make use of such mechanisms, including the costs of assembling and documenting claims; and whether applicants are cooperating with other applicants in implementing common mechanisms, or at least common features, such as a single repository of claims information to which right holders can refer in lodging claims with multiple new gTLDs. *eBay*.

Expand Scale. Scoring ICANN should use a larger scale (e.g. a 10-point scale) for scoring evaluation criteria, as the current 0-1-2 scale does not provide enough latitude. *Microsoft* at 9 (Guidebook comments, 15 Dec. 2008). *INTA* (15 Dec. 2008) (use 0-5 or 0-10 at a minimum).

Communication Limitation. (1) The meaning of “one communication round per application” should be clarified. (2) The interface may increase the likelihood of questions, “so it will put a higher burden on the evaluation teams to precisely word their questions and provide as much guidance as possible with regard to the type information needed.” *C. Gomes* (Module 2, 13 Dec. 2008). Evaluators should not be subject to a limit of one request for further information from an applicant. *INTA* (15 Dec. 2008).

Extended Evaluation Panel Choice. If an applicant fails the initial evaluation and applies for extended evaluation, it should have the choice of engaging the same panel that conducted the initial evaluation or a different panel. This affords the applicant a fair evaluation process, if the applicant thinks that the panel is prejudiced. *J. Seng* (8 Dec. 2008).

Proposed Rights Protection Mechanisms-Transparency. ICANN should provide for greater transparency and stakeholder inquiry of an applicant’s proposed mechanism to minimize abusive registrations and other activities that affect the legal rights of others. Stakeholders should be invited to query the applicant about specifics and contingencies regarding their plan for rights protection. ICANN must require applicants to provide substantive responses to these

queries, and to publish questions and responses for public review. *NetChoice* (Module 2, 15 Dec. 2008).

Diverse Business Models; Small Community Participation. When considering an application for a new TLD, purely objective criteria such as a requirement for a certain amount of cash on hand will not provide for the flexibility to consider different business models. ICANN should make the proper adjustments to the RFP in order to actually allow diverse business models and small, but valuable and representative communities, to participate. The process should allow small communities to not only participate in the process with an application, but also have a well balanced and sustainable business without excessive or unjustified burdens. *NIC Mexico* (9 Dec. 2008).

Registry Failure: Continuity; Documentary Evidence. Under 1.2.3.5, the “documentary evidence of ability to fund ongoing basic registry operations for then-existing registrants for a period of three to five years in the event of registry failure” is obviously insufficient, as the number of “then-existing registrants” is ZERO! Reference needs to be made to the projected number of registrants within the applications, and furthermore funds need to be held in escrow by a recognized third party, or some other form of security bond should be in place. Under 1.2.3.5 the bond or escrow of funds to “fund ongoing basic registry operations” is far too small a bond given the negative externalities that can be created by a malevolent Registry Operator. The bond or level of insurance needs to be much higher, perhaps in the order of USD \$10 million. The “documentation of outside funding commitments” also needs to be strengthened beyond simply “documentation” -- security bonds or insurance are stronger than simply words that can be altered. ICANN has no real means to assess the creditworthiness of these outside sources of funding, nor means of enforcing their financial commitments. Given ICANN's poor history in policing Registry Operators (e.g. VeriSign's SiteFinder) and registrars (too many to list!), it's clear that these extra safeguards from insurance companies are essential. *G. Kirikos* (24 Nov. 2008).

ICANN should clarify how an applicant can provide documentary evidence of its ability to fund ongoing registry operations “for then existing registrants” at a time when many applicants won't yet have any registrants. *Microsoft* (Guidebook Comments, 15 Dec. 2008). *Demand Media* (Module 1, 17 Dec. 2008) (1.2.3 (5) should be clarified regarding the funding of on-going operations in the event of registry failure). Registry failure provisions including a deposit to cover transition costs should be included. *INTA* at 4 (15 Dec. 2008). Requirement of having 3-5 years of registry's operational costs is onerous; should consider alternatives such as a pooled registry continuity plan or arrangements between registries to take over in the event of a registry's failure. *Van Couvering* (15 Dec. 2008).

## **Miscellaneous**

RFCs 3730 and 3734 appear to have been updated by 4930-4934. *Demand Media* (Module 2, 17 Dec. 2008).

Confidentiality. ICANN should clarify which portions of the application are to be confidential, and should further specify its methods for maintaining the confidentiality of this information. *Rodenbaugh* at 4 (16 Dec. 2008). *R. Fassett* (5 Dec. 2008) (financial confidentiality concerns). *G. Kirikos* (24 Nov. 2008) (financial questions should not be kept confidential; criminal and background checks should be authorized). ICANN should clarify exactly what information will be placed in public posting; because a great deal of sensitive information will be collected in the application, ICANN should only list the party applying and the gTLD being applied for. Postings

should not be made public until the end of the application window. *DHK* (15 Dec. 2008). *C. Gomes* (18 Nov. 2008) (concern expressed about no assurances by ICANN on keeping data confidential).

DNSSEC. ICANN should require the use of DNSSEC for any proposed new gTLD that is devoted to high trust applications (including but not limited to financial services). This should be a mandatory feature to protect consumers in such environments. *eBay* (15 Dec. 2008). *BITS* at 5 (15 Dec. 2008). To improve security, DNSSEC should be considered. The contract should require the new domain to adopt best available security measures such as DNSSEC, a robust Whois and the current Add Grace Period Limits Policy. *Bank of America* (15 Dec. 2008).

ICANN needs to provide more information about how it will select and monitor outside service providers who will be serving as evaluators. *BITS* (15 Dec. 2008) *INTA* (15 Dec. 2008) (the Guidebook should be amended to provide information about the selection process and criteria for evaluators); *G. Kirikos* (24 Nov. 2008). *SIFMA* (12 Dec. 2008). *IPC* (15 Dec. 2008).

Conflicts Policy. Module 2 should include a conflicts of interest policy for evaluators/examiners. ICANN should publish the names of the examiners and give applicants an opportunity to object. The language should also be narrowed to allow certain contacts with ICANN which are unrelated to the application. *Microsoft* (Guidebook comments, 15 Dec. 2008). The conflicts policy should also ensure that no party involved with consideration of an application has a conflict regarding prior or current work with the applicant or a party that might be adverse to the application. *INTA* (15 Dec. 2008).

Financial Crimes, Fraud, Breach of Fiduciary Duty Questions. The application form should contain questions intended to ascertain if the applicant or any of its officers, directors or managers has been convicted of financial related crimes, fraud, breach of fiduciary duty, or has been disciplined by any government for such offenses. *Microsoft* (Guidebook comments, 15 Dec. 2008). *G. Kirikos* (24 Nov. 2008) (financial requirements must create big barriers to malevolent entities securing a gTLD). The background of applicants, their principals, and their senior officers should be subject to review, perhaps through the use of a form similar to the Sponsoring Organization's Fitness Disclosure. *BITS*.

Suggestions on Scoring and Evaluation Criteria. The Guidebook should specify (and rate) at least the following: General registration policies, and special ones, if any (types of registrations or registrants, if distinction is made); Specific mechanisms for the TLD launch (sunrise, special allocation mechanisms; land rush, etc); Compliance/enforcement procedures, if any, and dispute resolution procedures; Special services (not necessarily in the New Registry Services meaning) offered and/or planned. *A. Abril i Abril* (Module 2, 15 Dec. 2008).

## **Community-Based**

Closed Branded gTLD. Based on the criteria for "community-based gTLD." A "branded" gTLD for which the brand owner is the applicant, that brand owner will operate for its own benefit, and for which the brand owner will restrict the population (which could range from merely the applicant itself to its divisions and personnel to its manufacturing and distribution channels) would be considered a "community-based gTLD." If ICANN does not intend to allow the "community-based gTLD" designation to apply to corporate, branded gTLDs, it should so state and provide a detailed explanation as to why not. In some instances, such as branded gTLD, it is conceivable that the applicant may be the only established institution representing the community and the requirements for written endorsement of the application should reflect that

possibility. *Microsoft* (Guidebook comments, 15 Dec. 2008). Operators of closed, branded gTLDs should have the flexibility to decide to stop operating the gTLD if they so choose. In such circumstance, it would be inappropriate for a third party with no rights in the brand to operate the gTLD. *Microsoft* (Guidebook comments, 15 Dec. 2008)

Financial Services gTLDs. The “written endorsement” requirement for community-based gTLDs is insufficient, because ICANN cannot consider one institution representative enough of a community. The threshold for a community-based gTLD should be significantly higher. A select group of industry associations (or regulatory agencies) should act as a consortium designated as the “community” to make decisions regarding the approval of any gTLDs whose names suggest they offer financial services or to endorse any applicants of such gTLDs. *BITS* (15 Dec. 2008). New gTLDs could create new rounds of financial fraud and increased costs to financial sector at a time of economic distress. There should be a separate and distinct application process for financial sector gTLDs: (1) top-down approach to ensure that no unsponsored gTLDs are issued and if issued that such gTLDs are managed within an industry and regulatory framework, with no “open” applications and explicit financial industry and regulatory endorsement; (2) subject financial sector gTLDs to community-established governance rules, including laws and regulations established by financial sector regulators. Applicants must show their ability to comply; (3) the objection process for financial sector gTLDs should allow objection on grounds of insufficient governance and include a process for financial regulatory objection; (4) allow financial gTLD ownership to be revocable or transferable at any time in future when the represented community or regulatory body determines and shows that the sponsored gTLD has not satisfied its governance requirements. *FDIC* (15 Dec. 2008). Financial sector does not yet have clear consensus on having a financial services sector gTLD. Fundamental concerns are raised regarding how to ensure only legitimate entities would be granted a financial sector gTLD. ICANN should have application controls and a “community” consortium approach for financial gTLDs. *ABA* (15 Dec. 2008). *Bank of America* (15 Dec. 2008) (further analysis and consensus needed before having financial sector gTLDs)

## **ISSUES, ANALYSIS AND PROPOSED POSITIONS**

### **Applicant Information**

#### **Issues**

Submission of Updated Information: Should applicant be permitted to supplement incomplete sections?

Subsidiaries/Affiliates. Should applicants be permitted to set up newly formed subsidiaries or affiliates to serve as the registry?

#### **Analysis**

Submission of Updated Information: ICANN recognizes that situations change and applicants may need to supplement sections of their application throughout the process, however, ICANN also needs to protect against the possibility of applicants changing their applications for competitive advantage. Material changes in the application information must be reported immediately. A material change after the evaluation would render that evaluation inaccurate.

Therefore, changes to applications are generally not permitted after the evaluation has started, i.e., at the close of the application period.

Subsidiaries/Affiliates: It is not an objective of ICANN to prohibit the formation of new subsidiaries or affiliates by an applicant to serve as the Registry Operator. However, the formation of new entities to resolve string contention, say by agreement between contending parties, is a material change to the application information that must be reported.

### **Proposed Position (for this version of the Guidebook)**

Submission of Updated Information: Applicants will be able to revise and supplement their application until the time when the application period is closed and submissions must be final. After this time, the Guidebook includes a requirement that an applicant notify ICANN in the event of any material changes to the application submitted.

Subsidiaries/Affiliates: It is acceptable for existing entities to set up newly formed subsidiaries or affiliates to serve as the registry. If new entities are formed after the evaluation performed (in order to resolve contention) the evaluation will be performed again, possibly incurring additional fees and possibly in the next round.

## **Financial Criteria**

### **Issues**

Should 1.2.3 be reworded to allow the submission of the latest “available” audited financial statements?

Can ICANN clarify how newly formed applicants should comply with the financial statement requirement?

### **Analysis**

ICANN’s requirements are suitably met in allowing applicants to submit the latest available audited financial statements, provided they are within a date of 12 months of the application and accompanied by interim statements. ICANN intends to update the Applicant Guidebook in line with the comments received to permit applicants to submit the latest available audited financial statements.

Newly formed entities should be permitted to submit pro forma financial statements with supporting data.

### **Proposed Position (for this version of the Guidebook)**

Section 1.2.3 will be revised to allow applicants to submit the latest “available” audited financials and to submit unaudited financials for the latest interim period.

For newly formed applicants, a pro forma balance sheet will be acceptable.

## **Evidence of Good Standing**

### **Issues**

Are the documentation requirements for proving “good standing” under 1.2.3 sufficient to detect sham applications?

Will ICANN clarify: the definition of “good standing,” the validity requirements for governments providing assurances of good standing, and the types of documentation necessary to establish good standing?

### **Analysis & Proposed Position (for this version of the Guidebook)**

The good standing requirement is to independently demonstrate existence and organization of the entity. ICANN must separately evaluate the completeness and accuracy of information submitted in the application in order to approve an application and the possible entry into a registry agreement for a TLD. ICANN is continuing to investigate common practices in the various regions in order to provide further guidance to applicants on this requirement.

The requirement should be flexible to accommodate different systems as well as newly formed and well-established companies. A good standing certificate or the equivalent under local law will be acceptable to reflect the existence of the entity. ICANN recognizes that jurisdictions will vary in custom and the application requirement is intended to be flexible. ICANN will accept submissions with supporting documents or information as to the relevance under local law.

## **Use of Public Comment**

### **Issue**

Should evaluators validate the accuracy of a public comment?

### **Analysis and Proposed Position (for this version of the Guidebook)**

Evaluators will be provided with public comment for use and reference in their evaluation. As part of the procedures for evaluators, they will be asked to apply appropriate judgment and verify comments if necessary.

The Guidebook and other documentation to the evaluators will reflect the ability to perform due diligence in regard to the public comments as required by the circumstances of that particular evaluation.

## **Scoring**

### **Issues**

Can ICANN clarify the type of rights that must be protected at start-up to score “1”?

Can ICANN attach the table of numbers omitted from Question 50 in Evaluation?

Will ICANN resolve the discrepancies in scoring in the Attachment of Module 2?

What are the criteria and what are the scoring guidelines for Section 3, Scoring, page A-25, Questions 57 & 58?

Will ICANN increase the criteria for earning a minimum acceptable score on proposed policies?

Will the scoring system for question 31, page A-11 of Attachment to Module 2 should turn on the amount of detail provided, or on the characteristics of the mechanisms themselves?

Will ICANN use a larger scale (e.g. a 10-point scale) for scoring evaluation criteria?

### **Analysis and Proposed Position (for this version of the Guidebook)**

As part of the updates to the Applicant Guidebook, ICANN is revising the Attachment to Module 2. All questions require a passing score of at least “1”. A series of additional consultations and discussion is being undertaken in order to determine what specific rights protection mechanisms might be included as a requirement in the evaluation. The table of numbers omitted from Question 50 can be included. Questions 57 and 58 are not scored individually but the answers to those questions will be used in combination with answers to other questions in order to score the criteria. For example, the soundness of the financial plan will be evaluated based upon answers to questions about expected revenue, the uncertainty in the projections and how to address major risks in the projections. This methodology is described in the preamble to the evaluation. There will be changes in the formatting of the questions and criteria to make this clear.

ICANN does not intend to adopt a larger scale for scoring evaluation criteria, but is reviewing areas where scoring can be improved to remove subjectivity and provide greater granularity for the applicants. Revisions to the scoring criteria will be posted in the revised version of the Guidebook and ICANN is undertaking independent evaluations of the scoring methodology to verify the scoring model or change it.

ICANN is reviewing the Applicant Evaluation Criteria and Scoring with the suggestions made by Mark Monitor, Chuck Gomes, CADNA, Microsoft, among others, and will be testing modifications to the evaluation criteria and scoring.

### **Evaluators**

#### **Issues**

Will ICANN clarify the meaning of “one communication round per application”?

Will the evaluation team word their questions precisely to provide as much guidance as possible with regard to the type information needed?

Will an applicant be allowed the choice of engaging the same panel that conducted the initial evaluation or a different panel after it fails the initial evaluation and applies for extended evaluation?

Will ICANN allow stakeholders to query the applicants about specifics and contingencies regarding their plan for rights protection?

Will ICANN provide flexible criteria when considering an application for a new TLD?

### **Analysis and Proposed Position (for this version of the Guidebook)**

The revised Guidebook gives some more detail on the exchanges between applicants and evaluators. Essentially, evaluators will ask one series of questions in an evaluation round if the information provided is not sufficiently clear to pass the application. Through a standard channel, evaluators will ask applicants specific questions to obtain the necessary information.

Stakeholders can comment through the public comment process and those comments will be made available to the evaluators. To have stakeholders actively involved in the evaluation through questioning would tend to slow the process and increase costs and decrease objectivity in a way that is unpredictable to applicants.

Whether or not the same panel hears extended evaluation is not definitely determined. Final decisions will be based upon the proposals and rules received from evaluation panel providers. Additional public comment is welcome on this issue.

The criteria are intended to be flexible in order to accommodate different business models as is described in the preamble to the evaluation criteria and scoring section of the Guidebook.

### **Ongoing Registry Operations**

#### **Issues**

Can 1.2.3 (5) be clarified as regards the funding of on-going operations in the event of registry failure?

Will 1.2.3.5, be edited to require further information, such as the projected number of registrants, and to require funds to be held in escrow by a recognized third party, or some other form of security bond?

Will the bond or level of insurance be increased, perhaps to as much as USD \$10 million?

Will ICANN strengthen the “documentation of outside funding commitments” requirement?

Can ICANN clarify how an applicant provides documentary evidence of its ability to fund ongoing registry operations “for then existing registrants” at a time when many applicants won’t yet have any registrants?

### **Analysis and Proposed Position (for this version of the Guidebook)**

ICANN has made clarification to several areas of the questions and scoring criteria. Also, independent evaluations of the scoring criteria are being performed with an eye toward making additional changes that will improve objectivity.

As suggested by Demand Media, Microsoft, INTA and others, ICANN will continue to clarify the evaluation questions on registry failure and continuity, provide additional information on the bond or level of insurance, and on how an applicant provides documentary evidence of its ability to fund ongoing registry operations.

## **Miscellaneous**

### **Issues**

RFCs 3730 and 3734 appear to have been updated by 4930-4934.

Will ICANN reevaluate the “written endorsement” requirement for community-based gTLDs?

Will ICANN provide guidelines for determining which portions of the application are to be confidential, and what methods are used to maintain the confidentiality of this information?

Should DNSSEC be required for any proposed new gTLD that is devoted to high trust applications?

Will ICANN revise the application to require background checks and/or disclosures of past fraud by an applicant, its officers, directors and managers?

Will ICANN provide more information about how it will select and monitor outside service providers who will be serving as evaluators?

Should ICANN develop a conflicts of interest policy for evaluators and allow applicants to view the names of and object to evaluators based on such conflicts?

Will ICANN edit the guidebook to provide more clarity on the issues of general and special registration policies, specific mechanisms for the TLD launch, Compliance/enforcement procedures, dispute resolution procedures; and special services offered and/or planned?

### **Analysis**

These are all good questions and comments that ICANN takes very seriously. ICANN will be confirming updates to RFCs and making the appropriate changes. ICANN will be offering some additional clarity with regard to confidentiality and the application process in general. ICANN believes in encouraging Registry Operators to use the most advanced technologies available to ensure the security of its information as it is fundamental to the security of the Internet. ICANN must also, however, balance these requirements with the constraints applicable to small Registry Operators who do not have and may not expect to have a large user base to justify the cost of certain measures. For these smaller Registry Operators, the requirement to implement these state of the art security measures, DNSSEC for example, could be too financially burdensome as a mandatory requirement. This requirement may change as DNSSEC becomes widely adopted.

### **Proposed Position (for this version of the Guidebook)**

RFCs 3730 through 3734 have been replaced with the most current RFCs 4930-4934 in the next version of the Guidebook.

ICANN will clarify which sections are designated confidential.

ICANN will continue to encourage Registry Operators to implement DNSSEC but for the time being such implementation will remain optional.

Background checks for applicants are a good suggestion, and there are rules for how and when this might be done in each jurisdiction. The evaluators will be provided with a variety of tools to use to verify information in their evaluations.

ICANN will publish information on the selection of evaluators as well as a RFP for such evaluators. The process for selecting evaluators will be open and transparent.

ICANN intends to add granularity in the evaluation questions and scoring, in line with comments and inputs received.

## **Community-Based**

### **Issues**

Has ICANN decided not to allow the “community based” designation to apply to corporate brand owners? Please explain.

Will ICANN consider allowing a [“closed”] branded TLD to cease operations of its TLD without requiring it to turn the operations over to a third party?

Will ICANN consider increasing the number of representative institutions necessary to satisfy the “written endorsement” requirement?

### **Analysis**

#### **Summary of key points:**

The concerns/questions regarding an applicant's freedom to select the type of application and the possibility of multiple representative institutions for a community are already covered in the current approach and no changes of the Applicant Guidebook are foreseen in these respects.

**Community based/Brand Owners:** It is wholly up to the applicant to select the type of application to file. ICANN will not verify nor change the type as such. Whether the application, if declared as community-based, will prevail in Comparative Evaluation for a contention situation is dependent on how well the application scores against the criteria, as detailed in the Applicant Guidebook. No change of the applicant's freedom to select the type of application to file is foreseen for the next version of the Applicant Guidebook.

**Multiple representative institutions:** If the community has a structure with multiple institutions that are representative of different parts of the community, it is wholly appropriate to take endorsement, or lack thereof, from all these institutions into account. Such endorsement is assessed only in a case when the application is in a contention situation that is resolved by Comparative Evaluation. As further detailed in Module 4 and the explanatory memorandum on string contention handling, the evaluation of the Endorsement criterion in such a case is already foreseen to take into account both endorsement and opposition from constituent parts of the

community and can thus address a situation where there are multiple representative institutions. No change of that aspect is foreseen for the next version of the Applicant Guidebook.

**Proposed Position (for this version of the Guidebook)**

Community based/Brand Owners: It is the applicant's choice to designate the application as community-based or open. There is no prohibition currently and none is envisaged for the next version of the Applicant Guidebook. The same criteria will be applied to all applicants in cases where there is a community-based objection and in cases of comparative evaluation.

Multiple representative institutions: The endorsement criterion applies to a case when a contention situation is resolved by Comparative Evaluation, where the endorsement will be taken into account as appropriate for the community addressed.

## **IX. TRADEMARK PROTECTION**

### **Summary of Key Points**

- Comments state that the introduction of new TLDs will increase burdens on rights holders by multiplying opportunities for malicious behavior at top and second levels of the DNS.
- ICANN will continue consultations over the next few months to promote a universal understanding of issues across the rights-holder community and derive potential solutions to possible deleterious effects of the introduction of new TLDs.

### **Summary of Input**

A substantial number of public comments asserted that the new gTLD program will create an array of trademark law protection concerns which must be addressed through further trademark protection measures. This section organizes the summary of responses about Trademark Protection into the following categories: *In General, Process and Procedure/Defensive Registrations; Objections; and Rights Protection Mechanisms.*

#### **In General**

Costs and Burdens on Trademark Rights Holders. Numerous comments raised concerns that the new gTLD program would potentially impose new burdens and costs on rights holders in well-known brands and trademarks. For example, the International Olympic Committee (IOC) asserted that ICANN's guidelines should explicitly acknowledge the IOC's preeminent IP rights in the Olympic trademarks and raised concerns about: what preventative measures can ICANN take to block or screen out unauthorized applicants for Olympic trademarks; what steps can be taken to ensure that the IOC does not have to expend funds chasing down unauthorized uses of Olympic trademarks? *IOC* (5 Dec. 2008). Others said that allowing registries to sell domains of famous trademarks and keep the profits from the sale is a basic flaw in ICANN policies, which undermines ICANN credibility and the entire domain system. *WMI* (13 Dec. 2008).

Monopoly Concerns. Commenters also raised concerns about the potential for the new gTLD program to destroy the DNS's level playing field by leading to the creation of single entity super brands and monopolistic generic TLDs and urged that more consideration is needed about how to guard against the creation of monopoly positions. E.g., *P. Tattersfield* (15 Dec. 2008)(generic gTLDs risk creation of monopoly positions that would not be permitted under equivalent trademark law; while on the surface a competitive, market-driven approach for generic gTLDs may be well-supported, in practice there may be significant concern about the specific entities that actually run them—e.g., “.search” run by Afilias or VeriSign as opposed to “.search” run by Microsoft); *ANA* at 4 (15 Dec. 2008) (new generic TLD policies and standing must be carefully reviewed). *NCUC* at 4 (15 Dec. 2008) (the proposal perpetuates a presumption that trademarks and domain names are identical rights and raises significant anticompetitive issues regarding generic names). Commenters also warned that the new program is likely to confuse rather than benefit consumers. E.g., *U.S. COC* at 3 (15 Dec. 2008); *Arab Team* at 3 (15 Dec. 2008) (users will lose faith in a system with many variations of TLDs existing for a single label). Particular industry segments are concerned about the rights to certain generic TLDs and urged that no action be taken on them pending further work and consideration about issues raised. For example, the ABA requests that no “.bank” gTLD be granted until such time as the ABA has secured a sponsor or community base. *ABA* at 1-4 (15 Dec. 2008. See also *BITS* at 2-3, 5 (15 Dec. 2008); *Bank of America* at 8 (15 Dec. 2008).

Single Enterprise/Corporate TLDs. A number of commenters said that further work and consideration is required regarding the issue of single enterprise or corporate TLDs.

For example, eBay stated that the draft guidebook may need adjustment to accommodate the possibility to new TLDs operated by individual corporations for their own use, whether strictly internal or consumer-facing. It said ICANN should clarify whether such applications would be labeled as “open” or as “community,” and urged that in appropriate circumstances a registry should be allowed to enter into an exclusive arrangement with a registrar to handle all registrations in a gTLD. *eBay* at 6 (15 Dec. 2008).

Microsoft asserted that if ICANN does not intend to allow the community based gTLD designation to apply to corporate, branded gTLDs, than ICANN should explain a rationale for not doing so. In some cases the applicant may be the only established institution representing the community and the written endorsement requirement should reflect that possibility. Operators of closed, branded gTLDs should have the flexibility to decide to shutter the gTLD; and set out that it would be inappropriate for a third party with no rights in the brand to operate the gTLD. *Microsoft* at 9-10 (Guidebook comments, 15 Dec. 2008). *See also INTA* at 7-8 (15 Dec.2008).

*GT* at 3-4 (15 Dec. 2008) (ICANN should amend the Guidebook to allow a “DNS wildcarding” exception for single enterprise TLD registries).

Potential negative impacts on the perception of DNS root due to single registrant TLDs were also raised. *W. Staub-CORE* (15 Dec. 2008) (single registrant TLDs will create a rush of brands to the top level; there should not be brand-based TLDs where the only conceivable use is reserved to the brand holder itself). Some commenters wanted further practical guidance about single enterprise/corporate TLDs. *E.g.*, is the application open to public or just to those who will be the registrar business? Can any company apply directly to ICANN for a new gTLD for its own business purposes and not resell second level domains? For example, can Nike apply for a .nike gTLD and operate it exclusively for themselves? And technically, will the Internet users be able to just type <http://nike> (without any second level domain name) to go their website? *J. Lam, Email Support*.

### **Process and Procedure; Defensive Registrations**

Numerous comments asserted that ICANN must improve the process and procedures for trademark protection if the new gTLD program is launched. For example one commenter highlighted these concerns with the new gTLD program: (1) little to no protection for global trademark holders; (2) excessive administrative costs for applicants; (3) virtual total control by ICANN with no accountability; (4) exposure to increased fraud and legal liabilities for trademark owners; and (5) easy access and control for unscrupulous entities to core Internet infrastructure components and ultimately threatens Internet commerce around the globe. *R. Raines-Chevron Corporation* (4 Dec. 2008).
