Many commenters emphasized that the new gTLD program will impose on them the necessity of expending resources to submit multiple defensive registrations to protect their trademarks, an especially negative cost impact given the global economic recession. *Internet Commerce Coalition* at 2 (15 Dec. 2008) (the new TLD program will greatly increase costs of protecting trademarks and brands). *Citrix* at 1 (15 Dec. 2008) (threatens brand integrity and is too costly). *INTA* at 2 (15 Dec. 2008) (costs imposed on trademark owners and businesses by the new GTLD program raise special concern in current global economic downturn). *E. Brunner-*

*Williams* (the \$75,000 annual fee is too high for most trademark owners to consider defensive registrations of TLDs, but possible for a large trade union and its membership).

USTA asserted that there is no substantiated need for new gTLDs, and is also concerned with trademark abuse in new gTLDs, the obligation on brand owners to defend their trademarks in new gTLDs, and the costs associated with the new gTLD process. They are concerned that brand owners will be forced to defensively register to protect their brands. *USTA* (15 Dec. 2008). *USCIB* at 2 (16 Dec. 2008) (having low-cost ways to protect trademarks at the pre- and post-allocation stages is a key concern). *Hearst Corporation* (15 Dec. 2008) (no commercial value in expanding gTLDs, and will require costly defensive actions by trademark owners). See also *Time Warner* (15 Dec. 2008) (launch of a very large number of new gTLDs poses huge exploitation risks and costs to major trademark owners). *Lego* (4 Dec. 2008) (will impose major costs; outsourcing technical administration to an ISP would lessen burden for trademark owners). *GE van Staden* (12 Dec. 2008); *GE Bandon* (11 Dec. 2008). *Adobe* at 1 (12 Dec. 2008) *Bank of America* at 2 (15 Dec. 2008). *Melbourne IT* at 1 (15 Dec. 2008). *Cyveillance* (15 Dec. 2008).

Commenters cited the need for additional, cost-effective trademark protection measures. Illustrative examples include the following:

Block Registration for Brand Holders. Procedures should be implemented whereby (analogous to the community trademark or PCT patent in which several countries are designated with a single registration): (a) holders of existing domain names or trademarks could register any number of TLDs with a single registration, with a reduced cost to allow such a block registration to be financially feasible; (b) mechanisms to avoid abusive registrations and to verify actual use/right of alleged right holders; (c) an existing registration of all domain names/extensions would effectively block new domain names/extensions that are confusingly similar to existing domains by means of notification to the existing domain name holder allowing it a right of first refusal during a certain period (as opposed to a single sunrise period) - only if it does not act on this right would the domain name become freely available; (d) Joint action - in order to protect their rights, domain name and trademark holders could file a single action or single submission for dispute resolution involving any number of TLD extensions that infringe prior rights, instead of having to file separate actions in each case. *Busse* (13 Dec. 2008).

Many other commenters raised concerns about the increased need for defensive registrations, and some emphasized giving trademark owners the right to block or park TLDs containing their trademarks and to purchase such TLDs at a low cost with no obligation to implement infrastructure to support it. *See, e.g., Lego* (4 Dec. 2008); *Visa* (13 Dec. 2008) (brand owners should be able to register their trademark extension to protect it but should not have to actively use it or fulfill back-end requirements).

Top Level Reserved Names List. ICANN should create a list of top-level reserved names based on clearly defined, objective criteria and a clear process requiring all new string applicants to refer to and honor this list to minimize disputes between new registry applicants and global trademark holders. A dispute procedure should be provided with registry applicants to bear the cost. If the holder of the registered name prevails, the name should be removed to a "White List" of names that are unavailable for registration. ICANN should consider this list concept for country and geographic names. ICANN should revise dispute process at the second level to mandate a standard sunrise process and incorporate the global brand reserve list for second level domains also. *AT&T* at 4-5 (15 Dec. 2008). *See also G. Kirokos* (24 Nov. 2008); *NAM* (15 Dec. 2008) (supports "reserved list" to protect brand owners, just as ICANN created a list of

reserved ICANN-related names to protect its own interests); *NYC* at 6 (13 Dec. 2008) (governments or non-governmental organizations should have same rights as ICANN to reserve their own names). IANA-related infrastructure names should be protected at all levels; the reserved names list has omitted significant Internet infrastructure names. *ARIN* (8 Dec. 2008). ICANN should create a reserved list based on objective criteria for trademark owners at the registry level and applicant requests for a domain name on the reserved list should be resolved in an expedited administrative proceeding. *Internet Commerce Coalition* at 6 (15 Dec. 2008). See also *INTA* at 4-5 (15 Dec. 2008); *Pattishall* at 2 (15 Dec. 2008) (consider reserved names list and/or sunrise); *Nike* (2 Dec. 2008); *CADNA* at 4-5 (15 Dec. 2008) (reserved names list); *FairWinds* at 2-3 (15 Dec. 2008); *L. Cordell* (15 Dec. 2008); *USTA* at 7-8 (15 Dec. 2008); *Lovells* at 3-4 (15 Dec. 2008) (reserved names system); *ITT* at 4 (15 Dec. 2008); *Visa* (13 Dec. 2008); *News Corporation* (15 Dec. 2008) (the reserved names list should be broadened to include well known trademarks).

Some public comments cautioned against ICANN establishing protection mechanisms for trademark owners beyond existing law. *E.g.*, *ICA* at 2, 10-12 (16 Dec. 2008) (protections for rights holders should be limited to enforcement under existing law, not based on creation of broader rights by ICANN fiat; a reserve list of trademark names should not be created because it would provide rights protections beyond the geographic and relevant marketplace limitations of trademark law; new rights or procedures should not supplant the UDRP; all second level registrations should be required to be subject to the UDRP). See also, *C. Christopher* (16 Dec. 2008) (lack of support by trademark owners for TLD expansion is self serving, especially by those who benefit from error traffic monetization and from not having a neutral network.; allowing trademark owners to remove themselves from .com and obtaining their own .brand may reduce trademark problems—consumers will no longer look to .com for individual trademarks).

WHOIS Commitment. New gTLDs will, like nearly all of the new gTLDs previously launched under the auspices of ICANN, operate as thick Registries. Accordingly, they should commit to making a full set of Whois data publicly available on each registration in the new gTLDs, so that copyright and trademark owners (as well as law enforcement, consumers, and members of the public) will have ready access to this information. *IPC* at 6 (15 Dec. 2008).

For the post-launch stage, new gTLDs should take on the same WHOIS publication obligations as those in previous rounds: nearly all new gTLDs have adopted a “thick” registry model in which extensive registrant contact information is collected and retained at the registry level. TLD applicants must specify how they will ensure that data collected by registrars and stored in the registry is accurate and up to date, and this information should be publicly evaluated. *eBay* at 5 (15 Dec. 2008).

ICANN should evaluate applicants’ commitment to maintaining and enforcing WHOIS requirements, and should encourage applicants to maintain centralized or “thick” WHOIS databases and adopt additional WHOIS requirements. *CSC* at 4 (15 Dec. 2008). *Time Warner* at 6 -7 (15 Dec. 2008) (new gTLD registries should be required to maintain “thick” registries and make full registrant contact data publicly accessible; applicants must have policies to ensure accuracy of WHOIS data and how they will enforce this requirement with registrars and resellers, and there should be a tie-in to ICANN’s WDRPS to shut down domains where WHOIS reports go unanswered and uncured for more than 15 business days). *AT&T* at 5 (15 Dec. 2008) (require applicants to maintain thick WHOIS data, inquire about proxy registrations and access to actual registrant data, standardize procedures in any new registry agreement; this is key to law enforcement and consumer safeguards). *U.S. COC* at 8 (15 Dec. 2008). *NAM* (15

Dec. 2008) (applicants must commit to open and accurate WHOIS system; proxy and private registrations should be discouraged if not prohibited). *Internet Commerce Coalition* at 7 (15 Dec. 2008) (require applicants to commit to open and transparent WHOIS database). See also *Visa* (13 Dec. 2008); *COA* at 2, 9-10 (15 Dec. 2008); *FairWinds* at 4 (15 Dec. 2008). *MarkMonitor* at 3 (15 Dec. 2008); *Lovells* at 4 (15 Dec. 2008); *IPC* at 6 (15 Dec. 2008); *Grainger* at 4 (15 Dec. 2008). *AIPLA* at 2 (15 Dec. 2008) (ensure enforcement of WHOIS data accuracy and establish policy regarding proxy or private registrations). *MARQUES* at 5 (15 Dec. 2008) (registry operators should be required to offer a privacy service but must provide for service to third parties and rights owners that need access to the registrant; registrars should not be allowed to offer Whois privacy protection services in the new gTLDs). See also *ITT* at 2-3 (15 Dec. 2008); *Bank of America* at 9 (15 Dec. 2008); *IACC* at 3 (10 Dec. 2008) (ICANN still needs to resolve outstanding Whois issues with existing gTLDs and should not exponentially magnify those problems by launching new gTLDs).

IP Registry/Other Mechanisms. ICANN must do more to provide scalable, cost-effective and efficient rights protection mechanisms to minimize the ICANN-imposed burden of having to secure defensive registrations and combat cybersquatting in as many as 500 new gTLDs. Possible steps include: (1) creating a “reserved list” to which rights owners could apply to have their marks excluded from second level; (2) developing 2-4 standardized Rights Protection Mechanisms (RPMs) that applicants could select from; (3) facilitate creation of a central repository for legal rights documentation on which rights holders may rely in pre-launch RPMs and requiring successful applicants to utilize the repository in their RPMs; (4) creating an online, cross-TLD interface through which rights holders can designate gTLDs they wish to participate in and gTLD operators may access the requisite data for participating rights holders. ICANN must discourage new gTLD registries from using RPMs as revenue-generating opportunities. *Microsoft* at 3 (Guidebook comments, 15 Dec. 2008). See also *ANA* at 3 (15 Dec. 2008); *Ameriprise* at 2 (15 Dec. 2008). *U.S. COC* at 7 (15 Dec. 2008) (ICANN should create a low cost or no-cost IP registry applicable to gTLD applicants and second level domains; it would be used to screen out infringing applications so that trademark owners do not have to defensively register marks in each new gTLD). *MarkMonitor* (15 Dec. 2008) (trademark owners in registry could get notice of infringing applications allowing them to apply for the gTLD). *K. Abbot* (8 Dec. 2008) *MARQUES* at 4 (15 Dec. 2008) (supports IP registry database concept). See also *Melbourne IT* at 3 (15 Dec. 2008); *Visa* (13 Dec. 2008); *SIFMA* at 4 (12 Dec. 2008).

Rights Holder Verification Process. ICANN should consider an alternative to a central IP registry database to facilitate sunrise registrations in new TLDs designed through a consensus process according to the following principles: real-time verification from authoritative sources; time stamp on all verified data; operation by a trusted third party on behalf of global Internet community; all communities to have a voice in developing technical and policy considerations; ICANN should not duplicate a sub-set of non-authoritative trademark data when other more authoritative sources exist. *M. Palage* (15 Dec. 2008).

Second-level concerns. ICANN should (1) require all new TLDs to implement a standard and effective pre-launch rights protection mechanism that would allow trademark owners to block their marks from being registered at second-level; (2) prevent use of “premium pricing” schemes for second-level domain names corresponding to or related to a well known trademark; and (3) require new TLDs to limit fees, if any, in any pre-launch rights protection mechanism to actual cost recovery. *News Corporation* at 3 (16 Dec. 2008). *SIIA* at 5 (15 Dec. 2008) (pre-launch framework to prevent abusive registrations lacking in Guidebook—this issue cannot be left to whims of TLD applicants). Applicants should be evaluated based on criteria such as the likely effectiveness of mechanisms for preventing abusive second-level registrations; costs imposed

on rights holders who make use of such mechanisms, including claims; whether applicants are cooperating with other applicants in implementing common mechanisms or features. Premium pricing of second-level domains should be prohibited. *eBay* at 4-5 (15 Dec. 2008). *IPC* at 5-6 (15 Dec. 2008) (ICANN must do much more to ensure effectiveness of pre-launch mechanisms). *MARQUES* at 4 (15 Dec. 2008) (detailed pre-launch rights protection mechanisms required). ICANN should incent TLD applicants to adopt ways beyond the UDRP compliance to deal promptly and effectively with abusive registration of second-level domains. *eBay* at 6 (15 Dec. 2008). For second-level registrations ICANN should mandate a notice/takedown procedure if the domain name is used in an infringing manner to a name on the IP Registry or require WHOIS verification and prohibit proxy or anonymous registrations for registrants intending to register a domain name conflicting with a name on the IP registry. *USTA* at 9 (15 Dec. 2008). See also *MARQUES* at 5 (15 Dec. 2008) (study notice/takedown experience to improve expedited suspension at registry level of domain names that facilitate sale of counterfeit goods and other infringement).

ICANN should: evaluate new gTLD applications not only on the level of detail used to describe their preventive mechanisms but also on how effective they are likely to be; require new gTLD operators to prevent registrations at the second level of any mark appearing on the gTLD reserved names list; require new gTLD operators to participate in a common repository for documentation of trademark claims that rights holders can invoke in any pre-launch mechanism for particular TLDs; provide a single portal through which rights holders can participate in any pre-launch mechanism provided by participating new gTLD registries and provide strong incentives in the evaluation process for new gTLD operators to participate in the common portal; provide strong incentives for new gTLD operators to limit fees in any pre-launch mechanism to actual cost recovery and to offload costs to ICANN-provided facilities such as the suggested common repository and single portal. *Time Warner* at 6 (15 Dec. 2008). ICANN should establish a baseline processes to ensure that IP rights holders can easily protect their trademarks and brands both prior and subsequent to launch of new gTLDs. *Internet Commerce Coalition* at 6-7 (15 Dec. 2008). *INTA* at 15-16 (15 Dec. 2008) (e.g., reserved trademark list, develop a few basic rights protection mechanisms that applicants could choose; database of cleared rights). See also *COA* at 2, 8-9 (15 Dec. 2008).

## Objections

Burden on Rights Holders. The IACC strenuously objects to the proposed Applicant Guidebook insofar as (i) it imposes 100% of the financial burden of objecting to any application made for a new gTLD upon the existing rights owner (except, ironically, for ICANN itself); and (ii) it imposes no requirement beyond adoption of a UDRP based dispute resolution model with respect to second level domain names. *IACC* (10 Dec. 2008). A less costly and more efficient IP protection solution should be considered to shift the burden to bad faith infringers including due diligence by ICANN regarding serial domain name abusers. *Visa* (13 Dec. 2008).

The ICANN plan reliance on the Legal Rights Objection procedure to filter out applicants seeking to establish new gTLDs that are identical or confusingly similar to preexisting trademarks and service marks (1) unfairly shifts the entire burden and of cost and risk onto trademark owners to identify and challenge applications; (2) is too uncertain and too limited to serve as an adequate protection against abusive applications. *Time Warner* at 2 (15 Dec. 2008). See also *SIFMA* at 5 (12 Dec. 2008); *IACC* at 1-3 (10 Dec. 2008) (suggests additional IP protection measures, including bad faith fines). ICANN should filter out the strongest global marks at an earlier stage, either through expanding the “reserved names” list of character strings that are barred from recognition as new gTLDs or through an adaptation of the non-

objection procedure contemplated for geographic names.—*i.e.*, require that any application be accompanied by a statement of non-objection from the owner of the mark. Also, applications should be disclosed as they are received, not when the application window closes, so that mark owners have the option of filing their own competing application rather than only having the option of invoking the objection procedure. ICANN should also take into account the record of past abusive conduct by the applicant in the existing and new TLD space, and build the expanded reserved names list into the string confusion algorithm to be used to guide determinations on string contention. *Time Warner* at 3 -4 (15 Dec. 2008). A pattern of abusive DNS behavior should be grounds for ineligibility to apply, not just a factor in adjudicating an LRO. *Bank of America* at 11 (15 Dec. 2008). The application procedure should include diligence for past domain name abuse and certainly this should be a factor if raised in any objection. *Nike* (2 Dec. 2008); *Microsoft* (Guidebook comments, 15 Dec. 2008) (application form should have questions about financial crimes, fraud, etc.).

Precedential value of successful objections. Famous trademarks should be added to the reserved name list. However, failing this, successful objections should have precedential value so trademark owners don't have to keep objecting. *Nike* (2 Dec. 2008). *MARQUES* (15 Dec. 2008).

## **Rights Protection Mechanisms**

Current Mechanisms Not Sufficient for New TLDs. The current trademark protection sunrise period system used for TLDs to date will not work economically or practically for new TLDs. The suggestion of an ICANN-supported database of trademarked items for purpose of pre-registering IP rights to protect them within proposed new gTLDs is encouraging. The UDRP is unlikely to be an effective remedy in the context of a very large number of new TLDs. *Net Names* at 1 (16 Dec. 2008). See also *Bank of America* at 2-3 (15 Dec. 2008); *Grainger* at 3 (15 Dec. 2008); *MarkMonitor* at 2 (15 Dec. 2008); *NCTA* at 2-3 (15 Dec. 2008); *USTA* at 8-9 (15 Dec. 2008); *CSC* at 3-4 (15 Dec. 2008); *U.S. COC* at 2-3 (15 Dec. 2008); *Ameriprise* at 2 (15 Dec. 2008). *News Corporation* at 3 (16 Dec. 2008) (with new gTLD program UDRP as tool for second level protection could be undermined completely). *Rodenbaugh* at 1-2 (16 Dec. 2008) (ICANN should study the costs of the new program for trademark owners and other rights holders; the new gTLD program will make abuses dramatically worse if stronger protection mechanisms are not developed to address abusive registrations). *eBay* at 1 (15 Dec. 2008) (existing defense mechanisms almost certainly not feasible once new gTLD process occurs). Most major corporations prefer that the new gTLD program launch be delayed until basic safeguards are adopted to protect against trademark abuse (74% of domain names containing a trademark were registered by 3<sup>rd</sup> parties and not the brand owner) *CSC* at 3 (15 Dec. 2008). *MarkMonitor* at 2 (15 Dec. 2008) (new tools against brand abuse needed that shift costs away from brand owners). See also *RILA* at 2 (15 Dec. 2008). ICANN should establish clear conflict avoidance procedures designed to avoid granting applications that infringe on global trademark holders; the new gTLD program does not afford comprehensive protections to globally recognized brands. *AT&T* at 1 (15 Dec. 2008); *NAM* at 3-4 (15 Dec. 2008) (UDRP will be impractical and too costly for new gTLD program).

Single mode of protection. ICANN should address why there is not a universal Rights Protection Mechanism (“RPM”) that all new gTLDs must follow. *Anonymous Email* (26 Nov. 2008). Presently, it is not proposed that there should be one single model of protection for the assignment of domains within a new gTLD, *i.e.* whether there should be a sunrise period or some other procedure, and the precise terms of any such sunrise. Consequently, with the anticipated launch of numerous gTLDs a trademark owner seeking to protect its key trademarks

will have to familiarize themselves with the particular model chosen for each one, and ensure that they comply. This will inevitably be more time-consuming, and consequently costly, than having one prescribed model. *BBC* (15 Dec. 2008); *MARQUES* (15 Dec. 2008); *Rodenbaugh* (16 Dec. 2008) (supports one-time standardized sunrise validations process for interested rights holders, but more and stronger mechanisms needed to protect rights both before and after infringements).

Explicit Minimum Standards. The draft Guidebook must state for applicants the nature of IP rights that it must consider and minimum standards applicants must have in place for developing a mechanism to protect the rights of others—e.g., the consequences if an assertion of rights is sustained, the consequences if the assertion is rejected, and the minimum standards of authentication to be applied. By making minimum standards known in advance, vendors can self-identify as possessing a solution they believe will fulfill ICANN’s minimum substantive requirements whether or not the procedural mechanism is a “sunrise” or a “stop” or some other form. Brand owners can determine the estimated cost of advanced registration and/or opposition and make strategic decisions regarding both. *GT* at 1-2 (15 Dec. 2008).

Best Practices. New gTLD applicants should be required to adopt strong best practices to protect IP rights; if the method chosen is sunrise period, trademark owners should be charged only a reasonable minimum fee to register their protected names at the second level on the new gTLD. *ICA* at 11 (16 Dec. 2008).

New Registry Agreement--Obligation to Protect. Section 2.7 of the proposed new registry agreement adopts a new, ongoing obligation to “protect the legal rights of third parties,” which goes beyond the current commitment to take specified and agreed-upon steps to protect such rights. It creates potential liability for infringement that is neither practical nor consistent with established law. *RyC* (6 Dec. 2008).

Abusive Registrations/Transparency. There should be greater transparency and stakeholder inquiry of an applicant’s proposed mechanism to minimize abusive registrations and other activities that affect the legal rights of others. The criteria should be increased for earning a minimum acceptable score on proposed policies to minimize abusive registrations. *NetChoice* (15 Dec. 2008).

## **Issues**

### **In General**

What preventative measures can be taken ICANN take to block or screen out unauthorized applicants for trademarks (e.g., Olympics)?

Why are Registries allowed to maintain registrations of famous trademarks and keep the profits?

How will ICANN handle industry-specific generic TLDs (e.g., “.bank” and request for delay until such time as banking industry has consensus and sponsorship is secured)?

How will ICANN handle single enterprise and “corporate” TLDs? E.g., could corporations have a formal relationship with an exclusive registrant?

### **Process and Procedure; Defensive Registrations**

Will ICANN increase the protection for trademark rights holders?

Will ICANN consider allowing trademark holders to apply for multiple TLDs on one application?

Will ICANN consider a low-cost alternative for trademark rights holders to reserve certain TLDs?

Is the application process open to the public or only potential Registry Operators?

Can a company apply for a TLD for internal use only (i.e., not sell second-level domains)?

Will ICANN require new Registries to commit to making a full set of Whois data publicly available so that trademark rights holders (and others—consumers, law enforcement, etc.) can have access to them?

Is ICANN considering any ways to lower the cost of defensive registrations for trademark rights holders?

Will ICANN consider a policy where trademark owners are allowed to apply for TLDs with no obligation to support it?

### **Objections**

Why is the financial burden of the objection process borne by existing rights holders?

Will successful objections have precedential value?

Does past abuse factor into the decision in the objection process?

### **Rights Protection Mechanisms**

Why isn't there a universal rights protection mechanism that all new gTLDs must follow?

With the expansion of the obligations regarding protection of the rights of third parties, do the Registry Operators face greater infringement liability exposure?

Will ICANN consider adding mechanisms that allow for greater transparency of an applicant's rights protection mechanism to minimize abusive registrations?

### **Proposed Position (for this version of the Guidebook)**

The guidebook should have a notation added indicating that information has been received regarding additional requests for trademark protection, and that this is an issue which ICANN has determined requires additional consultation. ICANN intends to conduct a series of discussions with all relevant parties relating to propose enhanced protections for trademark name holders. ICANN is in discussions with WIPO to coordinate setting up some conferences to propose some additional solutions to these issues.

If additional trademark protection mechanisms are agreed upon and included in the next guidebook, this would likely result in a cost savings to trademark holders, and additional consideration should be given to these concerns raised as part of any proposal.

It is possible that in consideration of additional mechanisms for trademark rights holders there may be solutions that require changes to this section in the next version of the Guidebook.

### **Analysis**

As with all situations, ICANN must balance the needs of individuals and individual constituencies with the needs of the community at-large. As it pertains to trademark protection, ICANN recognizes the trademark rights holders' concerns with protecting their brands and controlling costs associated with defensive registrations. ICANN believes in protecting brand owners' trademarks and preventing abusive registrations. To that end, ICANN is continuing to evaluate and update its brand protection strategy and will be setting out a process to receive further inputs regarding appropriate mechanisms to enhance those protections.

### **Process and Procedure; Defensive Registrations**

ICANN understands that trademark protection is of serious concern to the trademark rights holders and is requesting additional input on mechanisms to better protect those rights holders. On the other side of this issue is the need to protect competing trademark rights holders who believe they too have a right in the proposed TLD. ICANN has set forth an enhanced obligation on Registry Operators to protect the rights of third parties within the objection processes and rights protection mechanisms, which should help protect trademark rights holders.

ICANN Staff is evaluating a number of options for further enhancing the mechanisms available within the processes for trademark rights holders; however, it must also take into account the interests of non-trademark holder applicants. A system must be put into place that balances the needs of trademark holders to protect their interests while still promoting an open marketplace for the rest of the community.

The proliferation of defensive registrations is a concern that should be addressed because it is not beneficial to either the trademark rights holders or the Registry Operators.

### **Objections**

These questions bring to light important issues that need to be clarified. In the past, the reserved name list was not as successful as had been hoped in protecting trademark rights holders, and was not uniformly available.

The objection process as drafted requires the objector to bear the costs of the process to prevent frivolous objections and the exposure of TLD applicants to excessive costs. There are many factors that contribute to the resolution of the objection process and the factors utilized should include past abuse.

### **Rights Protection Mechanisms**

ICANN's position has been to develop and implement effective and efficient rights protection mechanisms. ICANN Staff sought and considered information from a variety of sources relating to the implementation plan, including setting out the paper promulgated by the IP Constituency (a copy of which can be found at:

<http://www.ipconstituency.org/PDFs/A%20Perfect%20Sunrise.PDF>) which indicated that no single rights protection mechanism was superior to another and that any number of methods could be equally successful.

All Registry Operators are required to post their rights protection mechanisms to allow applicants a window into the decision making process. It may be necessary to adopt formal steps to address issues of particular concerns to the community.

## **X. OBJECTION & DISPUTE RESOLUTION PROCESSES**

### **Summary of Key Points**

- Several specific questions regarding dispute resolution procedures are answered; new detailed procedures are introduced in the Draft Applicant Guidebook, version 2.
- Specific questions regarding aspects of community-based, legal rights and morality and public order objections are answered. Standards to be employed by morality and public order dispute resolution panels are introduced in the Draft Applicant Guidebook, version 2. There are other Guidebook clarifications.
- Dispute resolution fees models are discussed; the “loser pays” model remains as the preferred model.
- Whether there should be appeals and other post-decision activities are balanced. The current model of no appeals remains but post-delegation objections can be raised in certain areas, with mechanisms under construction, and the model of an Independent Objector is introduced.

### **Summary of Input**

This section organizes the summary of responses into the following categories: *Appeals and Post-Decision*, *Community-Based Objections*, *Existing Rights*, *Fees*, *Morality and Public Order*, and *Procedures*.

#### **Appeals and Post-Decision**

ICANN Authority. Under what circumstances will ICANN allow an application to go forward notwithstanding a successful objection (e.g., decision by DRP in favor of objector)? *K. Rosette* (Module 3, 26 Nov. 2008). *Microsoft* at 5 (Guidebook comments, 15 Dec. 2008) (ICANN must clarify meaning and consideration of panel decisions—i.e., would an application proceed notwithstanding a DRSP in favor of an objector?). See also *IPC* at 4 (15 Dec. 2008); *NCUC* (15 Dec. 2008) (need to clarify ICANN discretion to approve or deny).

Appeals to Dispute Resolution Mechanisms: IP rights holders should have legal recourse and the right to appeal an adverse ruling on an objection. *Internet Commerce Coalition* at 4 (15 Dec. 2008). The Guidelines should allow for a procedure to appeal a clearly erroneous DRSP decision. *MarkMonitor* (Module 3, 15 Dec. 2008). Panel decisions should not be subject to further review by ICANN, but rather to an appeal process by a third party dispute resolution provider and/or a court. *Rodenbaugh* at 5 (16 Dec. 2008). See also *U.S. COC* at 9 (15 Dec. 2008); *ANA* at 4 (15 Dec. 2008); *AIPLA* at 2 (15 Dec. 2008). Several ccTLD operators including Nominet, the operators of .uk, have a reasonably priced appeals process with a three person Appeals Panel. There are well-documented inconsistencies in UDRP decisions which an appeals process would help to even out. *MARQUES* would like a credibly valid appeals process included in LRO. *MARQUES* at 3 (15 Dec. 2008). No appeal opportunity is in clear conflict with common legal practice for organizations serving the public such as ICANN. *SIDN* at 4 (10 Dec. 2008).

Court Review. Will applicants whose strings are in contention and subject to determination by a single panelist have an opportunity for legal review comparable to the UDRP provision: "The mandatory administrative proceeding requirements set forth in Paragraph 4 shall not prevent either you or the complainant from submitting the dispute to a court of competent jurisdiction for

independent resolution before such mandatory administrative proceeding is commenced or after such proceeding is concluded.” (Section 4(k) of the UDRP) and if not, why not? *PIR* at 2-3 (15 Dec. 2008). There should not be a rule requiring a losing party in a formal legal rights objection to forfeit its rights to seek judicial redress—i.e., commenters object to the provision that in filing an application for a gTLD, an applicant agrees to accept the gTLD dispute resolution process, if that “acceptance” means that the applicant forfeits his right to protect his legal rights in the courts. *Bank of America* at 9 (15 Dec. 2008). See also *SIFMA* at 6 (12 Dec. 2008); *NCUC* at 5-6 (15 Dec. 2008); *Microsoft* at 4 (15 Dec. 2008). Page 3-1 in paragraph 3.1 says “an objector accepts the GTLD dispute resolution process by filing its objection.” Does that mean that the objector will be required to, in some way, agree not to challenge the outcome of the dispute resolution process such as in court? *COA GNSO New gTLD Question and Answer Open Teleconference*. The Draft Implementation Guidelines eliminate the right of applicants to challenge any ICANN decision or related dispute proceedings in a national court (unlike under the UDRP). So applicants would have no protection at all for their free expression rights and national courts would have no means of protecting their citizens from an abuse in an ICANN proceeding about a domain name. This point was also not in the GNSO's recommendations and is something that staff pulled out of a hat (as part of its bottom-up process) presumably in an attempt to protect itself from being sued. *R. Gross, IP Justice* at 2 (26 Nov. 2008). See also *G. Kirikos* at 10 (24 Nov. 2008) (accountability to courts); *IPC* at 3 (15 Dec. 2008); *Pattishall* at 3 (15 Dec. 2008) (review/appellate process necessary).

Effect of DRSP Decision. A decision from a DRSP should be final and binding on ICANN, rather than an “expert determination” to be considered by ICANN as a factor in the evaluation of a TLD application. *Visa* at 2 (13 Dec. 2008). See also, *U.S. COC* at 9 (15 Dec. 2008). Dispute resolution decisions should be binding and final on ICANN. *CSC* at 4-5 (15 Dec. 2008). Clarify impact of DRSP panel decision on ICANN and the LRO appeal standard. *Bank of America* at 5 (15 Dec. 2008). See also *Grainger* at 4 (15 Dec. 2008); *ITT* at 5 (15 Dec. 2008); *IPC* at 4 (15 Dec. 2008); *MARQUES* at 3 (15 Dec. 2008).

Post-delegation dispute resolution mechanisms: IP rights holders should be entitled to rely on representations in the application that are aimed at minimizing conflict between a new TLD and their IP rights and should have a means of redress available if those representations are violated. *Time Warner* at 5 (15 Dec. 2008); *INTA* at 16 (15 Dec. 2008) (supports development and publication of a post-delegation dispute resolution process as soon as possible); *IPC* at 6-7 (15 Dec. 2008); *MARQUES* at 4-5 (15 Dec. 2008); *SIIA* at 6 (15 Dec. 2008) (post-launch protections needed). ICANN should have a process for reviewing TLD allocations periodically regarding their use and adoption; violations of any approved proposal should also be addressed. *Hacker* at 3 (14 Dec. 2008). ICANN should create specific language for new gTLD registry agreements and consult with a DSRP for developing processes for post-delegation dispute resolution addressing post-launch infringement by a gTLD registry. *Microsoft* at 5-6 (Guidebook comments, 15 Dec. 2008); *COA* at 8 (15 Dec. 2008) (next draft Guidebook needs to address post-delegation obligations in detail).

## Community-Based Objections

Community Definition and Standing. There is no working definition of “community”, so it is possible that the community of “Internet users” and the community of “dog owners”, the community of “blondes” and the community of “anything you can reasonably describe” would be a “defined community” according to ICANN, and as such will have standing if there is an “established institution” to lodge the objection. Also, NCUC believes that further details as to standing need to be disclosed as soon as possible, to enable a more fruitful public discussion to

take place. *NCUC* at 3, 5 (15 Dec. 2008). The concept of community is poorly defined; for example, it will be unfair for a community-based applicant to lose on the basis of substantial opposition by a member of the community if the applicant counters with a showing of substantial support. *Bank of America* at 11 (15 Dec. 2008). See also *CADNA* at 6 (15 Dec. 2008); *COA* at 3-4 (15 Dec. 2008); *ASAE* (10 Dec. 2008).

Linkage to Community. The objector should be required to satisfactorily prove that the string it is objecting to has an association to the community it represents. This does not have to be a strong association, but that it passes the "absurdness" test. *J. Seng* (8 Dec. 2008).

Community Objection Criteria. Regarding point 3.1.2.4 Community Objection, It is an established institution. We feel that this is too limited. What if it is a community of people objecting that don't make up an institution or religious belief. *C. Schuddebeurs; Email Support*. The difference between existing legal rights objections and community-based objections should be described in more detail. *E. Brunner Williams; GNSO New gTLD Question and Answer Open Teleconference*. How will community objection criteria be weighed given subjectivity concerns? *USCIB* at 2 (16 Dec. 2008); *COA* at 5 (15 Dec. 2008). Concerns about the LRO also apply to the community objection procedure. *MARQUES* at 6 (15 Dec. 2008).

Defenses. "Defenses – Satisfaction of the standing requirements for filing a Community Objection (refer to paragraph 3.1.2.4) by the applicant is a complete defense to an objection filed on community grounds." Keeping this clause would imply that a community-based TLD could be squatted by a single member of the community. For instance, that one pharmaceutical company could apply for .pharma and enjoy "complete defense" against objections from any competitor, industry association or consumer group. Or that one bank could apply for .bank and that no other bank, nor associations of banks nor even a banking regulator could successfully object. Or that one tennis club could apply for .tennis and prevail against objection from any federation. It is dangerous to award complete defenses against objections on any ground; some communities have more than one generally accepted representative institution and these do not always agree. *W. Staub-CORE* (11 Dec. 2008). *A. Abril i Abril* (Module 3, 15 Dec. 2008) (automatic defense may yield perverse results).

## Existing Rights

Clarifications Re: Mark and Rights Holders. We request that there be clarification as to the definition of a "mark" relied-on by an objecting brand owner. We assume that this would include an unregistered mark? *BBC* (15 Dec. 2008). The Guidebook should provide more clarity on what constitutes a 'Rights Holder.' For example, with respect to trademark rights, the Guidebook should specifically address what types of trademark rights are eligible for disputes, such as whether common law rights, trademark applications, or trademark registrations and trade names qualify. *MarkMonitor* (Module 3, 15 Dec. 2008).

Ensure rights protection mechanisms are effective. ICANN must do more to ensure that these [rights protection] mechanisms are effective, accessible, low-cost and efficient for right holders to use. *IPC* at 5 (15 Dec. 2008); *Microsoft* at 3 (Guidebook comments, 15 Dec. 2008). Regarding point 3.4.4, Selection and Number of Panelists: There will only be one panelist in intellectual property rights proceedings. Is this sufficient? *C. Schuddebeurs; Email Support*.

Objection Standards. The 'legal rights' ground for objection cannot be clear cut. The law on trademarks, and intellectual property is not universally consistent. What amounts to 'standing legal rights' in one jurisdiction may very possibly not be recognized in other jurisdictions. *ISOC-*

*AU*. Regarding Point 3.1.1 Legal Rights Objections: What happens if two or more parties have equal legal rights? If someone files a TLD that is confusingly similar to someone else's registered mark an objection can be based on the Legal Rights objection. What happens if two or more parties have equal legal rights? What if the applicant owns a trade mark right as well as the objector? Regarding point 3.5.2.4: Knowledge should not be required for infringement or should this read as knowing or should know. *C. Schuddebeurs; Email Support*. How would something like .bank, where under US law you must be a bank to call yourself a bank, be objected against? Is the legal rights objection restricted to the string itself? *Bank of America-GNSO New gTLD Question and Answer Open Teleconference*.

## **Fees**

Fee details. These need to be more detailed. Brand owners are already spending hundreds of thousands to protect their trademarks online and there continues to be rampant online abuse. Having a cost of \$70 - 122K to object to an application is unacceptable. *Nike* (2 Dec. 2008). See also *BITS* at 7 (15 Dec. 2008).

Economic and financial considerations. ICANN should consider small economies when the dispute fees are finalized. *F. Purcell* (Module 3, 6 Nov. 2008). Is it possible for there to be more than two parties in a given dispute? If so, will all parties be required to pay the full 'Dispute Resolution Adjudication Fee? *C. Gomes-Compiled Comments on the New gTLD Applicant Guidebook*. *MarkMonitor* (Module 3, 15 Dec. 2008) (fees are high and duplicative; one fee should be filed in the case of a rights holder's objection to multiple applications for the same TLD).

No separate objection fee should be levied. It is morally offensive to charge a fee for an objection and this should be covered by the evaluation fee. If ICANN does not take that into account, ICANN may receive law suits. *A. Rosenkrans Birkedal* (10 Nov. 2008).

Deterrence Factor of Fee. A fee for filing an objection helps to avoid false and bad-faith filings. An applicant whose proposal has passed initial evaluation and has all the required support from pertinent communities and/or governments shouldn't have to pay for filing a response to an objection, nor any other associated costs. The applicant should have the right to defend himself from allegations without being required to pay to a third party. *NIC Mexico* at 3 (9 Dec. 2008). In order to be taken seriously, an opposition must be considered only if made by a person with standing under section 3.1.2 who has gone to the expense of paying the necessary fees and who has raised a recognized ground for objection. Allowing any person to post a public objection makes a mockery of the standing requirements. If ICANN believes it has defined standing too narrowly, then ICANN should broaden its rule using explicit categories. If ICANN believes its own procedures for objection may forestall inquiry into relevant areas of concern, it should broaden the grounds of objection. If ICANN believes that persons with limited financial means will not be able to raise their legitimate concerns, ICANN should consider waiving or reducing the fee to file an objection upon an application showing good cause. *Bank of America* at 6 (15 Dec. 2008).

Fee levels. Why is the cost of opposing a proposed gTLD string so prohibitively expensive? Why is it so much more expensive than a UDRP, and when will an upper price point cap be announced? *Anonymous Email* (26 Nov. 2008). The proposed process for the "legal right" DRP appears to have a proposed cost two orders of magnitude less than the proposed cost for the proposed process for "community objections" DRP. The choice of proposed vendors may explain a difference in pricing, but if the underlying process is not two orders of magnitude

different in complexity, than the difference in cost has no justification other than the vendor choice. If the "legal right" DRP involves forming judgments on questions of "substantial" (opposition) and "likelihood" (detriment), how is two orders of magnitude of cost difference commercially reasonable for the cost of forming similar judgments for "community objections"? *E. Brunner-Williams* (25 Nov. 2008). Fees for LROs should be at the lower end of range stated in the Guidebook. DRSP rules must specify when and under what conditions fees may increase or be refunded. Parties should be allowed to set up accounts with the DRSPs for administrative ease of payment. *INTA* at 9 (15 Dec. 2008)

Prevailing Party Reimbursement. The prevailing party in a dispute resolution proceeding should be reimbursed for all costs and expenses. This will deter parties from maintaining otherwise questionable proceedings. *Visa* at 1 (13 Dec. 2008). Fees, including attorneys fees and litigation costs should be recovered by the prevailing party. *U.S. COC* at 9 (15 Dec. 2008). See also *Lego* at 1 (4 Dec. 2008); *MarkMonitor* at 3 (15 Dec. 2008); *Grainger* at 2 (15 Dec. 2008); *ITT* at 5 (15 Dec 2008).

### **Morality and Public Order**

Legal Standards. [In relation to categories that are automatically banned] The ICANN paper [Oct 29, 2008] shockingly changes the AND to an OR in description of the US test: ICANN: "This limit should be construed as applying only to violent lawless action that is imminent or likely to result from the incitement." (p. 4 of 29 Oct. paper). So instead of this being a 2-part test as US law requires, ICANN will ban the speech if it meets either prong of the test - big difference and ICANN is not being honest about this legal standard (or is getting incompetent legal counsel). (Technically, it is a 3-part test in the US because the speaker must INTEND to produce the imminent lawless violence.) WHERE DID THE RESEARCH COME FROM THAT TOLD ICANN THE TEST INVOLVED AN "OR" RATHER THAN "AND" AS CLAIMED IN ICANN'S PAPER? *R. Gross, IP Justice* at 2 (26 Nov. 2008). See also *NCUC* (15 Dec. 2008); *ICA* at 2, 12-13 (16 Dec. 2008) (opposes law and public morality objections absent narrow and clearly articulated criteria).

Content Regulation. [In relation to categories that are automatically banned] It appears ICANN is attempting to regulate the content of websites, not URLs, since a domain name (2-6 letter string) cannot be child porn or sexual abuse of children. I'd like an answer from ICANN about how a URL can be child porn as a practical matter. *R. Gross, IP Justice* at 2 (26 Nov. 2008). *Y.E. Shazly* (Module 3, 2 Dec. 2008) (critique of ICANN moral and public order objection approach). *C. Preston* (Module 3, 12 Dec. 2008) (provides legal commentary supportive of ICANN morality and public order standards). ICANN should announce up-front if it will permit any "adult" extensions. *WMI* at 4 (14 Dec. 2008). The proposed standards open the door to unacceptable forms of content regulation by ICANN and provide the ability for a 'heckler's veto' over legitimate possible domains. ICANN needs to clarify the types of objective criteria and the nature of "independent judicial control" that will be used to determine the narrow exceptions that justify an interference with free expression. *NCUC* at 1-3 (15 Dec. 2008)

Standing. Who can bring a morality and public order objection? There is concern that attempts to make this anything other than a government (who has standing to object) will lead to arbitrary, subjective, and more widely conflicting standards. *R. Gross, IP Justice* at 3 (26 Nov. 2008). More details are needed regarding the Morality and Public Order Objection. *CADNA* at 5 (15 Dec. 2008). See also *Rodenbaugh* at 5 (16 Dec. 2008); *Pattishall* at 4 (15 Dec. 2008) (clarify standing); *NCUC* at 5 (15 Dec. 2008) (standing has yet to be determined). New TLDs should be restricted to protect the rights of those who would be offended or harmed by material

widely deemed offensive and not deserving of free speech protection, but the context must be balanced carefully. Any interested party should have the right to object on grounds of morality or public order. *INTA* at 11-12 (15 Dec. 2008)

Dispute Resolution. Module 3 of the Draft Applicant Guidebook states that objections based on morality and public order considerations will in principle be determined by the International Chamber of Commerce (ICC). As the ICC is an industry association for businesses, and as such represents and advocates on their behalf, we do not see the ICC as a particularly well-qualified arbiter of standards of morality and public order or as conducive to considering the interests of non-commercial parties in such a broad and values-based determination. *NCUC* at 3 (15 Dec. 2008). Uncertainty over whether the International Chamber of Commerce is the best place for dispute resolution on questions of morality and related issues. *A Muehlberg* (Cairo Meeting Public Forum, 6 Nov. 2008) See also Y. E. Shazly Cairo Meeting Public Forum, 6 Nov. 2008).

Issue Appropriate for Governments. ICANN should focus on coordinating technical functions related to the management of the DNS and not on matters more appropriately addressed by governments, such as adjudication of morality and public order and community objections in accordance with international human rights law. The proposed mechanisms to address these topics are inappropriate. *U.S. DOC-NTIA* at 2 (18 Dec. 2008). See also *APTLD* at 2-3 (15 Dec. 2008); *Arab Team* at 2 (15 Dec. 2008); *Demand Media* (Module 3, 15 Dec. 2008); *U.S. COC* at 5 (15 Dec. 2008) (ICANN should not assume powers and duties on issues best left to governments as recognized in WSIS Principle 49).

## Procedures

Abuse of Objections Process. In order to avoid potential abuse by entities that use their financial prowess to thwart smaller deserving players, a limit should be placed on the number of disputes per application. *J. Seng* at 3 (8 Dec. 2008). ICANN should take the possible abuse of objections (submitting an objection at the latest possible moment and thus forcing maximum costs at a competitor) into account when determining the objection period. ICANN should set limits on the objection grounds and protect applicants against abuse of objections. A start-up applicant, having already invested significantly in preparing the application and paid fees risks being financially "brought to his knees" by numerous objections of which none might even prevail. *SIDN* at 2 (10 Dec. 2008). See also *DHK* at 2 (15 Dec. 2008).

Panel Qualifications. Panelists should have sufficient years of experience in dispute resolution. ICANN must make clear the scope of documents that can be required by the panel; discovery should be allowed. *INTA* at 10 (15 Dec. 2008). *MARQUES* at 3 (15 Dec. 2008) (fluency of at least one panelist in local language should be required and panel must have sufficient trademark qualifications). ICANN should state a conflicts of interest policy for all panelists. *Rodenbaugh* at 5 (16 Dec. 2008).

General Procedural Comments. What is the limit of the panelist's discretion, and can the list identified in the draft Applicant Guidebook be improved by panelists? The categories are general and could lead to wide interpretation by panelists. *Y.E. Shazly* (Module 3, 2 Dec. 2008). See also *AIPLA* at 1 (15 Dec. 2008) (experts on LRO cases should be subject to approval of both parties); *MARQUES* at 3 (15 Dec. 2008) (use a small number of experts to chair panels and appeals for a fixed term to promote consistent decision-making); *INTA* at 10 (15 Dec. 2008) (hearings should be allowed in exceptional cases and must be public; the standard of proof should be explained). Fees need to be predictable; the panel's apparently unrestricted ability to

appoint experts is inconsistent with predictability. *Time Warner* at 5 (15 Dec. 2008). See also *COA* at 6 (15 Dec. 2008); *Pattishall* at 3 (15 Dec. 2008). For transparency, panel decisions should be published. See *IPC* at 4 (15 Dec. 2008); *AIPLA* at 1 (15 Dec. 2008); *MARQUES* at 3 (15 Dec. 2008); *Bank of America* at 10 (15 Dec. 2008). WIPO acting as the dispute resolution provider is problematic because it will inevitably favor and prioritize applications by trademark owners. *NCUC* at 5 (15 Dec. 2008). WIPO should be the sole provider of LRO services for at least 5 years with annual reviews. *MARQUES* at 3 (15 Dec. 2008). Consistency and transparency are needed in the online dispute resolution (ODR) process; a gateway provided by ICANN could help with this; these proceedings should be public. *InternetBar* (Module 3, 15 Dec. 2008). There should be a single organization with which all objections are filed and that organization should determine which DSRPs should resolve them. *Pattishall* at 3 (15 Dec. 2008); *IPC* at 4, 8-9 (15 Dec. 2008) (consider common portal for objections to promote efficiency; consider including a challenge of last resort). The new gTLD program might benefit from having a free period of mediation after submission of a complaint. *MARQUES* at 3 (15 Dec. 2008). Objections and responses should be made public. *ITT* at 5 (15 Dec. 2008). See also *G. Kirikos* at 10 (24 Nov. 2008); *INTA* at 9-10 (15 Dec. 2008) (lengthen the word limit for objections and responses; allow reasonable extensions of time to file responses; supports fee for filing a response; default judgment); *COA* at 6 (15 Dec. 2008) (word limit should be relaxed for a community objection; ICANN should reconsider policy that objections are not published as received). An objection category should be added regarding applicants who have a history of domain name abuse. *RILA* at 3 (15 Dec. 2008).

Three-Member Panels. ICANN should permit three member panels. *Internet Commerce Coalition* at 4 (15 Dec. 2008). Instead of only a single panelist in LRO cases, as in the existing UDRP, ICANN should consider constituting a three-person panel at the request of parties. *eBay* at 4 (15 Dec. 2008). See also *Microsoft* at 4 (Guidebook comments, 15 Dec. 2008); *MARQUES* at 3 (15 Dec. 2008); *AIPLA* at 1 (15 Dec. 2008) (LRO procedure should allow a 3 member panel); *Lovells* at 5 (15 Dec. 2008); *Pattishall* at 3 (15 Dec. 2008). Why wouldn't objectors be allowed to request a 3-member panel if they are willing to pay the expense if they lose? *C. Gomes-Compiled Comments on the New gTLD Applicant Guidebook*.

Dispute Resolution Criteria. What are the specific criteria that will be used to decide who wins a dispute resolution matter? When will such criteria be published? *Anonymous Email* (26 Nov. 2008). The standard for string contention is confusing similarity in sight, sound or meaning. The "Defenses" section should be removed or clarified, and other objection procedures should be clarified (e.g., clarify how the community objection might be accommodated if in effect there are two or more valid community claims to same or similar strings). *Rodenbaugh* at 5 (16 Dec. 2008). Regarding Point 3.1.1 criteria for String Confusion Objection: In module 2 (2.1.1) it is explained that by string confusion in the Initial Evaluation phase performed by ICANN is meant: "String confusion exists where a string so nearly resembles another visually that it is likely to deceive or cause confusion. For the likelihood of confusion to exist, it must be probable, not merely possible that confusion will arise in the mind of the average, reasonable Internet user. Mere association in the sense that the string brings another string to mind, is insufficient to find a likelihood of confusion". Do the same criteria apply to the dispute resolution? *Schuddebeurs; Email Support*. Guidance needed for resolving disputes among associations and applicants (e.g., a local association and an international NGO competing for a gTLD). See also *ASAE* (Module 3, 10 Dec. 2008).

Details or Clarification of Objections Process. Objection process should be efficient and cost effective, and more details are needed; a cost of \$70-\$120K to object is unacceptable. *Nike* (2 Dec. 2008). Further clarification is needed regarding standing to object. *NCUC* at 5 (15 Dec.

2008); *NAM* at 7 (15 Dec. 2008) (objections and responses should be made public). When can exact dispute resolution process rules be completed and published? *Rodenbaugh*; *GNSO New gTLD Question and Answer Open Teleconference*. The Guidebook should be clarified to indicate when potential objectors should file objections to an application. *ASAE* (Module 3, 10 Dec. 2008). Will there be a challenge of last resort? *MARQUES* at 6 (15 Dec. 2008). More detail is needed on panel procedures—e.g., documents, ensuring limits on panels appointing experts to be paid for by one or more parties. *Microsoft* at 4 (15 Dec. 2008). See also *Grainger* at 2 (15 Dec. 2008); *IPC* at 4, 8 (15 Dec. 2008); *INTA* at 9-10 (15 Dec. 2008) (various aspects of objection procedures require clarification—e.g., filing deadlines, single complaints with multiple objections, resolution of inconsistent outcomes by DSRPs; cooling off period).

Consolidated Objections. There should be an ability to consolidate complaints against the same party. *Nike* (2 Dec. 2008). Consolidated objections with a single filing fee should be allowed in appropriate circumstances. *Time Warner* at 5 (15 Dec. 2008). See also *Visa* at 2 (13 Dec. 2008); *SIFMA* at 6 (12 Dec. 2008); *DHK* at 2 (15 Dec. 2008); (consolidation should be required); *MARQUES* at 3 (15 Dec. 2008); *IPC* at 4 (15 Dec. 2008); *CADNA* at 2 (15 Dec. 2008). More information is needed on costs of filing objections and ways to reduce costs through consolidated objections. *USCIB* at 2 (16 Dec. 2008). *eBay* at 3-4 (15 Dec. 2008) (clarifications needed regarding consolidated objection scenarios; to promote consistency and predictability, more guidance and examples needed in Guidebook on LRO case resolution). There should be efficient procedures regarding combining multiple objections; opportunities to amend procedurally noncompliant objections, ability to refuse consolidated objection proposals by the DRSP. *Microsoft* at 4 (Guidebook comments, 15 Dec. 2008). See also *C. Gomes* at 6 (17 Nov. 2008); *BITS* at 7 (15 Dec. 2008) (clarify fees for consolidated objections); *Pattishall* at 3 (15 Dec. 2008) (more detail needed on resolving objections based on multiple grounds).

Online Submissions. Is it possible for each applicant to provide copies of all submissions to the DRSP associated with objection proceedings via the electronic system? *C. Gomes-Compiled Comments on the New gTLD Applicant Guidebook*.

Government Concern. The dispute resolution process is not a cost effective way for governments to participate and they should have an earlier opportunity to participate and object; the right of governments to objection and the mechanisms for it should be expressly indicated with costs minimized. Governments should be explicitly recognized as having standing to file an objection. *NYC* (13 Dec. 2008). ICANN should be doing more to minimize disputes with national governments and to increase their understanding of the new gTLD process, especially smaller, developing nation governments. *F. Purcell* (Module 3, 6 Nov. 2008).

Details Needed on LRO Procedure. The Legal Rights Objection (LRO) procedure will generally be the sole means that a trademark owner has at its disposal within the ICANN process to prevent the recognition of a new gTLD that infringes, dilutes, or otherwise harms or weakens its mark, and/or that will threaten to cause confusion detrimental to the mark owner's customers and the public at large. While the LRO procedure is sketched out in the draft applicant guidebook, much more detail will be needed before it can be determined whether this is a sufficiently robust safeguard for preventing these harms. *IPC* at 3 (15 Dec. 2008). See also *AIPLA* (15 Dec. 2008); *SIIA* at 5 (15 Dec. 2008); *Time Warner* at 4-5 (15 Dec. 2008); *eBay* at 3-4 (15 Dec. 2008). Finalized procedures are needed for business certainty—e.g., ICANN has not yet completed agreements with Dispute Resolution Service Providers; it would help rights owners and applicants to know the likely application of factors in the LRO standard. *Microsoft* at 4-5 (Guidebook comments, 15 Dec. 2008).

ICANN Duties and Legal Reviews. ICANN must commit itself to follow the rules and procedures of the Guidebook once final; ICANN is acting in a quasi-governmental capacity and its Guidebook should be considered akin to an administrative rule. *Bank of America* at 12 (15 Dec. 2008). ICANN should state how ICANN will conduct legal reviews of applications, consider legal objections from third parties, and discharge its responsibility to ensure that the process of introducing new gTLDs respects all relevant national and international law, including property rights. *U.S. DOC-NTIA* at 2 (18 December 2008). The dispute resolution processes give ICANN too much authority. *Cyveillance* at 2 (15 Dec. 2008).

## **ISSUES, ANALYSIS AND PROPOSED POSITIONS**

### **Appeals and Post-Decision**

#### **Issues**

How might applications go forward notwithstanding a successful objection?

Will the panels' decisions be final and binding on ICANN?

The guidelines currently do not provide for appeals. Should there be such a provision and does a lack of one conflict with the public interest?

Does an acceptance of the gTLD dispute resolution process mean that the participating party has forfeited all right to judicial review?

Do applicants forfeit their rights to protect their legal rights in the court?

#### **Analysis**

The comments that have been summarized above reflect concerns about due process and the protection of substantive legal rights. ICANN takes these concerns very seriously and, with considerable participation from constituency groups, has sought to create an objection process that is fair and adequately protects the rights of all participants in the process.

One may distinguish three types of recourse or legal action in connection with new gTLD applications: (a) recourse against the expert determination that is rendered in the New gTLD Dispute Resolution Procedure (e.g., an "appeal" or some other action), (b) action in defense of one's legal rights before a court with jurisdiction, and (c) legal action against ICANN by an applicant.

(a) As stated in Section 3.4.5 of the draft Guidebook, the dispute resolution panel's decision will be an expert determination. The New gTLD Dispute Resolution Procedure (the "Procedure") currently does not provide for an appeal or other recourse against the expert determination that is rendered by the Panel. While an expert determination will not be legally binding, as part of the dispute resolution process ICANN will follow the advice of the panel.

(b) It is implicit in the Procedure that an objector does not waive its right to defend its legal rights (e.g., trademark) before a court of competent jurisdiction merely by filing an objection to an applied-for gTLD.

(c) The terms and conditions of the application for a new gTLD contain an express waiver by the applicant of recourse against ICANN relating to the application evaluation and approval process. This does not bar claims against ICANN that may not be related to the application process, nor does it bar claims by the applicant against any other party.

It does not seem that the absence of an appeals process within the process conflicts with ICANN's role in serving the public interest. There are various countervailing factors to consider in formulating the dispute resolution procedure. Adding a procedure for appeal would increase the cost and extend the duration of many – if not most – proceedings, thereby delaying the introduction of many new gTLDs. If on appeal, the determination is “reversed,” there would be an argument for extending the process even further, resulting in great uncertainty in the process.

The dispute resolution process is intended to provide economic incentives for parties to participate in the process and to resolve disputes in a timely and efficient manner.

### **Proposed Position (for this version of the Guidebook)**

At this juncture, ICANN does not plan to introduce an appeals mechanism into the dispute resolution process that has been developed. ICANN has heard many comments about making sure the new gTLD program progresses as swiftly and efficiently as possible. A dispute process that does not include a separate appeals mechanism is intended to help minimize the delay of introduction of new gTLDs into the root zone.

Given the nature of the expert determination to be rendered at the completion of a dispute proceeding, an unsuccessful applicant cannot obtain judicial review of the rejection of its application.

An applicant is not prohibited, however, from pursuing its legal rights related to the application process in court against any party other than ICANN.

### **Community-Based Objections**

#### **Issues**

Will the definition of “community” and the role of an established institution be clarified?

Does an objector have to demonstrate an association with a community related to the string to which it objects?

Does an applicant who is able to fulfill the standing requirements to object have an absolute defense and could this complete defense to a community objection provided for in paragraph 3.1.2.4 lead to squatting?

In addition to describing “existing legal rights objections” and “community based objections,” the Guidebook or supporting documentation could do a better job differentiating the role of each.

#### **Analysis**

The creation of community-based gTLDs offers great opportunities for diverse communities to learn about each other, meet, and communicate through the Internet. However, the rights, obligations and interests of many communities and their representative institutions may be at odds with the legal rights of trademark rights holders. The comments that ICANN has received thus reflect both the avid interest that communities have in obtaining gTLDs and concerns that some people and entities have about definitions and criteria.

The concept of community is not easy to define. That said, the “working definition” of community, and requirements for a community-based gTLD, and objections thereto, are summarized in the draft Applicant Guidebook, Section 1.2.2.1. The Guidebook also sets out the standing requirements for what group or entity may object to a community-based application. Those requirements make clear that the objector does have to demonstrate a relationship to a community to have standing. Further, the objector must be an established institution that has an ongoing relationship with the community. This requirement will help to insure that the objector has some legitimacy as a representative of the community. Such a standing requirement is intended to avoid a multitude of objections from individuals, many of whom represent only themselves and have no relationship to or real interest in the relevant community.

The complete defense to a community objection provided for in paragraph 3.5.4 should not, in itself, lead to squatting for one reason, among others, that a successful registry operator must also make the registry operational. Note the requirements for obtaining a community-based gTLD (summarized in the Draft Guidebook, Section 1.2.2.1) and the post-delegation obligations that the successful applicant will assume (*id.*, Section 1.2.2.2).

Regarding a comparison of legal rights and community objections, different criteria are at issue for each. While it is true that there might be a situation where a gTLD could provide an objector with both grounds, they are exclusive in that the legal rights criteria is focused on providing a forum in which trademark rights holders can object to a gTLD on the basis of an existing legal right to a trademark. The community objection, on the other hand, has no basis in trademark or other intellectual property law and, instead, focuses on rights of organized groups.

### **Proposed Position (for this version of the Guidebook)**

An objector to a community-based gTLD must be an established institution with an ongoing relationship with a defined community that consists of a restricted population. See Draft Guidebook, Section 3.1.2.4. It will be made explicit in the revised Applicant Guidebook that the “defined community” is a community related to the string to which the objector objects.

### **Existing Rights**

#### **Issues**

One common theme that has arisen in various public comments are the concerns voiced by trademark owners in terms of the efforts and costs that may need to be expended to protect their Intellectual Property. Another section of this paper specifically relates to trademark protection and will discuss these overarching concerns.

Do holders of all types of trademark rights – including common law trademarks, trademark applications, and trade names – qualify as “rights holders” and what if both the applicant and the objector are rights holders?

Are the current mechanisms of enforcement low-cost and efficient?

How/Who can object against a string, such as “.bank,” where under U.S. law, it is suggested, an entity must be a bank to use such designation?

How will the “legal rights” grounds for objection be dealt with when the law on trademarks and other intellectual property is not universally consistent?

Regarding Section 3.5.2.4, why isn’t there a knowledge standard required for infringement?

Is the legal rights objection restricted to the string itself?

Is only one panelist in intellectual property rights proceedings sufficient?

## **Analysis**

ICANN appreciates the numerous comments it has received relating to trademark protection and is considering various options. As noted above, a separate section of this paper relates to trademark protection, which addresses the overarching concerns. The rest of this section will discuss the specific issues raised in the comments set forth in this paper.

The definition of mark was meant to allow objections on the basis of registered and unregistered marks. Further, the definition of “Rights Holder” was left broad to allow any person or entity that claims an existing legal right to object so as not to favor a registered mark over a mark that is not registered or to encourage sham filings to obtain registrations in jurisdictions which award them on a first to file basis.

ICANN has attempted to develop a process that is low-cost and efficient. Providing for an independent dispute resolution procedure is meant to achieve the goal of providing efficient and reasonably low cost ways in which rights holders can assert rights to an applied for string, and protect them on a global scale. ICANN is considering additional procedures, including some to apply post delegation; however, at this point allowing for global resolution in one forum in a relatively expeditious time frame goes a long way to providing effective, accessible, low cost and efficient ways for rights claims to be resolved. The UDRP proceedings will remain in effect, as well, for post delegation issues that arise in connection with second level domain disputes in the new gTLDs, and the specific laws of each jurisdiction still provide redress.

In terms of the issue raised regarding the potential gTLD .bank, it is not necessarily true that one must be a bank (i.e., a certain type of financial institution) in order to call oneself a “bank”. (Consider blood bank, food bank, sperm bank, etc.) If more than one entity applies for the gTLD .bank, all applicants for the gTLD would enter into the string contention process. Further, a .bank application may qualify as a community-based application and, in such a circumstance, gain consideration in cases of contention. If the eventual owner of the gTLD .bank uses the name or domain in a way that violates U.S. law, legal action could be taken against that owner in accordance with the law.

It is correct that there is no universal application of intellectual property law. Indeed, this fact has made it quite difficult to identify standards that would be viable on a global stage. Thus, the standards to be applied and balanced are from a number of jurisdictions that enforce intellectual property rights as well as from UDRP proceedings, the closest form of IP precedent available on an international basis. As none of the factors are absolute, knowledge is not a "requirement". However, sections 4 and 5 contemplate a knew-or-should-have-known standard.

ICANN did consider providing for three-member panels, but thought a one-member panel would be more cost efficient. Alternatively, ICANN is considering providing for three-member panels, but only to the extent that all parties agree.

### **Proposed Position (for this Version of the Guidebook)**

ICANN will provide more clarity in the revised Draft Applicant Guidebook in terms of the types of mark an objector or rights holder must have to file a valid objection. ICANN will also make clear in the revised Draft Applicant Guidebook and Procedures that parties may elect a three member panel, but only if all parties in the proceeding agree.

### **Fees**

#### **Issues**

Can the dispute resolution fees be more detailed and can the costs be curtailed or limited?

Can small economies be considered with dispute resolution fees are finalized?

Can the filing fee be funded by the evaluation fee?

Can standing requirements for filing an objection be broadened and allowances for fee waivers be made in lieu of permitting the posting of public objections by any person?

Will the prevailing party be reimbursed for costs and expenses?

If more than two parties participate in a dispute, do all parties pay the Dispute Resolution Adjudication fee?

Why is the proposed cost for the "community objections" DRP proposed process higher than the proposed cost for the "legal rights" DRP proposed process?

#### **Analysis**

Some concerns have been expressed over the estimated dispute resolution fees, particularly for those that are not fixed rate proceedings. The rules of procedure for these proceedings have been designed, in part, to minimize costs. The general rule ICANN is promulgating, that the losing party in the dispute resolution proceedings pays the full cost (i.e., panelists' fees and filing fees), will provide some protection against parties acting in bad faith.

The costs of a dispute resolution proceeding must be paid by the parties in that proceeding (with the prevailing party having its advance payments reimbursed). An applicant's successful

passage through the initial evaluation would not be a basis for waiving dispute resolution fees, as the costs of resolving a dispute arising from an objection must be paid.

The filing fee in dispute resolution proceedings should not be funded by the evaluation fee, as the two fees relate to different steps in the application process, one of which may not occur in some applications. If the evaluation fee were to cover filing fees in dispute resolution proceedings, it would have to be increased (since the evaluation fee is currently set on a cost-recovery basis). This would produce an excessive fee for applications to which no objection is filed. Further, the dispute resolution fee will not be paid to ICANN. Note also that the number of filing fees that must be paid by an individual applicant may vary, depending upon the number of objections that are filed against that applicant's gTLD.

The consolidation of objections should result in certain cost savings (and is therefore strongly encouraged by ICANN). It is intended that the applicant would pay a single filing fee when submitting its response to all of the consolidated objections. Parties would pay in advance the costs of only one proceeding, rather than multiple proceedings, and a single Panel would render one expert determination that is applicable to all of the consolidated objections. Consolidation, of course, is conditioned on the type of objection and the facts of each dispute. For example, legal rights objections depend largely on the rights of the objecting party and therefore it is less likely that cases could or would be consolidated. Morality and Public Order objections are intended typically to be about the applied for string and therefore, a better candidate for consolidation. Consolidation will be the decision of the dispute resolution service provider.

The costs of dispute resolution proceedings in connection with "community objections" are likely to be higher than the costs of "legal rights objections". The latter are unlikely to be as complex, and their duration can be predicted with some confidence. In contrast, proceedings that arise from "community objections" are likely to be more diverse in their nature and to involve more varied factual submissions. For this reason, variable fees based upon the time spent by the expert panelists are more appropriate for the "community objections" than fixed fees. Similar factors indicate that the costs of "morality and public order objections" are also likely to be higher than those of "legal rights objections". In addition, dispute resolution proceedings that involve three-member panels at an hourly rate will have higher costs than those involving a single panelist. If the hourly rate based dispute processes do not take as much time or are less complex than estimated, the amount of time spent by the dispute resolution panel would be less, and therefore the fees should be less than estimated as well.

Per Section 3.4.7 of the draft Applicant Guidebook, the process has been developed so that dispute resolution fees paid in advance by the prevailing party will be refunded to that party.

Simply submitting a public comment in objection to an applied for string will not be considered a formal objection.

### **Proposed Position (for this version of the Guidebook)**

Each dispute resolution provider will establish its fees. ICANN does not plan to include dispute resolution filing fees as part of the application fee, nor does ICANN intend in this round to announce a maximum level for dispute resolution fees.

### **Morality and Public Order**

## **Issues**

As related to the standards: (i) Does the test for incitement conflict with the test under US law; and (ii) what type of domain name would qualify as “child pornography” leading to an automatic ban?

Can anyone other than a governmental entity bring a morality and public order objection?

Is this dispute resolution process the right mechanism for adjudicating issues of morality and public order and community objections with international human rights law?

Can the types of objective criteria and the nature of “independent judicial control” used to determine when in interference with free expression is justified be clarified?

## **Analysis**

Issues of morality and public order with respect to rights of expression are inherently controversial. The accepted standards of morality and public order may vary widely in different societies and over time. As explained in the first Draft Applicant Guidebook (Section 3.5.3), ICANN is guided by two general principles in this area: (a) everyone has the right to freedom of expression, and (b) such freedom of expression may be subject to certain narrowly interpreted exceptions that are necessary to protect other important rights.

ICANN has conducted extensive research and consultations to develop standards under which the Morality and Public Order Objections should be reviewed. In addition to extensive research in every geographic region, ICANN conducted individual consultations with experts in the human rights arena, present and former judges of internationally recognized tribunals dealing in human rights and morality issues, as well as legal practitioners who regularly appear in such tribunals. In such consultations, the starting premise was always that found in the GNSO Principle G:

“The string evaluation process must not infringe the Applicant’s freedom of expression rights that are protected under internationally recognized principles of law” (emphasis added).

Internationally recognized principles of law, however, do include narrow restrictions. See, e.g., Articles 19(3) and 20 of the International Covenant on Civil and Political Rights, Article 10(2) of the European Convention on Human Rights and Article 13 of the American Convention on Human Rights. Thus, absolute freedom of expression is not protected under internationally recognized principles of law; there are permissible limits.

As the GNSO policy indicated, the standards that panels shall apply in dispute resolution proceedings should not necessarily be based upon U.S. law. The standards applied to morality and public order objections need to be as international in reach and applicability as possible, which ICANN has intended to identify now and in its Explanatory Memorandum on morality and public order objections, which can be found at: <http://www.icann.org/en/topics/new-gtlds/morality-public-order-draft-29oct08-en.pdf>.

The rule that would bar incitement to violent lawless action in new gTLD strings is not necessarily the same as the rule under U.S. constitutional law. Dispute resolution panels can consider whether under internationally recognized standards of law a string is likely to produce

violent lawless action and, if so, whether such action would be immediate (along with other factors), but it may not be appropriate to require “immediate” violence to sustain an objection. The DRSP panel is not bound to follow U.S. law in deciding morality and public order objections.

The standard that would bar incitement to or promotion of certain forms of discrimination has been criticized as a potential “heckler’s veto” or the adoption of a “European Standard” for limiting free expression. Rules barring incitement to or promotion of discrimination based upon race, color, gender, ethnicity, religion or national origin exist in various forms in many countries around the world, not just in Europe. See also Article 20(2) of the International Covenant on Civil and Political Rights, which provides for analogous limits upon free expression.

It is important to stress that the requirement that new gTLD strings not be contrary to generally accepted legal norms relating to morality and public order concerns the string – *i.e.*, the letters to the right of the dot. This is not a regulation of the content of websites. It would be optimal if a mere gTLD string could not constitute incitement or promotion of child pornography or other sexual abuse of children. However, taking into account the fact that new gTLD strings may comprise up to 63 characters, one must anticipate that a string could well incite or promote child pornography.

Based on a few comments, there seems to be some confusion about the role of the dispute resolution service providers (DRSP). The DRSP itself does not decide the disputes; the DRSP administers the dispute resolution proceedings. That administration includes the selection and appointment of the panel (comprising one or three experts) that will issue an expert determination. The rules of procedure that ICANN plans to implement state that panelists deciding morality and public order objections should be eminent jurists of international reputation.

ICANN agrees that the standing and standards issues are worthy of further discussion. One comment asserts that the standards will be “arbitrary, subjective, and ... conflicting” if parties other than governments have standing to file morality and public order objections. ICANN is still working to develop a mechanism relating to the standing requirements for filing objections relating to Morality and Public Order. Concerns have been expressed about leaving this open to any person or entity, but concerns have also been expressed about limiting this to just one defined group of people, such as governments. Allowing anyone to object is consistent with the scope of potential harm, but may be an insufficient bar to frivolous objections. On the other hand, while groups such as governments may be well-suited to protecting morality and public order within their own country, they may be unwilling to participate in the process. The current thought, on which ICANN invites public comment, is to develop a mechanism by which those objecting on these grounds must show a legitimate interest and harm or potential harm by the proposed string.

It has been suggested that the “proposed mechanisms” for this adjudication are “inappropriate”, but no specific details or constructive criticism were provided. ICANN remains open to suggestions for improving its dispute resolution procedure for morality and public order objections and other objections.

### **Proposed Position (for this version of the Guidebook)**

ICANN is recommending that the dispute resolution panel be provided the GNSO recommendation relating to Morality and Public Order (Recommendation No. 6), along with the categories of restriction described in ICANN’s Explanatory Memorandum dated 29 October

2008, as well as what will be set out in the Draft Applicant Guidebook, version 2. The categories include certain criteria contrary to principles of international law: (i) incitement to violent lawless action; (ii) incitement to or promotion of discrimination based upon race, color, gender, ethnicity, religion or national origin; (iii) incitement to or promotion of child pornography or other sexual abuse of children; and (iv) any other category that the panel determines would render a proposed TLD contrary to equally generally accepted identified legal norms relating to morality and public order that are recognized under principles of international law. With respect to standing, as noted above, ICANN is still working on standing requirements for filing an objection on these grounds.

## **Procedures**

### **Issues and Analysis**

There are naturally many questions about the details of the dispute resolution procedure. Some of these points will be clarified with the publication of the New gTLD Dispute Resolution Procedure (a detailed set of procedures governing the objection process, based upon the more general description in Module 3 of the Draft Application Guidebook, version 2). Meanwhile, ICANN wishes to answer as many of the specific questions that have been raised as possible:

Can a limit be placed on the number of objections allowed per application?

ICANN understands the concern. However, it seems appropriate not to place a limit in advance upon the number of objections allowed per application because there is no first come first serve requirement and placing a limit would prevent legitimate objectors from objecting.

Will ICANN take measures to protect applicants from objection abuse – like limiting the grounds for objection – in order to protect applicants from incurring potentially devastating costs in the process of responding to multiple objections?

The process has been designed to take these concerns into account. Both standing to object is limited as are the grounds for objecting, and certain standards for such objections are defined. Multiple objections on the same grounds can be consolidated, thereby reducing costs. In addition, the rule that the losing party pays the costs of the dispute resolution process (i.e., panelists' fees) should discourage frivolous objections.

Can the costs of objecting to multiple applications of the same TLD be consolidated?

This is not currently contemplated, but is something that will be considered in light of string contention and the dispute resolution provider rules.

What is the limit of the panelist's discretion, and can the list identified in the draft Applicant Guidebook be improved by panelists? The categories are general and could lead to wide interpretation by panelists.

Specific standards have been defined, within which panelists will exercise their discretion as independent experts.

Can complaints against the same party be consolidated?

Yes, provided that the objections are based upon the same grounds. Thus, two or more legal rights objections against the same applied-for gTLD can be consolidated, whereas a legal rights objection against a given gTLD cannot be consolidated with a community objection against the same gTLD. Consolidation will be at the discretion of the DRSPs.

Will ICANN provide more guidance on the objection process, specifically on timing, deadlines, and procedure?

Yes. ICANN will publish its New gTLD Dispute Resolution Procedure along with the Draft Applicant Guidebook, version 2, which identifies specific Procedures.

Will ICANN allow community based objections to be submitted to the International Chamber of Commerce?

Community-based objections shall indeed be submitted by the objector to the International Chamber of Commerce's International Centre for Expertise (ICC), which will administer the dispute resolution proceedings. The panel appointed by the ICC (and not the ICC itself) will issue the expert determination.

Can applicants provide copies of all submissions to the dispute resolution service provider associated with objection proceedings via the electronic system?

Yes. In fact, that is required.

Will ICANN permit legal rights objections to be adjudicated by three member panels, particularly if objectors are willing to pay the expense if they lose?

Yes, provided both parties agree.

What specific criteria are used to decide who wins a dispute resolution matter and when will such criteria be published?

Certain criteria – i.e., standards – have already been published. See draft Guidebook, § 3.5. The standards for deciding morality and public order objections will be published in the Draft Applicant Guidebook, version 2.

Can ICANN provide more detail about the existing legal rights procedure so that it can be determined whether this procedure is a sufficiently robust safeguard?

The publication of the New gTLD Dispute Resolution Procedure with the Draft Applicant Guidebook, version 2 will provide more detail.

What discretion does the ICANN Board have to reject an application that threatens the process, the stability of ICANN, or the interests of the Internet community, but that has otherwise cleared all steps in the process because no third party objected?

ICANN does have discretion to reject such applications. Other mechanisms that could help ensure that applications that may “threaten [] the process, the stability of ICANN, or the interests of the Internet community,” are also being carefully scrutinized and considered. Such a mechanism might include an independent third party or “Independent Objector” to ensure no obviously objectionable applications pass through

the process without objection. More information about ICANN's thinking about an 'Independent Objector' will be published with the Draft Applicant Guidebook, version 2.

Do the proposed standards for objection procedure open the door to unacceptable forms of content regulation or allow a 'heckler's veto' over legitimate possible domains?

No. Please see the "Morality and Public Order" Analysis.

Can ICANN provide more detail about who has standing to object?

The rules for standing for three of the four grounds for objections were provided in the draft Guidebook, Section 3.1.2. ICANN is still working on developing standing requirements for filing objections relating to Morality and Public Order. Concerns have been expressed about leaving this open to any person or entity, but concerns have also been expressed about limiting this to just one defined group, such as governments. The requirements will ensure that those objecting on the ground of morality and public order have and prove a legitimate interest and harm or potential harm resulting from the applied-for gTLD string.

How will ICANN conduct legal reviews of applications, consider legal objections from third parties, and discharge its responsibility to ensure that the process of introducing new gTLDs respects all relevant national and international law?

The dispute resolution process that is being developed by ICANN (Module 3) will perform exactly these tasks.

When can exact dispute resolution process rules be completed and published?

The current version of the Dispute Resolution Procedure will be published with the revised Draft Applicant Guidebook. These will be supplemented by the specific rules for the dispute resolution providers. The existing Rules of Expertise will apply for the disputes administered by the ICC. WIPO Rules for New gTLD Dispute Resolution Procedure will apply for disputes administered by the Arbitration and Mediation Center for the World Intellectual Property Organization. The ICDR Supplementary Procedures for ICANN's New gTLD Program will apply to the disputes administered by the International Centre for Dispute Resolution.

Does the same "confusion" principle set forth in Module 2 (regarding String Confusion Objection) apply to DRSP?

Yes; see Section 3.5.1 of the Applicant Guidebook.

### **Proposed Position (for this version of the Guidebook)**

Many of the comments received about the procedures are well-taken and will be addressed in a more detailed procedures document that will be published with the Draft Applicant Guidebook, version 2.

## **XI. STRING CONTENTION**

### **A. STRING CONTENTION: STRING SIMILARITY**

#### **Summary of Key Points**

- The objection-based dispute resolution process tests for all types of string similarity that might result in user confusion, including visual, aural and meaning similarity. The revised version of the Applicant Guidebook will highlight this.
- The string similarity check in the Initial Evaluation will be done based on visual similarity in order to identify most cases of contention or user confusion early in the process.
- The role of the algorithm is primarily for filtering; it is intended to provide informational data to the panel of examiners and expedite their review.

#### **Summary of Input**

It should be made very clear to applicants up front that the definition of confusing similarity is not just visual. It could be easily concluded, because the algorithm only covers visual confusion, that that's all that matters, which is not the case with regard to GNSO recommendation 2. C. *Gomes*; *INTERNET COMMERCE COALITION* (15 Dec. 2008)

String confusion should apply to visual confusion only. Any broadening of the standard will limit competition. *Demand Media* (15 Dec. 2008); *Pattishall* (15 Dec. 2008)

In the standard for string confusion, how will the probability of confusion be determined? This should be clearly defined. C. *Gomes*(18 Nov. 2008)

The similarity review will be conducted by a panel of String Similarity Examiners. This examination will be informed by an algorithmic score for the visual similarity between each applied-for string and each of other existing and applied-for TLDs. The score will provide one objective measure for consideration by the panel. The algorithm uses proprietary software to perform a series of mathematical calculations to assess the visual similarity between strings based upon the following parameters. Issue--It is inappropriate for ICANN to use an algorithm which is not public, and not based on public data. C. *Gomes*(18 Nov. 2008)

The string similarity algorithm only accounts for visual similarity, and does not address aural or phonetic similarity. The phonetic sound or meaning should be incorporated in the string similarity algorithm. *INTERNET COMMERCE COALITION* (15 Dec. 2008).

Concerned that confusing similarity is only restricted to visual and not other forms of perception. G. *Kirikos-GNSO New gTLD Question and Answer Open Teleconference*.

The string review process is visually, but objections can be on other grounds - like meaning. A. *Kinderis-GNSO New gTLD Question and Answer Open Teleconference*.

The current approach taken where every string is seen as independent from any other may cause problems. It could create unnecessary fights and problems. It doesn't full account for the

realities of other scripts. (RA, WT) - See *Cairo Participation Key (Cairo public forum, 6 Nov. 2008)*.

## **Issues**

**Scope of similarity:** How are all types of user confusion tested? How is the similarity test defined by standards that will be furnished to evaluators?

**Role of algorithm:** What is the role of the algorithm? Should an algorithm based on proprietary software be used and, if so, in what function and what kind of similarities should be covered?

## **Analysis**

**Scope of similarity:**

For the introduction of new gTLDs, the Generic Names Supporting Organization (GNSO) has recommended that: Strings must not be confusingly similar to an existing top-level domain or a Reserved Name. (Recommendation 2, [http://gnso.icann.org/issues/new-gtlds/pdp-dec05-fr-parta-08aug07.htm#\\_ftn26](http://gnso.icann.org/issues/new-gtlds/pdp-dec05-fr-parta-08aug07.htm#_ftn26))

The string contention lifecycle was developed to address this concern. There are two main components of string contention. The first involves identifying gTLD strings that are likely to deceive or cause user confusion in relation to existing TLDs or Reserved Names. In addition, proposed gTLDs in a given round must not be likely to deceive or cause user confusion in relation to each other.

The applicant Guidebook provides the standard to be used in the Objection process by dispute resolution providers to determine whether an applied-for string should be excluded or placed into a contention set based upon potential confusion: "String confusion exists where a string so nearly resembles another that it is likely to deceive or cause confusion. For a likelihood of confusion to exist, it must be probable, not merely possible that confusion will arise in the mind of the average, reasonable Internet user. Mere association, in the sense that the string brings another string to mind, is insufficient to find a likelihood of confusion."

More specific standards were considered during the development of the Guidebook. It seemed that very specific standards would lead to gaming or manipulation or would leave holes for the introduction of strings that would result in user confusion.

The revised Guidebook indicates in several places that this examination is not limited to visual checks only but also includes aural and meaning similarity, for example, any similarity that will result in user confusion.

In addition to the process that tests for all types of confusion, the Guidebook also includes a preliminary test. The Initial Evaluation includes a first check of similarity to find cases of identical strings among applications and string sets with a strong visual similarity. This is intended to capture many sets of string contention or instances of user confusion early in the process. It is not intended to replace the basic objection and dispute resolution model described above, just augment it.

The standard for this initial test is: "String confusion exists where a string so nearly resembles another visually that it is likely to deceive or cause confusion. For the likelihood of confusion to exist, it must be probable, not merely possible that confusion will arise in the mind of the

average, reasonable Internet user. Mere association, in the sense that the string brings another string to mind, is insufficient to find a likelihood of confusion.”

This is a standard first step in the application handling process. Given that similarities can be of other natures, these will be caught when objections regarding confusing similarities can be lodged based on a full range of similarities.

Role of algorithm:

The algorithm selected is a tool used by many trademark offices to provide evidence of identical strings and similarity cases worthy of closer scrutiny. It is developed to focus on visual similarity and there are no algorithms on the market that we know of that effectively extend to wider concepts of similarity. Its wide acceptance makes it an attractive product. Generally, ICANN would plan to make the code public. In this instance, its wide acceptance and evident effectiveness caused ICANN to accept, for now the fact that the software cannot be published. No other products, where publication of the code was acceptable, were found to be as economical, effective, reliable and repeatable as the currently selected algorithm. Developing new software is attended by substantial risk and cost.

The similarity check in the Initial Evaluation is a first check for obvious cases of similarity, based on visual similarity where the algorithm primarily has a filtering role, reducing the work load on the panel to focus on the most likely cases of similarity, while giving an indication of visual similarity for pairs of strings to scrutinize. The decision whether a string pair is confusingly similar or not is entirely with the panel.

The algorithm will allow the panel of examiners to swiftly sort through the  $n(n-1)$  combinations of applications in order to identify candidates where confusion might arise. Every combination of string can be ranked ordered according to score, allowing the examiners to scan down and identify a family of combinations for closer examination.

**Proposed Position (for this version of the Guidebook)**

Scope of similarity:

The scope of the string confusion objection and dispute resolution process includes all types of confusion: visual, aural, meaning and so on. This check is implemented through the policy recommended objection and dispute resolution process. The revised Applicant Guidebook will include specific descriptions of these types of similarity.

The Initial Evaluation includes a first check that is based on visual similarity. The intention of this early check is to identify many instances of contention or user confusion as soon as possible in the process.

At this preliminary check, an algorithm will be employed to sort all combinations of strings and provide similarity scores to evaluators that can use the score along with other evidence of similarity.

In response to comments on the draft Applicant Guidebook, ICANN has clarified the standard for string similarity in Initial Evaluation as visual but that other forms of confusion are available in the Objection process, as recommended by the GNSO Council.

Role of algorithm:

The algorithm has primarily a filtering role, reducing the workload on the panel to focus on the most likely cases of similarity, while giving an indication of visual similarity for pairs of strings. The decision whether a string pair is confusingly similar or not is entirely with the panel.

## **B. STRING CONTENTION: COMMUNITY**

### **Summary of Key Points**

- Advance postings of proposed strings in order to identify possible string contention is a good idea but may lead to abuses.
- The distinction between open and community-based applications is intended to provide a preference for bona fide community-based applicants in cases of contention between identical (or very similar) TLD strings.
- Brand owners may apply as community-based applicants. Whether they are extended the preference depends on whether that application meets the comparative evaluation criteria.

### **Summary of Input**

ICANN should post an open board for public comment on intended gTLD strings before the formal application process as a way of reducing string contention. *L. Ye (28 Oct. 2008)*

We encourage ICANN to remove the designation of open and community based from all gTLD applications. ICANN should allow all applicants to compete with each other on an equal basis through a comparative evaluation. *DHK (15 Dec. 2008)*.

On open vs. community-based TLD types, ICANN is commended “for defining a workable process for this complex issue of ‘community’.” *Demand Media (17 Dec. 2008)*.

Is the applicant's identification of its application as open or community-based dispositive? If not, under what circumstances will ICANN substantively examine that self-identification and change it? *K. Rosette (26 Nov 2008)*.

There is a need for clarifying the “Open” vs. “Community-based” question by publishing further examples of types of organizations that would fit in both categories – and then explaining the process of selection if there is string contention between Open and Community-based applicants. *IPC (15 Dec. 2008); COA (15 Dec. 2008)*.

Does ICANN consider a ‘brand’ application an ‘open’ gTLD or a ‘community based’ gTLD? *F. Hammersley (9 Dec. 2009)*.

There are many issues around community provisions that all Constituencies need to understand further. One issue for the IPC is whether a business application (e.g., an application to run a gTLD for the exclusive use of a single company) could ever be categorized as a Community-based application, and if so, under what circumstances? *IPC (15 Dec. 2008); COA (15 Dec. 2008)*.

### **Issues**

Should ICANN post intended strings for public comment before the formal application period is launched or, alternatively, before it is closed?

Should the distinction between open and community-based applications be eliminated?

What is the (potential) relationship between a brand and a community-based TLD?

### **Analysis**

The benefits of posting information about strings that are known beforehand to be contemplated for applications would be that the community be informed earlier with possibilities to discuss and provide feedback to the applicants at an earlier stage.

ICANN staff may have information about various gTLD projects and contemplated strings before the application period is launched, but it would be inappropriate for ICANN to announce such information for public comment. Early public information about strings could arguably facilitate voluntary agreements between contenders for the same string, but could equally well prompt others to apply for the same string, thereby exacerbating string contention rather than reducing it. This was discussed in depth during the policy development and the adopted policy clearly requires that proposed strings be kept confidential until the end of the application period. To announce proposed strings before the end of the application period would be at variance with the adopted policy.

To eliminate the distinction between open and community-based applications would certainly simplify the process. However, the distinction between open and community-based applications has been introduced to implement the approved policy and enable the required preference for community-based applications in contention situations, as the adopted policy requires. This is a core policy aspect that was discussed in depth during the policy development and clearly expressed in the finally adopted policy. The test of the application's worthiness of such preferential treatment is encapsulated in the Comparative Evaluation criteria and the threshold set for winning.

The distinction between open and community-based applications implements the approved policy, enabling the required preference for community-based applications in contention situations, as the adopted policy suggests. The test of the application's worthiness of such preferential treatment is encapsulated in the Comparative Evaluation criteria and the threshold set for winning. The policy reasons for creating a preference for community-based TLDs, as indicated in the record of the policy discussions, indicate that community-based TLDs enhance the name space and that true communities should be afforded some preferences and protections.

It is wholly up to the applicant potentially a brand owner, to select the type of application to file. ICANN will not verify nor change the type as such. Whether the application, if declared as community-based, will prevail in Comparative Evaluation for a contention situation is dependent on how well the application scores against the criteria, as detailed in the Applicant Guidebook.

### **Proposed position (for this version of the Guidebook)**

Confidentiality about proposed strings will be kept until the end of the application period, after which all will be posted publicly.

To eliminate the distinction between open and community-based applications would be in conflict with the adopted policy and the distinction will remain for the next version of the Applicant Guidebook. The distinction provides a vehicle for extending a preference to a bona fide community-based TLD in cases of contention.

### **C. STRING CONTENTION: COMPARATIVE EVALUATION**

#### **Summary of Key Points**

- The comparative evaluation criteria are altered to provide increased granularity in the scoring and an altered threshold for meeting the criteria in the revised version of the Applicant Guidebook.
- The only preference extended to community-based applicants is in cases of string contention. If the comparative evaluation criteria are not met, there is no other preference.

#### **Summary of Input**

Lower the required points to achieve community-based from 11 to 10 to bring the intent more in line with the purpose i.e. better balancing. *R. Fasset* *Employmedia.com* (5 Dec. 2008); *J. Seng* (8 Dec. 2008); *SIDN* (10 Dec. 2008); *CADNA* (15 Dec. 2008); *COA* (15 Dec. 2008).

Applying the most weight for nexus to trade names infers an assumption that the concern for implementation is the predictability of string contention for non-dictionary terms vs. dictionary terms. I think the reverse is true and that the intent of GNSO Implementation Guideline F (ii) - and the reason for its existence - is because the reverse is true. *R. Andruff* (20 Nov. 2008).

The Guidebook requires “an impossibly high threshold of proof - particularly when the review of an applicant’s nexus to a particular community is wholly subjective, i.e., subject to human fallibility.” A modification should be made to avoid auction, and factor in human error. *R. Andruff* (20 Nov. 2008).

Does the trade name of a community institution, as a gTLD string, offer the strongest connection ‘between proposed string and community’? *R. Fasset*, *Employmedia.com* (5 Dec. 2008).

Why does the first ‘Dedicated Registration’ policy get a higher score than the second? *C. Gomes* (18 Nov 2008).

The comparative evaluation procedures must not be used to capture generic words for the benefit of one group. Also, community scoring should be high (11 or above). *Demand Media* (15 Dec. 2008).

To what extent will “the good of the internet community” be taken into account in such a clash? Is it ICANN’s view that a Community-based application will always be better for the internet community? *S. Metalitz* (*IPC, COA*).

If a community-based application fails to emerge as a “clear winner” in a comparative evaluation, does any preference it would otherwise receive evaporate? *S. Metalitz* (*IPC, COA*).

What happens if a claim of support from the community is not substantiated? C. Gomes (18 Nov 2008)

### **Issues**

How should the scoring and threshold for winning in a comparative evaluation be modified to ensure that proper preference is given to a bona fide community application?

To what extent will "the good of the internet community" be taken into account in cases of string contention? Does the community-based TLD always prevail?

What preferences are given to community-based applicants that do not meet the comparative evaluation criteria?

Must community support be substantiated?

### **Analysis**

The threshold for winning is intentionally set with a view to prevent gaming attempts and identifying true Community applications. The risk for "false negatives" in the scoring can be moderated by a lowering of the threshold, but this has to be balanced against an increased risk for "false positives". In cases of generic words submitted as Community based strings, test runs by staff have also shown that the threshold is difficult to attain with the current scoring template and alternatives are being considered. There is merit in considering uniqueness in the nexus between string and community as a main factor for achieving a high score. To be an unambiguous identifier, the "ideal" string would have no other associations than to the community in question. This can arguably be achieved by using the community institution abbreviation as string, but there are other possibilities, for example by putting a prefix or suffix on a generic string to make it distinctly and uniquely associated with the relevant community (for example, prefixing "boy" to "scouts" for the community of boy scout organizations, or suffixing "growers" to "apple" for the associations of apple growers). Modification of the scoring template to reflect this approach is considered.

A higher granularity in the scoring template might provide for higher reliability in the scoring and reduce the impact of human judgment subjectivity. This is especially the case where the increase in granularity is attained by asking more detailed questions that are more objective. A higher granularity is considered, both by widening the scoring scale and de-aggregating some of the criteria (i.e., asking separate, more specific questions).

Registration policy is a criterion where a balance is needed between what is reasonably the most appropriate registration policy for a community and the risk for gaming of the process by an "open" application declaring itself as "community-based" to get an advantage in a contention situation. The approach taken is conservative in this respect, with the high score reserved for a registration policy only permitting members of the community to register. A widening has been considered, but it appears reasonable to maintain the chosen approach, while at the same time possibly de-aggregate this criterion in the scoring template in order to reduce the effect of missing out on one of the sub-criteria.

In accordance with the broad-based policy discussions, the category of community-based applications was introduced to implement a preference for community-based applications in contention situations. This preference is manifested in the process as an opportunity to win a

Comparative Evaluation for a contention situation. The test of the application's worthiness of such a preference is encapsulated in the Comparative Evaluation criteria and the threshold required for meeting the criteria, as detailed in the revised Applicant Guidebook. Both aspects are under review for the next version.

The only preference a community-based application will be given is the opportunity to win a Comparative Evaluation for a contention situation. If the application scores lower than the required threshold for winning, that opportunity is lost and there is no other preferential treatment to expect. In the eventuality that multiple community-based applications score above the required threshold in a Comparative Evaluation, they may all proceed to delegation if their strings are not identical or confusingly similar to each other. Otherwise, a further step is required to resolve the remaining contention among these applications.

Substantiated community support is a criterion that is scored for the application in a Comparative Evaluation. The absence of substantiated community support will lead to a lower score for the application in a Comparative Evaluation, reducing the application's likelihood of reaching an overall score above the required threshold for winning.

#### **Proposed Position (for this version of the Guidebook)**

The Comparative Evaluation scoring and threshold was reviewed and modified with increased granularity of the scoring template and an altered threshold for meeting the criteria in the revised version of the Applicant Guidebook.

### **D. STRING CONTENTION: COMMUNITY RESOLUTION ASPECTS**

#### **Summary of Key Points**

- In cases where multiple community-based applications meet comparative evaluation criteria, the other, non-community based applications that are in direct contention with the former will no longer be considered.
- In cases where multiple community-based applications address the same community and meet comparative evaluation criteria, if one applications demonstrates considerably more community support, it will prevail.
- In cases where multiple community-based applications meet comparative evaluation criteria, but neither has demonstrated significantly more support than the other or they represent different communities, and they cannot settle the contention amongst them, an auction will be held between these applications.

#### **Summary of Input**

In the case of two community-based applicants of equal strength, rather than go to auction, neither should get the proposed TLD. Instead:

- Establish a parallel and similarly-limited period for negotiating the merging of proposals whenever there is more than one community-based application for the same community, also under the control of an ICANN-appointed mediator. If agreement is reached, the parties would have a further month to amend one of the applications, if needed, and

such reformed application would be put at the very end of the evaluation queue, not delaying the process for other applicants.

- In case more than one community-based TLD passes the Comparative Evaluation (scores 11 or 12), and both applications are deemed to represent or have the support of similar or even sizable parts of the intended community, ICANN should refrain from allocating such TLD in this round, and the parties (both community-based and eventual open applicants) should resubmit it at the next application window, if they wish so. *A. Abril i Abril* (15 Dec. 2008); *CORE Internet Council of Registrars*; *PIR*.

What is the reason for not allowing contending parties to combine to form a new application? *K. Rosette* (26 Nov. 2008)

ICANN should encourage joint ventures as a means of resolving string contention, as opposed to prohibiting them. *CentralNIC* (13 Dec. 2008); *Melbourne IT* (15 Dec. 2008). Why are joint ventures not allowed? *C. Gomes* (18 Nov. 2008). Joint ventures will help resolve string contention among competing applications. *Demand Media* (15 Dec. 2008).

In the 1st public draft GFA text, this set always goes to auction if two or more of community-based applications score 11 points or more in the comparative evaluation, and the relative evaluation fails to determine a "clear winner". Suppose that all three community-based applications each score 11 points in the comparative evaluation, and the evaluators are unable to arrive at a basis for awarding priority between them.

Therefore, Chrysler LLC, with a capitalization that may be negative today, but historically has had better access to capital than any Tribal Government ever, is allowed to bid as a brand manager (JEEP CHEROKEE) against three rather poor tribes and their respective community-based applicants. This is not the outcome we should be designing for. The process should always select a qualified community-based application, and unlike contention sets formed for generic strings, communities can not change their names to accommodate the uniqueness of labels requirement of the DNS, there is no 'commercially reasonable' private settlement possible for communities, unlike commercial plays for generic strings." *E. Brunner-Williams* (15 Nov 2008)

ICANN may consider allowing applicants to apply for up to x (x being a reasonable number like 5 for example) gTLD strings with one application with a mandate to reduce it to one after string contention check. ICANN may charge a "change fee". ICANN may charge "change fee" if such action leads to extra work for ICANN and to discourage frivolous changes. *I. Vachovsky* (15 Nov. 2008)

Should an applicant who invests in the process but loses a String Contention be afforded the opportunity of selecting (or proposing) another character string that is not part of a contention set? *S. Metalitz (IPC, COA)*. Why can't an applicant choose an alternate string to avoid contention? The parties should be given an opportunity to select an alternative string if they fall into a contention set for auction. If the parties cannot agree to select different strings, then an auction would be able to proceed. *Smartcall* (4 Dec. 2008).

There will be a high degree of cooperation to resolve contention if the efficient allocation mechanism of last resort is auctions (as applicants will have incentives to not go to auction). If the mechanism is chance, less cooperation will occur and gaming may result. *Demand Media* (17 Dec. 2008). In the case of contention and where more than one applicant meets the criteria for community-based, "I believe ICANN has administered all that they can fairly and objectively

for the applicants with the final resolution to be left to an auction.” *R. Fasset, Employmedia.com* (15 Dec. 2008)

The option to elect to comparative evaluation raises an additional cost for community-based applicants. *E. Brunner-Williams* (15 Nov. 2008).

Does the cooling off period count against any applicable time limits? Why wouldn't the time limits be automatically extended for the amount of time used in the cooling off period? *C. Gomes* (18 Nov. 2008).

Will the Evaluators take into consideration the purpose of an application? Is “Content Contention” of concern to ICANN? Would ICANN accept two applications with dissimilar character strings but identical purposes? *S. Metalitz (IPC, COA)*.

It would be helpful for the Applicant Guidebook to clearly denote that the only instance when an applicant will be evaluated against another applicant is when two or more applicants each achieve the number of points required to be community-based. *R. Fasset, Employmedia.com* (10 Dec. 2008)

### **Issue**

How can a residual contention situation between multiple community-based applicants who meet the criteria in a Comparative Evaluation best be resolved, or possibly prevented?

### **Analysis**

The case at issue here is when there are multiple community applications, for identical or confusingly similar strings, that score above the threshold for criteria in a Comparative Evaluation.

There is some merit in refusing to resolve such a contention, notably to avoid polarization of the community, but this would have to be weighed against the negative consequences for all applicants involved in the contention set - their applications would all be considered void and they would have to reapply in the next round, implying both substantial extra costs and severe delays.

It should further be made clear that any final resolution necessary will be made ONLY between the community applications that score above the threshold, and NOT involve other applications in the contention set. This was ambiguous in the first version and will be clarified in the next version.

The opportunity to resolve the contention situation on a voluntary basis is present before a Comparative Evaluation takes place. To add an opportunity for such a resolution thereafter would carry a risk of delay with arguably meager chance of success, as the voluntary path has already been tried and failed. It is a preferred option to further facilitate the original opportunity for voluntary resolution by allowing more flexibility for agreements between the contending applicants, while safeguarding expedience in the process. Agreements between contending parties may result in deep modifications of an application that would have to be reviewed thru all steps from Initial Evaluation onwards. Applicants can investigate what agreements can be permitted in order to facilitate voluntary resolution of contention without resulting in substantive changes of any application. This should be considered in order to reduce the number of

contention cases to address by other means, thereby also avoiding additional costs for applicants.

An opportunity for applicants to present alternative strings, or to select a new string, would facilitate contention resolution and this was an option considered in the policy discussion but it was thought it would overly complicate the process. The agreed approach in the implementation advice accompanying the policy recommendations was, in short, that there be only one string per application to prevent gaming aspects.

For the final resolution in a case with multiple community applications, there are essentially two options to consider, either assessment of which one has majority support from the community or an auction among the winners. The first option is only applicable if the contenders do address the same community, while the second is applicable to any situation. From that perspective, an auction is preferred since that solution provides clarity of process and better predictability.

The role of the purported “purpose” of the TLD application: similarity of purpose between two applications is not a contention situation as defined by the process, which only is concerned with the ability of the TLD strings to coexist in the DNS. Provisions to prevent “content contention” are not part of the adopted policy, nor contemplated in the implementation. “Similarity of purpose” is, in fact, another way of saying “competition” and it is ICANN’s recognized duty to promote competition.

#### **Proposed Position (for this version of the Guidebook)**

A comparative evaluation where multiple community applications feature identical or confusingly similar strings and score above the threshold for meeting the criteria will need to be resolved through an additional step. In cases where the applicants represent the same community, there will be a test to determine if one of the applicants represents a significantly greater portion of the community. In cases where this is not so, the applicants will be afforded an opportunity to settle the contention. During that time, the community invoked in the applications may choose to support one of the applicants over the other, with the result that one of the applicants would no longer meet the criteria and the other applicant would prevail. Absent a failure of all these methods, an auction will be held.

If more than one community-based application meet the criteria, none of the non-community-based (open) applications in direct contention with the former will prevail. This step should only address the particular contention situation among these community applications and not involve other applications in the contention set in question. This will be clarified in the revised version of the Applicant Guidebook.

#### **E. STRING CONTENTION: LAST RESORT CONTENTION RESOLUTION--AUCTIONS**

##### **Summary of Key Points**

- The revised Guidebook proposes that if comparative evaluation, agreement between parties or other methods do not resolve contention among applicants, that auctions will be used as a last resort contention resolution method.
- Several other methods of contention resolution were considered. Auction is an objective, legal, timely way to resolve contention, while other candidates proved not to be.

- Bona fide community-based applicants meeting the criteria will not face non-community based applicants in auction. In certain cases, if after other additional methods fail, community-based applicants might face each other in auction.
- Proceeds from auctions will be returned to the community via a foundation that has a clear mission and a transparent way to allocate funds to projects that are of interest to the greater Internet community. One use of funds would be to sustain registry operations for a temporary period in the case of registry failure.

## **Summary of Input**

### **Support or Non-Objection to Auctions**

Demand Media strongly supports the use of auction to resolve contention for open TLDs. They note that there will be a high degree of cooperation to resolve contention if the efficient allocation mechanism of last resort is auctions (as applicants will have incentives to not go to auction). If the mechanism is chance, less cooperation will occur and gaming may result. Related to cooperation is the issue of self-resolution of string contention. Demand Media notes that joint ventures could be permitted if the joint venture proceeds with the original bidder except for the new ownership structure of the entity. *Demand Media* (15 Dec. 2008).

“As a related comment, I would like to add that the draft AGB is still unsure what to do in the case more than one applicant meets the criteria for community-based. In this scenario, I believe ICANN has administered all that they can fairly and objectively for the applicants with the final resolution to be left to an auction.” *R. Fasset (EmployMedia)* (15 Dec. 2008)

“Second, ICANN should encourage joint ventures as a means of resolving string contention, as opposed to prohibiting them. As long as the original applicant is part of the joint venture, the application shouldn’t change in substance sufficiently to prohibit an important means to resolve string contention. If ICANN really wants to use auctions as a contention resolution method of last resort, it should adopt a high refund policy, announce it soon, and permit joint ventures to be formed by two or more parties that are contending for the same or similar string.” *CentralNIC* (13 Dec. 2008). Several commenters also addressed the joint venture issue: E.g., noting that it is unclear why applicants may not resolve string contention situation through creating a joint venture to operate one string. *Rodenbaugh* (16 Dec. 2008). *Demand Media* (15 Dec. 2008). *K. Rosette* (26 Nov. 2008). *C. Gomes* (18 Nov. 2008). *Bank of America* (15 Dec. 2008).

4.3 Contention Resolution- “The Guidebook mentions an ‘efficient mechanism for contention resolution’ that has yet to be developed; the Guidebook only states a) that the first efficient means of resolution that will be employed is an attempt at a settlement between the two parties, and b) that auctions will be a last resort. ICANN should develop this mechanism that will come into play after attempts to settle a dispute between two competing applicants.” CADNA notes that the Guidebook needs further clarification regarding how funds resulting from auctions will be allocated. “There should be further clarification as to what would be deemed an appropriate allocation of these proceeds, the time frame for this decision and how this allocation would be determined through ‘community consultation.’” *CADNA* (15 Dec. 2008).

“The Guidebook mentions an ‘efficient mechanism for contention resolution’ that has yet to be developed; the Guidebook currently only states a) that the first efficient means of resolution that will be employed is an attempt at a settlement between the two parties, and b) that auctions will be a last resort. ICANN should develop this mechanism so that contention sets are not frequently pushed to auction.” *RILA* (15 Dec. 2008).

## General Concerns: Support for Comparative Evaluation Over Auction; Other

Supports mandatory, rather than optional, comparative evaluation on string contention. *AIPLA* (15 Dec. 2008) The DAG indicates that “auctions are one means of last resort” to resolve string contention. However, *SIIA* notes that no other means are discussed. *SIIA* has serious reservations about auctions as a mechanism for awarding new gTLDs.” *SIIA* (15 Dec. 2008)

Instead of auction, “not allocating the TLD would be more efficient to all parties involved (when multiple applicants for the same community-based TLD pass the evaluation and are all of them representative of such community).” *A. Abril i Abril* (15 Dec. 2008).

“If no community-based applications are presented other enterprises competing for a gTLD could be determined either between the competing parties or through an auction process (the one with the most money offered wins). There is no guarantee that the most appropriate trademark owner would retain a gTLD containing their brand name.” *R. Raines* (4 Dec. 2008).

“The so-called “comparative evaluation” process should be completely re-thought, since in its present form it will be extremely difficult for even a strong community application to emerge as a “clear winner” and escape being funneled into an auction.” “COA participants share the strongly stated concerns of the IPC regarding the inappropriateness of resorting to auctions to award gTLDs in most cases, see <http://www.ipconstituency.org/PDFs/IPC%20comments%20on%20auctions%20paper%20090708.PDF>, and thus urge ICANN to re-think the “comparative evaluation” procedure. Especially when only one community-based application is involved, it should be designed mainly to weed out specious claims of community-based status, rather than to impose an unjustifiably high hurdle between an otherwise qualified community applicant (including those that have survived Community Objection procedures) and the goal of a gTLD delegation.” *COA* (15 Dec. 2008)

The next Guidebook should clearly describe the nature of the “efficient mechanism for contention resolution”; it is doubtful that auction is appropriate for resolution of any string contention). *Bank of America* (15 Dec. 2008). *SIFMA* (12 Dec. 2008). *SIDN* (10 Dec. 2008) (revenues to ICANN aspect is problematic).

## Opposed to Auctions

On Module 4, George Kirikos asserts that auctions alone are insufficient mechanisms for allocating gTLDs, as they do not address the negative externalities imposed upon others.” “ICANN cannot be trusted to use the auction proceeds in a financially responsible manner, given what has been revealed in its IRS Form 990 disclosures, whereby ICANN's budget and staff compensation has been exploding to unreasonably high levels. Any proceeds should be used on a dollar-for-dollar basis to reduce ICANN fees for existing gTLD registrants, thereby refunding partially the externalities that ICANN is imposing upon society. Debacles like the ICANN Fellowship Project ...should not create new precedents for even grander debacles that ICANN and its insiders hope to fund through auction proceeds. Financial prudence in these tough economic times means not funding white elephants, but instead rebating the fees back to domain registrants.” “In the “Resolving String Contention”, bidders during any auction must place a bidding deposit of large enough size to ensure that no fraudulent bids take place (in which case the auctions would be replayed, but the deposit forfeited to the other bidders). It's unclear that the current mechanism adequately addresses this, given the short time frames discussed

(bank letters of credit or other instruments might be required before the auctions). We've seen spectrum auctions, for example, where bidders defaulted, e.g. [http://hraunfoss.fcc.gov/edocs\\_public/attachmatch/DA-08-2207A1.pdf](http://hraunfoss.fcc.gov/edocs_public/attachmatch/DA-08-2207A1.pdf). G. Kirikos (24 Nov. 2008)

Section 4.3 of the DAG states that "auctions are one means of last resort" to resolve string contention, but no other means are discussed. IPC reiterates its strong concerns about auctions as a mechanism for awarding new gTLDs (see <http://www.ipconstituency.org/PDFs/IPC%20comments%20on%20auctions%20paper%20090708.PDF> and previous submissions cited there). [These comments were addressed in the Explanatory Memo on Auctions, except for detail on uses of funds and revised comparative evaluation criteria. IPC (15 Dec. 2008).

"Section 4.3 deals with an auction to resolve contention. Is this to maximize the revenue of ICANN? This seems to go against the foundational principles to promote competition in the domain-name marketplace while ensuring Internet security and stability. Surely the parties should firstly be given the option of accepting an alternative name? If this is not agreed then by all means, have an auction." *Smartcall* (4 Dec. 2008)

For brand protection in resolving string contention in the new gTLD process, auctions should be avoided and other mechanisms should be developed. If auctions are deemed necessary in some cases, escrow amounts should be required to deter fraud or defaulting bidders; analysis of auctions and resultant revenues to ICANN in relation to ICANN's status as a nonprofit should also be assessed. *NAM* (15 Dec. 2008).

### **Opposed to Auctions – Don't Use if Rights Holder has Objected**

On Auctions, *MarkMonitor* recommends "Section 4.3- Auctions should not be adopted as a mechanism for string contention resolution if there has been an objection filed by a rights holder. This might occur if ICANN decides not to adopt the findings of the DRSP, and the rights holder has submitted an application for the string. To do so would enable ICANN to benefit from potentially infringing TLD applicants." *MarkMonitor* (15 Dec. 2008).

### **Opposed to Auctions – In Case of Community-Based Applicants**

"In the 1st public draft GFA text, this set always goes to auction if two or more of community-based applications score 11 points or more in the comparative evaluation, and the relative evaluation fails to determine a "clear winner". Suppose that all three community-based applications each score 11 points in the comparative evaluation, and the evaluators are unable to arrive at a basis for awarding priority between them.

Therefore, Chrysler LLC, with a capitalization that may be negative today, but historically has had better access to capital than any Tribal Government ever, is allowed to bid as a brand manager (JEEP CHEROKEE) against three rather poor (and corrupt for two out of the three) Tribes and their respective community-based applicants. This is not the outcome we should be designing for." "The process should always select a qualified community-based application, and unlike contention sets formed for generic strings, communities can not change their names to accommodate the uniqueness of labels requirement of the DNS, there is no "commercially reasonable" private settlement possible for communities, unlike commercial plays for generic strings." "It should be very clear that paying a fee to obtain access to an evaluated outcome rather than a auction outcome is an additional barrier to community-based applications who may be in a contention set, and failure to pay this fee will, in the simple case of a community-based

applicant and a "open" application, resolve the outcome as an auction in which the bidders are comprised of one auction-preferred bidder, and one auction-adverse bidder, with the obvious general outcome." "Again, this is not the outcome we should be designing for. The evaluation fee should be paid by the party forcing the evaluation, which is the "open" application which intentionally formed a contention set by applying for a community identifier, and has not withdrawn its application upon notice that a community-based application for that community identifier has been filed. Where there are no applicants within a contention set predisposed to an auction outcome, the evaluation fee should be paid by ICANN, which at its sole discretion selected the rather expensive International Chamber of Commerce rather than any other means to evaluate community-based applications, and which has, so far, rejected any contention outcomes other than "last man standing." *E. Brunner-Williams* (15 Dec. 2008)

"If there is no "clear winner" from the Comparative Evaluation, the resolution process is to process into a not-yet-finalized Efficient Mechanism for Contention Resolution, which will probably be auctions. Auctions do not appear to be a realistic mechanism for resolving contention among community-based applicants. Because it seems likely that many community-based applicants, such as non-profit organizations, may not have resources sufficient to compete with the open applicant in the auction setting, auctions are likely to favor those with open applications instead of those with community-based applications. In addition, an auction would work to the detriment of a community-based applicant unfortunate enough to compete with another community-based applicant and an open applicant. If the two community-based applicants both qualify through the Comparative Evaluation procedure and neither represents "a much larger share of the relevant community," they might both lose out to a better funded open applicant. This result seems contrary to the general preference for community-based applicants." *INTA* (15 Dec. 2008); *Arab Team* (15 Dec. 2008) (do not use auctions for community-based string contention).

### **Issues**

1. Whether to specify or more clearly explain that joint ventures are permitted under the current language of the Applicant Guidebook, as part of self-resolution of contention among competing applicants.
2. Whether to specify that ICANN staff is proposing that auctions be the last resort mechanism to resolve string contention.
3. Whether to add detail on potential uses of funds derived from auction.
4. Whether community-based applicants continue to auction in cases where comparative evaluation does not produce a clear winner.
5. Whether auctions should be used as a last resort contention mechanism in cases in which an objection has been filed against a proposed string.

### **Proposed Position (for this version of the Guidebook)**

1. Whether to specify or more clearly explain that joint ventures are permitted under the current language of the Applicant Guidebook, as part of self-resolution of contention among competing applicants.

Joint ventures are expected as part of the application process and it is designed to accommodate applications by new entities. Agreements are expected as part of self-resolution of string contention but a new entity, resulting in a material change to the application information would require re-evaluation for satisfaction of the Operational/Technical/Financial criteria. This might require additional fees or potential

postponement of consideration to a subsequent round. Applicants are encouraged to resolve contention amongst them by arriving at accommodations that do not materially alter the application information of the surviving applicant in order to achieve a timely resolution and decision. ICANN will work with evaluation service providers as they are retained to determine if re-evaluation can occur in a timely way.

2. Whether to specify that ICANN staff is proposing that auctions be the last resort mechanism to resolve string contention.

Considerable analysis of this question is provided below. Module 4 has been revised to clearly describe auction as the last resort contention resolution mechanism, only after contending parties have had an opportunity to resolve the contention themselves, comparative evaluation does not resolve the contention, and all objection processes or comparative evaluation processes are complete. It is expected that resolution between the parties will present a more economical resolution method for applicants and that most contention will be resolved in this manner.

3. What are uses of funds derived from auction?

Proceeds from auctions will be returned to the community via a foundation that has a clear mission and a transparent way to allocate funds to projects that are of interest to the greater Internet community. One use of funds would be to sustain registry operations for a temporary period in the case of registry failure. Other uses include outreach and education, and DNS stability/security projects. The revised Guidebook includes this added detail on the use of funds regarding the establishment of a foundation.

It is important to note again that it is thought that most cases of contention will be resolved by an agreement among the parties since that is a more economical solution to contention than auction. Therefore, few auctions are expected.

4. Whether community-based applicants continue to auction in cases where comparative evaluation does not produce a clear winner.

This situation is described more fully in a companion paper. Briefly:

- In cases where multiple community-based applications meet comparative evaluation criteria, the other, non-community based applications in direct contention with the former will no longer be considered.
- In cases where multiple community-based applications address the same community and meet comparative evaluation criteria, if one application demonstrates considerably more community support, it will prevail.
- In cases where multiple community-based applications meet comparative evaluation criteria, neither has demonstrated significantly more support than the other or they represent different communities, and they cannot settle the contention amongst them, an auction will be held between these applications.

Contending parties will be given an opportunity to resolve their differences, after which an auction will be conducted. An alternative was for both community-based applicants to come back at a later date (future round) after both have settled their differences but this seems to unnecessarily delay the delegation of a desired resource.

5. Whether auctions should be used as a last resort contention mechanism in cases in which an objection has been filed against a proposed string.

All objections will be resolved prior to resolution among contending applications. Presuming that the objection was not successful, and contention remains after the original objection was filed, then the contending applicants should proceed to resolution methods, including comparative evaluation, agreement among the parties, and auction.

## **Analysis**

### **Background**

Comparative evaluations were used in the 2001 proof-of-concept round and the 2003 sponsored TLD round. Comparative evaluation was also used in the .NET rebid process and transition of .ORG. It was widely noted in the community that ICANN did not have a good experience with comparative evaluation in the .NET rebid process.

The use of auctions in the new gTLD process has been discussed for many years. In 2004, ICANN received a paper on allocation of gTLDs via auction from the Organization for Economic Cooperation and Development (OECD) titled "Generic Top Level Domain Names: Market Development and Allocation Issues" (see <http://www.oecd.org/dataoecd/56/34/32996948.pdf>). This paper described allocation methods for gTLD strings, including auction and comparative evaluation. The OECD concluded: "On balance the economic arguments favour the use of auctions in some form, where scarcity exists, in relation to the goals set by ICANN for allocation procedures. They are particularly strong in relation to allocation decisions concerning to existing resources and where a 'tie-breaker' is needed during a comparative selection procedure for a new resource. In all cases, the best elements of comparative selection procedures could still be incorporated, at a prequalification stage for registries, using straightforward, transparent, and objective procedures that preserve the stability of the Internet" (pp. 51-52).<sup>1</sup>

The paper acknowledged that comparative evaluation may have the advantage of providing equity for new gTLD applicants, and permits the inclusion of broader objectives in the new gTLD selection process. However, it also noted that comparative evaluation lacks transparency and relies on subjective judgment in the determination of a winner for a proposed gTLD string.

Auction of new gTLDs was discussed during the development of the GNSO Recommendations during a meeting in Marina del Rey, California in 2007, and referenced in the final recommendations approved by the GNSO. Implementation details, including potential use of auctions, were discussed with the GNSO and others during the ICANN meetings in Los Angeles, Delhi, Paris and Cairo.

The GNSO Recommendations approved by the ICANN Board in June 2008 state that new gTLDs must be introduced in an orderly, timely and predictable way. There must be a clear and pre-published application process using objective and measurable criteria. All applications must initially be assessed in rounds until the scale of demand is clear.

---

<sup>1</sup> Legal scholars familiar with ICANN and the DNS have also recommended auction as a means for distributing new gTLDs. See "An Economic Analysis of Domain Name Policy," *Hastings Communication and Entertainment Law Journal* (2003) (by Karl M. Manheim and Lawrence B. Solum) (<http://law.bepress.com/sandiegolwps/le/art1>).

The GNSO also recommended that if there is contention for strings, applicants may:

1. resolve contention between them within an established time-frame;
2. if there is no mutual agreement, a claim to support a community by one party will be a reason to award priority to that application. **If there is no such claim, and no mutual agreement a process will be put in place to enable efficient resolution of contention** [emphasis added] and;
3. the ICANN Board may be used to make a final decision, using advice from staff and expert panels.

In early 2008, ICANN retained PowerAuctions, LLC as an auction consultant, and published an Economic Case for Auctions in August 2008. The Economic Case paper became the basis for the auction model incorporated as Chapter 6 of the Resolving String Contention explanatory memorandum attached to the draft Applicant Guidebook.

### **Allocation Mechanisms Overview**

The GNSO Recommendations anticipate that there will be cases where two or more identical or nearly identical strings will meet the qualifying criteria and successfully complete all evaluations. Applicants should first be provided an opportunity to resolve contention themselves. In cases where one or more contenders is community-based, comparative evaluation may be used. If comparative evaluation is not used or does not result in a clear winner, contention may be resolved by an “efficient mechanism.” Staff has proposed that this mechanism be auctions. There are essentially four ways to resolve contention:

- Comparative evaluation – subjective criteria are applied to each contender in order to determine the better or best applicant. This method, supported by the GNSO Council for community-based applicants, is problematic because devising measurable criteria is difficult and the process will lead to controversial results.
- Auction – In a pre-determined methodology, contending applicants submit monetary bids for the TLD. Generally, the highest bid wins. This method is objective. It is supported by the OECD (Organization for Economic Cooperation and Development, [www.OECD.org](http://www.OECD.org)) and other stakeholders including aspiring gTLD registries.<sup>2</sup>
- Random selection – A coin-flip or (in the case of several contenders) random drawing determines the winner. The method is objective but is problematic as law in certain jurisdictions provides a direct barrier to using a lottery or other form of selection by chance to determine the winner of a contested gTLD.

---

<sup>2</sup> The GNSO stated that in these cases “a process will be put in place to enable efficient resolution of contention.” In that report, the council indicated that they had considered auctions as discussed in policy discussions and implementation meetings with ICANN staff an auctions merited additional study.

- Best terms - The party agreeing to best contract terms would be the winner. Determination of what are best terms is problematic and will lead to gaming. For example, the choice could be made on a registry reliability or response time measure that won't necessarily serve registrants better but would result in a number of overreaching application promises.

### **1. Selection by Chance**

Selection by chance includes the use of lotteries, "short straw", "coin flip" or random selection as a mechanism for allocating applications for new gTLDs. ICANN has received advice from outside counsel that lotteries (or other selection by chance methods) might be viewed as illegal in some jurisdictions, and such laws may provide a direct barrier to using lotteries or other chance mechanisms in order to determine the winner of a contested gTLD.

### **2. Comparative Evaluation**

ICANN previously used comparative evaluation for the transition of .ORG from VeriSign to PIR, the .NET rebid process, and the 2000 and 2003 new gTLD rounds. Subjective aspects of comparative evaluation in the .NET rebid made selection of a winner in a close contest difficult and vulnerable to litigation. ICANN anticipates that comparative evaluation will be used to resolve contention among applicants when at least one applicant purports to represent a community or is seeking a community-based gTLD.

The disadvantages of comparative evaluations can be summarized as follows:

- It is difficult to establish clearly objective criteria that allow the evaluator to differentiate among competing applications that have already passed all evaluation criteria;
- comparative evaluations take relatively longer time periods than objective measures and cost more;
- Depending on how the comparative evaluation is structured, the process may favor well-connected applicants, and thus may not be any more protective of disadvantaged applicants than auctions;
- Comparative evaluation is difficult in cases where community-based applicants are up against open applicants over the same string.

### **3. Auctions**

ICANN has received a number of inputs from the community on the potential use of auctions to resolve contention among competing new gTLD applications.

Auctions are an objective and transparent means to resolve string contention. Given that bids are observable and verifiable by a court or any third party, the final allocation is less likely to be legally contested relative to a comparative selection procedure. The key benefits of a well-designed auction mechanism include the following:

- Transparent and objective means for determining a winner
- Efficient allocation – puts gTLD strings in the hands of those who value them
- Efficient process – fully dynamic auction, concludes in one day to one week
- Revenue maximization (although this is not one of ICANN's goals in the new gTLD process)

Parties competing for the same or similar strings would be able to collaborate with each other once contention sets have been identified. This would permit applicants for the same or similar strings to work out contention amongst themselves between the time in which all applications are posted and the initial evaluation process closes, and this would be in line with the GNSO

Recommendations. This would be a more cost effective solution for most contending parties and it is anticipated most contention would be resolved prior to the auction occurring. ICANN's task is to make a final determination among the applications received. As an example, how best should ICANN resolve contention for .shop if VeriSign, NeuStar, Afilias, Nominet and NIC.MX all meet the base criteria? An auction mechanism would provide for a clear and objective means for resolving contention among multiple applicants. In another example, how should ICANN resolve contention for .car, .cars, .care, and .cares (if it is determined that .car, .care and .cars are in contention and .cares and .care are in contention with each other)?

#### **4. Selection by Best Terms**

ICANN could also determine to resolve contention by selecting the applications that present the "best terms". This would require ICANN to identify in advance "best terms." Determination of what are best terms is problematic and will lead to gaming. For example, the choice could be made on a registry reliability or response time measure that won't necessarily serve registrants better but would result in a number of overreaching application promises.

#### **Uses of Funds**

ICANN's plan is that fees and costs of the new gTLD program will offset, so any funds coming from a last resort contention resolution mechanism such as auctions would result in new revenue to ICANN. Therefore, consideration of a last resort contention mechanism should include the possible uses of funds. Clearly, any funds must be used in a manner that supports directly ICANN's Mission and Core Values.

Given that possible new revenue from contention resolution mechanisms could range from zero to potentially significant sums, it is challenging to identify specific uses with certainty. Proceeds from auctions will be returned to the community via a foundation that has a clear mission and a transparent way to allocate funds to projects that are of interest to the greater Internet community. One use of funds would be to sustain registry operations for a temporary period in the case of registry failure. Other uses include outreach and education, and DNS stability/security projects. Other possible uses could include reduction in application fees or grants to support new gTLD applications or registry operators from communities in subsequent gTLD rounds, or other specific projects for the benefit of the Internet community in accordance with ICANN's security and stability mission.

## **XII. REGISTRY AGREEMENT**

### **Summary of Key Points**

- ICANN received dozens of thoughtful and constructive comments on the draft proposed Registry Agreement.
- There have been significant revisions to the proposed Registry Agreement in response to public commentary and discussions:
  - ICANN has modified the proposed process and included limitations on implementing global amendments to the form of the Registry Agreement.
  - ICANN has included covenants requiring equitable treatment among registry operators and open and transparent actions by ICANN.
  - The recurring registry fees to ICANN have been reduced to US\$25,000 per year, plus a flat \$0.25 per transaction for registries with over 50,000 names.

### **Summary of Input**

This section organizes the summary of responses about the Registry Agreement into the following categories: *General Comments, Covenants of ICANN, Consensus Policies, Compliance, TLD Delegation, Term and Termination, Payment Concerns, Pass-Through of Registrar Fees, Price Controls, Amendment Process, Dispute Resolution and Damages, Indemnification, Warranties and Liability, and Changes of Control.*

### **General Comments**

**General Concerns Regarding Proposed New Form of Registry Agreement.** The introduction of an entirely new “base agreement” in the draft appears to be based only on a desire to simplify the form of agreement. With a few exceptions, it certainly does not stem from the recommendations in “Term of Reference Four – Contractual Conditions: [http://gnso.icann.org/issues/new-gtlds/pdp-dec05-fr-parta-08aug07.htm#\\_Toc35657640](http://gnso.icann.org/issues/new-gtlds/pdp-dec05-fr-parta-08aug07.htm#_Toc35657640).” The resulting base agreement is so flawed in substantive provisions that consideration should be given to abandoning it in its entirety. At the very least, the Board should consider, as a possible starting point, the forms of registry management agreements in force for .ORG, .BIZ and .INFO. Among other sections that must be added: ICANN covenants, consensus policies, limits on ICANN authority to make changes; and certain fee provisions should be removed. *PIR* (15 Dec. 2008). ICANN must address other omissions and changes in the agreement - e.g., the TLD zone servers; the term of agreement; renewals; termination rights; dispute resolution; arbitration; liability; registry fees; RSTEP cost recovery; collection of registrar fees by registries; changes and modifications to the agreement; notice of changes; indemnification; and changes in control. *RyC* (6 Dec. 2008); *G. Kirikos* (24 Nov. 2008) (cites numerous deficiencies and need for revisions to the base agreement—e.g., renewal provisions, pricing, equal treatment trigger problem, fees, changes in registry control, rights protection mechanisms); *Demand Media* (Module 5, 15 Dec. 2008) (suggests numerous revisions – e.g., spell out rights protection mechanisms, indemnification, arbitration, community policies, audits); *A. Abril i Abril* (Module 5,

15 Dec. 2008) (certain omitted provisions should be added back into agreement — e.g., rights to data, traffic data, extent of delegated authority; clarification needed for public law corporations and community-based TLDs). Why does the currently proposed draft Registry Agreement deviate so much from existing Registry Agreements? It is very one-sided in favor of ICANN. Are there key areas in existing agreements that ICANN Staff think have been unsuccessful? If so, what are those and why are they thought to be unsuccessful? *C. Gomes* (18 Nov. 2008).

Need for a Balanced Agreement. Registries believe that we should focus now on crafting an agreement that is fair, gives ICANN the tools it needs to achieve its limited mission, and gives Registries the stability and predictability they need to operate businesses. Provisions under which changes to the fee provisions of each registry's agreement should be negotiated on an individual basis, as appropriate. *RyC* (6 Dec. 2008).

Impact on Existing TLDs. What will be the impact of the adoption of the new form of Registry Agreement on existing TLDs? *G. Kirikos* (24 Oct. 2008).

Compliance with Application; Changes. Do TLDs have to follow what was in the application? *J. Neuman, C. Greer; Notes from October 29 RyC Meeting.* ICANN should anticipate and accept that reasonable changes may occur during the course of what could be a lengthy review process. Registries also believe that the Registry Agreement should obligate operators to fulfill the commitments made in their applications, particularly with respect to community based applications, and note that this provision does not accomplish that goal. *RyC* (6 Dec. 2008). Can an applicant apply for a TLD and choose not to use it? Can applicants apply for a TLD to prevent others from using it? *F. Hammersley* (24 Nov. 2008; 6 Nov. 2008) (inquires about possible pre-application opinion on similarity to a reserved name; what is the position on gTLD "warehousing" to prevent others from using it).

Contract Execution. Section 4.4 – If an Applicant is in good faith negotiations with ICANN on the Registry Agreement, ICANN should not have the right to assign the contract to the runner-up applicant if the contract has not been signed within 90 days. *MarkMonitor* (Module 4, 15 Dec. 2008); *C. Gomes-GNSO New gTLD Question and Answer Open Teleconference.*

## **Covenants of ICANN**

ICANN Accountability. More ICANN accountability is needed. The covenants section of the Registry Agreement needs clarification and adjustment to conform with established registry expectations, and the agreement also raises concern due to certain unilateral changes. ICANN needs to reconsider the significant changes it made to the "Covenants of ICANN" (article 3) provision. The proposed changes in this section eliminate ICANN's obligations to (a) operate in an open and transparent matter consistent with its expressed mission and core values, and (b) not apply its standards, policies, procedures or practices arbitrarily, unjustifiably or inequitably, and not single out particular Registries for disparate treatment unless justified by substantial and reasonable cause. As previously discussed, because Bylaws can be changed, Registry Operators feel very strongly that ICANN's accountability for compliance with the most basic obligations of fair dealing should be set out in the Registry Agreement. *RyC* (6 Dec. 2008). Why was the reference to the "equitable treatment" provisions in the old form of Registry Agreement (Sections 3.2(a) and (b)) removed from the list of issues which consensus policies could not modify? *M. Palage, J. Neuman; October 29, RyC Meeting.*

Zone Server and Nameserver Implementation Timeframe. Related to Section 3.1, the Registry Operators believe that ICANN should be willing to commit to a best efforts standard that targets implementation within 7 days for changes to the TLD zone server and nameserver. ICANN is obligated to ensure that the authoritative root points to the designated TLD zone servers to the extent ICANN has the authority to do so. This is a very limited obligation with respect to a matter of fundamental importance to Registries, and should remain in the Registry Agreement. *RyC (6 Dec. 2008).*

## Consensus Policies

Limitations. Why was the definition of “Registry Services” removed from the Consensus Policy specification? *M. Palage, October 29, 2008, RyC Meeting.*

Scope of Consensus Policies. Registry operators cannot agree to expand the scope of Consensus Policies beyond the long-accepted picket fence, and believe that it is not in ICANN's long-term interests to do so. Because Bylaws can and do change, Registries feel that contractual protections for the picket fence are essential. *RyC (6 Dec. 2008).* Registry Agreement pricing is not a stability or security issue and thus not within the bounds of the picket fence. It is a matter on which each registry is free to agree via contract, but it is not an appropriate matter for Consensus Policy. *M. Palage, October 29, RyC Meeting.*

## Compliance

Audit Rights. ICANN has the right to audit a registry's compliance with each and every aspect of the Registry Agreement. ICANN already has the right to audit compliance with the fee arrangements and with ICANN's technical and functional specifications. This provision could impose significant costs on Registry Operators (even if ICANN has to pay the actual auditor) that are not justified unless the audit is necessary to investigate a bona fide complaint about a material violation of the Registry Agreement. *RyC (6 Dec. 2008).*

Sanctions Program. ICANN should require re-evaluations in the event of blatant violations of the TLD's specified purpose that simplifies the deregistration process. *Hacker (14 Dec. 2008).* Is there a compliance and sanctions process for the companies who will run the new gTLDs? And if so, what is it? *Anonymous Email (26 Nov. 2008).* Where in the draft base agreement is implementation of GNSO recommendation 17 about a “clear compliance and sanctions process must be set out in the base contract that could lead to termination?” *C. Gomes (18 Nov. 2008).* ICANN should use graduated sanctions for registries and additional rights protection mechanisms should be encouraged beyond UDRP. *MarkMonitor (Module 5, 15 Dec. 2008).*

Community-Based TLDs. On contracts post-delegation, Demand Media would like to see ICANN include in community contracts a requirement that changes only be considered due to changes within the community itself. *Demand Media*; [http://forum.icann.org/lists/gtld-transition/pdfm3Q\\_H889SJ.pdf](http://forum.icann.org/lists/gtld-transition/pdfm3Q_H889SJ.pdf). If a community application makes it through without contention, are they bound to the restrictions in application? *Demand Media-GNSO New gTLD Question and Answer Open Teleconference.*

Reporting Requirements. ICANN demands monthly reporting by the registry. It is unclear what the purpose of such reporting is and what the ground for such an obligation would be. ICANN

demands reporting on transfers. Again, it is unclear what the purpose of such reporting is and what the ground for such an obligation would be. *SIDN* (10 Dec. 2008).

Whois Obligations. Was it intended that all new TLDs have only the Whois obligations of their registries? If so, why? *S. Metalitz* (25 Nov. 2008). It is essential to combating online fraud that full Whois information be available at the Registry Operator level (Base agreement Section 2.4, specification 4). *Microsoft* (Guidebook comments, 15 Dec. 2008).

General; ICANN Enforcement Capacity. “Standards Compliance: Registry Operator shall implement and comply with all existing RFCs.” Does this include RFC 2549? *E. Brunner-Williams* (25 Nov. 2008). ICANN must demonstrate that ICANN has sufficient capacity to enforce contract compliance with an as-yet unknown number of new contracting parties, especially in light of outstanding questions regarding existing contracts (such as the proposed amendments to the Registrar Accreditation Agreements and problems with the Whois data accuracy reporting system). *U.S. DOC-NTIA* (18 Dec. 2008); *Lovells* (15 Dec. 2008); *News Corporation* (16 Dec. 2008) (ICANN also must dedicate resources to enforcement); *Grainger* (15 Dec. 2008) (policing new TLDs for compliance with intended use is ICANN’s responsibility). ICANN must foster consistency and empower its contracting parties with the clear right to suspend resolution to any abusively registered domain; this right is absent in the proposed new Registry Agreement. ICANN should consider a notice and takedown system for abusive registrations. *Rodenbaugh* (16 Dec. 2008); *ICA* (16 Dec. 2008) (strongly oppose cost-free takedown procedures for domains alleged to be established in bad faith for new and existing gTLDs; bad faith is already one of the key elements of the UDRP and should be one or three elements in a balanced proceeding, not the single determinative element; ICANN and registries should increase resources for taking down domains used for criminal activity).

## **TLD Delegation**

Applicant Implementation. The contract should allow the applicant to choose its own timetable for entering into the root zone. To prevent complete preclusion of a string by an applicant, an applicant should be required to proceed to delegation and to register at least one second level domain with legitimate content within three years after award of a gTLD. *Bank of America* (15 Dec. 2008); *Visa* (13 Dec. 2008) (brand owners should be able to register their trademark extension to protect it but should not have to actively use it or fulfill back-end requirements). We recommend that the contract require the new domain to adopt the best available security measures, such as DNSSEC, a robust Whois (see section 2.1.3) and the current Add Grace Period Limits Policy which currently does not have even “temporary policy” status. *Bank of America* (15 Dec. 2008). Is there any idea what the time period will be for ICANN to determine that a registry’s initial start-up requirements are not satisfied such that the gTLD can be delegated into the root zone within the time frame specified in the Registry Agreement? Should this correspond to the time period by which the TLD has to become active? *C. Gomes-Compiled Comments on the new gTLD Applicant Guidebook*.

## **Term and Termination**

Term of Agreement. Extending the term to ten years does not justify the many changes ICANN proposes to make in this agreement. In fact, the protections in place in the current agreements are far more important, and once in place, the term itself is less critical to Registry Operators. *RyC* (6 Dec. 2008).

**Termination and Renewal.** The current Registry Agreement places modest constraints on ICANN's rights to refuse to renew, which ICANN proposes to eliminate in the draft. The draft also eliminates existing provisions regarding the terms under which such renewals will take place. The current agreement assures ICANN that it can bring renewal agreements in line with contract changes that have been implemented during the term, but provide the degree of stability and predictability Registry Operators need to operate their businesses, both with respect to terms and pricing. Those protections should be maintained. *RyC* (6 Dec. 2008). The new draft extends ICANN's termination rights to any "fundamental and material breach" of the agreement, including any changed terms. *RyC* (6 Dec. 2008). Related to Section 4.4, the reference to "critical registry functions" should be defined in the same manner that this phrase is used in the proposed gTLD Registry Continuity Plan. *RyC* (6 Dec. 2008). Competitive bidding should be required for renewals of a gTLD Registry Agreement, rather than granting incumbents perpetual right to renew; this serves the interests of registrants and may lower domain prices and raise operating specifications. *U.S. DOC-NTIA* (18 Dec. 2008). If the Registry Operator operates a closed, branded gTLD or a gTLD with fewer than a set number of registrants, the Registry Operator should have the right to terminate the Agreement and cease operating the registry. *Microsoft* (Guidebook comments, 15 Dec. 2008). *Demand Media* (Module 5, 15 Dec. 2008) (registry should have right to terminate under certain conditions).

### **Payment Concerns, Pass-Through of Registrar Fees**

**Bilingual Fees.** Regarding Section 6.1 of the New gTLD Draft Agreement, the fee structures do not make any provisions for bilingual Registry Operators, who may be required under equality legislation to make bilingual domain registrations available at no extra cost to the end user. We wish to suggest that Registry Operators who are legally required to operate bilingually should be dealt with on a different fee structure. *dotCYM* (15 Dec. 2008).

**Registry Fee Collection.** Registry operators have agreed in the past to collect fees, subject to a specific cap, from Registrars on behalf of ICANN. Registry operators cannot, however, agree to the changes proposed by ICANN, which remove all limitations on what ICANN may require Registries to collect. Also, regarding Section 6.4, this provision would appear to obligate Registries to pay registrar fees with no phase-in period to allow Registries to first collect the fees from Registrars. Registries should not have to compensate ICANN for fees due by Registrars unless they have had the opportunity first to collect those fees. *RyC* (6 Dec. 2008).

### **Price Controls**

**Maintain Price Controls.** ICANN should clarify whether price controls that apply to domain names will be preserved; before any elimination of them ICANN must demonstrate the mechanisms to ensure that prices will be controlled by market forces. *News Corporation* (16 Dec. 2008); *K. Pilna* (16 Dec. 2008) (concern lack of price controls and preserving TLD neutrality); *eedlee* (Module 5, 12 Nov. 2008); *Swa Frantzen* (Module 5, 11 Nov. 2008); *A. Allemann* (Module 5, 12 Nov. 2008); *T. Smith* (Module 5, 8 Dec. 2008); *C. Christopher* (Module 5, 8 Dec. 2008); *P. Gusterson* (Module 5, 8 Dec. 2008); *D. Carter* (Module 5, 13 Nov. 2008) (why opening up old debate); *YouBeats* (Module 5, 12 Nov. 2008); *E. Rice* (Module 5, 13 Nov. 2008); *Searchen Networks* (Module 5, 14 Nov. 2008); *S. Morsa* (Module, 8 Dec. 2008); *B. Regan* (Module 5, 9 Dec. 2008); *G. Yandl* (Module 5, 15 Dec. 2008); *M. Menius* (16 Nov. 2008, 12 Dec. 2008, 15 Dec. 2008); *K. Pitts* (12 Nov. 2008); *C. Mendla* (13 Nov. 2008); *F. Schilling* (Module 5, 21 Nov. 2008); *K. Ohashi* (13 Nov. 2008); *K. Smith* (13 Nov. 2008); *Tom* (Module 5,

15 Nov. 2008, 13 Nov. 2008); *URL Names* (4 Dec. 2008); *C. Beach* (Module 5, 8 Dec. 2008); *J. Monasterio* (10 Dec. 2008); *M. Sumner* (Module 5, 13 Nov. 2008); *M. Castello* (13 Nov. 2008); *G. Boulter* (15 Nov. 2008); *R. Lafaye* (10 Dec. 2008); *A. Miller* (Module 5, 8 Dec. 2008); *J. Sprout* (11 Dec. 2008); *WMI* (14 Dec. 2008) (should not allow tiered pricing).

Impact on Innovation and Public Interest. Is it not in the ICANN charter to help support the growth and definition of the Internet for the public? The public does not need control but protection it seems from those that want to enslave it for profitable gain beyond what most can cope with. We need to help the newcomers as well as the founding members of the web to have as free and open a marketplace as can be made available. Allowing the introduction of open charging fees that could be anything the registrar deems appropriate is a recipe for disaster. As an example, .TV would have stood a much greater chance at succeeding if not for the incredibly high registration fees for their premium names. This was not good for the public, nor the domain owner. The public was denied a domain name that was stunted in its growth from the start. *M. Castello* (13 Nov. 2008).

Impact on Existing gTLDs. The new gTLD contracts must have hard caps in place to protect existing gTLD registrants. New gTLDs are NOT effective substitutes for existing gTLDs, and thus "competition" isn't going to keep VeriSign's pricing power in check. Even with a 10-year transition period, it would shock the conscience if VeriSign was permitted to arbitrarily and unilaterally raise the renewal price of .coms to millions or billions of dollars per year (say \$1 billion/yr for Google.com, \$10 million/yr for Hotels.com, \$50 million/yr for Cars.com, \$30 million/yr for Games.com, or whatever the market would bear), effectively re-auctioning the entire list of premium domain names to the highest bidder, removing the existing registrant and replacing things with .tv style pricing. Alternatively, all existing gTLD operators need to agree to language, before any new gTLDs are approved, that make explicit that the hard caps cannot be removed regardless of whatever happens in other gTLDs. *G. Kirikos* (24 Oct. 2008); *G. Kirikos* (4 Dec. 2008) (raises ICANN staff process concerns about changing price controls policy); *C. Christopher* (16 Dec. 2008) (equal cost registration and renewal for all registrants of retail TLDs to avoid extortion by registries, and ICANN must show its own financial accountability).

Lack of Price Controls. Maximum price caps or other terms benefiting consumers should be imposed in those cases where competitive bidding mechanisms will not adequately limit the ability of Registry Operators to exercise market power. *U.S. DOC-NTIA* (18 Dec. 2008); *ICA* (16 Dec. 2008) (draft contract for new registries lacks any pricing controls, and could lead to tiered pricing). Price caps should not be included in new gTLD agreements, but ICANN must be cautious about removing the caps in incumbent agreements given potential for tiered renewal pricing. *Go Daddy* (15 Dec. 2008); *D. Craig* (17 Nov. 2008) (new TLD purchaser should be able to set pricing, but there should be safeguards against monopolistic, unrestricted price increases); *I. Vachovsky* (15 Nov. 2008) (consider a model where gTLDs divided into two groups – (1) unregulated free market and competitive and (2) regulated monopolistic). To preclude abusive behavior, ICANN should have review mechanisms and then approve or disapprove any renewal price increases over a certain threshold. The potential exists for elimination of negotiated price caps in existing Registry Agreements, leading to differential pricing, as well as extortionate renewal pricing. *Rodenbaugh* (16 Dec. 2008). The base agreement represents a Trojan Horse that can be used by existing gTLD Registry Operators to engage in tiered pricing, due to the equal treatment clauses in existing contracts and the removal of price controls. It should take into account contingency that U.S. Dept. of Commerce will not renew the JPA. The base agreement tends to favor Registry Operators at the expense of registrants. There should not be bilateral, non-public agreement amendments by ICANN and

Registry Operators. *G. Kirikos* (24 Nov. 2008); *ICA* (16 Dec. 2008) (do not reopen tiered pricing through backdoor of new registry contracts).

Vertical Separation. Regarding vertical separation in registries under price caps, the Report is correct that relaxing the vertical separation requirement for registries operating under a price cap is undesirable, and will remain so for at least as long as those registries, particularly .com, account for such a disproportionate volume of current registrations. *Steve Metalitz (IPC)*. Open-access and price cap controls are essential complements to vertical ownership. *D. Maher* (forwarding J. Cave study). The new gTLD process must not be used to resurrect differential pricing by registries. ICANN should maintain vertical separation between registries and registrars and enforce equal access policies for registrars, with any exceptions to these policies strictly limited. ICANN should move slowly toward permitting integration of registry and registrar services, but should not use experimentation with single-organization and hybrid registries as a prelude to relaxing vertical separation and equal access requirements for a broader pool of gTLDs. *ICA* (16 Dec. 2008).

Objection to Registrar Price Disclosure; Notice of Increases. In a competitive market for registrar services, we do not understand ICANN's justification for requiring Registrars to disclose their price structure to registrants. The transparency of pricing for registry services provision is problematic; pricing policies are contracts between registries and registrars, not between registries and registrants. *RyC* (6 Dec. 2008). It is unclear why a registry has to publish prices on its website. *SIDN* (10 Dec. 2008). All Registries should be required to provide adequate notice before increasing renewal prices. *Network Solutions* (15 Dec. 2008).

Effect of Equitable Treatment Provision in Existing Registry Agreements. The following language—"ICANN shall not apply standards, policies, procedures or practices arbitrarily, unjustifiably, or inequitably and shall not single out Registry Operator for disparate treatment unless justified by substantial and reasonable cause" - could lead to existing gTLD operators such as VeriSign petitioning to get the same treatment as new gTLDs in regards to not having a pricing cap. This could open up the door to variable pricing, whereby registrants of popular and/or high-earning domains would have to pay more for the same service, simply because they can afford it. *M. Sumner* (Module 5, 13 Nov. 2008). Before any new contract is approved with VeriSign in regard to .com and .net, unambiguous language must be specifically included in the contract that prohibits tiered-pricing on new registrations and renewals in the .com and .net namespace. Comment on the CRA Report is against existing gTLD registries being able to modify their agreements to remove price caps. *M. Menius* (16 Nov. 2008). Given the existing Registry Agreements state that ICANN cannot apply inequitable policies to registries, a logical conclusion must be that if the new gTLDs have no pricing controls, the existing registries will apply to have price controls removed also, and ICANN will be in no position to deny them. *C. Beach* (Module 5, 8 Dec. 2008). Will the issue of tiered pricing be revisited; what mechanisms are in place to prevent existing gTLDs from using the "equitable treatment" clause to have price controls removed? *G. Kirikos* (24 Nov. 2008). If price caps are not included for new gTLDs, then price caps must be removed from the .biz Registry Agreement. Any material changes for the newer, no-price capped TLDs regarding vertical separation and equal access in general must be applied to NeuStar – this is required under the .biz Registry Agreement and ICANN's Bylaws. Price caps are appropriate for larger TLDs that have a much higher percentage of the market and are not appropriate for gTLDs that do not have any real market power. *NeuStar* (15 Dec. 2008).

## Amendment Process

Objection to unilateral amendment by ICANN; other changes. To remove the potential for unilateral amendments to the Registry Agreement by ICANN, ICANN should remove the Board's ability to override a GNSO's veto of agreement amendments. *NIC Mexico* (9 Dec. 2008); *Demand Media* (Module 5, 15 Dec. 2008) (remove ICANN ability to change contract); ICANN should not have ability to change contract terms unilaterally; *CentralNIC* at 2 (13 Dec. 2008); *dotSCO* (15 Dec. 2008) (ICANN should not have unilateral ability to alter contract); *Van Couvering* (15 Dec. 2008) (instead allow ICANN to make changes all at once, but changes have to approved by 2/3 of registries). This is completely unnecessary, and an extraordinary act of over-reaching on ICANN's part. ICANN has described this provision as providing necessary flexibility, but has not identified any situation in which the absence of this right has hindered ICANN's ability to perform its mission. But the fact is that ICANN already possesses authority to impose new obligations on Registry Operators through the Consensus Policy provisions of the agreement, and has emergency authority to do so using the Temporary Policy provisions of the Registry Agreement. These provisions give ICANN the authority at all times to make changes necessary to preserve the stability and security of the Internet and the DNS. ICANN has not – because it cannot – point to any situation where it needed the kind of blank check it is requesting here. *RyC* (6 Dec. 2008). These annexes should not be subject to unilateral change absent a stability or security consideration that supports creation of a Consensus Policy. *RyC* (6 Dec. 2008). *dotSCO* has reservations on the proposed provisions for “Universal Contract change,” and requests that ICANN respect the various legal systems that proposed Registries may be operating under. *dotSCO* (15 Dec. 2008).

Burden Shifting Concern. There is no justification for shifting the burdens in the way this provision does. Under the arrangement proposed by ICANN, however, ICANN can impose any changes it wants, and the burden is on Registries to block those that regulate activities outside the picket fence. Even if such burden shifting could be supported, the requirement of a vote of two-thirds of the number of Registries to overturn such changes is not an effective check in an environment involving hundreds, if not thousands, of TLDs employing many different business models. *RyC* (6 Dec. 2008).

GNSO Role. It is not clear what the ability of the GNSO Council to overturn a change by a two-thirds vote adds by way of protection for Registries. Rather, it problematically expands the mission of the GNSO Council, which currently consists of policy development only. *RyC* (6 Dec. 2008); *NeuStar* (15 Dec. 2008) (the GNSO Council should not be involved in any of the gTLD Registry Agreements except for the limited role already afforded to it as part of serving as managers of policy development per the Consensus Policy provisions of the agreements).

Clarifications and Modifications. What was the genesis of Article 7 of the new form of agreement, and how does ICANN expect to enforce these provisions? *J. Neuman; October 29, RyC Meeting.* What can ICANN change under Article 7 – Changes and Modifications? *Anonymous Email.* If Section 7 must stay in the Registry Agreement, then we request the following changes: (1) the term “Affected Registries” is unclear and should be defined; “Affected Registry Operator” should be defined as a “TLD operator that is materially impacted by such proposed change;” (2) ICANN should then provide notice to those TLD operators that ICANN has determined are the Affected Registry Operators who are entitled to vote; (3) ICANN should publish a list of those TLD operators that ICANN has determined are the Affected Registry Operators; (4) there should be a challenge process and dispute resolution process in the event that a party does not agree with ICANN's assessment of who constitutes an Affected Registry Operator; (5) the vote to disapprove the proposed changes to the Registry Agreement should be

51% of the Affected Registry Operators, not 2/3 vote; (6) in the event that the proposed change is disapproved by the Affected Registry Operators, the ICANN Board vote to override such disapproval shall be 2/3 vote of the ICANN Board. *Demand Media* (15 Dec. 2008). Section 2.7 of the proposed Registry Agreement should clarify that only changes that might decrease the effectiveness of Rights Protection Mechanisms are subject to prior ICANN approval. *Rodenbaugh* (16 Dec. 2008).

Uniform Standard Agreements. Uniform standard agreements that cannot be altered are essential. *WMI* (14 Dec. 2008); *SIFMA* (12 Dec. 2008). There should be one or at most two (one for open and another for community) standard contracts between ICANN and registry owners. The standard contract should not be subject to modification. The contract term must be finalized in the rule-making process and not left open for further negotiation or modification by the ICANN Board of Directors. *Bank of America* (15 Dec. 2008).

### **Dispute Resolution and Damages**

Process Details. The existing Registry Agreement sets out a specific process whereby either party can invoke the other party's cooperative engagement obligation, and then sets out a series of steps for that process. While there are many ways this process could reasonably proceed, these changes remove all specificity – including most importantly, specificity about when the period starts. *RyC* (6 Dec. 2008).

Arbitration Requests. The Registry Operators object to mandating a single arbitrator. Moreover, we see no grounds for substituting a blanket right to seek extraordinary damages for the limited right set out in of the current Registry Agreement (Failure to Perform in Good Faith), which provides procedural and substantive safeguards to prevent abuse. *RyC* (6 Dec. 2008). Can ICANN seek punitive damages under the new agreement? *J. Neuman, October 29, RyC Meeting.*

### **Indemnification, Warranties and Liability**

ICANN Liability. ICANN should be accountable and not have broad immunity. *RILA* (15 Dec. 2008); *G. Kirikos* (24 Nov. 2008); *SIFMA* (12 Dec. 2008); *CADNA* (15 Dec. 2008); *Bank of America* (15 Dec. 2008); *FairWinds* (15 Dec. 2008). Applicants must agree to release ICANN from liability for any acts or omissions in anyway connected with its consideration of the application, no matter how outrageous those acts or omissions may be. *RyC* (6 Dec. 2008).

Fee Liability Increase for Registries. The changes to Section 5.3 increase the liability for Registry Operators from “fees and sanctions owing” to fees paid during the preceding 12 months. ICANN's liability is not increased, however. *RyC* (6 Dec. 2008).

Indemnification. The indemnification provision (paragraph 5) is unfair – why should an applicant defend and indemnify ICANN if a disappointed objector or other applicant sues ICANN over the same string as that awarded to the applicant? ICANN is demanding sweeping indemnification rights without justification and without providing anything to Registries. There is no justification for such sweeping indemnification. *Bank of America* (15 Dec. 2008); *CentralNIC* (13 Dec. 2008); *RyC* (6 Dec. 2008). The covenant not to challenge and waiver in paragraph 6 are overly broad and unreasonable and should be revised in their entirety. *Microsoft* (Guidebook comments, 15 Dec. 2008).

Warranties. Registry operators do not agree with ICANN that the express waiver of warranties is unnecessary. *RyC* (6 Dec. 2008).

## **Changes of Control**

Approval; Assignments. Does ICANN anticipate revising this provision to require a Registry Operator to obtain ICANN's prior written approval for a change of control? If not, why not? *K. Rosette* (26 Nov. 2008). Parties should have the ability to assign their rights in any application under commercially reasonable circumstances. ICANN should retain discretion to approve or reject any such assignment to prevent the development of a market for TLD applications and to ensure that any assignee meets all of the applicant criteria previously met by the assignor. *Rodenbaugh* (16 Dec. 2008).

Notice Requirement. To the extent notification of subcontracting arrangements is required, it should be limited to subcontracts that have a material impact on a registry's compliance with the Registry Agreement. Moreover, while there may be situations in which it is appropriate for ICANN to seek advance notice of changes in control that should be the exception rather than the rule. *RyC* (6 Dec. 2008).

## **ISSUES, ANALYSIS AND PROPOSED POSITIONS**

### **General Comments**

#### **Issues**

What were the main objectives in crafting the proposed new Registry Agreement?

Why did ICANN determine to change its form of gTLD Registry Agreement?

What will be the impact of the adoption of the new form of new Registry Agreement on existing TLDs?

#### **Analysis**

During the process of creating a new agreement framework for new TLDs, ICANN endeavored to craft a flexible yet robust agreement that provides sufficient protections and clarity for new TLDs. The proposed new form of agreement is intended to be simpler and streamlined where possible, focusing on technical requirements and security and stability issues. These changes were made after taking into consideration input from the GNSO in its recent policy development processes on new gTLDs and contractual conditions. Much of the prior details in the Registry Agreement and associated appendices have been replaced with relevant specifications and requirements, which will be maintained on ICANN's web site.

In drafting the proposed new form of Registry Agreement, ICANN started with a list of concepts the agreement must or should include. Where appropriate, language was drawn from existing Registry Agreements. As proposed, each of the new TLD agreements will have an initial ten-year term, with an expectation of renewal, in order to allow operators of the new registries some surety in the investments necessary to build a successful registry. ICANN has incorporated proposed mechanisms into the form of new Registry Agreement to allow ease of effecting

changes and modifications during the life of the Registry Agreement. These form changes were deemed appropriate and beneficial to both parties.

### **Proposed Position (for this version of the Guidebook)**

The general comments on the new form of Registry Agreement raised a number of important issues that will be the subject of continuing community discussion. The revised version of the base Registry Agreement being posted with the second draft applicant guidebook incorporates a number of changes in response to further feedback, and discussion and thought on these comments will continue and changes will continue to be made in the proposed form of agreement.

Existing Registry Operators may approach ICANN to discuss adopting the new form of agreement, which would be the subject of bilateral discussions between the parties. ICANN will not require existing Registry Operators to implement the new form of agreement.

### **Application Process**

#### **Issues**

To what extent will ICANN mandate applicants adhere to statements made in their applications?

Why is ICANN requiring an applicant to execute a Registry Agreement within 90 days following a contention resolution?

#### **Analysis**

With respect to “community-based” TLDs, ICANN recognized that it needed to protect the community identified in the application from fraudulent applicants (i.e., applicants who had stated one purpose in their application and then once the TLD was granted used the TLD for an entirely different purpose).

Following resolution of string contention proceedings, an applicant should be in a position to enter into a Registry Agreement with all due haste, and accordingly 90 days should be more than sufficient time for this to occur.

### **Proposed Position (for this version of the Guidebook)**

Registry Operators will be required to comply with the terms of the Registry Agreement. Registry Operators will be required to warrant that all information provided and statements made in connection with the registry TLD application were true and correct. Also, community-based TLDs will be required to observe and implement measures set forth in their application relative to the defined community.

Per Section 4.3 of the proposed draft Registry Agreement, ICANN may terminate the Registry Agreement if the applicant does not complete all testing and procedures necessary for delegation of the TLD into the root zone within 12 months. Apart from requiring the Registry Operator to pass technical and operational checks sufficient to permit the TLD to be delegated in the rootzone, ICANN does not require a Registry Operator to utilize or operate a TLD in any specific manner.

Because the Registry Agreement will be signed by Registry Operators in a form that is substantially similar to the final proposed draft, 90 days should be enough time to resolve any minor points that may need to be negotiated by ICANN and the Registry Operator.

## **Covenants of ICANN**

### **Issues**

Will ICANN reconsider the removal of ICANN's covenants regarding operating in an open and transparent manner and equitable treatment among Registry Operators?

Why did ICANN remove the commitment to implement name server and TLD zone server changes within 7 days?

Why were ICANN's covenants removed from the list of provisions that could not be modified by Consensus Policies?

### **Analysis**

ICANN understands that applicants and Registry Operators need to feel confident that ICANN will live up to its obligations, and such obligations should be confirmed in writing. ICANN's Bylaws already require ICANN to act transparently and non-discriminatorily, but as a result of community feedback these commitments will also continue to be restated in the Registry Agreements.

With regard to the commitment to implement nameserver and TLD zone server changes within 7 days: ICANN understands that timely implementation of changes is an important matter and is constantly looking for ways to improve its efficiency, however, ICANN also sees the need for some flexibility regarding this requirement because it does not always have control over the receipt of necessary information and cooperation from third parties. ICANN is presently engaged in discussions with existing and potential Registry Operators regarding a service level commitment by ICANN with respect to nameserver change requests. ICANN has stated its goal is to complete nameserver changes within 10 days.

### **Proposed Position (for this version of the Guidebook)**

Consistent with ICANN's Bylaws, the covenants regarding operating in an open and transparent manner and equitable treatment will be reinstated.

For the reasons noted above, the commitment to \*always\* implement nameserver and TLD zone server changes within 7 calendar days of submission may not be sustainable as the gTLD name space rapidly expands. Apart from actions required by ICANN, ICANN must receive confirmation of certain changes from third parties, the timing of which may be outside of ICANN's control. Nevertheless, the revised draft Registry Agreement has been modified somewhat to continue to reference a goal of seven days for changes when possible.

With the reinstatement of the transparency and equitable treatment covenants, ICANN will include these covenants within the list of topics that may not be modified through the Consensus Policy process, consistent with other recent Registry Agreements.

## **Consensus Policies**

### **Issues**

Why was the definition of “Registry Services” removed from the list of items comprising the picket fence?

What will protect Registry Operators from expansion of the scope of Consensus Policies, particularly in relationship to the process set out in Article 7 of the proposed Registry Agreement by which the agreement and specifications can be modified, subject to certain requirements?

### **Analysis**

In light of comments received, ICANN considers it is appropriate to incorporate a definition of “registry services” in the revised proposed Registry Agreement. This definition will be relative generally to compliance provisions in the agreement.

ICANN reviewed and considered the continuing relevance of each item included within the “picket fence,” which contains the topics excluded from the adoption of Consensus Policies. The definition of “registry services” was included within the list of topics excluded from Consensus Policies contained in Registry Agreements negotiated during 2005-2006, but not during 2001-2002. The genesis for the inclusion within the 2005-2006 Registry Agreements was the concern of Registry Operators regarding the process for the approval of new or modified registry services and the attendant definition of registry services. Subsequently, a Consensus Policy regarding the process for the approval of new registry services (including a definition of registry services) was adopted, rendering the earlier concern regarding changes to the contractual definition a non-issue.

It has historically been the position within Registry Agreements that pricing matters should not be a subject of Consensus Policies, and that is why pricing of registry services is an excluded topic from the topics on which Consensus Policies may be adopted.

### **Proposed Position (for this version of the Guidebook)**

ICANN will include a definition of Registry Services in the specification incorporated into the proposed new form of agreement.

The specification on Consensus Policies retains the concept of the picket fence and exclusions from Consensus Policy adoption, and the scope of the fence is appropriately revised to remove items that are no longer relevant, similar to the revisions in 2005 of the list of Consensus Policies exclusions included in the 2001 form of agreement.

See also discussion regarding changes to the amendment process specified in Article 7 as it relates to the consensus policies provisions of the agreement.

## **Compliance**

### **Issues**

Why is the proposed expansion of ICANN's audit rights appropriate?

Will ICANN include a sanctions program as part of the Registry Agreement?

Are community-based TLDs going to be held to their stated purpose and operation for a defined community?

Why does ICANN requiring monthly reporting on items such as monthly transfers?

Was it intended that all new TLDs have only the Whois obligations of thin registries? If so, why?

Will ICANN be able to enforce compliance with the increased number of TLDs?

### **Analysis**

Audit and compliance provisions are important components of a contractual relationship whereby accurate reporting is essential. With that in mind, ICANN has carefully considered the scope of its audit provisions and the affect they could have on the Registry Operators. ICANN has reviewed and reconsidered the audit provisions in light of public comments and determined that the scope was perceived by the community as broader than intended. The scope of ICANN's audit rights will accordingly be clarified and limited to some extent in the next version of the proposed agreement to cover only the covenants of Registry Operator (which are enumerated in Article 2 of the agreement).

With regard to the institution of a monetary sanctions program, ICANN looked to past agreements and its past course of dealing to evaluate the costs and benefits associated with the implementation of such a program. After careful consideration, ICANN's assessment is that, in the past, when a sanctions-like program was in place, there was little opportunity or need to utilize it and a reluctance to do so given the punitive nature. In addition, an ability by ICANN to unilaterally impose sanctions on a Registry Operator without the requirement of proceeding through arbitration was considered to raise due process concerns. The first draft proposed base agreement included a provision permitting the imposition of punitive or exemplary damages by arbitrators in cases of repeated willful breaches of the agreement, and the new draft includes a proposal that arbitrators be permitted to order operational sanctions such as temporarily restricting Registry Operator's right to sell new registrations.

The Registry Agreement requires compliance with all terms and conditions. ICANN employs appropriate tools and procedures to monitor compliance. ICANN has the ability to terminate the Registry Agreement for repeated and willful material breach. It is not ICANN's objective to \*sanction\* Registry Operators through fines or some other punitive means in the case of minor infractions and noncompliance issues. In ICANN's experience, "good citizen" Registry Operators are willing to work with ICANN in the event there is a disagreement over contractual requirements.

As part of the creation of new gTLDs, ICANN will continue to implement and enhance its contractual compliance oversight program <<http://www.icann.org/en/compliance/>>. The audit provisions of the proposed Registry Agreement were included specifically for this purpose. ICANN has already initiated the planning that will be necessary to ensure operational readiness in the new environment to be created by the addition of new gTLDs.

### **Proposed Position (for this version of the Guidebook)**

ICANN will revise the audit rights provision in the agreement included as part of the updated Applicant Guidebook to more closely align with the provisions in the current Registry Agreement, which cover compliance with the fee arrangements, monthly reporting specifications and technical and functional specifications. The scope of ICANN's audit rights will be clarified and limited to cover only the covenants of Registry Operator (which are enumerated in Article 2 of the agreement).

For Registry Operators who are repeatedly problematic, ICANN can bring action in front of an arbitrator and request the award of punitive damages. In addition, ICANN will clarify in the proposed Registry Agreement that ICANN may request that an arbitrator sanction the Registry Operator for noncompliance issues, including operational sanctions such as an order temporarily restricting a Registry Operator's right to sell new registrations if appropriate.

Community-based TLDs will not be able to make changes to community-specific terms without support from the community. Any necessary material changes to the community-based TLD operator's agreement would only be approved following appropriate public notice and comment.

ICANN requires monthly reporting by all Registries operators for tracking purposes including expected database demands, fees compliance and policy compliance.

ICANN is only requiring the publication of "thin" Whois data due to the multitude of applicable laws (including data protection and privacy laws) in different jurisdictions. Registry operators would be free to collect and publish additional data in accordance with their individual business plans and agreements. ICANN is exploring a possible requirement that Registry Operators would have to collect additional data, which would not be required to be publicized, as an additional safeguard against loss of information in the event of registry or registrar failure.

As discussed above, ICANN plans to enhance and strengthen its contractual compliance program <<http://www.icann.org/en/compliance/>>. The audit provisions of the proposed Registry Agreement were included specifically for this purpose. ICANN has already initiated the planning that will be necessary to ensure operational readiness in the new environment to be created by the addition of new gTLDs.

## **TLD Delegation**

### **Issues**

What security resources will be required of TLD operators in order to safeguard DNS stability and security?

Will there be specific timing obligations related to delegation into the root-zone?

### **Analysis**

The stability and security of the DNS is a primary focus of ICANN's mission. ICANN believes in encouraging Registry Operators to use the most advanced technologies available to ensure registry security is fundamental and appropriate. ICANN must also, however, balance these requirements with the constraints applicable to small Registry Operators who do not have and may not expect to have a large user base to justify the cost of certain measures. For these smaller Registry Operators, the requirement to implement these state of the art security

measures, DNSSEC for example, could be too financially burdensome and is therefore optional. Please refer, for example, to the evaluation questions and criteria (#46) for details regarding the treatment of applicants' plans to implement DNSSEC.

ICANN is and will remain committed to encouraging the use of adequate security measures. For the time being, the requirement to implement DNSSEC will remain optional for Registry Operators due to the expense and burden it would place on smaller Registry Operators. Likewise, ICANN is only requiring the publication of "thin" Whois data due to the multitude of data protection and privacy laws in different jurisdictions. Registry operators would be free to collect and publish additional data in accordance with their individual business plans and agreements. ICANN is exploring a possible requirement that Registry Operators would have to collect additional data, which would not be required to be publicized, as an additional safeguard against loss of information in the event of registry or registrar failure.

ICANN is requiring applicants to commit to go through the required steps for a TLD to be delegated into the root zone to attempt to deter "blocking" applicants, who have no intention of actually running a TLD, but would attempt to take the opportunity to do so from other applicants. The new gTLD application process and the proposed base Registry Agreement are being designed to assure that ICANN retains the ability to respond flexibly and resiliently to changing circumstances and marketplace evolution that could occur with the growth of the Internet and the expansion of the name space.

### **Proposed Position (for this version of the Guidebook)**

For additional details on security requirements and evaluation, please refer to the evaluation questions and criteria section titled "Demonstration of Technical & Operational Capability."

Registry operators are required to complete technical and operational checks to allow the TLD to be delegated into the root zone within 12 months of execution of the Registry Agreement. There are no other staged requirements for TLD start-up.

### **Term and Termination**

#### **Issues**

What is the justification for the changes to the term and termination provisions in the proposed Registry Agreement?

What protections does the proposed Registry Agreement offer against arbitrary decisions by ICANN not to renew a Registry Agreement?

How will "fundamental and material breach" and "critical registry operations" be interpreted for purposes of the termination provisions of the proposed Registry Agreement?

Will ICANN consider a competitive bidding process for TLD renewals?

#### **Analysis**

ICANN balanced considerations relative to the security of a longer term against ICANN's need to be able to act to terminate the agreement, or determine not to renew, in the case of repeated

bad actor Registry Operators. Accordingly, there is less rigidity relative to the right to renewal of the proposed Registry Agreement.

Providing a 10-year potential term of the agreement is beneficial to the Registry Operator by providing assurance on the issue of business continuity and supporting the basis for investment by the Registry Operator. However, by proposing a ten-year term, ICANN must have the flexibility to implement modifications to the agreement during the term. On balance, providing a longer term for the agreement with the flexibility to modify seemed likely to be more desirable to the community as opposed to short 3 or 5 year term agreements which do not include a flexible process for making amendments such as the equivalent of Article 7 in the proposed agreement.

Proposed Section 4.2 (Renewal) has been modified somewhat in response to comments and allows for automatic renewal so long as the registry hasn't been deemed in fundamental and material breach of the agreement during the initial term. Essentially, this means that so long as the Registry Agreement hasn't been terminated due to breach, or subject to an uncured breach at the time of proposed renewal, it will be renewed.

As part of the evaluation of applications, ICANN will be carefully selecting among applicants those that are best suited and most qualified to operate a TLD. Registry Operators should expect to invest significant time, effort and expense in building a robust business model to support registry operations and service the registrants within the TLD. Mandating a rebid process for a TLD upon renewal would de-incentivize Registry Operators from making this investment, and directly counter the philosophy relative to the selection of each TLD Registry Operator.

#### **Proposed Position (for this version of the Guidebook)**

The termination rights provision will be revised for clarification and specificity. The definition of "critical registry functions" does not appear to be necessary as this section is generally describing the transition obligations of the outgoing Registry Operator. The registry functions that are considered to be critical in the context of the Registry Continuity Plan do not necessarily correspond directly to the responsibilities of an outgoing Registry Operator protect registrants and registrars by cooperating in a smooth transition to a new operator.

The inclusion of termination rights for ICANN relative to fundamental and material breaches of the Registry Agreement is consistent with existing Registry Agreements and will also relate to "fundamental and material breach" of the agreement as the same may be modified during its term.

The comments concerning the idea of requiring the rebid of TLDs upon expiration of the initial term of a Registry Agreement raise profound economic questions that will be addressed separately from this legal analysis, and will continue to be the subject of community discussions.

#### **Payment Concerns, Pass-Through of Registrar Fees**

##### **Issues**

What adjustments can be made to the fee structure to accommodate Registry Operators who are required to make bilingual registrations at no extra charge?

Why was the cap on the registrar fee that could be collected from the Registries eliminated?

How will the timing on collection and payment by Registries of the Registrars' fee if the obligation is triggered operate?

### **Analysis**

ICANN received a number of thoughtful comments on the proposed model for the calculation of fees to be paid by Registry Operators to ICANN. Please refer to the separate paper on financial considerations for a detailed discussion of the proposed fee model. One of the GNSO's implementation guidelines was that "ICANN should take a consistent approach to the establishment of registry fees." The model being proposed (in the separate paper on financial considerations) attempts to find a balance between fairness and consistency, but it would be difficult to find a consistent fee model that is well-matched to every jurisdiction where registries will operate and to every varied business model that registries will implement.

The provision allowing the pass-through of the registrar fees has been a component of existing Registry Agreements and this is not a conceptual change. ICANN must retain the flexibility to require registries to collect this fee from the registrars, however the fee is fully recoupable by the registry from registrars. Any such fees would be approved through the ordinary ICANN budget approval process, but otherwise there is no special phase-in period for collection and payment of these fees by registrars or registries; they would be collectible from registries (and through them from registrars) directly upon invoice as they are under current Registry Agreements and registry-registrar agreements.

### **Proposed Position (for this version of the Guidebook)**

The proposed agreement is sufficiently flexible to allow Registry Operators to adapt their own fee structures regarding domain name registrations as necessary to comply with local law.

ICANN must retain some flexibility to adjust the fees that registries pass through to registrars in response to changes in the evolving marketplace. These fees, however, will be justified in ICANN's annual budget and will therefore be subject to public scrutiny and comment. In response to comments ICANN will cap the transactional component of the Variable Registry-Level Fee. Registries will have the flexibility to include a provision in the registry-registrar agreement that gives them assurance on the ability to collect the registrar fees on a timely basis.

### **Price Controls**

#### **Issues**

Will ICANN reconsider inclusion of price controls in the Registry Agreement?

How will ICANN deal with price caps under vertical ownership?

Will the issue of tiered pricing with respect to new registrations and renewal registrations be revisited?

Has ICANN considered the affect that the absence of price controls will have on new Registry Operators as well as existing Registry Operators?

Why is ICANN requiring Registries to disclose their pricing and fee structure?

### **Analysis**

One of ICANN's main goals of the proposed Registry Agreement is to provide enough flexibility for Registry Operators to implement a variety of business models. ICANN has commissioned studies on whether there should be price controls in new gTLDs, and also a study on the effects of vertical registry-registrar separation. Please refer to those separate detailed analyses for treatment of the concerns raised in this set of comments.

### **Proposed Position (for this version of the Guidebook)**

In General. ICANN has commissioned a study on the economics of and relative need for price controls in new gTLDs, which will be posted as soon as available.

Vertical Separation. ICANN commissioned a comprehensive study on the effects of vertical separation, which has been posted at <http://www.icann.org/en/topics/new-gtlds/crai-report-24oct08-en.pdf>.

Transparency of Pricing for Registry Services. ICANN has modified the proposed requirement in response to comments. Six months' notice of a registry price increase has been incorporated consistent with other recent Registry Agreements. Further, the functional and performance specification and now also section 2.9 of the Registry Agreement obligate Registry Operators to offer up to ten-year registrations.

Equitable Treatment. As it relates to an ability for Registry Operators under existing Registry Agreements to invoke the "equitable treatment" clause to require ICANN to agree to the removal of price controls under existing agreements, "equitable treatment" does not mean that every TLD will have the same agreement. Specifically, existing Registry Agreements are not alike in all respects and include distinctions to address differing business and market concerns. ICANN's current Registry Agreements differ from each other markedly in some aspects, for example some registries (unsponsored) operate under price caps, while other current Registry Agreements (sponsored) have no price controls. Please refer to the separate economic studies for further discussion and analysis of this issue.

### **Amendment Process**

#### **Issues**

Why did ICANN decide to include the process set forth in Article 7 allowing ICANN to implement modifications to the Registry Agreement and specifications during the term of the agreement?

What modifications and changes to the Registry Agreement (and incorporated specifications) can ICANN implement under Article 7?

Why did ICANN propose to allow veto of a proposed agreement modification by the GNSO Council?

## **Analysis**

The proposed process for amending the Registry Agreement is a deviation from the current form Registry Agreement, and ICANN has carefully considered all comments on the proposed contract change mechanism. The problem the Internet community faces as the population of TLDs increases is how to deal with the inevitable changes and advancements, either in technology or circumstance, that affect all or substantially all TLDs. For example, concerns relating to changes due to market growth or dominance, or the need to impose new requirements due to Internet security or stability concerns. With anticipated significant growth in the TLD space, the burden to negotiate individual changes is too great to bear, and not achievable from a practical standpoint. With that in mind, Article 7, allowing contract changes and modifications to be implemented across all new TLDs, was conceived to create a mechanism where changes affecting all or substantially all TLDs could be made efficiently but still provide procedural safeguards for affected Registry Operators to act to contravene proposed changes.

The Registrar Accreditation Agreement (the "RAA") includes an analogous procedure to modify the form of agreement across all registrars, but it requires a lengthy and cumbersome development, approval, and implementation process that can more than 5 years to complete. ICANN's experience with attempting to negotiate and implement changes to the RAA have demonstrated the need for a flexible and efficient process for public discussion and approval of beneficial changes to the form of ICANN's agreements. In order to retain authority to address any adverse effects or consequences of the introduction of a large number of new gTLDs, ICANN needs a mechanism allowing modification to the agreement.

### **Proposed Position (for this version of the Guidebook)**

ICANN's proposal included in the October 2008 draft agreement provides that ICANN would first consult with Registry Operators and the public for at least 30 days on any proposed changes to the agreement. Any material changes to the Registry Agreement would continue to be subject to ICANN Board approval. ICANN would give Registry Operators notice 90 days before any changes would take effect. This flexibility is also intended to benefit the registry community. Specifically, Registry Operators who believe change or modification to the Registry Agreement is necessary or appropriate will be able to suggest such a change or modification for consideration in a public forum.

ICANN has incorporated proposed mechanisms into the form of new Registry Agreement to allow ease of effecting changes and modifications during the life of the Registry Agreement. The process proposed by ICANN allows for public notice, discussion and opposition by the registry community, and, as noted above, any material changes to the Registry Agreement and specifications would require ICANN Board review and approval.

Existing gTLD operators (who would not be subject to the provisions of Article 7) are subject to the terms of their agreements, which cannot be amended without negotiation and bilateral agreement with ICANN. ICANN understands the concerns the Registry community has with proposed Article 7 and believes that a compromise is possible. The February 2009 v2 revised version of the proposed Registry Agreement reflects a modified Article 7 incorporating changes to address community comments, including: 1) a new preliminary 30-day consultation period prior to posting a notice of any proposed change, 2) a new requirement that any proposed changes could be vetoed by a majority of affected registry operators (instead of providing that a two-thirds' vote of either the registries or the GNSO Council could veto any change), and 3) a

prohibition on using the amendment process to modify ICANN's covenants in the agreement or provisions on Consensus Policies.. Community discussions on how to reach a compromise model for approval of global amendments to the form of the Registry Agreement (or whether such an amendment process is necessary at all) will continue, and further changes to this provision in the agreement can be expected.

## **Dispute Resolution and Damages**

### **Issues**

Why was the specificity regarding (i) the procedure for cooperative engagement between senior management of the Registry Operator and ICANN and (ii) the arbitration process removed?

Why did ICANN eschew a panel of three arbitrators in favor of only one with respect to the arbitration of disputes under the Registry Agreement?

Can ICANN seek punitive damages under the proposed Registry Agreement?

### **Analysis**

ICANN determined to revise the dispute resolution provisions contained in the proposed Registry Agreement in an attempt to simplify and streamline the agreement. With respect to the provisions mandating a process for cooperative engagement by senior management of both parties, ICANN did not believe incorporating a rigid process into the proposed Registry Agreement was necessary. In making this decision, ICANN considered the current course of dealing in communications with Registry Operators, pursuant to which points of contention are raised and typically resolved in such cooperative discussions which proceed in a fashion suitable to both parties. As relationships with Registry Operators have evolved, ICANN has not experienced difficulty in arranging management level discussions (akin to cooperative engagement) to resolve issues and or points of disagreement regarding Registry Agreement provisions.

ICANN simplified the arbitration provision in the proposed Registry Agreement, allowing the parties to rely on the rules of the ICC. ICANN's decision to mandate a single arbitrator as opposed to a panel was driven by an interest in keeping the process both efficient time wise (selecting a single arbitrator is generally quicker than selecting a panel) and also in cost (a single arbitrator's fees versus the fees for a panel of arbitrators). From a legal perspective, ICANN does not perceive a notable benefit from having three arbitrators render a decision as opposed to a single arbitrator. Conversely, having to select and appoint three agreed-upon arbitrators can increase the time involved before a matter can be substantively decided and also raises costs that are ultimately passed on to registrants.

ICANN may ask an arbitrator for an award of punitive damages against a Registry Operator in circumstances where the Registry Operator has been in repeated and willful fundamental and material breach of the agreement. This right to punitive damages will be in addition to ICANN's right to ask for specific performance, or sanctions (monetary or operational) against the Registry Operator.

## **Proposed Position (for this version of the Guidebook)**

ICANN has removed the very specific contractual provisions as unnecessary, with the expectation that ICANN and Registry Operators will keep open communications to resolve disputes before escalating to formal action. In response to comments, the revised version of the agreement has been modified to make it clearer that either party may initiate good-faith communications concerning any dispute.

As discussed above, ICANN does not perceive a notable benefit from having three arbitrators render a decision as opposed to a single arbitrator, and therefore the concept of a single arbitrator remains in the dispute resolution article of the proposed Registry Agreement.

Under the parameters specified in the proposed agreement (repeated willful fundamental and material breach) ICANN can request an arbitrators to award punitive damages, or specific performance. ICANN will clarify in the revised proposed Registry Agreement that ICANN may request the arbitrator order sanctions against the Registry Operator, which could include monetary and/or operational sanctions.

## **Indemnification, Warranties and Liability**

### **Issues**

How does the provision regarding the limitation of liability of the parties to fees paid during the prior 12 months operate differ from existing agreements?

Why were the indemnification provisions in the proposed Registry Agreement revised from those included in existing Registry Agreements and what is the effect?

Why was the express waiver of warranties relating to services, including implied warranties of merchantability, non-infringement or fitness for a particular purpose removed?

What is the justification for the requirement applicants release ICANN from liability from any acts or omissions associated with its consideration of the application?

### **Analysis**

In the process of preparing the proposed Registry Agreement, ICANN specifically focused on provisions that could be simplified to the benefit of both parties. In the provision relating to the limitation of the liability of the parties, ICANN revised to allow ICANN to recover in an indemnification proceeding an amount equal to fees paid in the past 12 months, together with exemplary or punitive damages imposed by an arbitrator. This can be compared to existing Registry Agreements that allow ICANN to recover an amount equal to fees and monetary sanctions (imposed as a result of breaches of the agreement) due and owing in the last 12 months.

Regarding the topics on which the proposed Registry Agreement requires the Registry Operator to indemnify ICANN, as compared to existing gTLD agreements, the provision does not include the several other grounds for which ICANN could claim indemnification, such as (a) ICANN's reliance, in connection with its decision to delegate the TLD to Registry Operator or to enter into the Registry Agreement, on information provided by Registry Operator in its application for the

TLD; (b) Registry Operator's establishment of the registry for the TLD; (c) collection or handling of Personal Data by Registry Operator; and (d) any dispute concerning registration of a domain name within the domain of the TLD for the registry.

The express waiver of warranties relating to services, including implied warranties of merchantability, non-infringement or fitness for a particular purpose was deleted as not applicable to the commitments under the Registry Agreement. There are no express warranties made by the Registry Operator, and implied warranties typically seen in agreements relating to the sale of goods are not applicable.

Regarding the application indemnification provision, ICANN anticipates that rejected or unsuccessful applicants might try to take legal action in an attempt to challenge the decision, and possibly delay the advancement of the new gTLD program. Accordingly, ICANN has carefully considered how to protect the new gTLD program from such challenges. The release from such potential claims was deemed appropriate in light of these considerations.

### **Proposed Position (for this version of the Guidebook)**

As discussed above, the limitation on liability provisions are appropriate for the proposed Registry Agreement as they are consistent with the revised provisions relating to dispute resolution.

The indemnification provisions included in the proposed new form of agreement (as compared to existing gTLD agreements) have been narrowed to require the Registry Operator to indemnify ICANN only for losses and damages caused by the Registry Operator's operation of the TLD or the provision of registry services. As part of the revisions to the form of Registry Agreement, ICANN viewed it as appropriate to reduce ICANN's rights in this regard.

It was determined to be unnecessary to include an express waiver of warranties, implied or otherwise, in the proposed Registry Agreement. As discussed above, the express waiver of warranties relating to services, including implied warranties of merchantability, non-infringement or fitness for a particular purpose was deleted as not applicable to the commitments under the Registry Agreement.

### **Changes of Control**

#### **Issues**

Is a Registry Operator required to obtain ICANN's prior approval in the context of a change in control transaction, such as a sale of the entity?

Should there be a materiality threshold requiring notice to ICANN of arrangements to subcontract registry operations?

#### **Analysis**

ICANN's prior approval to a change in control of a Registry Operator, such as the sale of all assets of or equity in the relevant entity, is not required. ICANN simply requires notice no less than 10 days prior to the anticipated event. Requiring ICANN pre-approval of any change of control of a contracting party could be burdensome. Similarly, with subcontracting

arrangements, ICANN simply requires notice and not pre-approval. Notice requirements with respect to such events are, at a minimum, typical in a business agreement.

**Proposed Position (for this version of the Guidebook)**

ICANN will retain the provision as included in the draft Applicant Guidebook. A materiality requirement has been added to the notice of subcontracting requirement.

### **XIII. REGISTRY/REGISTRAR SEPARATION**

#### **Summary of Key Points**

- An independent report was commissioned to study registry-registrar separation requirements after considerable community inquiry about the issue.
- The report (by Charles River Associates) weighed the benefits and risks to lifting the restrictions, taking into account the current and proposed gTLD environment.
- The report proposed a limited lifting of the restrictions in a way that reduced risk so that the effects could be studied.
- Based on the report and a set of public consultations, a model for lifting the current restrictions in a limited way, is introduced in the revised Applicant Guidebook for discussion.

#### **Summary of Input**

Below is a summary of input addressing registry and registrar separation and ownership comments submitted in (1) the first comment period regarding the new GTLD Draft Applicant Guidebook consultation; and (2) the consultation addressing the Charles River Associates (CRA) report – Revisiting Vertical Separation of Registries and Registrars - which was commissioned by ICANN. ICANN staff prepared an earlier summary and analysis of the CRA comments which is posted at <http://forum.icann.org/lists/crai-report/msg00035.html>. ICANN also conducted two face-to-face consultations regarding the CRA Report in December 2008.

#### **(1) Comments in the new gTLD Consultation**

**Maintain Separation.** There should be separation between registries and registrars; registries must continue to sell registrations through registrars and should not discriminate among registrars; with limited exception a registrar should not sell domain services of an affiliated registry (exception should allow sales of an affiliated registry up to a certain threshold of names—i.e., 100,000); this exception eliminates need for a special single organization TLD exception; registries must provide reasonable notification period before making domain renewal price changes; ICANN should maintain existing market protections for registries with market power. *Network Solutions* (15 Dec. 2008). ICANN should move slowly toward permitting integration of registry and registrar services, but should not use experimentation with single-organization and hybrid registries as a prelude to relaxing vertical separation and equal access requirements for a broader pool of gTLDs. *ICA* (16 Dec. 2008).

**Maintain Accredited Registrar Model.** The Accredited Registrar model should be required regardless of how the vertical integration and separation issues are resolved. *RC* (15 Dec. 2008).

**Equitable Considerations.** It is unfair to allow registrars to own new registries but to not allow existing registries to own registrars. *NeuStar* (15 Dec. 2008); *J. Neuman* (26 Nov. 2008) (clarify registry-registrar issues).

**Risks of Ownership Changes.** To avoid risk of a speculative marketplace developing through “flipped” registries, ICANN should clarify policy regarding changes of ownership or control of a registry; there is no restriction on ability of an applicant to flip registry to a buyer unvetted by ICANN, even immediately after delegation. *IPC* (15 Dec. 2008); *G. Kirikos* (24 Nov. 2008); *K.*

*Rosette* (26 Nov. 2008) (clarify ICANN approval policy regarding registry control change); *R. Raines* (4 Dec. 2008) (change allowing cross ownership could be exploited and increase cyber crime); *CentralNIC* (13 Dec. 2008).

Allow Cross-Ownership. *Melbourne IT* (15 Dec. 2008) (supports allowing single organization operating a “closed” gTLD to operate both the registry and registrar functions subject to safeguards). *J. Cady* (3 Nov. 2008) (clarify separation and consider novel uses allowing one company to do both). *Demand Media* (15 Dec. 2008) (change policy for new registries, allow cross ownership and do not impose price controls).

(2) Comments in the CRA Report Consultation (meetings held in Washington, DC and Los Angeles on 11 & 19 Dec 2008, respectively)

The views expressed in the comments to the publication of the CRA report on registry-registrar separation can be categorized as follows:

Cross ownership:

- support for limited cross-ownership where a registry could own an accredited registrar but not service names in its own TLD, and a registrar could own a registry as long as it did not service names in the TLD that it owns;
- support for limited cross-ownership with a self-management threshold of varied size (from 20,000 to 100,000 names);
- support for cross-ownership without a threshold; and
- support for continued registry-registrar separation.

Use of accredited registrars:

- wide support for continuing use of accredited registrars; and
- some opinion that “private label” registries, need not use accredited registrars.

These viewpoints and suggestions are summarized in specific models discussed below:

**One Cross-Ownership Model with Limited Self-registration**

During the Consultation on Registry-Registrar Separation in Washington, DC on 11 December 2008, Jon Nevett of Network Solutions presented the following model based on adherence to the following safeguards:

- if there is cross-ownership, there should be separation between the registry and registrar functions;
- registries must continue to sell domain registrations through registrars;
- registries should not discriminate among registrars;
- with a limited exception, a registrar should not sell domain services of an affiliated registry;
- registries must provide a reasonable notification period before making any pricing changes on domain renewals; and
- ICANN should maintain existing market protections with regard to registries with market power.

The model generally agrees with the CRA recommendation that a registry and registrar may be corporate affiliates, but the registrar may not sell the domain name services of an affiliated company, so long as market protection mechanisms are in place and enforced.

The model would permit:

- a registry to sell domain name services through an affiliated ICANN accredited registrar until the registry meets a certain threshold of names, such as 100,000 names;
- once the threshold is met, the registrar would no longer be able to accept new registrations, but would be permitted to manage its existing base;
- the registrar would not be required to divest these names; and
- other market safeguards would remain in place.

One aspect is that the model would help a new registry reach a sustainable level of registrations to remain competitive in the market. This would allow small, community-based TLDs to be supported by an affiliated registrar with an understanding of the needs of the TLD. Under this model, ICANN would not need to adopt the CRA recommendation for single organization TLDs.

Other comments suggested variations of the first model.

Vittorio Bertola recommended that registries could self-manage up to 20,000 names, but between 20,000-100,000 names, registries must accept willing accredited registrars. He recommended full vertical separation for registries charging a fee and managing over 100,000 names.

Michael Palage also supported the suggestion that registries could provide registration services direct to registrants up to a certain threshold, such as 50,000 names.

During the DC consultation session on 11 December 2008, Carolyn Hoover of DotCoop noted that they could support the model of a 100,000 name cap at start-up for self-management through an affiliated registrar as a reasonable long-term approach for starting a registry. Carolyn noted that many of the problems they experienced would not have occurred if they had been able to continue to support the names managed by the affiliated registrar, rather than divesting them after six months from launch.

Eric Brunner-Williams of CORE supported the idea of the Nevett Model but thought the 100,000 name cap was too large. He thought the proper number was somewhere below 100,000 names. This would help support proposed TLDs aimed at small linguistic or cultural communities, allowing them to directly serve their community when there may be little interest from other registrars. His comments were made from the experience of .MUSEUM (which CORE serves as the backend Registry Operator). .MUSEUM proposed to self-manage a number of registrations without using ICANN accredited registrars. In the renewal of the 2007 .MUSEUM sTLD Agreement, MuseDoma was permitted to self-manage up to 4,000 names.

Amadeu Abril i Abril also supported the idea of registry self-management of names through an affiliated registrar, up to a cap, such as 10,000 names. He did not support single-organization TLDs.

s

The concept of the Network Solutions Model was supported by Liana Ye, who suggested that ICANN “allow registrar[s] to operate both as registry and registrar to a certain point before they

have to separate into two entities to encourage start-up operation without price cap.” She also suggests that legal separation is important and there should be a requirement that at least 50% of the directors [for a registry or registrar] cannot be the same.

The threshold concept was supported by the gTLD Registry Constituency in its comments.

“It would be possible to come up with a numerical threshold of registrations below which relaxation of these requirements could apply, and above which the restrictions would apply. The RyC believes that further study should be conducted on what those thresholds should be and how these registries would transition to new restrictions [upon surpassing the threshold].”

Melbourne IT recommends that where a registry offers registrations to third parties, the registry should be allowed to operate its own registrar (up to a cap of 50,000 names in total), as well as allowing other ICANN accredited registrars to offer names on the same commercial terms. Upon reaching the cap, the registry would not be able to sell additional registrations (or registrations for other gTLDs). This would assist a small registry to get started, but ensure that if the registry was dealing with large numbers of registrants, the registrants have the option to choose registrars in a competitive market.

Unlike Network Solutions’ model, Melbourne IT supports a single-operator closed TLD operating both the registry and registrar functions. To avoid gaming, the operator would be limited to single organizations as the registrant for all second level domain names in the TLD and the registry prevented from licensing registrations to third parties.

### **A Second Model with Unlimited Self-registrations**

Richard Tindal of Demand Media provided an alternate model for discussion, which supports the cross-ownership of gTLD registries and ICANN accredited-registrars. Demand Media supports the conclusion in the CRA Report that registries be able to sell directly to the public through an affiliated registrar. Demand Media supports legal but not ownership separation of registry and registrar functions. Unlike the Nevett model, the Demand Media model would not have a 100,000 name threshold.

Demand Media notes that registrars should be able to own a registry and sell through domain services of that registry but the registry should also be open to other willing registrars. “We believe the objective of enhanced competition in TLDs will be harmed if TLD operators are not allowed (under equal terms) to also promote their TLD at the retail level via an accredited registrar which is owned by the registry.”

Demand Media supports relaxation of price caps. *“For registries not operating under a binding price cap, the arguments in favor of vertical separation and equal access requirements are less clear cut. We would recommend that ICANN take steps towards relaxing one or both of these requirements. We agree.”*

Demand Media supports keeping market safeguards in place for registries with market power. This concept is supported by NeuStar. Comments from GoDaddy echoed the cross-ownership with no threshold approach. GoDaddy advocates the elimination of existing restrictions on registry-registrar cross-ownership as a way for ICANN to stimulate competition. This comment was also supported by Antony Van Couvering.

In response to earlier models (such as the Networks Solutions 100,000 name threshold or Melbourne IT 50,000 name threshold), GoDaddy notes that the limit “provides a warm fuzzy” but if cross-ownership works for the first 50,000 names, there is no sound reason to limit it there. The caps also impose on registrants who want additional domain names in a new name space (or other TLD) to then manage names between two different entities, or incur additional expense in getting their existing names transferred.

GoDaddy cites to existing examples of registry-registrar cross-ownership (Hostway & .PRO, the consortium of registrars that formed .INFO, VeriSign’s management of .TV, GoDaddy’s joint venture for .ME). “There are no such integration restrictions within several major ccTLD name spaces, yet it isn’t collapsing, there is robust competition, and the ccTLD space continues to grow.”

Of the two CRA models, GoDaddy recommends that the issue of single owner TLDs be referred back to the GNSO Council for vetting with the community and examination of the policy implications.

### **Cross-Ownership/Equitable Treatment**

Jeff Neuman of NeuStar recommends that registries be able to operate an accredited registrar, as long as the registrar did not sell registrations of the TLD that owns it.

Neuman suggests that a registry should be able to have an ownership interest in a registrar as registrars can already have in a registry under the existing rules.

“NeuStar’s main point is that there needs to be a level competitive playing field and ICANN has not been able to achieve this to date. IF justification exists to allow registrars to directly or indirectly serve as registries, THEN steps needed to be taken to ensure that existing registries are not discriminated against. IF registrars are allowed to enter the registry market, then NeuStar agrees with the CRAI recommendation that a registry should not serve as a registrar in the TLD for which it serves as the registry. However, NeuStar is not certain that ICANN has established sufficient justification as to why a registrar should be allowed to enter the registry market. NeuStar also believes that ALL loopholes need to be closed to make sure that a registry does not resell the names as a reseller to circumvent the rules. IN other words, a registrar should not directly OR *indirectly* be allowed to sell names in a TLD for which it has a *direct or indirect* ownership in the registry.”

Amadeu Abril i Abril (CORE) notes that some registrars serve as backend Registry Operators today (like CORE) and they should be permitted to do so and operate a registry as long as they do not sell registrations in the TLD they are managing.

NeuStar also notes that price cap flexibility must be offered to existing registries if offered to new gTLDs (except for registries with market power).

### **Comments against lifting of registry-registrar separation requirement**

Steve Metalitz (on behalf of Intellectual Property Constituency, IPC) noted that ICANN has not made clear why the CRA Report was requested. The IPC urges ICANN to provide its reasoning and assumptions underlying the request to CRA to conduct the report. The IPC also note that the comprehensive economic study has not been done and would be valuable for a number of

ICANN initiatives. The IPC is asking for a status update on that study.

The IPC notes that some registrars are large domain name holders. "Because several registrars own vast domain portfolios, the equal access and vertical separation requirements also have the positive effect of preventing particular *registrants* from having privileged access to domains in particular registries. Relaxing the [registry-registrar separation] requirements could inhibit competition in the market for domain names."

The IPC agrees that relaxing of the vertical separation requirement for registries operating under price caps is undesirable and should remain in place for .com.

On single-owner TLDs, the IPC notes this is theoretically possible "but the devil is in the details." The IPC does not understand why a gTLD operated as a money-making venture should be excluded from the single-owner model. Owners of a collective mark may want to register a gTLD and sell second-level registrations to members. The same may be true of trade associations or franchisors. "The Report's description of the single-owner model should have made clear what gTLDs should not qualify for the single-owner model."

The IPC calls the hybrid model proposed in the report deeply flawed and should not be given serious consideration. If not for vertical separation, ICANN may have to take on more monitoring and enforcing compliance. See <http://forum.icann.org/lists/crai-report/msg00013.html>.

Patrick Mevzek notes that he sees no reason to relax the current registry-registrar separation under the current market conditions. He notes that makes sense to let registries own registrars or the opposite as long as the registrar does not register domain names in the registry it owns or that owns it, provided there are proper safeguards in place. He suggests data should be publicly available to be able to see who owns these entities. "It is not a big problem already for registries, due to their current low numbers, but it is already a huge problem currently for registrars, as some studies have shown even basic data such as true postal address and phone numbers are not really available for all current registrars."

He suggests performance criteria for new gTLDs should be established before any new gTLD is introduced. See <http://forum.icann.org/lists/crai-report/msg00019.html>.

David Maher submitted a comment on behalf of Public Interest Registry ("PIR") noting that the CRA Report had four major shortcomings:

1. "PIR believes that the public interest in supporting competition does not favor a breakdown of the current separation of registry and registrar ownership. Even more so, the (limited) separation in the current rules, as reflected in the contracts so far, should be made symmetric [registrars should not be permitted to own registries]."
2. "PIR believes that the conclusions of the CRAI Report do not give ICANN a basis for an implicit policy to remove all cross ownership restrictions on new gTLDs. PIR further believes that any policy ultimately adopted should be applicable equally to registries and registrars and to existing and new gTLDs."
3. The proposed experiments in the Report do take account of the risks of self-dealing by registrars that own registries.
4. The creation of the accredited registrar program has led to problems with monitoring compliance and ownership across 900+ registrars. "Blurring lines of registry/registrar

ownership would strengthen incentives for the economically strongest registrars to engage in the anti-competitive practices.”

PIR believes ICANN should adopt a general policy limiting or prohibiting cross ownership between registries and registrars. See <http://forum.icann.org/lists/crai-report/msg00020.html>.

David Maher also provided a study by Jonathan A.K. Cave titled “A name by any other rows: an economic consideration of vertical cross-ownership between registries and registrars” by Jonathan A.K. Cave of the University of Warwick. The paper is an analysis of the proposal to relax, eliminate or substantially modify cross-ownership of registries and registrars from an economic perspective. The paper sets forth arguments for the continuing necessity of vertical restrictions, and makes recommendations based on the current market.

Cave notes that vertical control can distort competition between registries, encourage registries to become integrated, and may lead to “capture” by market power in a concentrated layer. This may give integrated registrars unfair advantages in bargaining with other registries, and it may give advantages to commercial registries over non-commercial registries that do not own registrars. Cave states that open-access and price cap controls are essential complements to vertical ownership.

Among the open issues are:

- “The extent of real competition in the registrar market or in the registry market;
- The extent of any anti-competitive behavior in relation to prices, entry, name access and quality of service and the degree to which this is predatory or collusive;
- Whether competition is actually producing useful efficiencies (lower costs, lower prices, better distribution of name access, incentives to invest in the DNS system or in the economic valorization of names); and
- Whether real (and useful) innovation is going on, as opposed to ‘mere novelty.’”

Cave recommends that these issues can be addressed through 1) the development of a unified model considering the current registry-registrar market and the possibility of vertical control by ownership, 2) a panel econometric study of the competitive performance of DNS markets (including market facing ccTLDs) and of efficiency indicators, and 3) a forward-looking analysis based on models with the increase in TLDs. See <http://forum.icann.org/lists/crai-report/msg00021.html>.

Paul Tattersfield noted that it would be helpful if consultants such as CRA would do similar analysis on other areas of concern on the introduction of new gTLDs (such as large registries push boundaries of their positions). See <http://forum.icann.org/lists/crai-report/msg00023.html>. He asks a question on what happens to a .brand TLD when brand owners merge.

“One area the report doesn't touch upon are the implications from the creation of pure generic gTLDs and how to guard against the creation of monopoly positions. It is simple to make the statement for allowing open competition and let the market decide, and on the surface many people will support that notion. Of all the people who support the opening up of the DNS to allow generic new gTLDs like .search for example perhaps run

by Afilias or VeriSign etc. How many of those same people would show the same enthusiasm if .search was secured by Microsoft?”

George Kirikos asserted that the CRA Report provided only theoretical arguments, not empirical data, therefore the report should be discounted. He also states that competition should be promoted through a tender process. See <http://forum.icann.org/lists/crai-report/msg00024.html>.

Max Menius stated that he is against existing gTLD registries being able to modify their agreements to remove price caps. See <http://forum.icann.org/lists/crai-report/msg00033.html>.

## **Issues**

1. Why was the CRA Report on Registry-Registrar separation requirements issued?
2. To what extent should the limitation on cross-ownership of registries and registrars be lifted as part of the new gTLD process, and why?
3. If it is determined to permit limited cross-ownership, which model should be considered for further community consultation?

## **Analysis**

**Previous Consultations.** ICANN has received input from constituency groups, and stakeholders in the community over several years on the topic of registry-registrar separation. During the consultations on the development of the GNSO recommendations, the topic was discussed. The GNSO approved a recommendation (19) that “registries must use only ICANN accredited registrars in registering domain names and may not discriminate among such accredited registrars.”

During the ICANN meeting in November 2007 in Los Angeles, California, ICANN conducted an open session on the GNSO recommendations and a number of viewpoints were raised about registry-registrar separation and potential models. ICANN committed to undertaking a study of registry-registrar separation requirements and the effects of lifting such restrictions on the marketplace, most importantly, on registrants.

**CRA Report.** ICANN requested Charles River Associates International (“CRA”) to perform economic research pursuant to two resolutions of the ICANN Board of Directors: 1) the 18 October 2006 resolution of ICANN's Board of Directors seeking more information relating to the registry and registrar marketplace; and, 2) the 26 June 2008 resolution of ICANN's Board, directing the development and completion of a detailed implementation plan for the new gTLD Policy.

ICANN's policies regarding the relationship between registries and registrars have evolved over time. Current gTLD Registry Agreements prohibit registries from acquiring directly or indirectly more than 15% of a registrar (since the 2001 agreements). ICANN's founding is connected to a core value of fostering competition in the registry and registrar functions. Adding competition at the retail level for domain names is one of ICANN's first major accomplishments.

CRA engaged in interviews with members of the community over the course of several months in the first half of 2008. The Report is based on economics expertise, research and interviews of various stakeholders between February and June 2008. The CRA Report on Revisiting

Registry-Registrar Separation was posted for public comment from 24 Oct to 23 Dec 2008. The CRA Report is available at <http://www.icann.org/en/topics/new-gtld-crai-report-24oct08-en.pdf>.

CRA's report makes certain recommendations regarding the relationship between registries and registrars. The report describes the risks and benefits associated with lifting the current restrictions. CRA notes that ownership separation reduces the risk of discrimination as required by the equal access provision. CRA also notes that some of the proposed new gTLD models would be incompatible with vertical separation (e.g., privately held or ".brand" type TLDs are mentioned). The report suggests that vertical integration could promote the growth of new gTLDs, facilitate registry innovation, and eliminating the 15% restriction may encourage registrars to acquire registries.

It also describes the role of price caps in determining whether restrictions should be lifted. CRA's report suggests that, for registries operating under price caps, the arguments in favor of vertical separation and equal access are less clear-cut. The report recommends lifting the restrictions in a limited way first. The limitations are put in place to guard against the risks identified. For example, completely lifting the restrictions may put at risk the equitable treatment requirement. So a model that limits how many names a registry could "self-register" ameliorates that risk. As the CRA report points out, such a restriction also obviates some of the benefits: innovative bundling of services by cross-owned entities will not occur if the limitation on self-registration is left in place.

In particular, the CRA report makes two proposals that might apply to the implementation of the new gTLD program. These models are meant to inform discussion.

First, CRA proposes that, for single organization TLDs, that organization be permitted to operate both the registry and the registrar that sells second-level domain name subscriptions.

Second, CRA proposes that a registry may own a registrar so long as the wholly-owned registrar does not sell second-level domain names subscriptions in the TLDs operated by the registrar.

After the publication of the CRA report, ICANN convened open consultation sessions to discuss the report and its effects on the proposed new gTLD implementation model.

Recent Consultations. ICANN conducted two open consultation sessions on the CRA report, one in Washington DC on 11 December 2008 and one in Marina del Rey, CA on 19 December 2008. The comments received were summarized (see above), and ICANN is developing a synthesis paper based on the models received in the comments and consultations. Based on the comments and input, ICANN staff is weighing a number of additional models suggested for re-evaluating registry-registrar separation and cross-ownership as part of the new gTLD process.

The comments received on the CRA Report and consultation period generally agree that there should be continued separation of registrar and registry functions, but that a limited form of cross-ownership or self-management may be permitted. There was also general agreement with the GNSO recommendation that registries must use the accredited registrar model. Registrars, registries, and individual commenters noted that registries should treat registrars equitably and provide sufficient notice of domain renewal pricing changes.

**Proposed Position (for this version of the Guidebook)**

Based on the comments and input, a number of additional models suggested for re-evaluating registry-registrar separation and cross-ownership as part of the new gTLD process are being weighed. To clarify the discussion, one model was selected (based on the findings in the CRA report and public discussion of it) for inclusion into the revised Applicant Guidebook. The limited lifting of the restriction also recognizes that entities will work around organizational restrictions in an environment where there are many top-level domains if the restrictions are maintained.

Possible model taking into account public comment, CRA Report, gTLD implementation and practicalities: The key elements of a proposed limited lifting of restrictions on registry-registrar cross-ownership include the following:

- Maintain separation between the registry and registrar functions (with separate data escrow and customer interface);
- Registries continue to use only ICANN-accredited registrars;
- Registries should not discriminate among registrars;
- With a limited exception, a registrar should not sell domain services of an affiliated registry (this limit may be up to a threshold of 100,000 domain names, although the registrar may continue to manage its existing base once the threshold is met); and
- Reasonable notice should be provided before any pricing changes are made on domain renewals.

This model follows the CRA recommendation for a conservative approach by limiting the number of names a registrar could sell in its co-owned registry. The model also supports small, targeted registries (including community-based applicants or single-entity TLDs), and recognizes that limited cross-ownership may provide economic benefit and competitive benefit in the domain name market.

This model has been incorporated into the Guidebook for discussion by updating the proposed Registry agreement clause regarding the treatment of registrars.

Policy Development 2

New Top-Level Domains

**Reference List.....59**

## ***Summary***

1. As requested by the GNSO Council at its 22 September 2005 teleconference (<http://gnso.icann.org/meetings/minutes-gnso-22sep05.shtml>), this document sets out past decisions on the policy for implementing new top-level domains, provides relevant references and sets out other considerations in four issue areas. These issue areas are whether to introduce new gTLDs, selection criteria, allocation methods and contractual conditions.
2. It is recommended that the GNSO launch a focused policy development process, in close consultation with the broader ICANN community including the Government Advisory Committee (on the public policy aspects of new top-level domains) and the ccNSO (on internationalized domain names). The report proposes draft Terms of Reference for this work.

## ***B. Objective***

1. This report is designed to give the GNSO Council the information necessary to make a decision about whether to proceed with a policy development process on a new top-level domain strategy. It should be read in conjunction with the Background Report on Internationalized Domain Names which is being prepared for a separate process to be undertaken in conjunction with the ccNSO.
2. The GNSO Guidelines for Issues Reports have been used to frame this document. In particular, the Issues Report describes the key issues, provides directly relevant background and links; recommends whether to proceed with the policy development process and proposes Terms of Reference for a GNSO Working Group.

### **3. Background**

1. The GNSO is tasked with determining whether to continue to introduce new gTLDs and, if this determination is affirmative, developing robust policy to enable the selection and allocation of new top-level domains.
2. Following discussions at the ICANN meeting in Luxemburg on the strategy for introduction of new gTLDs, ICANN staff and the GNSO Council have cooperated to compile decisions and documents relating to the introduction of new top-level domain names. The compilation covers main documents and decisions since 2000. The latest version is available at <http://gnso.icann.org/issues/new-gtlds/new-tlds-31aug05.htm>. This compilation has been the subject of discussions on the GNSO Council mailing list and the source for an analysis in table format available at:  
<http://www.gnso.icann.org/mailing-lists/archives/council/msg01249.html>.
3. On 1 September 2005 a process proposal was presented at the GNSO Council meeting. At this meeting, the Council recalled the

New Top-Level Domains  
Whether to introduce new TLDs

original Names Council recommendation of 18-19 April 2000, which stated:

*“The Names Council determines that the report of Working Group C and related comments indicate that there exists a consensus for the introduction of new gTLDs in a measured and responsible manner. The Names Council therefore recommends to the ICANN Board that it establish a policy for the introduction of new gTLDs in a measured and responsible manner, giving due regard in the implementation of that policy to:*

*(a) promoting orderly registration of names during the initial phases;*

*(b) minimizing the use of gTLDs to carry out infringements of intellectual property rights;*

*and (c) recognizing the need for ensuring user confidence in the technical operation of the new TLD and the DNS as a whole.*

*Because there is no recent experience in introducing new gTLDs, we recommend to the Board that a limited number of new top-level domains be introduced initially and that the future introduction of additional top-level domains be done only after careful evaluation of the initial introduction.”*

4. The view of the Council was that ICANN should complete the evaluation of the introduction of a limited number of new top-level domains, as described in the report from the New TLD Evaluation Process Planning Task Force. The report (<http://www.icann.org/committees/ntepptf/final-report-31jul02.htm>) described four aspects to evaluate (technical, business, legal, and process). Part of the evaluation dealing with Policy and Legal issues

New Top-Level Domains  
Whether to introduce new TLDs

was completed in July 2004 (<http://icann.org/tlds/new-gtld-eval-31aug04.pdf>). Further experience is also available as additional sponsored top-level domains are introduced in 2005 (for example, .travel, .mobi, and .jobs). The Council considered that the evaluation work could proceed in parallel with development of a comprehensive new gTLD policy, with the expectation that the evaluation would be complete before any final policy recommendations were presented to the Board for approval.

5. At a conference call on 22 September 2005 (<http://gns0.icann.org/meetings/agenda-gns0-22sep05.htm>) the Council resolved to request ICANN Staff to produce an Issues Report. On the basis of the Issues Report, a decision would be made to conduct a policy development process on the introduction of new top-level domain names. The issues report should cover the following core issues: whether to continue to introduce new gTLDs; the criteria for approving applications for new gTLDs; the allocation method for choosing new gTLDs and the contractual conditions for new gTLDs.
6. The GNSO Council determined that the Issues Report would cover all four issue areas, with a presumption of an affirmative answer to

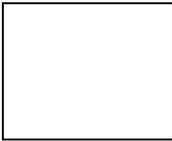

New Top-Level Domains  
Whether to introduce new TLDs

the first issue area; the question whether to introduce new TLDs.

This document is prepared in response to this request, with four parts corresponding to the issues listed above. The rules for Issues Reports also require that ICANN Staff provide confirmation of the relevance of the work to the GNSO and to the ICANN community. Finally, in compliance with the Issues Report Guidelines, ICANN Staff are required to provide draft Working Group Terms of Reference. These are found at the end of this document.

7. The GNSO Council made a simultaneous request for ICANN Staff to provide a separate background document featuring existing documents and decisions associated with the introduction of internationalized domain names at the top-level. This work would be considered in view of a policy development process to be conducted jointly by the GNSO and ccNSO.
8. In addition to the compilation of ICANN documents mentioned above, reference material is available in studies and reports by other entities such as the OECD, WIPO, the National Research Council and Summit Strategies International which can be found in the Reference List at the end of the document.

#### ***4. Whether to introduce new top-level domains***

9. The work of the DNSO (later to evolve into GNSO and ccNSO) preceding the two-step “proof of concept” introduction of gTLDs produced a policy supporting the introduction of new gTLDs in a measured and responsible manner. Although this was a policy established for a temporary purpose, there is implicit recognition that additional gTLDs would be introduced, subject to evaluation of initial introductions. The evaluation has been made, but not completely, and a conclusion needs to be firmly drawn as to whether new TLDs shall continue to be introduced.
10. As stated above, the GNSO Council has determined that finalizing the evaluation is not seen as a prerequisite for starting working on the other elements of the GNSO Council resolution of 22 September 2005. Accordingly, work can proceed in parallel on these two fronts. Constituencies and other members of the ICANN community will be invited to review the submissions that they made to the original new gTLD policy development process in 1999 and 2000 and thereafter, and consider whether the limited introduction of new gTLDs has changed their views in any significant way.

New Top-Level Domains  
Whether to introduce new TLDs

11. A short recapitulation of the emergence of top-level domains is provided in the following sections. Prior to ICANN's establishment, Dr. Jon Postel introduced the first generic top-level domains, implying a semantic structuring of the DNS with .COM intended for business users, .ORG for non-profit organizations, .NET intended for network users etc. During the early and mid-1990s, as country code TLDs were being delegated, the root zone was expanding by 10-20 TLDs or more per year for nearly a decade. From 1994 to 1996, 40 or more TLDs were added each year.
12. ICANN was established in November 1998. At the time, the .COM, .NET and .ORG gTLDs were commonly available for registration, while .INT, .EDU, .MIL and .GOV were available for registration by specific communities only. In addition, approximately 246 country code top-level domains were available for countries and territories to enable registrations of local domain names. A full list of all current TLDs, maintained by IANA, can be found at <http://data.iana.org/TLD/tlds-alpha-by-domain.txt>.
13. Since 1998 the industry has gone through an unprecedented development. The Internet is available across the globe and the number of users is approaching 1 billion. Internet access and use is

New Top-Level Domains  
Whether to introduce new TLDs

now seen as mission critical for many users. ICANN itself has also changed substantially with an increase in the complexity and volume of its work and adaptation of its staffing, organization and working methods.

14. With respect to gTLDs, there are at present nine additional top-level domains. The registry agreements can all be found at <http://www.icann.ORG/registries/agreements.htm> and a full listing of all the registries can be found at <http://www.icann.ORG/registries/listing.html>. A further set of gTLDs will be added as new sponsored top-level domain agreements are signed during the course of 2005.
15. The market for domain names shows continued signs of growth. Domain name market data can be found in a variety of sources, for example in VeriSign's latest report, found at: <http://www.verisign.com/stellent/groups/public/documents/newsletter/030725.pdf>.
16. An article in DNJournal.com, at <http://dnjournal.com/columns/50million.htm>, foresees that if the 30% growth rate experienced in the year 2005 continues, the number of gTLD domain name registrations would double to 100 million in less

New Top-Level Domains  
Whether to introduce new TLDs

than 3 years. Usage patterns are developing and studies from both the OECD and the NRC show that proven demand for new top-level domains is inconclusive, with contentions about advantages claimed by some in stark contrast to the drawbacks purported by others. The NRC report elaborates at some length on the advantages and drawbacks. The NRC Report also states that, from a security and stability perspective, the introduction of “tens” of new TLDs per year could be done without risks. The report calls for predictability in the introduction of new top-level domains by publishing time schedules as well as applying measures to follow-up and stop the process if need be.

## **CONSIDERATIONS**

17. The decision whether to introduce new top-level domains is informed by reviewing previous constituency statements (see the full list of reports in the Reference List); examining external studies and reports and taking account of developments in Internet use and the domain name registration industry. Some additional considerations are outlined below.

New Top-Level Domains  
Whether to introduce new TLDs

18. Introduction of new gTLDs remains a matter of controversy in the Internet community. Additional TLDs are requested by many that see a business opportunity in running a new TLD. Whether there is true market demand for new TLDs from end-users is another matter and is likely to be conditional on multiple factors. There are also negative aspects associated with the introduction of new gTLDs such as the risk of marketplace confusion and additional costs for trade mark protection for intellectual property right holders.
19. While there seems to be a reasonable consensus within the Internet community that a measured introduction of additional TLDs can be undertaken with negligible risks for the security and stability of the Internet, assessments of suitable addition rates do vary. It should be noted in this context that the processes associated with TLD management/administration may set stricter limits than plain security/stability/technical considerations regarding how many TLDs can be added within a given time frame or how many can be maintained after their creation.
20. Additional information can be found in IETF documents, inter alia from [RFC 3071](#) , which provides a different typology of domain

New Top-Level Domains  
Whether to introduce new TLDs

names and domain use, and from [RFC 3467](#), which elaborates on the uses of the domain name system.

21. Regardless of the chosen approach, the possibility of measuring the success or failure of the approach should be considered.

Accordingly, there is a need to foresee methods to evaluate, correct and possibly halt the process as appropriate.

### ***A. Summary of Previous Selection Criteria***

22. The following sections describe selection criteria which have been used in four previous ICANN TLD assignment processes. They provide a baseline for selection criteria to be applied in future allocations of new TLDs. Further work needs to be done to identify areas where modified or new criteria could be developed. Whilst some similarities exist across each of the four examples, the sections below illustrate the differences in each of the processes. In the interim, analysis of the evaluation of each of the four processes has been left out.

23. Previous GNSO work concluded that TLD strings should be proposed by the applicants and not prescribed by ICANN. However, there is also a need to develop policy that may place possible limits on strings that can be used at the top-level. Further discussion is required about establishing vetting processes which are objective and robust.

24. The selection criteria fit within the categories outlined below and are discussed in detail in the following sections:

25. Technical: The requirement to maintain the Internet's security and stability has been paramount. Through each successive round, the technical criteria have become more stringent and detailed. The technical criteria are designed to ensure that the registry meets all of ICANN's stability and security obligations, enables effective resolution of all domain names and reflects best practice technical developments. These criteria have evolved significantly over the last several years to now include requirements to conduct registry services with strong expectations of data and equipment security; the use of the latest software and hardware; the best technical personnel and ongoing commitment to technical improvements that reflect ICANN's requirements to run a stable and secure Internet architecture.

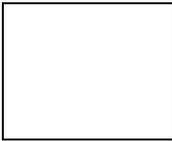

26. Financial and Business: The provision of detailed financial and business plans feature as critical selection criteria which have become more exacting and subject to, for example, international accounting standards, through each subsequent round. The criteria range across the provision of evidence that the applicant is financially viable over the long term; revenue and pricing models that demonstrate detailed understanding of the domain name

registration business; evidence of sufficient qualified staffing; customer service commitments in languages other than English on a 24/7/365 basis; innovative service offerings and the willingness to contribute to ICANN's budget objectives.

27. Legal and Regulatory: These criteria are difficult to analyze as each round had different objectives. The criteria revolve around commitments to ICANN's policy development process; to ICANN's consensus based decision making; to compliance with California-based contractual arrangements; and to public notification of terms and conditions of contracts. However, enhancement of competition in domain name registration services at the registry and registrar level, enhancing the diversity and utility of the domain name system and strengthening policy development procedures have also been key themes.

28. Community Expectations: ICANN's diverse community has very differing expectations but some central themes have emerged. Public comment periods on both selection criteria and evaluation methods are expected. ICANN processes have included deliberate periods of public comment during which the Internet community is able to comment on applicants and their application data. In

addition, applicants are able to ask questions and receive answers about the process which are posted on the ICANN's website. The public comment archives provide useful examples of the kinds of questions that were raised during the comment period. These comments were taken into account by the evaluators, particularly in the sTLD process and the .NET process. See, for example, <http://www.icann.org/org/tlds/net-rfp/net-rfp-public-comments.htm>.

29. Application Processes: The application process has become more stringent and robust with a shift to on-line application processes and full cost recovery fees for applicants. In addition, specific probity arrangements that prevent applicants influencing ICANN Board and Staff members have been established. There are also requirements for willingness to enter negotiations on the basis of draft contracts that set out standard terms and conditions and for availability to conduct follow-up evaluation negotiations.

30. External factors: The common element in the analysis of external factors is that whatever action ICANN takes to expand or modify the domain name space, there is sure to be intense interest from all areas of the Internet community in addition to the Government Advisory Committee and other ICANN entities.

## ***B. Selection Criteria 2000 Generic and Sponsored Top-Level Domain Process***

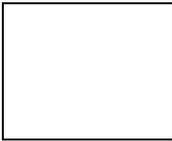

31. On 16 July 2000 the ICANN Board voted on a resolution (<http://www.icann.ORG/tlds/new-tld-resolutions-16jul00.htm#00.460>) to enable the introduction of a limited number of sponsored and unsponsored top-level domains.
32. The 2000 round of new TLDs applications resulted in the introduction of .biz, .info, .name and .pro as unsponsored top-level names and .aero, .museum and .coop as sponsored top-level domains. The formal documentation can be found at <http://www.icann.ORG/yokohama/new-tld-topic.htm> .
33. Instructions for applicants and early discussion about the initial selection criteria can be found at <http://www.icann.ORG/tlds/new-tld-application-instructions-15aug00.htm>. Forty five applications were received in the process. The key criteria in this initial round included the areas set out below.
34. Technical: These criteria can be found at <http://www.icann.ORG/tlds/application-process-03aug00.htm#1e>

and included a technical capabilities plan including “the following topics ...physical plants, hardware, software, facility and data security, bandwidth/Internet connectivity, system outage prevention, system restoration capabilities and procedures, information systems security, load capacity, scalability, data escrow and backup capabilities and procedures, Whois service, zone file editing procedures, technical and other support, billing and collection, management and employees, staff size/expansion capability, and provisions for preserving stability in the event of registry failure.

Required supporting documentation included: company references, diagrams of systems (including security) at each location, personnel resumes and references”.

35. Financial and Business: These criteria were contained in sections relating to the provision of business plans and required “detailed, verified business and financial information about the proposed registry”; company information, current and past business operations, registry/Internet related experience and activities, mission, target market, expected costs/expected budget, expected demand, capitalization, insurance, revenue model, marketing plan, use of registrars and other marketing channels, management and

employees, staff size/expansion capability, long-term commitment/registry failure provisions.

36. Legal and Regulatory: These criteria revolved around the treatment of (then) existing gTLD policies and proposals how new TLDs would be treated. There were no explicit requirements to commit to ICANN's policy development processes. However, explicit plans were expected to address name registration policies and the explanation of why applicants could argue that their application was unique and responded to unmet demand.

37. Community Expectations: There was a lot of discussion within the community about what top-level domains ought to be chosen, the history of which can be found at <http://www.icann.org.org/announcements/icann-pr16nov00.htm>.

38. Application Processes: The application process required the payment of a USD 50,000 non-refundable fee. The application materials differentiated between sponsored and unsponsored applications; required a "fitness disclosure", application for specific dispensation to hold material confidential and hard copies of application material delivered to ICANN's offices. There was a

publicly posted question and answer period and a public comment period.

39. External factors: At the time of the 2000 round, the Internet boom was at its height. There was a lot of industry interest in the potential to expand the domain name space which is evidenced by the number of applications ICANN received and the robust discussion which took place about the selection of seven new TLDs.

## ***5. Selection Criteria 2004 Sponsored Top-Level Domain Process***

40. The second process is the sponsored top-level domain round held in 2004 which, so far, has enabled the introduction of .mobi, .travel, .cat and .jobs. Other applications are still under consideration and include .post, .xxx, .tel (pulver), .tel and .asia.

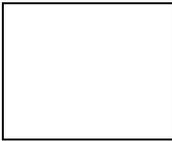

41. The selection criteria for the 2004 sTLD round were posted on ICANN's website and, for the first time, an electronic website based application process was used to collect applicant information. ICANN provided a set of explanatory notes; set out what applicants needed to do to comply with the application process; provided a forum for answering questions about the application process and posted a timeline for applicants to follow.

42. One of the key characteristics in this process was the criteria for establishing a sponsoring community and organisation that would be responsible for domain name registration policies applicable for the top-level domain.

43. Technical: The minimum technical criteria were contained in Part E of the application material. Applicants were required to demonstrate their technical competence by showing how they would, for example, conduct registry operations; what kind of registrar-registry protocols would be required; how zone files would be managed; what facilities would be provided; how data escrow would be handled; what technical support would be available and how data and systems recovery would be managed.

44. Financial and Business: These criteria were contained in Part C and D of the application material which required detailed business plans and financial models. The business plan required appropriate staff to be identified; a marketing plan, plans for registrar management and appropriate fee structures. Most importantly, applicants were required to show why their application was unique and innovative; added community value to the domain name space, enhanced the diversity of the Internet and enriched global communities. In addition, applicants were expected to show how their operations would protect the rights of others through compliance with dispute resolution mechanisms and compliant registration systems.

45. Legal and Regulatory: A key element of the sponsored top-level domain application process was the requirement that applicants adequately define and demonstrate the support of a sponsored TLD community with evidence from a supporting organisation. The applicants were required to demonstrate that the proposed sponsoring organisation was appropriate for the purpose, would participate in ICANN's policy development processes and had support from the broader community.

46. Community Expectations: In this RFP, there were specific efforts made to diversify the domain name space; to demonstrate the attractiveness of different kinds of domain name spaces and to have different policy making processes that would be the responsibility of the sponsoring organisations. The public comments submitted for the sTLD process can be found at <http://forum.icann.ORG/lists/stld-rfp-general>.

47. Application Processes: Part F of the application material contained an Application Checklist to assist applicants in ensuring that their application materials complied with all sections of the RFP.

48. External factors: There were a number of special factors which arose throughout the application process including the status of regional geographic specific sTLDs; the treatment of identical string applications and the influence of the GAC principles of national governments with respect to public policy questions relating to some applications. The sTLD process is ongoing.

## **6. Selection Criteria .ORG Contract Reassignment**

49. The reassignment of the .ORG contract took place during 2002 with the final agreement between Public Internet Registry and ICANN being signed on 3 December 2002. PIR commenced operation on 1 January 2003. There is a wide range of material available on the ICANN website including the selection criteria, application material, staff evaluations and public comments on the process. These are found at <http://www.icann.org.org/tlds/org/rfp-20may02.htm>.

50. The final contract can be found at <http://www.icann.org.org/tlds/agreements/org/>. (Note that the contract is a very large file with numerous appendices.)

51. The key selection criteria for the .ORG contract were contained in an on-line “proposal form” which applicants were required to fill out and submit in hard copy. Ten applications were received by ICANN in a competitive tender process.

52. The selection criteria <http://www.icann.org.org/tlds/org/criteria.htm> on the .ORG reassignment focus on the “need to preserve a stable,

well functioning .ORG registry”, “ability to comply with ICANN’s policies”, “enhancement of competition for registration services”, “differentiation of the .ORG TLD”, “inclusion of mechanisms for promoting the registry’s operation in a manner that is responsive to the needs, concerns, and views of the noncommercial Internet user community”, “level of support for the proposal from .ORG registrants”, “the type, quality, and cost of the registry services proposed”, “ability and commitment to support, function in, and adapt protocol changes in the shared registry system”, “transition considerations”, “ability to meet and commitment to comply with the qualification and use requirements of the VeriSign endowment and proposed use of the endowment” and “the completeness of the proposals submitted and the extent to which they demonstrate realistic plans and sound analysis”. These criteria are consistent with, in particular, those applied in the .NET reassignment. The following sections set out the specifics of the selection criteria.

53. Technical: The RFP made specific reference to the size and complexity of the .ORG registry. In 2002 there were 2,700,000 domain names in the .ORG registry. The RFP asked specifically for applications from companies that already offered registry services

and who could demonstrate the capacity to run a “domain-name registry of significant scale”. The Technical Plan included specific information about transition planning. Other technical requirements were an explanation of registry-registrar models; database capabilities; data escrow and backup; physical facilities; publicly accessible WHOIS; technical support and compliance with technical specifications in RFCs.

54. Financial and Business: The .ORG selection criteria focused specifically on the following key areas: equivalent access for registrars, enhancement of competition, differentiation of the .ORG TLD (also relevant in the “community expectations” section) and supporting documentation (setting out the applicant’s business information, annual reports, business references and community support).

55. Legal and Regulatory: The .ORG RFP required applicants to comply with a draft agreement which was posted during the RFP process, available at <http://www.icann.ORG/announcements/announcement-24oct02.htm>. In addition, applicants were expected to agree to

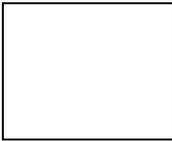

requirements to comply with ICANN's published policies and to participate actively in new policy development initiatives.

56. Community Expectations: Responsiveness to the non-commercial Internet user community was a key selection criterion in the .ORG reassignment. Management of the USD 5 million .ORG endowment and provision of indications of community support also fit into this category.

57. Application Processes: The .ORG applicants were required to pay a fee of USD 35,000 in addition to the cost of preparing the application form. Eleven applications were received. The applicants used the application question period and public comments about the applications were received through the ICANN website. A "fitness disclosure" was also required in addition to a formal statement identifying materials that would remain confidential. The general information about applicants and the statement of information about applicants refers specifically to the emphasis placed on the applicants' ability to operate a large registry including identifying any outsourcing arrangements.

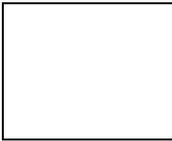

58. External factors: Key external factors were the management of the VeriSign endowment, the transition of a very large existing database and support for the non-profit sector: The process for effecting changes to the .ORG registry services agreement can be found at <http://www.icann.org.org/announcements/announcement-22apr02.htm>.

## ***7. Selection Criteria .NET Reassignment***

59. The fourth example of a process with strict selection criteria was the reassignment of the .NET contract. The .NET registry had approximately six million registered domain names. The GNSO had recommended a distinction between absolute and relative criteria. The absolute criteria were developed with the broader ICANN community to “ensure that the .NET top-level Domain is administered at a very high level of safety, security, efficiency and fairness.” Each applicant had to satisfy all the absolute criteria. Comparisons were then made on the basis of the relative criteria and how well each applicant responded to those criteria.
60. There were five applicants for the .NET contract – VeriSign, NeuStar (as Sentan Registry Services), Afilias, DENIC and CORE. VeriSign was determined to be the successor operator after a comprehensive evaluation process.
61. The current version of the contract can be found at <http://www.icann.org/org/tlds/agreements/net/net-registry-agreement-01jul05.pdf> . A public comment period ran until 10 October 2005 on proposed amendments to the .NET contract.

Reference to the public comment period can be found at

<http://www.icann.org/announcements/announcement-22sep05.htm>.

62. In the RFP, there was a strong focus on absolute technical criteria, similar to those applied in the .ORG reassignment.

63. Technical: These criteria were absolute and included requirements for explicit descriptions (and substantiation) of existing registry operations; a “burdens and benefits” analysis of registry plans and all technical components of planned registry services. In addition, applicants were expected to provide detailed information on name server functional specifications; patch, update and upgrade policies; performance specifications; service level agreements, WHOIS specifications and data escrow arrangements. Explicit compliance with a range of RFCs was also required in addition to the provision of information about technical capabilities; sourcing of expert staff and highly detailed technical plans for ongoing operation in addition to detailed technical migration plans.

64. Security and stability of operations was a critical element of the absolute selection criteria. This included technical and business

failure contingency plans in addition to robust transition and migration plans.

65. Financial and Business: These criteria ranged across the provision of information about directors, officers, key staff and number of employees; the kind of organization and its core business. In addition, applicants were expected to provide pricing plans and demonstrate financial strength and long term viability. A detailed business plan was required, including staffing plans, expense models and cash availability.

66. Legal and Regulatory: These criteria included commitments to ICANN's existing consensus policies and compliance with all future consensus policies; a focus on increasing the competitive supply of registry services and innovative registry services

67. Community Expectations: ICANN processes include deliberate periods of public comment during which the Internet community can state their views. The .NET process outcome was contested and the public comment archives can be found at

<http://www.icann.ORG/tlds/net-rfp/net-rfp-public-comments.htm>.

68. Application Processes: The application process for the .NET contract required payment of a USD 200,000 application fee (with a graduated refund payable depending on the number of applicants). Each unsuccessful applicant received a USD 150,000 refund. There were procedures for non-compliant proposals and a requirement that portions of the application material be made public (and then commented upon by members of the ICANN community). Probity and conflict of interest measures were put in place to prevent applicants from attempting to influence ICANN Board and Staff members.

## **CONSIDERATIONS**

69. Doubts have been expressed about whether it is necessary for ICANN to qualify new gTLDs on the basis of support and sponsorship by a community; the provision of business and financial plans and addition of new value to the name space. The NRC report suggests pre-qualification of applicants on technical capability, basic financial viability, and adherence to registrant protection standards and compliance to ICANN policies.

70. As stated earlier, the presumption is that it should be left to the imagination of potential bidders to propose strings for new gTLDs. From that perspective, an essential aspect to analyze is what character strings are acceptable and under what conditions. This relates to elements such as string length, technical, linguistic, cultural or even political aspects. There is a case for investigating whether there are any external authoritative sources that could be useful for vetting purposes, where both negative and positive list approaches can be considered.
71. The GAC has stated clear views on how to consider certain strings for TLDs, inter alia in a letter to ICANN dated 3 April 2005 (<http://www.icann.org/correspondence/tarmizi-to-twomey-03apr05.htm>)
72. There are examples of negative list approaches concerning domain names on the second level, which may be of relevance also for TLD strings. Reserved names lists are also mentioned in the chapter on contractual conditions. A recent addition on this topic is [the reserved names list](#) for .EU that is now published, covering country names of EU Member States in a plurality of languages.

73. The selection criteria previously used can be assessed for future selection processes from both an overall perspective and from a detailed perspective on each criterion. It is clear that ICANN should strive for process simplicity, especially since simplicity is an integral element of ensuring predictability in its processes.

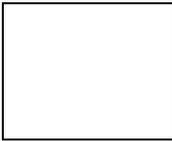

## **8. Contractual Conditions**

74. This section sets out analysis of the key contractual conditions relating to the initial 2000 round of new TLDs, the conditions for the new sTLDs and the contractual arrangements for the .ORG and .NET reassignment processes. The analysis is not intended to be comprehensive across each of the sets of agreements but rather to identify key points and areas where the agreements have evolved.

75. As noted above in the Selection Criteria section, contractual conditions have evolved to reflect the growing maturity of ICANN's organisation and the changing commercial environment in which registries operate. A list of all gTLDs can be found at <http://www.icann.ORG/registries/listing.htm> . All contracts between ICANN and gTLD operators and sponsors can be found at <http://www.icann.ORG/registries/agreements.htm>.

76. The change in approach for the 2005 TLD agreements was designed to streamline the agreement structure and to allow additional flexibility. Basic provisions have been reduced to key points; repetitious items have been removed and appendices have been simplified or eliminated altogether.

77. Other changes from the 2001 generic and sponsored top-level domain agreements include those set out in the following sections.
78. Obligations of Parties: The provisions have been simplified to eliminate clauses that repeated ICANN's mission as set out in the Bylaws. In addition, clauses relating to limitations around certain business practices by registry operators have been eliminated where they are overly prescriptive. Registry operator's obligations have been reduced to those covenants that are of fundamental interest to ICANN.
79. Consensus Policies: The old agreements provided a framework for the development of "consensus policies" including topics on which policies applicable to the registry operator may be developed. Since the original agreements were drafted in 2001, ICANN's restructuring and industry changes have had a significant effect on the way in which ICANN's policy development processes have been codified through the Bylaws. In the new form agreement, the reference to "consensus policies" includes all existing policies as of the date of the agreement, and all policies later developed through the policy development process, as part of ICANN's Bylaws. Some scoping of the development of policies under the agreement is included in the

2005 agreements. However, the Bylaws are intended to be the authoritative guide on the due process and procedure for the development of consensus policies.

80. Zone File Access: The updated registry agreements continue to obligate registry operators to provide zone file access to ICANN and to provide a free copy of the zone file to requesting parties.

81. Reserved Names: The identification of reserved top-level domain strings is simplified in two ways. One, a list on the IANA website that is updated from time to time and two, a list of names reserved from registration consistent with the relevant appendix which would be updated as needed.

82. Registry-Registrar Relationships: The existing framework of agreements for registry operators requires them to do business with (and only with) all ICANN-accredited registrars as well as mandating “equal access” to registry services and resources. The new .NET registry agreement continues this practice. The new .NET agreement prohibits registries from acting as registrars. However, registries may provide for volume discounts, marketing support and other incentive programs provided that the same

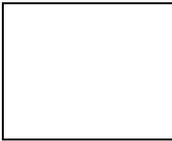

opportunity to qualify for those discounts and programs is available to all registrars.

83. Data Escrow: The 2001 registry agreement required data escrow (zone file copy) by the registry operator. In addition, the 2001 agreement also specified by appendix both the specifications for the data escrow and the form of data escrow agreement. The new .NET agreement also has this requirement.

84. WHOIS Policy: WHOIS policies (including consideration of public WHOIS, requirements for independent providers and ICANN's specifications) remained unchanged in the .NET agreement.

85. Functional and Performance Specifications: The functional and performance specifications were set out in Appendix C to the 2001 TLD agreements. The 2005 agreements set forth the specifications in Appendix 7.

86. Notice and Process for Proposed Registry Services & Product Changes: ICANN's pre-2005 registry agreements did not describe a procedure for ICANN to follow in considering registry requests to introduce new services or otherwise modify the registry agreement. A GNSO policy development process was launched in 2003 to

assist ICANN with developing such a procedure. The work of that GNSO PDP has been incorporated into all recent ICANN registry agreements

87. Dispute Resolution: The provisions governing dispute resolution contain mandatory arbitration provisions and also impose requirements that parties engage in co-operative discussions before proceeding to any arbitration demand. It is important to note that the intention of amending these provisions is to resolve any disputes through early informal processes (although these are mandated procedures). The new .NET provisions also contain specific performance provisions which give options to remedy non-performance through measures other than contract termination.

88. Termination Provisions: ICANN's termination rights revolve around an understanding of uncured and fundamental and material breaches of enumerated provisions relating to registry operator performance including those conditions relating to preserving security and stability; complying with consensus policies; handling of registry data; compliance with the process for approval of new registry services or material changes to existing services; and payment of ICANN fees.

89. Fees and Pricing: These conditions relate to fixed registry fees, transaction based fees and variable fees (essentially pass through of registrar fees when not collected from registrars directly).
90. Term of Agreement and Renewal: These conditions specify the time period for the gTLD assignment and conditions for renewal of the agreement.

## **CONSIDERATIONS**

91. With the current contractual conditions as a starting point, there is a need to select essential contract conditions on which policy decisions are possible. In addition, there is an opportunity to identify policy aspects on new suggestions for contractual provisions.
92. ICANN is moving towards simplification of the registry contracts and standardized contracts could also be considered. Such aspects are especially appropriate to consider if a large number of new top-level domain names are to be added to the root level. A detailed proposal to simplify current agreements has been introduced during a public comment period. When reviewing the contractual conditions, past and current policy debates on TLD use could be

considered. An example would be the discussions about to what extent sponsored TLD registries should be able to set and change policies for domain name registration.

93. Currently, the contractual conditions feature cancellation of the contract as the principal sanction available. This “nuclear option” is clearly only applicable in extreme cases of non-compliance and has never been used. Some recent registry contracts, however, feature arbitration with other sanction possibilities for the compliance regime and such approaches could be considered further.

94. Suggestions put forward in the WIPO report to safeguard the interests of IPR holders are relevant to domain name registration rules.

95. IETF findings and proposals provide input for reviewing certain contractual conditions. Examples are the technical best practices for TLD zones that the DNSOP working group has elaborated and the results from the CRISP working group relating to WHOIS.

## **9. Allocation Methods**

96. There are technical, processing and maintenance limits on the number of new gTLDs that could be introduced within a given time frame. The number of applications that meet stipulated selection criteria may exceed these limits, calling for an allocation method to handle such situations. Accordingly, policy choices about allocation methods need to be made. The policy choices should consider that combinations of such options are possible and could be related to different purposes. [check on RFC reference to numbers of TLDs that can be added]
97. There is a number of allocation methods to choose from and these methods can be grouped into the following categories; sequential or first-come/first-served, random selections in the form of ballots or lotteries, auction models (with increasing or decreasing bidding) and comparative evaluations, commonly known as “beauty contests”.
98. To date, ICANN has only used comparative evaluation methods. These evaluation procedures have differed in the details, by applying different criteria as explained in the selection criteria

chapter above. Evaluations have been performed in different ways; in-house, with mixed teams or by external consultants.

99. In the 2000 “proof-of-concept” round, ICANN used a comparative hearing process conducted by ICANN Staff and Board to select 7 out of the 44 applicants on the respective merits of their cases in fulfilling the specified selection criteria.

100. In the 2004 round for sponsored gTLDs, ICANN issued an open invitation for any applicants to propose new sponsored top-level domains. This time, ICANN engaged a project manager, selected by competitive bidding and assisted by three review panels, to determine whether the selection criteria were fulfilled or not. Allocation of a TLD to an applicant was to be conditional only upon fulfillment of these criteria. This process was designed to have an objective evaluation by experts insulated from lobbying by applicants, who were prohibited from contacting the evaluator. The intention was further to avoid lobbying pressure on ICANN Staff and Board as well as to minimize the risk for potential criticism about subjectivity in the process.

101. The .ORG reassignment was conducted in 2002 as a competitive tender process based on an open RFP with the selection criteria as specified in the previous chapter. Eleven applications were received and the evaluation was performed using a multi-team approach. The evaluation tasks were distributed by topic between consultants, constituencies and ICANN staff (as described in an evaluation report at: <http://www.icann.org/tlds/org/preliminary-evaluation-report-19aug02.htm> ). PIR was selected as the proposed new registry for this gTLD and the ICANN Board resolved in accordance with this proposal.

102. The .NET reassignment was conducted in 2004-2005 as a competitive tender process based on an open RFP with the selection criteria specified in the previous chapter. Five bids were received and the evaluation was conducted by an outside consultant, assigned to this task through competitive bidding and selection by ICANN Staff and Board. The final evaluation and recommendation by the consultant is available at: <http://www.icann.org/announcements/announcement-28mar05.htm>.

## **CONSIDERATIONS**

103. It should be recognized that the final decision to allocate a gTLD lies with the ICANN Board, where contractual arrangements are taken into account for the final approval. This implies that judgments can sometimes become complex, especially when an application attracts intense community and media interest. The .NET reassignment is a case in point, where the Board followed the consultant's recommendation to reappoint VeriSign as registry for .NET. However, community concerns were raised about the contractual conditions which, in response to those concerns, have been renegotiated, posted for public comment and presented to the Board.

104. ICANN has considerable experience in comparative evaluation methods. Two other allocation methods mentioned initially, first-come/first-served and random selection, are self-explanatory. ICANN has no experience of either model or of using auctions. Information about auction methods can be found in a variety of publications a selection of which are found in the Reference List.

105. The choice of allocation method has significance only if the number of valid applications is higher than the number of available slots for new TLDs. With criteria defined for a successful

application, it could be considered reasonable to accept them on a first-come/first-served as long as they meet the criteria, provided that the number of such applications is lower than, or equal to, the number of available slots for new TLDs. However, experience with “land rush” effects in domain name registrations show that first-come/first-served does not work when many valid applications are supplied at the same time. With this in mind, it is prudent to foresee the need for another allocation method from the outset.

106. The NRC report states that “If new gTLDs are to be created, the currently employed comparative hearing or expert evaluation processes should not be assumed to be the only processes for selecting their operators” and suggests that if the number of qualified applicants turns out to be less than the number of available slots, all would be chosen; if not, a market-based selection process, i.e. an auction, could be used to select among the applicants. The report further contends that “because of the wide range of intents and corresponding designs of such processes, they must be carefully designed, drawing on the wide range of previous experience in the design of auctions”.

107. In the process of determining the preferred allocation method, ICANN is constrained by some legal requirements that may limit the options for choosing allocation methods. Such limitations need to be investigated in parallel as soon as preferred allocation methods start to emerge in the selection process.

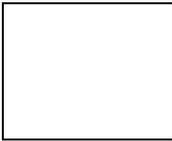

## ***10.Relevance***

108. Issues surrounding the creation of new top-level domains and the policies for undertaking that work are directly relevant to the GNSO's mission and the ICANN Bylaws. It is anticipated that very close consultation will take place between other parts of ICANN's organisation including the ccNSO, the Government Advisory Committee and expert technical working groups.

109. This work will have a lasting value and applicability and will establish a framework for future decision making. The work will also have an impact on existing policies for registry services.

### ***C. Staff Recommendation***

110. It is recommended that the GNSO launch a focused policy development process on the issues outlined in the 22 September 2005 resolution in close consultation with the broader ICANN community including the Government Advisory Committee (on the public policy aspects of new top-level domains) and the ccNSO on (internationalized domain names).

### ***D. Proposed Working Group Terms of Reference***

111. The draft Working Group Terms of Reference reflects very diverse objectives across the ICANN community. The GNSO is tasked with determining whether to continue to introduce new gTLDs and, if that is affirmative, developing robust policy to enable the selection and allocation of new top-level domains. The proposed Terms of Reference found below could be used as a guide for further work.

112. Term of Reference One: Should new top-level domain names be introduced?

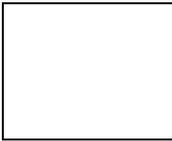

- (a) Given the information provided here and any other relevant information available to the GNSO, the GNSO should assess whether there is sufficient support within the Internet community to enable the introduction of new top-level domains. If this is the case the following additional terms of reference are applicable.

113. Term of Reference Two: Selection Criteria for New top-level Domains

New Top-Level Domains  
Staff Recommendations & Proposed Terms of Reference

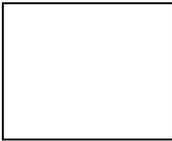

- (a) Using the existing selection criteria from previous top-level domain application processes and relevant criteria in registry services re-allocations, develop modified or new criteria which specifically address ICANN's goals of expanding the use and usability of the Internet. In particular, examine ways in which the allocation of new top-level domains can meet demands for broader use of the Internet in developing countries.
- (b) Examine whether preferential selection criteria could be developed which would encourage new and innovative ways of addressing the needs of Internet users.
- (c) Examine whether distinctions between restricted, unrestricted, sponsored and unsponsored top-level domains are necessary and how the choice of distinctions meets the interests of relevant stakeholders.
- (d) Examine whether additional criteria need to be developed which address ICANN's goals of ensuring the security and stability of the Internet.

- (e) Examine whether additional criteria can be developed to normalize and simplify the administrative process of selecting and implementing new top-level domains.

#### 114. Term of Reference Three: Allocation Methods for New Top-Level Domains

- (a) Using the experience gained in previous rounds of top-level domain name application processes, develop modified or new criteria which simplify and standardize the allocation methods for selecting new top-level domain names.
- (b) Examine the full range of allocation methods including auctions, ballots and comparative evaluation processes to determine the most predictable and stable method of implementing additions to the Internet root.
- (c) Examine how allocation methods could be used to achieve ICANN's goals of fostering competition in domain name registration services and encouraging a diverse range of registry services providers.

115. Term of Reference Four: Contractual Conditions for New Top-Level Domains

- (a) Using the experience of previous rounds of top-level domain name application processes and the recent amendments to registry services agreements, develop modified or new contractual criteria which are publicly available prior to any application rounds.
- (b) Examine whether additional contractual conditions are necessary to improve ICANN's contractual compliance regime to provide predictability and security of registry services.
- (c) Examine whether a registry services code of conduct, in addition to contractual conditions, would improve a compliance regime which is easily understandable and recognizes differences in approaches to offering registry services whilst, at the same time, ensuring the stability and security of the Internet.

116. At the Council meeting on 28 November 2005, it was resolved to adopt Terms of Reference as follows:

New Top-Level Domains  
Staff Recommendations & Proposed Terms of Reference

117. Should new generic top-level domain names be introduced?

- (a) Given the information provided here and any other relevant information available to the GNSO, the GNSO should assess whether there is sufficient support within the Internet community to enable the introduction of new top-level domains. If this is the case the following additional terms of reference are applicable.

118. Selection Criteria for New Top-Level Domains

- (a) Taking into account the existing selection criteria from previous top-level domain application processes and relevant criteria in registry services re-allocations, develop modified or new criteria which specifically address ICANN's goals of expanding the use and usability of the Internet. In particular, examine ways in which the allocation of new top-level domains can meet demands for broader use of the Internet in developing countries.
- (b) Examine whether preferential selection criteria (e.g. sponsored) could be developed which would encourage

New Top-Level Domains  
Staff Recommendations & Proposed Terms of Reference

new and innovative ways of addressing the needs of Internet users.

- (c) Examine whether additional criteria need to be developed which address ICANN's goals of ensuring the security and stability of the Internet.

119. Allocation Methods for New Top-Level Domains

- (a) Using the experience gained in previous rounds, develop allocation methods for selecting new top-level domain names.
- (b) Examine the full range of allocation methods including auctions, ballots, first-come first-served and comparative evaluation to determine the methods of allocation that best enhance user choice while not compromising predictability and stability.
- (c) Examine how allocation methods could be used to achieve ICANN's goals of fostering competition in domain name registration services and encouraging a diverse range of registry services providers.

## 120. Policy to Guide Contractual Conditions for New Top-Level Domains

- (a) Using the experience of previous rounds of top-level domain name application processes and the recent amendments to registry services agreements, develop policies to guide the contractual criteria which are publicly available prior to any application rounds.
- (b) Determine what policies are necessary to provide security and stability of registry services.
- (c) Determine appropriate policies to guide a contractual compliance programme for registry services.

PART THREE – INTERNATIONALISED DOMAIN NAMES WORKING GROUP REPORT (IDN-WG)

PART FOUR – RESERVED NAMES WORKING GROUP FINAL REPORT

PART FIVE – PROTECTING THE RIGHTS OF OTHERS WORKING GROUP FINAL REPORT

PART SIX – GOVERNMENTAL ADVISORY COMMITTEE PUBLIC POLICY PRINCIPLES

PART SEVEN – CONSTITUENCY IMPACT STATEMENTS

PART EIGHT -- REFERENCE MATERIALS

**Return to Final Report: Part A**

1. This section provides detailed information about the progress of the policy development process and the documentation produced throughout the series of teleconferences and face-to-face consultations that have taken place since December 2005, through 2006 and 2007. All of the meetings were open to observers and many different stakeholders attended the meetings taking an active part in the discussion. In addition, all

meetings were open to remote participation by teleconference and file-sharing technology for some meetings. Participation data is provided in Part Two below.

2. The first step of the policy development process was the release of the *Issues Report* on 5 December 2005. The *Report* sets out an early collation of issues that the GNSO wished to take into account in developing the Terms of Reference for future rounds. For example, the selection criteria used in previous application rounds for new top-level domains were used to guide the development of Term of Reference Two in this PDP. An evaluation of the selection criteria and methods used in the re-bidding of the .org and .net registry contracts was also conducted. The *Issues Report* contained Staff Recommendations about potential terms of reference and, in the main, those Recommendations were adopted by the GNSO Council. The *Report* is found at <http://gnso.icann.org/issues/new-gtlds/gnso-issues-rpt-gtlds-05dec05.pdf>.

3. A Public Comment Period was launched on 6 December 2005 to solicit input from the ICANN community about the proposed Terms of Reference (found at <http://www.icann.org/announcements/announcement-06dec05.htm>). The Public Comment Period ran until 31 January 2006. For this PDP public comment periods have been used in different ways than in the past. In general, public comment calls have been far more targeted and highly structured to get responses on particular areas of concern to the Committee. This was a successful initiative enabling information to be collected in a consistent way that improved the quality of subsequent *Reports*. The archive of comments can be found at <http://forum.icann.org/lists/new-gtlds-pdp-comments/>).

4. In addition to a Public Comment Period, a *Call for Expert Papers* was announced on 3 January 2006 (found at <http://icann.org/announcements/announcement-03jan06.htm>). The request for input was advertised widely in the international press and yielded eleven responses from a diverse range of stakeholders. The authors of the papers were invited to present their papers and participate in a question and answer session at the 23 - 25 February 2006 Washington meeting. A full listing of all the inputs, including the *Expert Papers*, can be found at <http://gnso.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm>.

5. The ICANN Board has been regularly updated on the progress of and taken a keen interest in the work of the new TLDs Committee. For example, the Board meeting of 10 January 2006 shows discussion within the Board about its involvement in new TLDs policy development process (found at <http://www.icann.org/minutes/minutes-10jan06.htm>). The Board passed a resolution at the March 2006 Wellington meeting urging the Committee to work as quickly and efficiently as possible.

6. A draft *Initial Report* was released on 19 February 2006 (found at <http://icann.org/topics/gnso-initial-rpt-new-gtlds-19feb06.pdf>) and a request for public comments was announced at the same time that was open between 20 February 2006 and 13 March 2006. The archives for those comments are found at <http://forum.icann.org/lists/new-gtlds-pdp-initial-report/>. The draft *Initial Report* was used to facilitate discussion at subsequent Committee meetings and to give some guide to the broader community about the Committee's progress in its early stages.

7. The GNSO's new TLDs Committee held a three day meeting in Washington DC between 23 and 25 February 2006. The meeting notes can be found on the GNSO's Committee archive at (<http://forum.icann.org/lists/gtld-council/msg00030.html>). A central element of the discussion focused on re-visiting ICANN's Mission and Core Values to ensure that the deliberations on the Terms of Reference were tightly constrained. The substantive discussion over the three-day meeting also included discussion on whether to introduce new top-level domains (<http://forum.icann.org/lists/gtld-council/msg00027.html>) and potential selection criteria which could be used in a new round of top-level domain applications (<http://forum.icann.org/lists/gtld-council/msg00026.html>).
8. Analysis of the lessons learned from previous TLD rounds was included in the broader discussions held in Washington DC (<http://forum.icann.org/lists/gtld-council/msg00030.html>). In addition to discussing general selection criteria, detailed discussion of technical requirements also took place (<http://forum.icann.org/lists/gtld-council/msg00028.html>). Following the Washington meetings, it was clear that further information about technical criteria was necessary to inform the Committee's work. On 15 March 2006 a formal call was made for additional information on technical criteria (found at <http://gnso.icann.org/issues/new-gtlds/tech-criteria-15mar06.htm>). No responses were received to that specific call but, in the resulting recommendations, particular attention has been paid to addressing relevant technical standards across the full range of registry operations, including those that relate to Internationalised Domain Names.
9. In response to the Committee's work and to discussions at the March 2006 Wellington meeting, the Board indicated its intention to facilitate the implementation of new top-level domains (found at <http://www.icann.org/minutes/minutes-31mar06.htm>.)
10. The new TLDs Committee met in Brussels between 11 and 13 May 2006 to discuss, in further detail, the work that had been undertaken on refining the selection criteria and allocation methods. In addition, a full day was spent on discussing policies for contractual conditions with a special presentation from ICANN's Deputy General Counsel. The Committee has archived, on 18 May 2006, records of the Brussels discussion and output from the meeting can be found at <http://forum.icann.org/lists/gtld-council/msg00133.html>
11. At the Brussels meeting, a revised work plan was devised (found at <http://forum.icann.org/lists/gtld-council/msg00130.html>) which include a high level commitment to producing an *Initial Report* in time for discussion at ICANN's June 2006 Marrakech meeting.
12. A draft *Initial Report* was released on 15 June 2006 (found at <http://gnso.icann.org/issues/new-gtlds/issues-report-15jun06.pdf>) and further discussion took place on the Committee's mailing list prior to the Marrakech meeting.
13. The ICANN Board meeting of 30 June 2006 showed, again, the Board's interest in facilitating the policy development process on new top-level domains, particularly in encouraging ongoing discussions with the GAC. (found at <http://www.icann.org/minutes/resolutions-30jun06.htm>). After inputs from the Marrakech

meeting a final version of the *Initial Report* was released on 28 July 2006 (found at <http://gnso.icann.org/drafts/newgtlds-issues-report-01-28jul06.htm>).

14. The Committee conducted another set of face-to-face consultations in Amsterdam between 29 and 31 August 2006 to further refine the Committee's findings and to develop a set of draft *Recommendations*. Prior to the Amsterdam meeting, a comprehensive public comment period was conducted. These public comments (found at <http://forum.icann.org/lists/gtld-council/msg00189.html>) were used as working materials for the Committee to consider, in addition to Constituency Statements, the previous set of Expert Papers and comprehensive commentary for a wide variety of observers to the meetings.

15. The Committee met with the GAC on four occasions during the course of the consultations – in Wellington, Marrakech, Sao Paulo and San Juan – where progress on the Committee's work was shared with GAC members. In addition, at the San Juan meeting, GAC members were given a presentation about how the GAC's Public Policy Principles had been incorporated directly into the Committee's principles, recommendations and implementation guidelines.

16. Considering all the materials derived from the face-to-face meetings, discussions on email lists, expert materials and expert papers, on 14 September 2006 a set of draft *Recommendations* was released by the Committee for broader consideration (found at <http://gnso.icann.org/issues/new-gtlds/recom-summary-14sep06.htm>).

17. Between 14 September and 5 October 2006 email discussion took place that improved and clarified the language of the *Recommendations* and ensured that Constituencies had sufficient time to rework their recommendations where necessary.

18. On 5 October 2006, the Committee conducted a two-hour teleconference to discuss the draft *Recommendations* (the MP3 recording can be found at <http://forum.icann.org/lists/gtld-council/msg00224.html>). The purpose of the meeting was to confirm that the *Recommendations* reflected the intentions of the Committee and to conduct further work on refining elements of the *Recommendations*, particularly with respect to the selection criteria and allocation methods to resolve contention between string applications.

19. On 11 October 2006, the GNSO Committee Chairman and GNSO Chair, Dr Bruce Tonkin, sent formal correspondence to the Chair of the Governmental Advisory Committee and the Chair of GAC Working Group I, requesting the GAC's assistance with the public policy impacts of the introduction of new TLDs (found at <http://gnso.icann.org/mailing-lists/archives/council/msg02891.html>).

20. Based on the substantive nature of the Committee's email traffic on the draft *Recommendations*, a further update was released to the Committee on 18 October 2006 (found at <http://forum.icann.org/lists/gtld-council/msg00234.html>) for consideration whilst the drafting of the *Final Report* takes place.

21. The Committee met again at ICANN's Sao Paulo meeting in December 2006 and continued their work with the release of an updated version of the *Final Report* (found at <http://gnso.icann.org/drafts/GNSO-PDP-Dec05-FR13-FEB07.htm>).

22. From February 2007 until May 2007 a series of working groups continued with separate streams of work. The Internationalised Domain Names Working Group (IDN-WG) released its *Final Report* on 22 March 2007

(found online here <http://gnso.icann.org/drafts/idn-wg-fr-22mar07.htm>). The Reserved Names Working Group (RN-WG) released its first report on 16 March 2007 (found online here <http://gnso.icann.org/drafts/rn-wg-fr19mar07.pdf>) and its *Final Report* on 23 May 2007 (found online here <http://gnso.icann.org/issues/new-gtlds/final-report-rn-wg-23may07.htm>). The Protecting the Rights of Others Working Group (PRO-WG) completed its *Final Report* on 1 June 2007 (found online here <http://gnso.icann.org/drafts/GNSO-PRO-WG-final-01Jun07.pdf>).

23. After the June 2007 San Juan meeting, the Committee continued to meet on a weekly basis with small sub-groups working on, in particular, Recommendation 6 and 20 and more detailed implementation guideline

24. The updated version of the draft *Final Report: Part A* was released on 30 July for a Committee "last call" on the package of recommendations.

25. The following timetable was released in conjunction with the updated draft to enable the completion of the Committee's work prior to the ICANN Board meeting on 2 November 2007.

- i. Committee comment 30 July to 6 August
- ii. Committee meeting 6 August
- iii. Public comment period begins 9 August
- iv. Public comment period ends 29 August
- v. Synopsis of public comments released to Committee for consideration
- vi. GNSO Council vote on recommendations

26. After the GNSO Council's vote, the Board Report can be prepared.

**GAC PRINCIPLES REGARDING NEW gTLDs**

Presented by the Governmental Advisory Committee

March 28, 2007

1.1 The purpose of this document is to identify a set of general public policy principles related to the introduction, delegation and operation of new generic top level domains (gTLDs). They are intended to inform the ICANN Board of the views of the GAC regarding public policy issues concerning new gTLDs and to respond to the provisions of the World Summit on the Information Society (WSIS) process, in particular *"the need for further development of, and strengthened cooperation among, stakeholders for public policies for generic top-level domains (gTLDs)"*[2] and those related to the management of Internet resources and enunciated in the Geneva and Tunis phases of the WSIS.

1.2 These principles shall not prejudice the application of the principle of national sovereignty. The GAC has previously adopted the general principle that the Internet naming system is a public resource in the sense that its functions must be administered in the public or common interest. The WSIS Declaration of December 2003 also states that *"policy authority for Internet-related public policy issues is the sovereign right of States. They have rights and responsibilities for international Internet-related public policy issues."*[3]

1.3 A gTLD is a top level domain which is not based on the ISO 3166 two-letter country code list[4]. For the purposes and scope of this document, new gTLDs are defined as any gTLDs added to the Top Level Domain name space after the date of the adoption of these principles by the GAC.

1.4 In setting out the following principles, the GAC recalls ICANN's stated core values as set out in its by-laws:

- a. Preserving and enhancing the operational stability, reliability, security, and global interoperability of the Internet.
- b. *Respecting the creativity, innovation, and flow of information made possible by the Internet by limiting ICANN's activities to those matters within ICANN's mission requiring or significantly benefiting from global coordination.*
- c. *To the extent feasible and appropriate, delegating coordination functions to or recognizing the policy role of other responsible entities that reflect the interests of affected parties.*
- d. *Seeking and supporting broad, informed participation reflecting the functional, geographic, and cultural diversity of the Internet at all levels of policy development and decision-making.*
- e. *Where feasible and appropriate, depending on market mechanisms to promote and sustain a competitive environment.*
- f. *Introducing and promoting competition in the registration of domain names where practicable and beneficial in the public interest.*
- g. *Employing open and transparent policy development mechanisms that (i) promote well-informed decisions based on expert advice, and (ii) ensure that those entities most affected can assist in the policy development*

*process.*

*h. Making decisions by applying documented policies neutrally and objectively, with integrity and fairness.*

*i. Acting with a speed that is responsive to the needs of the Internet while, as part of the decision-making process, obtaining informed input from those entities most affected.*

*j. Remaining accountable to the Internet community through mechanisms that enhance ICANN's effectiveness.*

*k. While remaining rooted in the private sector, recognizing that governments and public authorities are responsible for public policy and duly taking into account governments' or public authorities' recommendations.*

## **2. Public Policy Aspects related to new gTLDs**

When considering the introduction, delegation and operation of new gTLDs, the following public policy principles need to be respected:

### Introduction of new gTLDs

#### 2.1 New gTLDs should respect:

a) The provisions of the Universal Declaration of Human Rights<sup>[5]</sup> which seek to affirm "*fundamental human rights, in the dignity and worth of the human person and in the equal rights of men and women*".

b) The sensitivities regarding terms with national, cultural, geographic and religious significance.

-

2.2 ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities.

2.3 The process for introducing new gTLDs must make proper allowance for prior third party rights, in particular trademark rights as well as rights in the names and acronyms of inter-governmental organizations (IGOs).

2.4 In the interests of consumer confidence and security, new gTLDs should not be confusingly similar to existing TLDs. To avoid confusion with country-code Top Level Domains no two letter gTLDs should be introduced.

### Delegation of new gTLDs

2.5 The evaluation and selection procedure for new gTLD registries should respect the principles of fairness, transparency and non-discrimination. All applicants for a new gTLD registry should therefore be evaluated against transparent and predictable criteria, fully available to the applicants prior to the initiation of the process. Normally, therefore, no subsequent additional selection criteria should be used in the selection process.

2.6 It is important that the selection process for new gTLDs ensures the security, reliability, global interoperability and stability of the Domain Name System (DNS) and promotes competition, consumer choice, geographical and service-provider diversity.

2.7 Applicant registries for new gTLDs should pledge to:

a) Adopt, before the new gTLD is introduced, appropriate procedures for blocking, at no cost and upon demand of governments, public authorities or IGOs, names with national or geographic significance at the second level of any new gTLD.

b) Ensure procedures to allow governments, public authorities or IGOs to challenge abuses of names with national or geographic significance at the second level of any new gTLD.

2.8 Applicants should publicly document any support they claim to enjoy from specific communities.

2.9 Applicants should identify how they will limit the need for defensive registrations and minimise cyber-squatting that can result from bad-faith registrations and other abuses of the registration system

#### Operation of new gTLDs

2.10 A new gTLD operator/registry should undertake to implement practices that ensure an appropriate level of security and stability both for the TLD itself and for the DNS as a whole, including the development of best practices to ensure the accuracy, integrity and validity of registry information.

2.11 ICANN and a new gTLD operator/registry should establish clear continuity plans for maintaining the resolution of names in the DNS in the event of registry failure. These plans should be established in coordination with any contingency measures adopted for ICANN as a whole.

2.12 ICANN should continue to ensure that registrants and registrars in new gTLDs have access to an independent appeals process in relation to registry decisions related to pricing changes, renewal procedures,

service levels, or the unilateral and significant change of contract conditions.

2.13 ICANN should ensure that any material changes to the new gTLD operations, policies or contract obligations be made in an open and transparent manner allowing for adequate public comment.

2.14 The GAC WHOIS principles are relevant to new gTLDs.

### **3. Implementation of these Public Policy Principles**

3.1 The GAC recalls Article XI, section 2, no. 1 h) of the ICANN Bylaws, which state that the ICANN Board shall notify the Chair of the Governmental Advisory Committee in a timely manner of any proposal raising public policy issues. Insofar, therefore, as these principles provide guidance on GAC views on the implementation of new gTLDs, they are not intended to substitute for the normal requirement for the ICANN Board to notify the GAC of any proposals for new gTLDs which raise public policy issues.

3.2 ICANN should consult the GAC, as appropriate, regarding any questions pertaining to the interpretation of these principles.

3.3 If individual GAC members or other governments express formal concerns about any issues related to new gTLDs, the ICANN Board should fully consider those concerns and clearly explain how it will address them.

3.4 The evaluation procedures and criteria for introduction, delegation and operation of new TLDs should be developed and implemented with the participation of all stakeholders.

N.B. The public policy priorities for GAC members in relation to the introduction of Internationalised Domain Name TLDs (IDN TLDs) will be addressed separately by the GAC.

ICANN GNSO new TLDS report 2007 – impact statement on behalf of the Commercial and Business Users Constituency (BC)

### **Background**

Under ICANN existing guidelines within the Policy Development Process constituencies are asked under section 11c to provide: "an analysis of how the issue would affect each constituency, including any financial impact on the constituency".

There are innumerable uncertainties to the outcome of the PDP for TLDs including:

- the number of TLDs
- the nature of the TLDs
- the ability of ICANN to implement the safeguards discussed by the GNSO
- the number of those safeguards that reach consensus support within the GNSO
- the weight given by the Board to those safeguards.

For this reason the BC impact statement is necessarily written in terms of what the impact may look like given certain implementation scenarios.

#### **A world of healthy competition and good faith**

If the outcome is the best possible there will be a beneficial impact on business users from:

- a reduction in the competitive concentration in the Registry sector
- increased choice of domain names
- lower fees for registration and ownership
- increased opportunities for innovative on-line business models.

#### **A world of increased opportunity for abusive competitive practises and fraud**

There are a number of recommendations that seek to control abusive competitive practices as well as opportunities for consumer and business fraud such as cyber-squatting, typo-squatting, phishing and other forms of bad faith activity:

- graduated sanctions for contract compliance by Registries and Registrars
- avoiding confusingly similar domain names
- avoiding infringement of third party prior rights especially trade mark rights
- clear, quick and low-cost procedures for dispute resolution and the removal of bad faith registrations
- measures to prevent abuse of personal data or other commercially-valuable data.

If ICANN fails to implement the above recommendations there will be a negative impact on business users from:

- user confusion about site ownership and subsequent reputational damage to well-known businesses
- costs from diminished user confidence in e-commerce
- wasted costs of defensive registrations and online brand monitoring and enforcement

- wasted costs in legal and other actions to prevent avoidable criminal and cyber-squatting activity
- wasted costs and fraudulent losses to businesses and their customers from phishing and malware sites.

In the worst case scenario the negative impact on business users globally both directly and indirectly from reputation and confidence-related loss could be billions of dollars.

END

#### The Intellectual Property Constituency Impact Statement Regarding the Introduction of New gTLDs

	<b>PRINCIPLE</b>	<b>IPC IMPACT</b>
<b>A</b>	<b>New generic top-level domains (gTLDs) must be introduced in an orderly, timely and predictable way.</b>	<b>To the extent that new gTLDs are introduced, the IPC strongly agrees with this principle, especially with respect to the need for an orderly introduction. However, the IPC still takes issue with the notion that new gTLDs must be introduced. Based on past experience, the addition of new gTLDs will likely result in numerous defensive registrations of otherwise unnecessary domain names by IP owners (which we note include all trademark owners such as Registrars, Registries, ISPs, etc.). Such an introduction not only places a significant burden and cost to IP owners, it results in absolutely no value whatsoever to IP owners, not to mention Internet users in general. In fact, while arguments are made that the introduction of new gTLDs will increase competition and thus lower registration costs for domain name owners, this is not the case. In October of 2007, Verisign will increase the registry fee for registering domain names for .com, .org and .net domain names. To the extent that there has been any rise in the registration of domain names, the IPC submits that this is not as a result of increased demand, but rather represents in large part the practice of defensive registrations or the abusive practices of domain name tasting, parking, kiting and the like. Finally, it is critical that appropriate mechanisms be in place to address conflicts that may arise between any proposed new gTLD and the IP rights of others.</b>

**The IPC believes that many of these concerns may be minimized by limiting any new gTLDs to those that offer a clearly differentiated domain name space with mechanisms in place to ensure compliance with the purposes of a chartered or sponsored TLD. Market differentiation will create a taxonomic or directory-style domain name structure, ensuring that certainty and confidence are part of the user experience and that registrants will find a unique name space where they want to be and in which they can easily be located.**

<p><b>B</b> Some new generic top-level domains should be internationalised domain names (IDNs) subject to the approval of IDNs being available in the root.</p>	<p>As mentioned above, appropriate mechanisms must be in place to address conflicts that may arise between any proposed new gTLD and the IP rights of others.</p>
<p><b>C</b> The reasons for introducing new top-level domains include that there is demand from potential applicants for new top-level domains in both ASCII and IDN formats. In addition the introduction of new top-level domain application process has the potential to promote competition in the provision of registry services, to add to consumer choice, market differentiation and geographical and service-provider diversity. [Consistent with GAC Principle 2.6]</p>	<p>To begin with, there has been little empirical evidence that the introduction of new gTLDs has, in fact, promoted competition, or added to consumer choice or market differentiation, even though it might have the potential to do so. Any proposed new gTLD must be clearly targeted at a particular industry, economic sector, or cultural or language community, with a requirement that there is sufficient support or demand the relevant industry, economic, cultural or language sector to minimize the concerns set forth with respect to Principal A above. The mere introduction of competition for registry services must be outweighed by the burdens and costs to IP owners and Internet users et forth with respect t Principal A above. ICANN does not need to and should not encourage registry competition in the absence of a clear need for a new gTLD, without which will only create a gTLD replete with defensive registrations and no added value to consumers.</p>
<p><b>D</b> A set of technical criteria must be used for assessing a new gTLD registry applicant to minimise the risk of harming the operational stability, security and global interoperability of the Internet.</p>	<p>IPC agrees that technical and operational stability are imperative to any new gTLD introduction.</p>

---

<b>E</b>	A set of capability criteria for a new gTLD registry applicant must be used to provide an assurance that an applicant has the capability to meet its obligations under the terms of ICANN's registry agreement.	ICANN should be in a position to inquire whether a registry applicant will depend for its financial viability on defensive registrations, and if so to withhold approval of such applicant.
<b>F</b>	<b>A set of operational criteria must be set out in contractual conditions in the registry agreement to ensure compliance with ICANN policies.</b>	<b>To be feasible, the terms of registry agreements should be aligned with policies adopted by ICANN and allow enforcement by ICANN of any non-compliance. The impact of the absence of such criteria or the lack of enforcement thereof on the IPC and Internet users in general is evidenced in ICANN's 2006 Consumer Complaint Analysis (see, <a href="http://www.icann.org/compliance/pie-problem-reports-2006.html">http://www.icann.org/compliance/pie-problem-reports-2006.html</a>) In particular, the lack of access to Whois data, or the false or inaccurate submission thereof, significantly impacts the time and resources of and costs to IP owners vis-à-vis the handling of infringements on the Internet.</b>

---

NUMBER	RECOMMENDATION	IPC Comment
1	<p><b>ICANN must implement a process that allows the introduction of new top-level domains.</b></p> <p><b>The evaluation and selection procedure for new gTLD registries should respect the principles of fairness, transparency and non-discrimination. All applicants for a new gTLD registry should therefore be evaluated against transparent and predictable criteria, fully available to the applicants prior to the initiation of the process. Normally, therefore, no subsequent additional selection criteria should be used in the selection process. [GAC2.5]</b></p>	<p><b>See comments with respect to Principle A.</b></p>
2	<p>Strings must not be confusingly similar to an existing top-level domain.</p> <p>In the interests of consumer confidence and security, new gTLDs should not be confusingly similar to existing TLDs. To avoid confusion with country-code Top Level Domains no two letter gTLDs should be introduced. [GAC2.4]</p>	<p>Agreed.</p>
3	<p>Strings must not infringe the existing legal rights of others that are recognized or enforceable under generally accepted and internationally recognized principles of law.</p> <p>The process for introducing new gTLDs must make proper allowance for prior third party rights, in particular trademark rights as well as rights in the names and acronyms of inter-governmental organizations (IGOs). [GAC2.3]</p>	<p>Agreed, and as stated before, appropriate mechanisms must be in place to address conflicts that may arise between any proposed new string and the IP rights of others.</p> <p>While the IPC notes that GAC has made a specific reference to trademark rights, the IPC agrees with NCUC that such rights could include "freedom of expression" rights to the extent they are recognized and enforceable under generally accepted and internationally recognized principles of law provided that such rights do not infringe the existing legal rights of others as set forth in the first paragraph.</p>
4	<p>Strings must not cause any technical instability.</p>	<p>IPC agrees that technical and operational stability are imperative to any</p>

		new gTLD introduction.
5	<p>Strings must not be a Reserved Word.</p> <p>ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities. [GAC2.2]</p>	<p>Agreed, to the extent that a Reserved Word is such that its use could cause technical or operational instability to the DNS.</p>
6	<p><b>Strings must not be contrary to generally accepted legal norms relating to morality and public order.</b></p> <p>New gTLDs should respect:</p> <p>a) The provisions of the Universal Declaration of Human Rights which seek to affirm "fundamental human rights, in the dignity and worth of the human person and in the equal rights of men and women".</p> <p>b) The sensitivities regarding terms with national, cultural, geographic and religious significance. [GAC2.1]</p>	<p><b>The IPC simply concurs with NCUC regarding the implementation issues raised by such a recommendation.</b></p>
7	<p><b>Applicants must be able to demonstrate their technical capability to run a registry operation for the purpose that the applicant sets out.</b></p>	<p><b>IPC supports this recommendation.</b></p>
8	<p>Applicants must be able to demonstrate their financial and organisational operational capability.</p> <p><b>An application will be rejected or otherwise deferred if it is determined, based on public comments or otherwise, that there is substantial opposition to it from among significant established institutions of the economic sector, or cultural or language community, to which it is targeted or which it is intended to support.</b></p>	<p>ICANN should be in a position, through various mechanisms, to determine that adequate resources exist to ensure that the applicant will not be dependent on defensive registrations for financial viability.</p> <p>Moreover, the IPC believes that the ability to reject an application as set forth in the second provision of this recommendation is an important feature for many members of the IPC (if there is substantial opposition, this raises the concerns set forth in our comments with respect to Principle A) and thus specifically and wholeheartedly endorses it.</p>

9	<b>There must be a clear and pre-published application process using objective and measurable criteria.</b>	<b>IPC supports this recommendation.</b>
10	<b>There must be a base contract provided to applicants at the beginning of the application process.</b>	<b>IPC supports this recommendation.</b>
11	<b>Staff Evaluators will be used to make preliminary determinations about applications as part of a process which includes the use of expert panels to make decisions.</b>	<b>IPC supports this recommendation, and in doing so stresses the need for ICANN to continue to increase its staffing resources to maintain the security and stability of the DNS.</b>
12	<b>Dispute resolution and challenge processes must be established prior to the start of the process.</b>	<b>IPC supports this recommendation.</b>
13	Applications must initially be assessed in rounds until the scale of demand is clear.	<b>IPC supports this recommendation</b>
14	<b>The initial registry agreement term must be of a commercially reasonable length.</b>	<b>IPC supports this recommendation.</b>
15	<b>There must be renewal expectancy.</b>	<b>IPC supports this recommendation.</b>
16	<b>Registries must apply existing Consensus Policies and adopt new Consensus Polices as they are approved.</b>	<b>IPC supports this recommendation.</b>
17	<b>A clear compliance and sanctions process must be set out in the base contract which could lead to contract termination.</b>	<b>IPC supports this recommendation assuming the process will have "teeth" and assuming ICANN's continued monitoring and enforcement of registry contractual obligations.</b>
18	If an applicant offers an IDN service, then ICANN's IDN guidelines must be followed.	IPC supports this recommendation.
19	Registries must use ICANN accredited registrars.	IPC supports this recommendation, assuming accreditation of registrars is held to high standards to avoid a "Register Fly" situation.

Implementation Guideline

IPC Comments

IG A	The application process will provide a pre-defined roadmap for applicants that encourages the submission of applications for new top-level domains.	To the extent that the submission of applications is encouraged, it should be because of the clear need for a new TLD.
IG B	Application fees will be designed to ensure that adequate resources exist to cover the total cost to administer the new gTLD process.  Application fees may differ for applicants.	ICANN should be a position, through various mechanisms, to determine that adequate resources exist at an applicant to ensure that the applicant will not be dependent on defensive registrations for financial viability.
IG C	ICANN will provide frequent communications with applicants and the public including comment forums which will be used to inform evaluation panels.	IPC supports a requirement for public posting of string applications in internationally recognized publications and comment forums on applicants.
IG D	A first come first served processing schedule within the application round will be implemented and will continue for an ongoing process, if necessary.  Applications will be time and date stamped on receipt.	Based on experience with the 'land rush' effect in domain name registration, it is apparent that first-come, first-serve simply does not work when many valid applications are received at the same time. IPC endorses the use of comparative evaluation methods to allocate new gTLDs. IPC strongly advises against the use of auctions or lotteries (that have nothing to do with the competence and financial viability of an applicant) to resolve competition between applicants.
IG E	The application submission date will be at least four months after the issue of the Request for Proposal and ICANN will promote the opening of the application round.	Given the potential impact any new gTLD will have on the IPC, ICANN must ensure that there will also be an adequate time period for public comment once applications are submitted.
IG F	<b>If there is contention for strings, applicants may:</b>  i) <b>resolve contention between them within a pre-established timeframe</b>  ii) <b>if there is no mutual agreement, a claim to support a community by one party will be a reason to award priority to that application</b>	i) Yes.  ii) Yes. IPC prefers the market driven approach and encourages the sponsorship by a well defined community. However, the "priority" for a claimed community support

iii) **If there is no such claim, and no mutual agreement a process will be put in place to enable efficient resolution of contention and;**

should be subject to Recommendation 8, second paragraph).

iii) Yes.

iv) **the ICANN Board may be used to make a final decision, using advice from staff and expert panels.**

iv) Yes.

IPC urges ICANN to ensure that its review of applications continues to be vigorous to keep a high standard to meet the selection criteria.

IPC urges caution in presenting any proposal that would eliminate those aspects of the gTLD application process providing for the security and stability of the DNS. This concerns not only technical matters, but those aspects of the Internet DNS and registry operation designed to safeguard users and the general public, including, e.g. the examination of proposals to protect intellectual property.

IG G

**Where an applicant lays any claim that the TLD is intended to support a particular community such as a sponsored TLD, or any other TLD intended for a specified community, that claim will be taken on trust with the following exception:**

Yes, again subject to Recommendation 8, second paragraph. IPC again strongly advises against the use of auctions or lotteries to resolve competition between applicants.

i) **the claim relates to a string that is also subject to another application and the claim to support a community is being used to gain priority for the application**

A comparative evaluation process will best meet ICANN's goals of fostering competition in registration services and encouraging a diverse range of registry service providers.

Under this exception, Staff Evaluators will devise criteria and procedures to investigate the claim.

IG I

External dispute providers will give decisions on complaints.

IPC supports the use of external dispute providers in the same manner as existing UDRP mechanisms, but simply notes that this should not be necessarily to the exclusion of the ICANN Board. There may be decisions that only the ICANN Board can resolve and such issues should not be overlooked or not dealt with

		simply because there is no external dispute provider available to resolve it.
IG J	An applicant granted a TLD string must use it within a fixed timeframe which will be specified in the application process.	IPC does not support the warehousing of TLD strings and supports a timeframe after applicant grant by which the TLD string must be operational.
IG K	The base contract should balance market certainty and flexibility for ICANN to accommodate a rapidly changing market place.	No comment
IG L	ICANN should take a consistent approach to the establishment of registry fees.	No comment
IG M	The use of personal data must be limited to the purpose for which it is collected.	Personal data collected by the registry should be used in ways that are not incompatible with the purposes for which it was collected, taking into account the full range of public policy considerations.
IG N	ICANN may establish a capacity building and support mechanism aiming at facilitating effective communication on important and technical Internet governance functions in a way which no longer requires all participants in the conversation to be able to read and write English.	IPC support multilingual effective communication on important Internet governance functions.
IG O	ICANN may put in place a fee reduction scheme for gTLD applicants from economies classified by the UN as least developed.	The IPC does not object <i>per se</i> to the use of a reduced fee scheme, but is skeptical that the positive effect of such a scheme will outweigh the negative impact of an underfunded applicant's inability to meet the selection criteria set by ICANN. We strongly recommend that any graduated fee structure be viable and significant enough to ensure compliance with appropriate registry selection criteria, as well as eliminate bad-faith actors who might seek to pay a minimal entry fee and then conduct unscrupulous activities.

---

IG P	ICANN may put in place systems that could provide information about the gTLD process in major languages other than English, for example, in the six working languages of the United Nations.	IPC supports the dissemination of information about the process in multiple languages.

ISPCP Constituency Statement on Impacts – New TLDs Page 1

Internet Service Provider and Connectivity Provider Constituency

## Statement on Impacts – Introductions of New Top Level Domains

### Overview

This is the ISPCP's statement on Impacts relating to the GNSO PDP Dec 05 – Introduction of New Top Level Domains – Consolidated Recommendations.

### Section 1 – Principles

The ISPCP is highly supportive of the principles defined in this section of the PDP, especially with regards to the statement in (A):

***"New generic top-level domains (gTLDs) must be introduced in an orderly, timely and predictable way."***

Network operators and ISPs must ensure their customers do not encounter problems in addressing their e-mails, and in their web searching and access activities, since this can cause customer dissatisfaction and overload help-desk complaints. Hence this principle is a vital component of any addition sequence to the gTLD namespace.

The various criteria as defined in D,E and F, are also of great importance in contributing to minimize the risk of moving forward with any new gTLDs, and our constituency urges ICANN to ensure they are scrupulously observed during the applications evaluation process.

### Section 2 – Proposed Recommendations

Here the ISPCP would like to make the following observations:

With regards to recommendation 2:

***"Strings must not be confusingly similar to an existing top-level domain."***

This is especially important in the avoidance of any negative impact on network activities.

The same applies to recommendation 4:

***"Strings must not cause any technical instability."***

The ISPCP considers recommendations 7 and 8 to be fundamental. The technical, financial, organizational and operational capability of the applicant are the evaluators' instruments for preventing potential negative

impact of a new string on the activities of our sector (and indeed of many other sectors). ISPCP Constituency Statement on Impacts – New TLDs Page 2

With regards to recommendation 13:

***"Applications must initially be assessed in rounds until the scale of demand is clear."***

This is an essential element in the deployment of new gTLDs, as it enables any technical difficulties to be quickly identified and sorted out, working with reduced numbers of new strings at a time, rather than many all at once. Recommendation 18 on the use of IDNs is also important in preventing any negative impact on network operators and ISPs.

### **Section 3 – Implementations Guidelines**

We consider that guideline B, which states:

***"Application fees may differ for applicants."*** ,

has some potential for negative impact on our sector. Our recollection is that this caveat was proposed with a view to reducing the application fee for certain categories of applicants, as a mechanism for avoiding exclusion based on application cost. Recent discussions in the GNSO have exposed some opinions that question the 'fairness' of the application fee (as it has been applied heretofore), on the grounds that it constitutes an entry barrier and disenfranchises legitimate potential applicants. The risk in proceeding with such a policy, is that it paves the way for hasty, last minute me-too applications, that have not really developed a solid project, and are simply trying their luck in getting a string...Perhaps when such arguments on exclusion are expounded, then the '.cat' sTLD can be pointed at as a prime example of a well-planned 'grass-roots' community TLD, which successfully applied for a string without any 'special' cost considerations. A potential profusion of hasty, ill-conceived new gTLDs is not something the ISPCP would view as beneficial to our sector.

### **Section 4 – IDN Working Group Areas of Agreement**

The ISP community believes that areas of agreement 5, 6, and 9 are essential to the careful implementation of IDN TLDs. Without careful adherence to these recommendations, the implementation of IDNs may be successful on a technical level but will result in support and user confusion problems amongst the customers of ISPs. The ISPCP believes that these "Areas of Agreement" are essential to implement **prior** to any pursuit or proposal for IDN TLDs.

The ISP community also believes that the third "Area of Agreement" will be particularly difficult to implement in practice. The ISP community would be significantly impacted if the mechanism for gathering language community input on new IDN gTLD strings included a process that reached out to general, public Internet users through the community that provides access and connectivity. The ISPCP believes that a process for **"Language Community Input for Evaluation of new IDN gTLD Strings"** must be clearly established and vetted prior to allowing introduction of new IDN gTLD string. Failure to do so will impact many sectors, including the ISP and connectivity community. ISPCP Constituency Statement on Impacts – New TLDs Page 3

### **Section 5 – Reserved Name Working Group Recommendations**

The ISP community accepts and agrees with the ICANN and IANA recommendations of Section 5 and finds no negative impact on ISP operations or support. The ISPCP is also support of, and finds no negative impacts for, the recommendation on symbols in new gTLDs.

The ISPCP community notes that recommendation 6 – reservation of single letters at the top level – is an important and critical recommendation to the ISP community. We believe that there are old resolvers in

operation in developing countries that would be severely impacted (e.g. not work correctly) in the presence of single letters at the top level. Specifically we believe that very old versions of BIND – potentially in use in very small, underfunded ISPs in economically challenged areas – may not process incoming resolution requests properly. The ISP community strongly supports recommendation 6 and believes that further research, at a later date, would be necessary before all impacts on ISPs and connectivity providers could be identified.

The ISPCP notes that an unavoidable impact of these recommendations is problems resulting from poorly written application layer software. The ISP community was severely impacted during the introduction of TLDs that had more than 3 ASCII characters. Many pieces of software incorrectly filtered these TLDs – most likely because software designers thought that there could not be TLDs whose length was greater than three characters. During the first 18 months of introduction of those TLDs there were many calls to ISPs to "fix" the problem with the new TLDs – despite the fact that the ISP and connectivity community were not responsible for issues at the application layer. We fully expect that some software and application designers have also made assumptions about TLDs that will be contradicted by the new recommendations in section 5. The unavoidable impact on ISPs and connectivity providers will mirror the problems that occurred during the introduction of TLDs such as .areo, .travel, or .coop. The ISP community suggests that the existence of so-called "Controversial Names" will also lead to potential regulatory or community pressure impacts on those who provide connectivity.

#### **Section 6 – PRO Areas of Agreement**

The ISPCP believes that the six "Areas of Agreement" in the area related to PRO will have no significant impact on ISPs or connectivity providers.

#### **Section 7 – Areas of Broad Agreement**

The ISPCP sees the Principles and Recommendations in this section, as reasonable safeguards to a measured and controlled expansion of the generic domain namespace, subject to the comments expressed above.

### **COMMENTS FROM ICANN'S NON-COMMERCIAL USERS CONSTITUENCY (NCUC)**

#### **The GNSO New TLD Committee's Draft Final Report On The Introduction Of New Generic Top Level Domains**

#### **GNSO Policy Development Process (GNSO PDP- Dec05)**

**12 June 2007**

#### **Overview**

ICANN's Non-Commercial Users' Constituency (NCUC) appreciates this opportunity to comment on the GNSO Draft Recommendations for New GTLD Policy. While much progress has been made in recent weeks to resolve differences, much work remains before a consensus policy can be reached. The NCUC refers to its earlier constituency statements on the introduction of new gTlds, in particular, its statement of December 2006.<sup>[1]</sup>

Our overall concern remains that despite platitudes to certain, transparent and predictable criteria—the GNSO's draft recommendations create arbitrary vetoes and excessive challenges to applications. There are some for incumbents; for trademark rights holders; for the easily offended, for repressive governments and worst of all, for "the public". It's a wolf in sheep's clothing. A recipe for irregularity, discretion and uncertainty in the new domain name space.<sup>[2]</sup>

Among the more troubling proposals is the introduction of criteria in which strings must be 'morally' acceptable and not contrary to 'public order' (Recommendation #6). A concept borrowed from trademark law without precedent in the regulation of non-commercial speech.<sup>[3]</sup> NCUC opposes any string criteria related to 'morality' or 'public order' as beyond ICANN's technical mandate.

Following recent discussions and revisions, the draft now refers<sup>[4]</sup>, in passing, to 'freedom of speech' rights, but concerns remain that a restriction on certain expression in part of the world will be extended outside that nation, possibly even to the entire world, through ICANN policy. If the GNSO disagrees with NCUC and ultimately include string criteria on morality and public order in its final report, then the recommendations should make clear that ICANN policy on this matter will not be more restrictive than the national law in which an applicant operates.

NCUC remains particularly troubled with Recommendation #20 that would allow the showing of a "substantial opposition" to entirely reject an application. It swallows up any attempt to limit string criteria to technical, operational, and financial evaluations. Recommendation #20 violates internationally recognized freedom of expression guarantees and insures that no controversial string application will ever be granted.

NCUC continues to reject Recommendation 11 and an expanded role of ICANN staff and outside expert panels to evaluate string criteria that is not technical, financial, nor operational.

#### **Recommendation 1.**

This is a laudable Recommendation and we support it. We support the broad introduction of many new gTLDs.<sup>[5]</sup> We welcome the recognition that there are no technical constraints to introducing new gtlds and we hope to see consumer choice and demand served by a more robust approach in the future. ICANN's role is not to second guess the market place and decide which ideas are likely to succeed, but rather, to facilitate the process for the consumer's decision.

We refer to our concerns above as to the relationship between transparent, predictable criteria and vetoes over applications from unlimited sources.<sup>[6]</sup> By the many grounds for challenge introduced, criteria will be created and applied *ex post facto* by those responsible for determining challenges. We are also concerned that "normally" in this context be defined more precisely. These issues must be addressed if the objectives of this Recommendation are to be achieved. In particular, a public opposition period is in direct contraction with Recommendation 1 and Implementation Principle A: "New generic top-level domains (gTLDs) must be introduced in an orderly, timely and predictable way."

#### **Recommendation 2**

It is beyond dispute that the DNS does not mirror trade mark regulation. Rather it grants plenary rights in words,<sup>[7]</sup> without any of the compromises in the requirements for recognition, the limits to infringement and the defenses.<sup>[8]</sup> This is best reflected in the serious issue in the DNS, whereby— *all* rights-holders now seek protection from dilutive use —when only truly famous marks are entitled to that protection in trade mark law.

The Recommendation is vague and thus a general veto for incumbents at the top level. We refer to Professor Christine Haight Farley's legal briefing paper (Attachment A) as to the meaning of confusingly similar. <sup>[9]</sup> We also refer to Professor Jacqueline Lipton's legal briefing paper (Attachment B) and its discussion regarding the limitations within trademark law on the rights of trademark holders to regulate speech.

The GNSO's draft recommendations cherry pick from trade mark law to create a pastiche of 'values' — divorced from context and structure.<sup>[10]</sup> No account is taken of the legal requirement of use in commerce<sup>[11]</sup> — yet trade mark law requires this. What about fair use, comment, nominative use, criticism, parody and tribute? All protected at law. Under the US Anti-Cybersquatting Consumer Protection Act (ACPA) for example, unless inherently distinctive (i.e. made up words), marks comprised of descriptive (ordinary dictionary) words

must acquire secondary meanings in order to become distinctive, otherwise famousness must be made out.<sup>[12]</sup> Even then there is the safe harbor for fair and lawful use of another's trademark in a domain name.<sup>[13]</sup> These balancing requirements are not reflected in the Recommendation—although lip service is paid to them.<sup>[14]</sup> Defined criteria are absent and the promised balance and protection—a blank page open to numerous interpretations.

This Recommendation fails to adequately accommodate non-commercial speech and fair use of trademarks. Presumably what this all really means is that no "sucks" gTLDs (cyber-gripes) will ever be granted, nor indeed notdotcom, or anything that refers to or discusses an association with an existing trademark. Real competition often requires overlapping services that offer consumers choice.<sup>[15]</sup>

### Recommendation 3.

This ground for challenge is for rights holders. The language is vague and overbroad— *"existing legal rights of others."*<sup>[16]</sup>

There is no recognition that trade marks (and other legal rights) have legal limits<sup>[17]</sup>and — *defenses.*<sup>[18]</sup> This Recommendation should also state that *such legal rights are subject to their legal limits* under their own national law. Without this—only half of trade mark law is adopted—the claimed rights, *but none of the defenses.*

After recent discussion and forthcoming revisions, the draft now refers to 'Freedom of Speech'.<sup>[19]</sup> We welcome the amendment to the Recommendation, although believe it should use the term "Freedom of Expression" since that is the term used in international treaties and agreements. We remain concerned however that general references to Conventions and Treaties must be translated into real protection for the right of the public to make use of their legal rights to language and free speech.

Bizarrely, the level of support for the rights-holder seems to be thought to be determining—rather than the validity or extent of his claimed rights and the existence of defences:

"ii. An application may be rejected or deferred if it is determined, based on public comments or otherwise, that there is **substantial opposition** to it from significant established institutions of the economic sector, or cultural or language community, to which it is targeted or which it is intended to support. **ICANN staff will develop criteria and procedures for making this determination**, which may be based upon ICANN's procedures which were used to examine the 2003 round of sponsored TLD applications."

What is provided for here is discretion.<sup>[20]</sup> This (now recommendation #20) cannot be meaningfully considered absent the criteria. We also oppose the *"substantial opposition"* formula—used again elsewhere. This is not predictable criteria and nor in this case is it of any relevance whatsoever to the nature and quality of the rights claimed and the existence of limits and defences. We refer to the objectives of Recommendation 1 and their contradiction with a public opposition period.

### Recommendation 5

We oppose any attempts to create lists of reserved names. Even examples are to be avoided as they can only become prescriptive.

We are concerned that geographic names should not be fenced off from the commons of language and rather should be free for the use of all. This has been the traditional approach of trade mark law and remains the case in many nations.<sup>[21]</sup> Moreover the proposed recommendation does not make allowances for the duplication of geographic names outside the ccTLDs—where the real issues arise and the means of resolving competing concurrent use and fair and nominative use.

### Recommendation 6

Again, we welcome the amendment to include recognition of rights to Freedom of Expression.<sup>[22]</sup> It is quite clear that this applies to single words and to strings, see *Taubman v. Webfeats* 319 F.3d 770 (6th Circuit 2003) ("*The rooftops of our past have evolved into the Internet domain names of our present. We find that the domain name is a type of public expression, no different in scope than a billboard or a pulpit, and [defendant] has a First Amendment right to express his opinion about [plaintiff], as long as his speech is not commercially misleading, the Lanham Act cannot be summoned to prevent it*)."

We welcome the deletion of GAC Public Policy principle 2.1 from the GNSO's recommendations. We objected in the strongest possible terms to the vague standard of "*sensitivities*," which would subject all to the most restrictive views and had no place in the international legal order. GAC quoted selectively from the preamble to the 1948 Universal Declaration of Human Rights (UDHR) without reference to the enumerated specific right to Freedom of Expression in Article 19.<sup>[23]</sup> The UDHR Art. 29(2) provides the only permitted limits.<sup>[24]</sup> Similarly, the European Convention on Human Rights (ECHR) mandates Freedom of Expression should only be subject to limits prescribed by law<sup>[25]</sup> and necessary in a democratic society for one of the enumerated purposes, see Article 10<sup>[26]</sup> which also applies to commercial expression.<sup>[27]</sup> Strict scrutiny is applied to any attempt to limit the free expression of an idea.<sup>[28]</sup>

This Recommendation is borrowed from trade mark law<sup>[29]</sup> and the French concept of '*ordre public*.'<sup>[30]</sup> This is now subject to Article 10 ECHR<sup>[31]</sup> and Freedom of Expression and the modern standard is high.<sup>[32]</sup> While a few nations limit Free Expression by laws preventing hate speech, and incitement to violence, lowering the threshold to '*sensitivities*' is tantamount to mandating political correctness,<sup>[33]</sup> forced hegemony, and is dangerous and to be resisted in every context. It does not matter how laudable the public policy objective, ICANN should remain content neutral.<sup>[34]</sup>

We oppose any string criteria based on morality and public order. The context is not exclusively commercial speech so trade mark law is not an analogy as registration of marks on government Registers involves an element of state sanction<sup>[35]</sup> that is not true of the DNS (though many seek it).<sup>[36]</sup> There is no consensus on the regulation of morality in non-commercial speech in international law. We refer to the quote from *Taubman* (above)—the TLDs are billboards. *Democracies do not have laws requiring people to speak or behave morally*. Some nations do have such rules – undemocratic theocracies mainly.

ICANN should stick to its technical remit, which it risks grossly exceeding here. It should defer to applicable national laws on matters of public order and morality. Applicants should comply with the content laws in the countries in which they operate.<sup>[37]</sup> The only real issue is, in any event, public order which is already served by nations' own laws on obscenity, fighting words, hate speech and incitement.

Please be aware that criticism, satire, parody of others and their beliefs are a fundamental tenant of Freedom of Expression<sup>[38]</sup> which includes the right to offend. ICANN must ensure this *in practice* and mere references to Treaties and Conventions do not go far enough.

#### **Recommendation 7**

We record that this must be limited to transparent, predictable and minimum technical requirements only. These must be published. They must then be adhered to neutrally, fairly and without discrimination.

#### **Recommendation 8**

We support this recommendation to the extent that the criteria is truly limited to minimum financial and organizational operational capability. We remain concerned that in implementation of this recommendation, burdensome, expensive, and unnecessary criteria could be applied. All criteria must be transparent, predictable and minimum. They must be published. They must then be adhered to neutrally, fairly and without discrimination.

**Recommendation 9**

We strongly support this recommendation and again stress the need for all criteria to be limited to minimum operational, financial, and technical considerations. We also stress the need that all evaluation criteria be objective and measurable. We note that a 'public opposition process' as contemplated by Recommendation 20 and the use of ICANN staff and expert panels (Rec. #11) to evaluate any additional criteria will significantly detract from the goals of Recommendation 9.

**Recommendation 11**

The use of ICANN staff to evaluate applicant criteria should be limited to the function of determining whether objective operational, technical, and financial criteria are met only. ICANN staff should not be making evaluations about morality or other public policy objectives. We furthermore strongly oppose any use of "Expert" panels to adjudicate someone's right to use a domain name. Neither ICANN staff nor expert panels can provide any level of public accountability or legitimacy to adjudicate fundamental rights. This will only invite insider lobbying and gaming. Getting this issue right in the policy gives meaning to the rest of the recommendations. Without objectivity, neutrality, impartiality and accountability here –all of the other Recommendations are meaningless platitudes. This function should be tendered out – just as the validation process in the Sunrise Rights Protection Mechanism has been in some cases. Arms length contractors should perform this task.

**Recommendation 12**

Our position in relation to Recommendation 11 applies mutandis mutandi. This should be tendered to qualified professionals, selected by rota, at arms-length who apply certain criteria.

**Recommendation 20**

As discussed above, we strongly oppose the '*substantial opposition*' criteria for rejecting a domain. A public opposition period grants a veto on the creation of a domain for any vocal (or well-financed) minority, or for any competitor in the marketplace of ideas or services.

Recommendation #20 is *totally* incompatible with internationally recognized Freedom of Expression guarantees. Not even trade mark applicants must have everyone agree –they can still succeed in the face of an opposition. This Recommendation will insure that no controversial gtlds will exist and provides the means for killing the following types of applications for new gtlds:

- The Catholic Church objects to the Church of England's application for ".christian";
- China objects to an application of ".humanrights" in Chinese characters;
- A competing bank applies for a ".bank";
- Competing factions within the same community each claim to be the rightful owner;
- The Moral Majority objects to Planned Parenthood's application for ".abortion".

Recommendation 20 swallows up any attempt to narrow the string criteria to technical, operational and financial evaluations. It asks for objections based on entirely subjective and unknowable criteria and for unlimited reasons and by unlimited parties. ICANN should endeavor to keep the core neutral of these types of policy conflicts, both because they invite disaster for ICANN to become entwined in such issues, but also because such a policy is incompatible with freedom of expression rights. In short, Recommendation #20 is bad policy for the public and it is bad policy for ICANN.

**ATTACHMENT A TO NCUC STATEMENT****LEGAL BRIEFING FROM LAW PROFESSOR CHRISTINE HAIGHT FARLEY****Professor of Law and Associate Dean for Faculty and Academic Affairs****American University Washington College of Law****RESPONSE TO THE DRAFT FINAL REPORT OF THE GNSO NEW GTLDS COMMITTEE ON THE INTRODUCTION OF NEW GENERIC TOP-LEVEL DOMAINS****June 6, 2007****Statement by Christine Haight Farley****Professor of law****American University Washington College of Law**

I want to begin by commending the GNSO New TLDs Committee on their policy recommendations and implementation guidelines for the introduction of new top-level domains. Through the Draft Final Report ICANN has explicitly stated its intention to make the GTLD application process open and transparent. The Draft Final Report has focused the issues and prompted a useful discussion. However, because I believe that the Draft Final Report includes a number of misstatements of domestic and international trademark law, I offer my legal analysis of these provisions.

I will address my remarks only to Recommendations 2, 3 and 6 as these recommendations rely heavily on trademark law concepts.

Before I make observations specific to these recommendations, I would like to offer some general remarks about the overall incongruence between trademarks and domain names. It is important to note at the outset this general lack of equivalence between trademark law and domain name policy. For instance, trademark law the world over is fundamentally based on the concept of territoriality. Thus trademark law seeks to protect regionally and market-based marks without implication for the protection or availability of that mark in another region. In contrast, domain names have global reach, are accessible everywhere and have implications for speech around the world.

Likewise, trademark protections hinge on what the relevant consumer thinks. Again, the law considers the viewpoints of consumers of a particular country, region or market, and acknowledges the variability of these viewpoints across regions. Domain names are not directed to a certain class or geographical region of consumers—they are accessible to all. Therefore in order to take account of consumers' viewpoints, it would be necessary to consider a global public. The resulting one-size-fits-all approach would be anathema to trademark law in that it would leave consumers confused in one place while unjustifiably denying speech rights in another.

Finally, trademarks rights are not applied abstractly of in theory, but are always considered in context. Thus, in order to determine whether the use of a mark by another would likely cause confusion, it is necessary to analyze how mark is used in commerce. Consideration will be given to what goods or services it is applied to, what design or color scheme accompanies the use, what the level of consumer sophistication is, what marketing channels are used, etc. Generic top-level domains are necessarily abstract. We can not know in advance what the content of a website hosted at a certain address will be. It is therefore impossible to make fine-tuned conclusions about the appropriateness of certain domains. For these reasons, I strongly urge domain name policy makers to consider carefully the appropriateness of importing trademark law concepts into domain name policy.

**Recommendation 2: "Strings must not be confusingly similar to an existing top-level domain."**

In this recommendation, the Committee seems to be collapsing two distinctly different concepts: confusing similarity and likelihood of confusion. The Draft Final Report states that "'confusingly similar' is used to mean that there is a likelihood of confusion."<sup>[39]</sup> However, confusingly similar is a different legal standard than likelihood of confusion. The Committee appears to base this recommendation on Section 3.7.7.9 of the ICANN Registrar Accreditation Agreement, which it cites, implying that the legal standard is consistent. But that section of the ICANN Agreement explicitly employs the standard of infringement, which is likelihood of confusion.

A determination about whether use of a mark by another is "confusingly similar" is simply a first step in the analysis of infringement. As the committee correctly notes, account will be taken of visual, phonetic and conceptual similarity. But this determination does not end the analysis. Delta Dental and Delta Airlines are confusingly similar, but are not likely to cause confusion, and therefore do not infringe. As U.S. trademark law clearly sets out, the standard for infringement is where the use of a mark is such "as to be likely, when used on or in connection with the goods of such other person, to cause confusion, or to cause mistake, or to deceive..."<sup>[40]</sup> While it may be that most cases of confusing similarity are likely to cause confusion, because the infringement standard takes account of how the mark is used, some cases of confusing similarity will not likely cause confusion.

In trademark law, where there is confusing similarity and the mark is used on similar goods or services, a likelihood of confusion will usually be found. European trademark law recognizes this point perhaps more readily than U.S. trademark law. As a result, sometimes "confusingly similar" is used as shorthand for "likelihood of confusion." However, these concepts must remain distinct in domain name policy where there is no opportunity to consider how the mark is being used. As applied to domain names, the only level of analysis is the first level of analysis: confusing similarity.

A related problem with this recommendation is that it equates domain names with trademarks as legally protectable properties. They are not. Trademarks are legally protected intellectual property because it is believed that the commercial use of a mark by another that is likely to cause confusion would injure consumers. Trademarks are legally protectable intellectual property also because their owners have developed valuable goodwill in the marks. Neither of these conditions of legal protection apply in the case of domain names.

Moreover, it is not clear what consumers would be confused about when encountering a string that is confusingly similar to an existing top-level domain. Because, unlike trademarks, strings are not inherently commercial communication means, it does not follow that consumers would incorrectly assume that the string would indicate source of origin. For example, <http://nmhm.washingtondc.museum/> does not suggest to consumers a connection with [www.museum.com](http://www.museum.com).

Beyond top-level domains, the Draft Final Report states that "strings should not be confusingly similar either to existing top-level domains like .com and .net or to existing trademark and *famous names*."<sup>[41]</sup> The

Draft Final Report notes that the Committee relied on "a wide variety of existing law" to reach this standard. [42] And yet, "famous names" is not a legal category under any trademark law. International trademark law grants rights to "well-known marks"[43] and to "trade names,"[44] and U.S. law grants rights to "famous marks,"[45] but "famous names" seems to be a construct created by the Committee. Clearly, the domain name policy should protect only recognized intellectual property.

**Recommendation 3: "Strings must not infringe the existing legal rights of others that are recognized or enforced under generally accepted and internationally recognized principles of law."**

There are simply too many legally recognized trademarks in the world to make this recommendation workable. The United States alone registers well over 100,000 trademarks each year[46] and there were 1,322,155 active certificates of registration last year. In the United States, state registered trademarks and common law trademarks are also legally recognized. Protected trademarks include generic terms, geographical terms, names, and fanciful words.

**Recommendation 6: "Strings must not be contrary to generally accepted legal norms relating to morality and public order."**

The Committee is correct that a variety of trademark legislation restrict registrations based on some notion of offense or immorality. Unfortunately, the Committee seeks to extend this trademark law concept to domain name policy. This extension is not a natural one and presents many problems in its application.

Where these content restrictions exist in trademark law they are understood as merely restricting the registration of trademarks, not the use of such trademarks. That is, under certain legislation a trademark may be deemed unregistrable but the trademark owner may still use the trademark in commerce and may even have the benefit of legal protection over the trademark. The only restriction is that the trademark owner is denied certain benefits of registration.

The United States has such a content restriction in its trademark law.[47] What saves this legislation from violating the First Amendment is that it is not a restriction on use; it is merely a restriction on certain legal benefits deriving from federal registration. Any restriction of the use of the trademark would need to comply with the First Amendment. For instance, a mark may be restricted from use where it has been found to be obscene. Obscenity is a legal category whose threshold is well above the category of immoral or offensive speech.

The restriction of a generic top-level domain is more akin to the restriction on use than to the restriction on federal trademark registration. Because restricting offensive words in Generic top-level Domains would concomitantly restrict the ability of all speakers, commercial and non-commercial, ICANN should consider legal models outside of trademark law that better address the balance of speech rights.

This recommendation also illustrates the lack of fit between trademark law and domain name policy. Because trademark law is territorial in nature, legal standards reflect the consumer perspectives of the particular state. These standards are thus expected to vary from state to state as the way consumers respond to marks in one state may differ from the way consumers would respond to the same mark in another state. Trademark content restrictions are similar in approach. For instance, under U.S. trademark law, a mark will be refused registration if it is deemed to be scandalous or immoral when considered from the perspective of "a substantial composite of the general public." [48] The "public" is understood to mean the U.S. public. In order to extend this legal standard to domain names it would be necessary to consider a substantial composite of the general public of the entire world. This is obviously an unworkable standard.

Moreover, trademark law standards are always applied in the context of how a consumer would encounter the mark. Thus, the USPTO and the courts consider the entire label, what products or services are sold under the mark and what channels of commerce and marketing will be used. As a result, marks

challenged as being scandalous may in fact be found to have a double entendre.[49] The extension of this trademark law standard to domain name policy thus risks prohibiting words as generic top-level domains that could well be used in inoffensive ways.

A few other observations are in order. First, under U.S. trademark law, in cases of doubt or ambiguity, both the USPTO and the Federal Circuit will pass the mark to publication to give others the opportunity to object. [50] If ICANN finally decides to employ any content restrictions, erring on the side of permitting the speech should be the rule.

Second, the Paris Convention permits rather than requires content restrictions. Article 6*quinquies* of the Paris Convention merely allows a Member state to deny registration to a mark duly registered in another Member state on the grounds of morality or public order.[51] This article makes clear the expectation that a mark may be acceptable in one state, while it is offensive in another. The WTO TRIPS Agreement is silent on content restrictions.[52]

Finally, although some trademarks have been denied registration under U.S. trademark law, this remains a little known or utilized provision of U.S. trademark law. Furthermore, the majority of challenges brought under this provision are brought by third parties and not the USPTO.

Thank you for your consideration.

Respectfully submitted,

**New Top Level Domain Name Introduction Proposals**

**Briefing Paper: Some Legal Issues**

**Professor Jacqueline Lipton**

**June 6, 2007**

## **Background**

I have been asked to prepare a brief legal issues paper for IP Justice, by its Executive Director, Robin Gross. The paper is in respect of ICANN's recent Proposed Recommendations for the introduction of new generic Top Level Domain Names (gTLDs) and the Noncommercial Users' Constituency's (NCUC) suggested amendments to those recommendations.[53]

### **Issues Raised by IP Justice and NCUC (ICANN Recommendations 3, 6, 8, and 11)**

The current ICANN recommendations contemplate that ICANN should implement a process that would accommodate the introduction of new gTLDs that are not currently available to Internet domain name registrants or registries. In its recommendation paper,[54] it contemplates several principles for deciding on strings of characters that may be utilized in a new gTLD. These principles include:

- New strings should not infringe the existing legal rights of others (*Recommendation 3*).
- New strings should not be contrary to generally accepted legal norms relating to morality/public order (*Recommendation 6*).
- Applications for new strings should be rejected or deferred if there is substantial opposition to a relevant string from 'among significant established institutions of the economic sector, or cultural or language community, to which it is targeted or which it is intended to support' (*Recommendation 8*).
- ICANN staff evaluators will make preliminary determinations about applications for new gTLD strings (*Recommendation 11*).

The NCUC and IP Justice have raised particular concerns about aspects of these recommendations.[55] Specifically, they are concerned that some of ICANN's proposals give too much weight to trademark holders' interests without giving sufficient weight to other competing legal interests in words and phrases, such as those arising from legal concepts of free speech.[56] They have also voiced concerns that under Recommendation 6, ICANN may by default be trying to legislate internationally for morality and public order and that this may not be an appropriate burden for ICANN, as opposed to national lawmakers. They raise related concerns with respect to ICANN Recommendations 8 and 11 in the sense that these recommendations focus more on international legal and cultural norms than on the technical capacities and functions of ICANN. Recommendation 8 also raises the specter of censorship in the introduction/use of new gTLDs by bodies that have not been clearly defined in the ICANN proposals. It is also unclear how decisions would be made as to the rejection or deferral of new strings on this basis. Which organizations would be consulted? Whose policies would be applied? What experts, if any, would ICANN consult?

### **ICANN Recommendations 5, 9 and 12**

I would add some similar concerns about the following ICANN recommendations:

- New strings should not include country, territory or place names or words describing countries, territories, languages or peoples in the absence of agreement with relevant governments or public authorities (*Recommendation 5*).
- Applications for new gTLDs must entail a clear and pre-published application process using 'objective' and 'measurable' criteria (*Recommendation 9*).

- Dispute resolution processes must be established prior to the start of the relevant process (*Recommendation 12*).

**Recommendation 5.** This recommendation raises the specter of government censorship or control of particular gTLDs. This may or may not prove to be a problem in practice given the existence of two character country-code top level domains (ccTLDs) within the current system. These ccTLDs have apparently not, to date, created major problems, at least as compared with some of the issues arising under currently available gTLDs. However, it is possible that a new gTLD string pertaining to a country would prove to be more desirable than a corresponding ccTLD and this recommendation may give imbalances of power or control over particular new gTLDs to certain governments or public authorities. In some ways this concern mirrors the concerns of IP Justice and the NCUC about Recommendation 8 to the extent that it is unclear under that recommendation whose policies should be protected in the decision to defer or reject registration of a particular gTLD string. An associated concern with recommendation 5 is that it may not always be clear who is the relevant government or public authority who would need to agree to the use of a particular new gTLD: for example, would all Asian countries have to agree to the use of a '.asia' gTLD and, if so, how should 'Asian country' be defined in this context and who should define it?[57] Moreover, who should decide which 'public authorities' should be consulted about use of particular new gTLDs? How should 'public authority' be defined here?

**Recommendation 9.** This recommendation calls for the use of pre-published 'objective' and 'measurable' criteria in the application process for new gTLDs. It is not clear how ICANN *per se* would establish such criteria. If it is contemplated that ICANN would consult relevant national and international bodies or individuals in discharging this problem, then perhaps this recommendation is not so problematic. However, such a consultation process would likely take a long time and may slow down the introduction of new gTLDs for a considerable period. Such a process would entail: (a) identifying relevant expert bodies; (b) consulting with them on relevant issues: and, (c) translating relevant issues into a set of pre-published objective and measurable criteria for the new gTLD application process. This further assumes that such issues are indeed transferable to objective and measurable criteria.

**Recommendation 12.** Dispute resolution processes may be much more problematic in practice than contemplated by ICANN's recommendation 12. My assumption is that Recommendation 12 refers to simple dispute resolution processes for new gTLDs such as those currently in effect under the Uniform Domain Name Dispute Resolution Policy (UDRP)[58] for some existing gTLDs. The problem here is that dispute resolution processes that take account of multiple legal interests outside commercial trademark interests are not easy in practice. Different jurisdictions, and different bodies within the same jurisdiction, may diverge widely in attitudes and even in laws on free speech, public order etc. Arbitrators under simple UDRP-style dispute resolution processes may not be equipped to handle these kinds of disputes. Dispute resolution procedures may therefore have to be somewhat more complex than is currently contemplated by ICANN if they are to take account of a variety of competing legal interests, rather than merely trademark interests. For example, while there are some things a simple arbitration process can handle well, there are other things that are much more complex and difficult and may need to be turned over to national courts or experts.[59]

### **General Discussion**

It is important to start re-focusing the regulation of the Internet domain name system generally on interests outside of pure trademark interests. The introduction of new gTLDs and the development of processes for introducing them may provide a good opportunity for achieving this goal. However, any attempt to regulate broad policy issues relating to social and cultural norms on speech, public order and morality in domain names will be very difficult for any national or international body or group. ICANN also faces the practical

difficulty that its major area of expertise is technical and functional. It is therefore important for ICANN to clarify what groups, bodies or individuals it might utilize in carrying out future legal and social developments within development of its domain name processes. In particular, ICANN should consider more specifically who to consult in formalizing specific processes for: (a) the introduction of new gTLD strings; (b) establishing dispute resolution procedures for those strings; and, (c) deciding whether the introduction of particular new strings should be deferred or rejected.

It should also be noted at the outset that many of the key problems identified by ICANN, IP Justice and the NCUC reflect legal issues that have arisen in the past with respect to existing gTLDs, although perhaps in slightly different contexts. In other words, the balance between trademark interests and other legitimate interests in Internet domain names, for example, has already proved problematic in situations involving disputes about registration and use of domain names under existing gTLDs (notably .com, .org and .net). Thus, in many ways, the 'balance of interests' questions in the new gTLD debates could be regarded as an extension of unresolved issues under current domain name laws and policies. The addition of new gTLD processes will likely exacerbate existing legal problems. The upside of this is that it may, and hopefully will, provide a new forum for addressing some of these problems.

In my view, it is important to put the debate about new gTLD processes into its historical context in order to properly address the concerns that have been raised here. So please bear with me for a couple of paragraphs while I describe this context and why it is important now. The current framework for regulating disputes relating to '.com', '.net' and '.org' domain names has been focused largely on the protection of commercial trademark holders against cybersquatters.[60] There is little harmonized attention paid to the protection of other legitimate interests in relevant Internet domain names within this framework. This is evidenced in the drafting of the UDRP and the American Anti-Cybersquatting Consumer Protection Act (ACPA).[61] While these regulations do make allowances for 'legitimate interests' in domain names where relevant domain names have not been registered or used in bad faith,[62] they do not set out rules to affirmatively protect non-trademark-based registrations and uses of .com, .org or .net domain names.[63] This is not particularly surprising because it was not the intention behind these rules to do so.

The historical focus on the protection of trademarks against bad faith cybersquatters is understandable within its context. These were key concerns of relevant regulators in the mid to late 1990s when e-commerce was in its infancy, and governments wanted to encourage this new medium of commerce. It was widely thought – although not universally agreed – that bad faith cybersquatting *per se* was a socially wasteful activity that potentially harmed the development of electronic commerce without producing any associated social benefits.[64] There is probably nothing inherently wrong with the UDRP and ACPA in this respect. They did deal with a real world problem and, in many respects, they are now old news. Presumably, this is why debates today about the introduction of new gTLD processes do not dwell on the rules and regulations implemented in 1999. However, those rules and regulations have raised new post-1999 problems that have not yet been addressed in a systematic way.[65]

Issues under the existing domain name system that relate to the balance of trademark interests with other legitimate interests in domain names do include the need to balance trademark interests with interests such as: interests in personal names, cultural and geographic indicators, free speech (including the right to parody, comment on and criticize a trademark holder), other basic human rights, and rights to free and democratic government.[66] ICANN has identified some of these issues in its recommendations. IP Justice and the NCUC have raised concerns about clarification of, as well as appropriate implementation of, ICANN's stated goals here.

The main problem for ICANN in identifying and implementing these kinds of 'interest balancing ideals' is that, as with its administration of existing gTLDs, ICANN's expertise is largely technical and functional. It is not a body staffed with people whose main expertise is to deal with these difficult balances of competing legal and

social interests in multiple societies around the world. Effectively bringing debates about international public order and morality, as well as free speech and human rights generally, into a predominantly technical process comes at a high cost. However, failing to address these issues in a relevant forum also comes at a high cost, as previous and current experiences have shown us.

What is needed at this point is a combination of the following: (1) ensuring that the technical aspects of this process do not somehow become a default proxy to legislate for important and complex national and international social, cultural and legal norms; (2) more clearly identifying bodies or individuals who can appropriately identify and make recommendations on relevant issues within the development of the more technical aspects of the process; and, (3) ensuring that these bodies are brought into the relevant process in time to prevent damage to important legal and social interests. To some extent, that may be what is happening at the moment, but this process may need to be more formalized to avoid exacerbating some of the problems that have arisen in the past under the current domain name system.

### **Conclusions**

The aim of this briefing paper has been to raise awareness of ideas that may be pertinent in the ongoing process to develop new gTLDs. My hope is that this paper generates, or at least facilitates, useful debate in this context. There are, as yet, no clear solutions to many of the problems addressed. We seem to be at a point in the development of the new gTLD processes where it would be useful to more fully identify and discuss relevant legal and social issues, as well as bodies and individuals that may be best suited to advise on them, and ultimately help draft and implement regulations about them where possible. This is an important time in the development of the domain name system and this kind of debate and development would prove extremely useful, particularly in order to avoid some of the practical problems with respect to new gTLDs that are already evident in the administration of domain names registered under existing gTLDs.

Jacqueline D. Lipton, Ph.D.

[1] Available online at: [http://www.ipjustice.org/ICANN/NCUC\\_Comments\\_on\\_New\\_gTLDs.pdf](http://www.ipjustice.org/ICANN/NCUC_Comments_on_New_gTLDs.pdf)

[2] Indeed— one of its refrains is a '*substantial opposition*' formula. This is not rule based predictable criteria.

[3] ICANN should defer to nations' laws on obscenity and not attempt to gold-plate them with unrelated concepts from trade mark law.

[4] This was added to the draft on 7 June 2007 to Recommendation 6.

[5] We note the defensive and cautious approach employed in the discussion on this recommendation is symptomatic of the suspicion with which the creation of new a gTLD has historically been approached— as the grant of an indulgence. This has led to the artificial scarcity of today.

[6] We also welcome standard contracts albeit that we believe that everyone would be also served by stronger analysis and recommendations on standardization in Rights Protection Mechanisms.

[7] G. Dinwoodie, *(National) Trademark Laws and the (Non National) Domain Name System*, 21 U. PA. J. Int'l Econ. L. 495 (2000) p. 520.

[8] Those include the requirements that marks be well-known or famous before dilution can be claimed; the limits to dilution, the requirement that the speech must be commercial and the infringing use— use as a trade mark, the prohibition on generic and descriptive marks; honest concurrent use; geographic and territorial limits and others.

[9] It says in (iii)"In addition, the concept of "confusingly similar" is used to mean that there is a likelihood of confusion on the part of the relevant public. In international trade mark law, confusion may be visual, phonetic or conceptual. The Committee used a wide variety of existing law to come to some agreement that strings should not be confusingly similar either to existing top-level domains like .com and .net or to existing trademark and famous names"

[10] The pre 7 June draft, referred to consumer confidence and security. These have now gone. No criteria replace them to provide any qualifications.

[11] See §10(6) of the UK 1994 Trade Marks Act 1994 which requires use in the course of trade for infringement. See also Art. 5 of the Trade Marks Directive (89/104). In *Arsenal Football Club v Matthew Reed* [2003] R.P.C. 9 the ECJ affirmed the proprietor cannot prohibit the use of a sign identical to the trade mark for goods also identical, if that use cannot affect his interests as proprietor having regard to its functions—so that certain uses for purely descriptive purposes are excluded from the scope of Art. 5(1). This includes use creating the impression of a link in trade, so that the use must be in the course of trade and in relation to goods within Art. 5(1). If there is identity of sign and goods or services, the protection under Art.5(1) (a) is absolute, whereas Art.5(1) (b) also requires a likelihood of confusion, see *Anheuser-Busch v Budejovicky Budvar NP* Case C -245/02 [2005] E.T.M.R 27. See also §10(6) which enables comparative advertising —also permitted by Directive (97/55/EC)—but also reference to and identification of genuine goods and services of the proprietor provided honest. See Lanham Act, 15 U.S.C. §1114(1)(a) which defines infringement as use of "a registered mark in connection with the sale, offering for sale, distribution, or advertising of any goods or services or in connection with which such use is likely to cause confusion, or to cause mistake, or to deceive...". Further under the Federal Trademark Dilution Act (FTDA) a claimant alleging a violation must prove inter alia: " the defendant is making a commercial use of the mark in commerce." The Anticybersquatting Consumer Protection Act 1999 (ACPA) requires bad faith *intent to profit*. See *Taubman v. Webfeats* 319 F.3d 770 (6th Circuit 2003) ("The Lanham Act is constitutional because it only regulates commercial speech, which is entitled to reduced protections under the First Amendment" many expressions of a mark were not a 'trademark use' and not likely to cause confusion and therefore "outside the jurisdiction of the Lanham Act and necessarily protected by the First Amendment."). See *Bosley Med. Inst. v. Kremer*, 403 F.3d 672 (9th Cir. 2005)(non-commercial expression of opinion was not a "trademark use" subject to regulation by the mark holder). See also *1-800 Contacts v. WhenU.com* 414 F3d 400 (2d Cir. 2005), (the vast majority of uses were outside the scope of trademark law and only those specific uses visually associated with the sale of goods/services could be regulated by trademark).

[12] The following factors are to be considered in relation to distinctiveness and famousness under 15 U.S.C. §1125(c)(1): (A) the degree of inherent or acquired distinctiveness of the mark; (B)the duration and extend of use of the mark in connection with the goods or services with which the mark is used; (C)the duration and

extent of advertising and publicity of the mark; (D)the geographical extent of the trading area in which the mark is used; (E)the channels of trade for the goods and services with which the mark is used; (F) the degree of recognition of the mark in the trading areas and the channels of trade used by the marks' owner and the person against whom the injunction is sought; (G)the nature and extent of use of the same or similar marks by third parties; and (H) the Act by which it was registered.

[13] 15 U.S.C. §1125(B)(ii).

[14] See (ix) *"The proposed implementation plan deals with a comprehensive range of potentially controversial (for whatever reason) string applications which balances the need for reasonable protection of existing legal rights and the capacity to innovate with new uses for top level domains that may be attractive to a wide range of users"* In fact –this claimed balance is entirely absent. We can only assume it refers to implementation guideline 6 *"ICANN will provide for the ability to settle conflicts between applicants (such as string contention) at any time. A defined mechanism and a certain period for resolution of identified conflicts will be provided."*

[15] Muller & McKnight, *The Post .com Internet*, (2003) at p. 11, [www.digital-convergence.info](http://www.digital-convergence.info).

[16] Prior to 7 June, it also employed *"prior third party rights"* and gave the examples of trade marks and rights in names and acronyms of inter-governmental organizations.

[17] E.g.—commercial use; geographic and territorial limits; the Nice Classification system for classes; requirements of true fame for dilution.

[18] E.g. fair use; genericness/descriptiveness; honest concurrent use; own name; invalidity; deceptiveness, geography, etc.

[19] We would also like to see recognition of the rights of all to the commons of language. These include but are not limited to the rights of the public to free speech and to use descriptive and generic words, including where permitted by the law of the nation state where they reside, to use words which may be subject to Legal Rights in particular classes of the Nice Classification System—outside those classes. In relation to unregistered Legal Rights, they include the right to use words that are not subject to protection in their nation state or where no goodwill or reputation arises in their nation state in relation to such a word. They include the right to make fair and legitimate use of words in which others may claim Legal Rights. Trade mark law does this—via the limits, and the highly sophisticated compromises in the defenses.

[20] Further, it continues: iii. There are a number of ways in which ICANN could approach the resolution of this type of problem which includes the full range of "ICANN saying nothing; ICANN identifies a possible issuing and ICANN files a complaint; ICANN identifies a possible issue but relies on a complainant to file it formally; ICANN identifies an issue, makes a decision and the applicant can appeal." iv. The final approach to this set of potentially controversial problems will be resolved through ongoing discussions with members of the Committee and ICANN's implementation team. This is Byzantine and esoteric. To the uninitiated it is also meaningless. To the initiated it represents the ability to lobby against a particular application. We refer the Council to the admirable aims expressed in Recommendation 1.

[21] The UK 1994 Trade Marks Act provides at §3(1)(c) that trade marks which consist exclusively of signs or designations which serve to indicate geographical origin should not be registered and the ECJ has interpreted this as requiring that geographical names which are liable to be used as undertakings must remain available to such undertakings as indications of the geographical origin of the category of goods concerned, see *Windsurfing Chiemsee* [1999] ETMR 585. See however the European Regulation 2081/92 on the Protection of Geographical Indications and Designations of Origin for Agricultural Products and Foodstuffs, as amended by Regulation 535/97, which allows protections for these products.

[22] This change was made on 7 June 2007.

[23] "Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers."

[24] " (2) *In the exercise of his rights and freedoms, everyone shall be subject only to such limitations **as are determined by law solely for the purpose** of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society.*"

[25] This binds all in the UK because it binds the courts who must interpret all law in accordance with it, §6 Human Rights Act 1998.

[26] "(1) Everyone has the right to freedom of expression. This right shall include freedom to hold opinions and to receive and impart information and ideas without interference by public authority and regardless of frontiers...(2) The exercise of these freedoms, since it carries with it duties and responsibilities, *may be subject to such formalities, conditions, restrictions or penalties as are prescribed by law and are necessary in a democratic society*, in the interests of national security, territorial integrity or public safety, for the prevention of disorder or crime, for the protection of health or morals, for the protection of the reputation or rights of others, for preventing the disclosure of information received in confidence, or for maintaining the authority and impartiality of the judiciary."

[27] See *Casado Coca v Spain* (1994) 18 EHRR 1 §§33-37

[28] Art 10's limitations must be justified by objectives in the public interest, in so far as those derogations are in accordance with the law, motivated by one or more of the legitimate aims under those provisions and necessary in a democratic society, that is to say justified by a pressing social need and, in particular, proportionate to the legitimate aim pursued, see Case C-112/00 *Schmidberger Internationale Transporte und Planzuge v Austria* [2003] 2 CMLR 34, p.1043.

[29] Art. 6 quinquies, paragraph B3 of the Paris Convention of 20 March 1883 (as last revised at Stockholm on 14 July 1967) provides for refusal and invalidity of registration in relation to trade marks that are 'contrary to morality or public order'. See Art. 7(1)(f) of the Community Trade Mark Regulation and Art. 3(1)(f) of the Trade Marks Directive. In the UK §3(3)(a) of the Trade Marks Act 1994, trade marks shall not be registered if they are 'contrary to public policy or accepted principles of morality'.

[30] *Philips Electronics NV v Remington Consumer Products* [1998] RPC 283 at 310 per Jacob J. See also the use of the words 'contrary to ... public order' in the English text of Article 6 quinquies of the Paris Convention and the words 'qui sont contraires à l'ordre public' in the French language versions of Article 7(1) (f) of the Community Trade Mark Regulation and Article 3(1)(f) of the Trade Marks Directive.

[31] This is treated as falling within prevention of disorder as the relevant enumerated purpose. That is, by accommodating the concept of '*ordre public*' within the '*prevention of disorder*' (in the French text of the Convention '*à la défense de l'ordre*') under Article 10. However, the right to freedom of expression predominates and any real doubt as to the applicability of the objection must be resolved by upholding the right to freedom of expression, hence acceptability for registration.

[32] See Case R 111/2002-4 *Dick Lexic Limited's Application* (25 March 2003) the Fourth Board of Appeal of the Community Trade Marks Office at §9 "these words merely designate things but they do not transmit any message; secondly, the association of the two words does not necessarily reinforce the connotation of the mark.... In principle, the mark does not proclaim an opinion, **it contains no incitement, and conveys no**

*insult*. In the Board's opinion, in these circumstances, the mark should not be regarded as contrary to either public policy or accepted principles of morality." See also IN THE MATTER OF Application No. 2376955, to register a trade mark in classes 25 & 26 by Sporting Kicks Ltd, Decision by C Hamilton 11 November 2005 where the level was a badge of antagonism and likely to cause alarm or distress.

[33] The only measure we are aware of is the Additional Protocol (to the European Convention on Cybercrime) concerning the Criminalization of Acts of a Racist and Xenophobic Nature Committed Through Computer Systems in force in 2006. The US did not sign or ratify due to its conflict with First Amendment Free Speech and nor did the UK.

[34] In *Reno v. American Civil Liberties Union*, 117 St. Ct. 2329 not even the legitimate and important congressional goal of protecting children from harmful materials, was to abridge the freedom of speech protected by the First Amendment.

[35] For the US position see, *Moral Intervention in the Trademark Arena: Barring the Registration of Scandalous and Immoral Trademarks* (1993) 83 TMR 661 by Stephen R. Baird

[36] Further, trade mark laws are territorially limited and ccTLDs are premised on the assumption that a nation is monocultural with a unitary legal system and a generally accepted standard of morality and taste often with only one or two dominant religions. No such standards can be extrapolated globally in a multicultural context.

[37] If the proposed name would infringe **a law** in a nation state which objects to the application—the application could be granted with conditions restricting or preventing its use in the objecting state(s) which we understand is technically possible. This would prevent one State imposing its laws on others.

[38] We refer to the Parliamentary Assembly of the Council of Europe Resolution 1510 (2006) on Freedom of Expression and Respect for Religious Beliefs: "10. *Human rights and fundamental freedoms are universally recognized, in particular under the Universal Declaration of Human Rights and international covenants of the United Nations. The application of these rights is not, however, universally coherent. **The Assembly should fight against any lowering of these standards**.....* 11.. *What is likely to cause substantial offence to persons of a particular religious persuasion will vary significantly from time to time and from place to place.* 12. *The Assembly is of the opinion that freedom of expression as protected under Article 10 of the European Convention on Human Rights **should not be further restricted to meet increasing sensitivities of certain religious groups**. At the same time, the Assembly emphasises that hate speech against any religious group is not compatible with the fundamental rights and freedoms guaranteed by the European Convention on Human Rights and the case law of the European Court of Human Rights."*

[53] Available at <http://www.ipjustice.org/ICANN/062007.html>, last viewed on June 5, 2007.

[54] Available at <http://www.ipjustice.org/ICANN/GNSORecomOverview11May2007.htm>, last viewed on June 5, 2007.

[55] These concerns are voiced at on IP Justice's website in NCUC's Recommended Amendments to the ICANN proposals: <http://www.ipjustice.org/ICANN/062007.html>, last viewed on June 5, 2007.

[56] See for example recommendation 3 which specifically mentions 'trademark' rights under the original ICANN proposal, but would additionally include free expression rights under the suggested NCUC amendments.

[57] In Australia, for example, 'Asia' colloquially tends to refer to Asia-Pacific countries such as Malaysia, Thailand, Indonesia etc, while in the United Kingdom, the term is more likely to be used to refer to countries such as India and Pakistan, with the term 'oriental' often reserved for Asia-Pacific countries.

[58] Full text available at: <http://www.icann.org/udrp/udrp-policy-24oct99.htm>, last viewed on June 6, 2007.

[59] For example, an arbitrator can generally quite easily tell if a domain name has been registered for a socially wasteful purpose (eg registering a domain name and offering it up for sale without using the relevant website for any other purpose). This can be established by simply looking at the website and probably comes under a heading like 'socially wasteful bad faith cybersquatting'. However, if the relevant website contains some content and is being used in some way to communicate a message – whether complimentary or not - about an associated trademark holder or other entity, it is much more difficult for an

arbitrator to establish respective rights and interests in the relevant domain name. This kind of situation (eg unauthorized fan website, unauthorized political commentary, unauthorized gripe site or parody site about a trademark holder) will entail balancing free speech interests against the legal rights of the complainant. Those legal rights themselves may be based in a variety of laws such as trademark, privacy, unfair competition etc. Any dispute resolution mechanism that truly attempts to balance these interests effectively, either in an existing domain space or with respect to an application to register a new gTLD, is going to have to be a lot more complex than existing systems like the UDRP. The question is how to establish such a system and who should administer it. ICANN may not be best charged with this function at the end of the day. See also discussion in Conclusion section of: Jacqueline Lipton, *Who Owns 'Hillary.com'? Political Speech and the First Amendment in Cyberspace*, Boston College Law Review, (forthcoming, spring 2008), draft available at: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=982430](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=982430).

[60] "Cybersquatting, according to the United States federal law known as the Anti-Cybersquatting Consumer Protection Act, is registering, trafficking in, or using a domain name with bad-faith intent to profit from the goodwill of a trademark belonging to someone else. The cybersquatter then offers to sell the domain to the person or company who owns a trademark contained within the name at an inflated price." (definition from Wikipedia, available at: <http://en.wikipedia.org/wiki/Cybersquatting>, last viewed on June 6, 2007).

[61] 15 U.S.C. § 1125(d).

[62] 15 U.S.C. § 1125(d)(1)(B)(ii); UDRP, para. 4(c).

[63] With the exception of 15 U.S.C. § 1129 from the ACPA which does protect personal names against bad faith cybersquatters regardless of trademark status.

[64] See, for example, discussion in Jacqueline Lipton, *Beyond Cybersquatting: Taking Domain Name Disputes Past Trademark Policy*, 40 Wake Forest Law Review 1361, 1369-1371 (2005) (full text available at: <http://www.law.wfu.edu/prebuilt/w08-lipton.pdf>, last viewed on June 5, 2007). The most cited example of traditional cybersquatting is probably the case of Dennis Toeppen who registered reportedly around 100 domain names corresponding with well known marks in the hope of making significant amounts of money for transfer of the names to relevant trademark holders. Today, Toeppen chronicles his own story at: <http://www.toeppen.com/>, last viewed on June 5, 2007. Many have written about conduct such as Toeppen's and about its place in the development of the current gTLD regulation system. For a summary of these legal developments in the late 1990s and more detail on the concerns I raise here, see: Jacqueline Lipton, *Beyond Cybersquatting: Taking Domain Name Disputes Past Trademark Policy*, 40 Wake Forest Law Review 1361 (2005) (full text available at: <http://www.law.wfu.edu/prebuilt/w08-lipton.pdf>, last viewed on June 5, 2007).

[65] Despite some attempts to refer certain issues to the World Intellectual Property Organization ('WIPO'): for example, the need to balance trademark interests against interests in personal names and geographic and cultural indicators. These issues are discussed in the Second WIPO Internet Domain Name Process, Chapters 5-6, available in full text at: <http://www.wipo.int/amc/en/processes/process2/report/html/report.html>, last viewed on June 5, 2007.

[66] I have written previously, and in detail, about many of these issues in the following articles: Jacqueline Lipton, *Beyond Cybersquatting: Taking Domain Name Disputes Past Trademark Policy*, 40 Wake Forest Law Review 1361 (2005) (full text available at: <http://www.law.wfu.edu/prebuilt/w08-lipton.pdf>); Jacqueline Lipton, *Commerce vs Commentary: Gripe Sites, Parody and the First Amendment in Cyberspace*, Washington University Law Review (forthcoming, summer 2007), draft available at: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=925691](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=925691); Jacqueline Lipton, *Who Owns 'Hillary.com'? Political Speech and the First Amendment in Cyberspace*, Boston College Law Review, (forthcoming, spring 2008), draft available at: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=982430](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=982430).

## Impact Statement of the Registrars Constituency

### Regarding the Draft Final Report on the

### Introduction of New Generic Top-Level Domains

July 4, 2007

---

Recommendation 1	ICANN must implement a process that allows the introduction of new top-level domains.	IMPACT: New gTLDs present an opportunity to Registrars in the form of additional products and associated services to offer to its customers. However, that opportunity comes with the costs of implementing the new gTLDs as well as the efforts required to do the appropriate business analysis to determine which of the new gTLDs are appropriate for its particular business model.
Recommendation 2	Strings must not be confusingly similar[15] to an existing top-level domain.	IMPACT: Registrars would likely be hesitant to offer confusingly similar gTLDs due to customer service and support concerns. On the other hand, applying the concept too broadly would inhibit gTLD applicants and ultimately limit choice to Registrars and their customers.
Recommendation 3	Strings must not infringe the existing legal rights of others that are recognized or enforceable under generally accepted and internationally recognized principles of law.	IMPACT: Very little direct impact.
Recommendation 4	Strings must not cause any technical instability.	IMPACT: This is important to Registrars in that unstable registry and/or zone operations would have

---

a serious and costly impact on its operations and customer service and support.

Recommendation 5	Strings must not be a Reserved Word.	IMPACT: Depends on what Words are reserved and what, if any, the process is for adding Words to the reserved list. If applied too broadly it would inhibit gTLD applicants and ultimately limit choice to Registrars and their customers.
Recommendation 6	Strings must not be contrary to generally accepted legal norms relating to morality and public order.	IMPACT: If applied too broadly it would inhibit gTLD applicants and ultimately limit choice to Registrars and their customers.
Recommendation 7	Applicants must be able to demonstrate their technical capability to run a registry operation.	IMPACT: This is very important to Registrars in that inefficient registry operations would have a serious and costly impact on its operations and customer service and support. Minimum technical requirements should be applied, but not to the extent that it inhibits new entrants.
Recommendation 8	Applicants must be able to demonstrate their financial and organisational operational capability.	IMPACT: This is important to Registrars insofar as it might impact stable operations of the registry and/or zone. However, only minimal requirements should be applied so as not to inhibit new entrants or an open market.
Recommendation 9	There must be a clear and pre-published application process using objective and measurable criteria.	IMPACT: Important in that clear, objective, and measurable criteria will encourage applicants resulting

in more choice for Registrars and their customers.

Recommendation 10	There must be a base contract provided to applicants at the beginning of the application process.	IMPACT: This would benefit Registrars in that they would have a clear understanding of the policies and operational rules that will impact their and their customers' relationships with Registry Operators.
Recommendation 11	Staff Evaluators will be used to make preliminary determinations about applications as part of a process which includes the use of expert panels to make decisions.	IMPACT: Very little direct impact assuming that costs are recouped from application fees and not increases in Registrar fees.[AK1]
Recommendation 12	Dispute resolution and challenge processes must be established prior to the start of the process.	IMPACT: Very little direct impact assuming that costs are recouped from application fees and not increases in Registrar fees.
Recommendation 13	Applications must initially be assessed in rounds until the scale of demand is clear and there is a reduction to zero of applications for the same string.	IMPACT: Very little direct impact assuming that costs are recouped from application fees and not increases in Registrar fees.
Recommendation 14	The initial registry agreement term must be of a commercially reasonable length.	IMPACT: Same as for Recommendation 10.
Recommendation 15	There must be renewal expectancy.	IMPACT: Same as for Recommendation 10, except that this must also be qualified with clear

and reasonable termination provisions.

Recommendation 16	Registries must apply existing Consensus Policies[16] and adopt new Consensus Polices as they are approved.	IMPACT: Same as for Recommendation 10.
Recommendation 17	A clear compliance and sanctions process must be set out in the base contract which could lead to contract termination.	IMPACT: Same as for Recommendation 10.
Recommendation 18	If an applicant offers an IDN service, then ICANN's IDN guidelines[17] must be followed.	IMPACT: Creates a stable and consistent experience for Registrars and their customers, reducing the cost of implementation, operations, and customer service and support.
Recommendation 19	Registries must use ICANN accredited registrars.[AK2]	IMPACT: Registrars support this requirement that registries provide domain names only through ICANN-accredited registrars. Registrars have invested considerable resources to establish themselves under the Accreditation paradigm and are governed by ICANN's contract and policies. Permitting the use of non-ICANN accredited registrars would threaten the security and stability of the DNS, as ICANN would have no contract with – and therefore no control over – the providers or their activities. Allowing the use on non-accredited registrars or allowing Registries to offer registration services direct to consumers also would place accredited registrars at a competitive disadvantage as they

are required to follow certain ICANN-imposed requirements. Similarly, permitting registries to sell directly to consumers would place registrars at an unfair advantage and create certain antitrust concerns. Recent events have made it clear that some improvements to the Accreditation process may be warranted, but overall it has worked well in creating competition, reducing costs to consumers, and improving the quality of services offered.

---

Recommendation 20	<p>An application will be rejected if it is determined, based on public comments or otherwise, that</p> <p>there is substantial opposition to it from among significant established institutions of the economic sector, or cultural or language community, to which it is targeted or which it is intended to support.</p>	Very little direct impact
-------------------	---	---------------------------

### **Impact Statement from the gTLD Registry Constituency regarding the Introduction of New gTLDs 6 June 2007**

With regard to the GNSO Dec05 PDP (Introduction of New gTLDs) and in response to the requirement in the ICANN Bylaws Annex A (GNSO Policy-Development Process) for the GNSO Council to provide to the ICANN Board "(a)n analysis of how the issue would affect each constituency, including any financial impact on the constituency", the gTLD Registry Constituency (RyC) hereby provides the following information.

#### 1. General Impact on the RyC

The introduction of new gTLDs directly impacts members of the RyC and the constituency as a whole by:

1. Increasing competition for existing gTLD registries
2. Enlarging the potential members of the RyC
3. Expanding the diversity of the RyC.

Regarding increased competition, the RyC has consistently supported the introduction of new gTLDs because we believe that:

- There is clear demand for new gTLDs
- Competition creates more choices for potential registrants
- Introducing TLDs with different purposes increases the public benefit
- New gTLDs will result in creativity and differentiation in the domain name industry
- The total market for all TLDs, new and old, will be expanded.

In the RyC consensus statement submitted at the beginning of the New gTLD PDP, we listed the following specific benefits of new gTLDs:

- Added choices for Internet users, not only in terms of the ability to obtain a domain name registration in a given new TLD, but also in terms of security options, trust features, use policies, and other innovative factors that vary by registry operator or sponsor
- Expansion of Internet usage through the market development efforts of new and existing providers of registry services
- Opportunity to test user demand for specific TLDs
- Particularly in case of TLDs with a focused and defined community, opportunity to develop a resource that best serves the needs of that community while providing intrinsic value to all internet users.

With regard to potentially enlarging the potential member base of the RyC and expanding the diversity of the RyC, we believe that this could have both negative and positive consequences. The RyC started out with one member, later expanded to eight members, then nine, and now has 15 members plus one pending member. Doing business as a constituency in some ways is much easier with a smaller number of members, so as the constituency continues to grow it can be expected that participating in the GNSO will become more complicated for the RyC. Attempting to reach consensus positions as part of the policy development process will sometimes be more difficult. On the other hand, as the RyC membership has increased, the diversity of ideas and varied experiences of constituency members have expanded and thereby broadened the perspective of the entire membership. We believe that the challenges that come with a larger membership are manageable and are worth the benefits that come from new ideas and different points of view.

## 2. Financial Impact on the RyC

The financial impact on the RyC may best be divided into two categories: impact on RyC members and impact on the Constituency as a whole.

The financial impact on individual gTLD registry operators and sponsors will vary depending on many factors such as, but not limited to, the following: 1) whether or not they are involved in any new gTLDs; 2) what effects increased competition has on their current business; 3) the extent to which they may be able to

leverage the investments they have made in their existing business model into new opportunities; 4) their ability to market their offerings in an expanded market; and 5) any changes in RyC fees as a consequence of increased membership and/or changes in expenses.

The financial impacts on the Constituency as a whole will be dependent on how many new members join the RyC and whether or not Constituency expenses grow in proportion to membership size or possibly can be used more effectively. At this point in time, the RyC believes that the financial impact on the RyC may be neutral. Some expenses may increase as the membership grows (e.g., Secretariat costs, luncheon meetings with the Board during ICANN meetings); other expenses may remain constant or rise at a rate that is lower than the membership growth. Regardless, the Constituency will have the ability to adjust RyC member fees up or down as needed to accommodate actual expenses approved by the membership.

### 3. Impact of Selected New gTLD Recommendations on the RyC

Recommendations included in the Draft Final New gTLD PDP Report that may have impact on the RyC and/or its members are listed below in italic font followed by discussion of possible impacts.

#### Recommendation 2

*Strings must not be confusingly similar to an existing top-level domain.*

This recommendation is especially important to the RyC. At least one gTLD registry has already received a customer service call that demonstrates user confusion with regard to an IDN version of an existing gTLD using an alternate root. It is of prime concern for the RyC that the introduction of new gTLDs results in a ubiquitous experience for Internet users that minimizes user confusion. gTLD registries will be impacted operationally and financially if new gTLDs are introduced that create confusion with currently existing gTLD strings or with strings that are introduced in the future.

There is strong possibility of significant impact on gTLD registries if IDN versions of existing ASCII gTLDs are introduced by registries different than the ASCII gTLD registries. Not only could there be user confusion in both email and web applications, but dispute resolution processes could be greatly complicated.

It is also critical to remember that there are several hundred thousand domain name registrants who have registered IDN domain names at the second level in existing gTLDs who would likely desire in most cases to expand their IDN registration at the top level. If confusingly similar versions of existing gTLDs are introduced, would those registrants have to defensively register their names in the new gTLDs? If so, that could have large impact on those gTLD registries that have in good faith introduced IDN second-level domain names in response to user demand from the non-English speaking Internet community.

#### Recommendation 9

There must be a clear and pre-published application process using objective and measurable criteria.

This recommendation is of major importance to the RyC because the majority of constituency members incurred unnecessarily high costs in previous rounds of new gTLD introductions as a result of excessively long time periods from application submittal until they were able to start their business. We believe that a significant part of the delays were related to selection criteria and processes that were too subjective and not very measurable. It is critical in our opinion that the process for the introduction of new gTLDs be predictable in terms of evaluation requirements and timeframes so that new applicants can properly scope their costs and develop reliable implementation plans.

There is nothing that can be done now to correct the flaws in previous new gTLD rounds, but on behalf of new organizations that may consider applying and potentially become members of the RyC, we strongly support this recommendation and firmly believe that it has the chance of reducing the impact on them.

#### Recommendation 10

There must be a base contract provided to applicants at the beginning of the application process.

Like the comments for Recommendation 9, we believe that this recommendation will facilitate a more cost-effective and timely application process and thereby minimize the negative impacts of a process that is less well-defined and objective. Having a clear understanding of base contractual requirements is essential for a new gTLD applicant in developing a complete business plan.

#### Recommendations 14 and 15

The initial registry agreement term must be of a commercially reasonable length.

There must be renewal expectancy.

The members of the RyC have learned first hand that operating a registry in a secure and stable manner is a capital intensive venture. Extensive infrastructure is needed both for redundant registrations systems and global domain name constellations. Even the most successful registries have taken many years to recoup their initial investment costs. The RyC is convinced that these two recommendations will make it easier for new applicants to raise the initial capital necessary and to continue to make investments needed to ensure the level of service expected by registrants and users of their TLDs.

These two recommendations will have a very positive impact on new gTLD registries and in turn on the quality of the service they will be able to provide to the Internet community.

#### Recommendation 19

Registries must use ICANN accredited registrars.

The RyC has no problem with this recommendation for larger gTLDs; the requirement to use accredited registrars has worked well for them. But it has not always worked as well for very small, specialized gTLDs. The possible impact on the latter is that they can be at the mercy of registrars for whom there is not good business reason to devote resources.

In the New gTLD PDP, it was noted that this requirement would be less of a problem if the impacted registry would become a registrar for its own TLD, with appropriate controls in place. The RyC agrees with this line of reasoning but current registry agreements forbid registries from doing this. Dialog with the Registrars Constituency on this topic was initiated and is ongoing, the goal being to mutually agree on terms that could be presented for consideration and might provide a workable solution.

### Call for papers -- Policy Development for introduction of new gTLDs

3 January 2006

The GNSO Council has voted to launch a Policy Development Process on new gTLDs and to establish a work program in consultation with the ICANN staff and the Board. As part of this process, the GNSO Council has extended the public comment process until January 31, 2006 (see <http://www.icann.org/announcements/announcement-06dec05.htm> (<http://www.icann.org/announcements/announcement-06dec05.htm>)). In addition, in order to inform the recently launched Policy Development

**Recent Announcements**

[ICANN Request for Proposal: Middle East Domain Name Industry Study 2023](#)

Process on new gTLDs, the GNSO is inviting organizations and individuals to submit substantive papers on the issue areas identified in the Terms of Reference for this PDP:

**1. Should new generic top-level domain names be introduced?**

Given the information provided here and any other relevant information available to the GNSO, the GNSO should assess whether there is sufficient support within the Internet community to enable the introduction of new top-level domains. If this is the case the following additional terms of reference are applicable.

**2. Selection Criteria for New Top-Level Domains**

- (a) Taking into account the existing selection criteria from previous top-level domain application processes and relevant criteria in registry services reallocations, develop modified or new criteria that specifically address ICANN's goals of expanding the use and usability of the Internet. In particular, examine ways in which the allocation of new top-level domains can meet demands for broader use of the Internet in developing countries.
- (b) Examine whether preferential selection criteria (e.g. sponsored) could be developed which would encourage new and innovative ways of addressing the needs of Internet users.
- (c) Examine whether additional criteria need to be developed which address ICANN's goals of ensuring the security and stability of the Internet.

**3. Allocation Methods for New Top-Level Domains**

- (a) Using the experience gained in previous rounds, develop allocation methods for selecting new top-level domain names.
- (b) Examine the full range of allocation methods including auctions, ballots, first-come / first-served and comparative evaluations to determine the methods of allocation that best enhance user choice while not compromising predictability and stability.
- (c) Examine how allocation methods could be used to achieve ICANN's goals of fostering competition in domain name registration services and encouraging a diverse range of registry services providers.

**4. Policy to Guide Contractual Conditions for New Top-Level Domains**

Subscribe (https://subscribe.icann.)

(a) Using the experience of previous rounds of top-level domain name application processes and the recent amendments to registry services agreements, develop policies to guide the contractual criteria which are publicly available prior to any application rounds.

(b) Determine what policies are necessary to provide security and stability of registry services.

(c) Determine appropriate policies to guide a contractual compliance program for registry services.

The purpose of this additional request for substantive contributions is to gather detailed input from experts, interested parties and individuals to inform the policy development process. Submitters of papers should address the topics or sub-topics related to the above areas and should provide reasoned background analysis and references for statements expressed. Contributions can be submitted until 31 January 2006 as text documents and/or as PowerPoint presentations to the GNSO Secretariat by email to [gns.secretariat@gns.icann.org](mailto:gns.secretariat@gns.icann.org) (<mailto:gns.secretariat@gns.icann.org>). Received papers will be considered for oral presentations to the GNSO Council during February 2006, via scheduled conference calls with the GNSO Council.

### Minutes | Regular Meeting of the Board | 31 March 2006

A regular meeting of the ICANN Board of Directors was held in Wellington, New Zealand on 31 March 2006, and was called to order shortly after 8:30 a.m. local time.

Chairman Vinton G. Cerf presided over the entire meeting. The following other Board Directors participated in all or part of the meeting: Raimundo Beca, Susan Crawford, Mouhamet Diop, Demi Getschko, Hagen Hultzs, Joichi Ito, Veni Markovski, Alejandro Pisanty, Hualin Qian, Njeri Rionge, Vanda Scartezini, Peter Dengage Thrush and Paul Twomey.

Liaisons present included Steve Crocker (SSAC), Daniel Dardailler (TLG), Roberto Gaetano (ALAC), Thomas Narten (IETF), Mohamed Sharil Tarmizi (GAC), and Suzanne Woolf (RSSAC). John Jeffrey, General Counsel and Board Secretary, was also present. Other staff present included Kurt Pritz, Vice President, Business Operations, and Daniel Halloran, Deputy General Counsel.

The entire meeting was held in public and was streamed in video on the Internet. Also, a real-time transcription was posted on the ICANN website following the meeting, and is available at <  
<http://www.icann.org/tlds/agreements/xxx/proposed-xxx-agmt-09aug05.pdf>>.

### **ICM Registry sTLD Application**

Veni Markovski introduced a resolution, seconded by Hagen Hultzsich:

Whereas, on 1 June 2005, the ICANN Board authorized the President and General Counsel to enter into negotiations with ICM Registry LLC relating to proposed commercial and technical terms for the .XXX sponsored top-level domain.

Whereas, on 9 August 2005, the proposed .XXX sponsored TLD registry agreement was posted on the ICANN website <<http://www.icann.org/tlds/agreements/xxx/proposed-xxx-agmt-09aug05.pdf> (<http://www.icann.org/tlds/agreements/xxx/proposed-xxx-agmt-09aug05.pdf>)> and submitted to the ICANN Board for approval.

Whereas, on 15 September 2005, the ICANN Board directed staff to discuss possible additional contractual provisions or modifications for inclusion in the .XXX Registry Agreement, to ensure that there are effective provisions requiring development and implementation of policies consistent with the principles in the ICM application, and to return to the board for additional approval, disapproval or advice.

Whereas, discussions between ICANN and ICM Registry have continued, and additional public input has been received concerning the terms of the proposed sTLD agreement.

Whereas, on 30 March 2006, ICANN's Governmental Advisory Committee issued a communique identifying public policy issues relating to the ICM Registry application <<http://gac.icann.org/web/communiqués/gac24com.pdf> (<http://gac.icann.org/web/communiqués/gac24com.pdf>)>.

Resolved (06.12), the President and the General Counsel are directed to analyze all publicly received inputs, to continue negotiations with ICM Registry, and to return to the Board with any recommendations regarding amendments to the proposed sTLD registry agreement, particularly to ensure that the TLD sponsor will have in place adequate mechanisms to address any potential registrant violations of the sponsor's policies.

Following discussion, a vote was taken on the resolution, which the Board adopted by a 12-0 vote with three abstentions (Michael Palage, Alejandro Pisanty, and Hualin Qian abstained for reasons stated in the real-time transcription <<http://www.icann.org/meetings/wellington/captioning-board-31mar06.htm> (<http://www.icann.org/meetings/wellington/captioning-board-31mar06.htm>)>).

### **Consideration of ccNSO's Recommendation 3 on Proposed ICANN Bylaws Changes**

Peter Dengate Thrush introduced a resolution, seconded by Michael Palage:

Whereas, the ccNSO Council has considered a number of issues which are understood to stand in the way of a number of ccTLD managers joining the ccNSO.

Whereas, the ccNSO Council resolved on 28 May 2005, to initiate a ccNSO Policy Development Process to consider changes to ICANN Bylaws Article IX (Country-Code Names Supporting Organisation), Annex B (ccNSO Policy-Development Process) and Annex C (the scope of the ccNSO) to address the matters outlined in paragraphs A to M of section 3.2 of the Issues Report as published on 7 June 2005.

Whereas, the ccNSO has conducted the ccPDP in accordance with Annex B of the ICANN Bylaws.

Whereas, the ccNSO Council resolved on 2 December 2005, to approve the Board Report containing eight ccNSO Recommendations for changes to improve and clarify the ICANN Bylaws on the ccNSO and the ccPDP in the interest of the ccNSO membership, the ccNSO Council and other stakeholders.

Whereas, the Issue Manager has submitted the Board Report <<http://ccnso.icann.org/announcements/ccnso-board-report-04dec05.pdf> (<http://ccnso.icann.org/announcements/ccnso-board-report-04dec05.pdf>)> to the Board for consideration on 2 December 2005.

Whereas, the proposed ccNSO Bylaw changes have been posted for public comment on the ICANN webpage <<http://www.icann.org/announcements/announcement-21dec05.htm> (<http://www.icann.org/announcements/announcement-21dec05.htm>)> for over 21 days, and one comment concerning Recommendation 3 was received.

Whereas, Recommendation 3 suggested the addition of a new subsection 3 to ICANN Bylaws Article IX, Section 6, which would require that "Any change of this article IX shall be recommended to the Board by the ccNSO by use of the procedures of the ccPDP as stated in Annex C to these bylaws, and shall be subject to approval by the Board."

Whereas, the General Counsel has advised the Board that adopting the ccNSO Recommendation 3 may raise issues regarding corporate governance and might adversely impact ICANN's organizational structure.

Whereas, the Board believes that it is essential that the Board maintain its role of independent oversight of the organization and its Bylaws, and that this independence is one of the key elements which makes ICANN free from capture by any particular interested party or industry sector.

Resolved (06.11), that the Board hereby rejects ccNSO Recommendation 3, and directs staff to communicate to the ccNSO that it is amenable to receiving further input from the ccNSO through its processes for a supplemental recommendation regarding good faith notice and consultation, before the amendment of any provision of Article IX of the ICANN Bylaws.

Following discussion, a vote was taken on the resolution, which the Board adopted by a 15-0 vote.

#### **SSAC Report on Alternative TLD Name Systems and Roots**

Alejandro Pisanty introduced a resolution, seconded by Hagen Hultzsich:

Whereas, on 30 March 2006, ICANN's Security and Stability Advisory Committee (SSAC) submitted a comprehensive report entitled Alternative TLD Name Systems and Roots: Conflict, Control and Consequences. The report was the subject of a valuable workshop presented by the SSAC at these meetings in Wellington.

Whereas, the SSAC report describes the operational models and the technical mechanisms alternative TLD name system and root operators employ to provide name resolution and registration services, and considers the impact on Internet users and service providers (ISPs), domain name registrants, and registries that operate under agreements with ICANN.

Resolved (06.13), the ICANN Board hereby accepts the Report, and thanks SSAC Chair Steve Crocker, SSAC Fellow Dave Piscitello, the members of SSAC, and all other contributors for their efforts in the creation of the report.

Resolved (06.14), the ICANN Board directs staff to forward the Report to ICANN's advisory parties for their consideration in connection with the IDN TLD policy development process.

Following discussion, a vote was taken on the resolution, which the Board adopted by a 15-0 vote.

#### **SSAC Report on DNS Distributed Denial of Service (DDoS) Attacks on TLD and Root Name System Operators**

Hagen Hultzsich introduced a resolution, seconded by Veni Markovski:

Whereas, on 30 March 2006, ICANN's Security and Stability Advisory Committee (SSAC) submitted a security advisory on DNS Distributed Denial of Service (DDoS) Attacks. The advisory was the subject of a valuable workshop presented by the SSAC at these meetings in Wellington.

Whereas, the SSAC Advisory describes recent incidents, identifies the impacts, and recommends countermeasures that TLD name server operators can implement for immediate and long-term relief from the harmful effects of these attacks.

Resolved (06.15), the ICANN Board hereby accepts the Report, and thanks SSAC Chair Steve Crocker, SSAC Fellow Dave Piscitello, the members of SSAC, and all other contributors for their efforts in the creation of the Advisory.

Resolved (06.16), the ICANN Board directs staff to forward the Report to Internet service providers and operators, to ICANN's advisory committees and supporting organizations, and to other interested parties for their consideration.

Resolved (06.17), the ICANN Board urges interested parties to consider a strategy to encourage the broad adoption of BCP 38, RFC 2827, Network Ingress Filtering: Defeating Denial of Service Attacks which employ IP Source Address Spoofing and SSAC004, Securing The Edge to reduce or mitigate entirely not only the threats posed by DNS DDoS attacks, but other, similar DDoS attacks as well.

Following discussion, a vote was taken on the resolution, which the Board adopted by a 15-0 vote.

#### **Consideration of and Approval of ICANN's Strategic Plan**

Paul Twomey introduced a resolution, seconded by Michael Palage:

Whereas, ICANN's 2006-2009 Strategic Plan is based on many rounds of consultation with the community through workshops at ICANN meetings, through Supporting Organizations and Advisory Committees and through public forums on the ICANN website.

Whereas, the 2006-2009 Strategic Plan gives a brief description of challenges and opportunities that ICANN is likely to face in the next few years and outlines five strategic objectives for the ICANN community.

Whereas, the strategic objectives in the plan will form the framework around which the 2006-2007 Operational Plan is constructed.

Whereas, members of the community have been very generous with their time and the Board appreciates the work that they have done.

Resolved (06.18), the Board approves the 2006-2009 Strategic Plan, and directs the President and staff to move forward with the community-based operational planning process based on the strategic objectives as set forth in the plan.

Following discussion, a vote was taken on the resolution, which the Board adopted by a 15-0 vote.

#### **Review of Recommendations 06.01 and 06.02 of the Board's Reconsideration Committee**

Vanda Scartezini introduced a resolution:

Whereas, on 28 February 2006, the Board approved a set of agreements to settle the legal disputes between VeriSign, Inc. and ICANN.

Whereas, in requests for reconsideration RC 06-1 and 06-2, various parties requested reconsideration of that Board decision;

Whereas, the Reconsideration Committee has reviewed the reconsideration requests and has submitted its recommendations to the Board, as posted at

<http://www.icann.org/committees/reconsideration/reconsideration-recommendation-06-1.htm>

(<http://www.icann.org/committees/reconsideration/reconsideration-recommendation-06-1.htm>)> and

<http://www.icann.org/committees/reconsideration/reconsideration-recommendation-06-2.htm>

(<http://www.icann.org/committees/reconsideration/reconsideration-recommendation-06-2.htm>)>.

Resolved (06.19), that the Reconsideration Committee's Recommendation RC 06-1 is adopted for the reasons stated in that recommendation.

Resolved (06.20), that the Reconsideration Committee's Recommendation RC 06-2 is adopted for the reasons stated in that recommendation.

Following discussion, a vote was taken on the resolution, which the Board adopted by a 14-1 vote (Raimundo Beca voted against).

#### **Internationalized Domain Names Discussion**

Mouhamet Diop and Hualin Qian led a discussion on the status of ICANN's IDN efforts, including discussions on IDN technical implementation tests planned for later in 2006.

#### **Appointment of Lyman Chapin as the Chairman of the Registry Services Technical Evaluation Panel**

Hualin Qian introduced a resolution, seconded by Veni Markovski:

Whereas, on 8 November 2005, the ICANN Board approved the consensus policy adopting a process for the implementation of proposed new registry services <http://www.icann.org/minutes/resolutions-08nov05.htm> (<http://www.icann.org/minutes/resolutions-08nov05.htm>)>.

Whereas, according to the consensus policy, the technical evaluation of proposed registry services will be conducted by a standing panel of experts coordinated by a Chair "who is agreeable to both ICANN and the

registry constituency of the supporting organization then responsible for generic top level domain registry policies."

Whereas, ICANN and the gTLD Registry Constituency of the GNSO have reached an agreement that Lyman Chapin is an outstanding candidate for the Chair position.

Whereas, Lyman Chapin is eminently qualified to take on such a position.

Resolved (06.21), the President and the General Counsel are directed to enter into an agreement with Lyman Chapin to undertake the duties of Chair of the Registry Services Technical Evaluation Panel.

Following discussion, a vote was taken on the resolution, which the Board adopted by a 15-0 vote.

### **Notice of Intent to Advance Implementation of New gTLD Process**

Susan Crawford introduced a resolution, seconded by Veni Markovski:

Whereas, ICANN's Core Values support the introduction and promotion of choice and competition in the registration of domain names where practicable and beneficial in the public interest; and

Whereas, ICANN's Generic Names Supporting Organization ("GNSO") has launched a policy development process designed to determine specific mechanisms for the additional introduction of new generic Top Level Domains (gTLDs); and

Whereas, consistent with the timelines for policy development specified in ICANN's Bylaws, the GNSO should complete its initial report on new gTLDs before ICANN's next public meeting in Marrakech, Morocco in June 2006; and

Resolved (06.22), ICANN Staff is authorized and instructed to post a "Notice of Intent to Advance Implementation of New gTLD Process," as soon as practicable, stating that ICANN intends to advance the implementation of a new gTLD process on or before 1 January 2007. The Notice should instruct interested parties to monitor and participate in the public process now underway in the GNSO; and,

Resolved (06.23), the Board asks the GNSO to make its best efforts to complete its initial report on new gTLDs at or before ICANN's next public meeting in Marrakech, Morocco so that the GNSO's report can be posted for public comment, considered by the Board and the rest of the ICANN community, and implemented by Staff in accordance with the Board's instructions, with sufficient time to allow for advancement of a new gTLD process on or before 1 January 2007.

Resolved (06.24), the Board asks the Chair to communicate this action to ICANN's supporting organizations and advisory committees.

Following discussion, the Board adopted the resolution unanimously (by "wave").

**Board Minutes and Reporting**

Alejandro Pisanty led a discussion on preparation for, and reporting on, ICANN's Board meetings.

**Thanks to Scribes, Sponsors, and Staff**

Vint Cerf introduced a resolution:

The Board wishes thanks to the Government of New Zealand for significant contribution to hosting the GAC, and most particularly to the Honorable David Cunliffe and the Honorable Winnie Laban for opening the ICANN meeting in Wellington.

The Board extends its thanks to all sponsors of the meeting, including Public Interest Registry, Afilias, auDA, Melbourne IT, VeriSign, City Link and especially Andy Linton who has managed the technical aspects for the host FX Networks and AsianetCom for international bandwidth, ICMP, Domainz, Catalyst, State Services Commission, Logic Boxes, Skenzo FabulousDomains, ausRegistry, Overstock, Internet Users Society of Niue.

Special thanks go to Laura Virgo and team, the Conference Organisers, Conference On Line.

We would like to acknowledge the effort made by the staff of the Wellington Convention Center to meet all of our many requests.

The Board expresses its great appreciation to the ICANN staff present here in Wellington; Laura Brewer; and Terri Darrenougue and the rest of the ICANN staff for their dedicated efforts in ensuring the smooth operation of the meeting.

The Board adopted the resolution by acclamation.

**Thanks to Local Hosts**

Peter Dengate Thrush introduced a resolution:

Whereas, ICANN has successfully completed its 2006 Meeting in Wellington, New Zealand.

Resolved (06.25), the ICANN Board expresses its deep appreciation and thanks, on its own behalf and on behalf of all participants, to .nz Registry Services, the Office of the Domain Name Commissioner, and InternetNZ. Special thanks to InternetNZ's Colin Jackson, President, David Farrar, Vice President and Chair of the ICANN meeting committee, and Keith Davidson, Executive Director of InternetNZ.

Vint Cerf adjourned the meeting at 11:25 a.m. local time.

<b>Appendix D – Call for Papers</b>	<b>51</b>
<b>Bibliography</b>	<b>62</b>

## Executive Summary

1. This document is the third draft *Initial Report* which sets out the key findings that have emerged from a four-phase policy development process. The key elements of that process have been formal Constituency Statements, a Call for Expert Papers and a Public Comment Period. In addition, the GNSO Council's new top-level domains Committee (new TLDs Committee) has conducted three separate face-to-face consultations to discuss each Term of Reference. These meetings have been open to observers. In addressing the Terms of Reference, very close attention has been paid to understanding ICANN's Bylaws, Mission and Core Values.
2. The following sections set out each Term of Reference, the findings that have emerged and, at the end of each section, offer some recommendations for the next steps which could take place. Background information, summaries of Constituency Statements, Call for Expert Paper responses and a summary of the first Public Comment Period are found in the Appendices. In addition, the Appendices include information about how the PDP has been conducted, lists meeting attendees, explains the use of communication technology which has broadened remote participation opportunities and facilitated face-to-face meetings.
3. There are two other GNSO policy development processes that have a direct bearing on the work here. The PDP Feb 06

on Policies for Contractual Conditions for Existing TLDs<sup>1</sup> and the work which has been undertaken on internationalised domain names (IDNs)<sup>2</sup>. The results of these two additional workstreams need to be taken into account when making final recommendations about the introduction of new top level domain names. In addition, there are close links between the establishment of a PDP's terms of reference, the results of the PDP and the final Request for Proposal for any new application round. The final link in the chain is the resulting contract which enables the registry operator to start its service.

4. Any policy development process calls for implementation planning to be established to ensure that appropriate resources are made available. Early work will be undertaken by staff to facilitate a timely implementation of the policy outcomes as they emerge.
5. The GNSO's Committee will meet to discuss this Report on Thursday 15 June 2006 to prepare the final version of the Report for discussion at the June 2006 ICANN meeting in Marrakech. This document will also be used to facilitate discussion with the full range of ICANN Supporting Organisations, the Governmental Advisory Committee and the broader community.
6. The GNSO Committee has been discussing a definition for a new TLD. So far, "...a gTLD is a generic TLD and is a top or

<sup>1</sup> The *Preliminary Taskforce Report* can be found at <http://forum.icann.org/lists/pdp-pcceg-feb06/msg00085.html>. The *Internationalised Domain Names Issues Report* can be found at <http://gns0.icann.org/issues/idn-tlds/issues-report-28may06.htm>

<sup>2</sup> The *Internationalised Domain Names Preliminary Issues Report* can be found at <http://gns0.icann.org/issues/idn-tlds/issues-report-28may06.htm>

first level Internet domain name that is unique and defined through an exclusive contract with ICANN. It includes but is not limited to the current sponsored and unsponsored TLDs.”<sup>3</sup>

---

<sup>3</sup> For further discussion, see the GNSO mail archive found at <http://forum.icann.org/lists/gtld-council>.

## Term of Reference 1: Recommendations

*Term of Reference 1. Should new generic top level domain names be introduced?*

*Given the information provided here and any other relevant information available to the GNSO, the GNSO should assess whether there is sufficient support within the Internet community to enable the introduction of new top level domains. If this is the case the following additional terms of reference are applicable.*

1. This Term of Reference was the subject of detailed discussion at the 24 & 25 February 2006 face-to-face consultations held in Washington DC. It was clear from the results of that meeting, and the subsequent discussion which has taken place about the three other Terms of Reference, that there is support to introduce new top level domains. Subsequently, at the 31 March 2006 ICANN Board meeting in Wellington, the Board made clear its intention to proceed with the introduction of new top level domains<sup>4</sup>.
2. The Washington DC meeting notes<sup>5</sup> indicate that there were a wide variety of reasons to be cautious about the introduction of new TLDs including “ [the] selection and implementation process was time consuming, expensive and unpredictable; [the] limitation on the number added caused problems for other

---

<sup>4</sup> See Board resolution at <http://www.icann.org/minutes/resolutions-31mar06.html>.

<sup>5</sup> See the full text of notes at <http://forum.icann.org/lists/gtld-council/msg00030.html>.

applicants that met selection criteria; some selection criteria were not objective, clearly defined, and measurable enough to allow independent evaluation to be effective...". These concerns have been addressed in subsequent discussions about selection criteria, allocation methods and policies for contractual conditions.

3. Multiple reasons for supporting the introduction of new gTLDs were put forward in the Constituency Statements and Call for Papers responses. These included enhancement of competition at the registry level; increased choice for registrants or end-users, innovative new services for both existing and emerging markets and avoidance of the proliferation of alternative roots.
4. The Washington DC meetings showed that there were additional reasons for introducing new gTLDs including "[a] small TLDs [is] OK if it meets the needs of the community that has put [the idea] forward and doesn't exclude others that are within that community; the new gTLDs introduced so far do not yet cater for parts of the international community that use characters sets other than the limited set from the ASCII character range; a policy is required for the introduction of IDNs at the top level, and [we] need to consider the political and cultural environments as demand for these IDNs is increasing...". Part of this work is being addressed through the IDN *Issues Report* referred to earlier and the proposal to work jointly with the ccNSO.
5. There were some common elements articulated by meeting participants which indicated that the following selection criteria

“baskets” were useful<sup>6</sup> including sound business, technical and operational plans; operational stability, reliability, security and global interoperability; and simplicity and predictability of domain name registration rules.

6. The consistent underpinning of the discussion was that, whatever action is taken, it is consistent with ICANN's limited technical co-ordination mission; that an enabling and competitive environment for the provision of domain name management be fostered and that domain name registration rules are clear. GNSO new TLDs Committee Chairman, Bruce Tonkin, released the following statement after the Washington DC meeting which enabled the Committee to move forward with consideration of the remaining Terms of Reference, “...taking into account the lessons learnt from the limited introduction of new TLDs since 2000, the GNSO supports the continued introduction of new gTLDs. Prior to introducing new TLDs, the GNSO recognises that the lessons learnt, the submissions made in response to PDP-Dec05 and further input, should be taken into account to identify and develop [C]onsensus on the selection criteria, allocation methods, and implementation processes. Note that there was no formal vote taken on the statement above, and the intent of identifying a "rough consensus" was to allow the committee to move forward to the topic of selection criteria.”<sup>7</sup> It is useful to refer to other expert reports in this area, including the

---

<sup>6</sup> See the full notes at <http://forum.icann.org/lists/gtld-council/msg00028.html>.

<sup>7</sup> See Bruce Tonkin's 26 February 2006 [gtld-council] Discussion on whether to continue with the introduction of new gTLDs.

work of the OECD on domain names, the Summit Strategies Report and the World Bank report. In particular, there is detailed expert work about selection criteria and requests for proposals with the Asian Development Bank, the OECD and the World Bank. The bibliography found at the end of the document contains references to a selection of other work that has informed the GNSO Committee.

- 7. Recommendation on Term of Reference 1: That work proceeds to enable the introduction of new top level domains, taking into account the recommendations found in the following sections.**

## Term of Reference 2: Recommendations

### Term of Reference 2. Selection Criteria for New Top Level Domains

- a) *Taking into account the existing selection criteria from previous top level domain application processes and relevant criteria in registry services re-allocations, develop modified or new criteria which specifically address ICANN's goals of expanding the use and usability of the Internet. In particular, examine ways in which the allocation of new top level domains can meet demands for broader use of the Internet in developing countries.*
- b) *Examine whether preferential selection criteria (e.g. sponsored) could be developed which would encourage new and innovative ways of addressing the needs of Internet users.*
- c) *Examine whether additional criteria need to be developed which address ICANN's goals of ensuring the security and stability of the Internet.*

1. This Term of Reference was the subject of detailed discussion during two day face-to-face meetings on 24 & 25 February 2006 in Washington DC and on 25 & 26 March 2006 in Wellington, New Zealand, as part of ICANN's regular round of meetings. There was consensus around both the principles for developing selection criteria that map directly to ICANN's Bylaws, Mission and Core Values and the practical impact of providing

appropriate policy guidance to the Board about criteria that could be used in further rounds of new top-level domain applications<sup>8</sup>.

2. There was agreement that further work needed to be done with respect to technical criteria and a supplementary Call for Information from Constituencies was made on 8 March 2006<sup>9</sup>. The Call for Information listed questions regarding four specific areas including whether the minimum technical criteria for registry operations should be set according to the current registry requirements of, for example, .NET registry; whether the minimum technical criteria should make some reference to the proposed size of a new registry; whether a separate registry operators' accreditation scheme be established and, if so, what should that scheme look like; and whether other business operations criteria continue to be included in a registry operator's application to ensure that any registry operator is adequately funded and professionally managed.
3. At the Washington DC meeting, responses to the selection criteria questions were mapped closely to a review of ICANN's Mission and Core Values. The selection criteria used in the 2000 and 2004 rounds for new top level domains were used as reference points<sup>10</sup>. Constituency representatives were asked to clarify the positions taken in the Constituency Statements but no

---

<sup>8</sup> See Bruce Tonkin's 27 February 2006 email (04:00h) which provides a summary of comments made by Washington meeting attendees (<http://forum.icann.org/lists/gtld-council/msg00030.html>)

<sup>9</sup> Found at <http://gnso.icann.org/issues/new-gtlds/tech-criteria-15mar06.htm>

<sup>10</sup> See Bruce Tonkin's 26 February 2006 summary of lessons learnt at [gtldcouncil] Output of brainstorming session on lessons learnt from the previous introduction of new gTLDs since 1999.

attempt was made to reach consensus positions prior to the Wellington meeting.

4. The positions can be found at Appendix I as part of the earlier drafts of this *Report*. The main area of agreement was that selection criteria should reflect ICANN's limited technical mission. It was clear that any selection criteria should be as objective and straightforward as possible and that any selection process would be published prior to an application round beginning. It was clear from discussions that provision of a sound business plan which demonstrated an ability to comply with ICANN policy (where appropriate) and meet minimum technical standards was important. "Objectivity" was a consistent thread throughout the discussions and it was thought that following this principle would encourage participation in any new selection round. This would also enable competitive provision of registry services where an open market environment was most beneficial to end-users.
5. The continuing stability and security of the Internet was another recurring theme which included the treatment of internationalized domain names where compliance with ICANN's evolving IDN guidelines was seen as important. It was clear that compliance with best practice technical standards was necessary within any registry. This included the ongoing use of ICANN accredited registrars.
6. The Wellington meeting provided further opportunities to refine the outputs of the Washington meeting. The GNSO Committee

Chairman released a copy of the presentations made at the Wellington meeting and these are summarized below<sup>11</sup>.

7. The Committee members then developed more detailed positions at the Wellington meetings. After a further day of discussion it was clear that there was strong support for continuing to apply robust technical criteria through any application round. In addition, if applicants wished to offer internationalized domain names then compliance with ICANN's IDN guidelines was required. There was strong support for supplying a list of Requests for Comment (RFCs) and other technical standards relevant to registry operators.
8. There was strong support for the levying of an application fee to participate in any new TLD round. There was also strong support for applicants being required to demonstrate financial viability and a robust operational plan. These criteria fit into a basket of requirements around the application process itself including the production of an application time line, compliance with probity requirements, a pre-published base contract and a pre-published set of criteria against which applications would be evaluated.
9. There was strong support for applicants being able to demonstrate that their application aimed at a clearly differentiated domain name space and that the purpose of the new TLD was clearly understood.

---

<sup>11</sup> See Bruce Tonkin's 28 March 2006 email to the Council list <http://gns0.icann.org/mailling-lists/archives/council/msg02274.html>

10. Committee members supported maintaining the requirement to use ICANN accredited registrars to register domain names. They also supported the ongoing compliance with ICANN consensus policies (more discussion of this element is found in section on contractual conditions).
11. There was also strong support for ensuring compliance with, in the case of chartered TLDs, the charter of the TLD and for addressing domain name registration violations. No agreement was reached about whether the current model of sponsored/unsponsored; restricted/unrestricted; chartered/unchartered would continue.
12. There was discussion of other selection criteria which did not get the full support of the group.
- 13. Recommendations on Term of Reference 2: The criteria with strong support can be divided into three clear areas.**

**Firstly, “process” criteria which will guide the establishment and conduct of any application round. These criteria include a mandatory application fee; application round probity rules and clear timelines for application completion.**

**Secondly, “technical” criteria which includes compliance with a minimum set of technical criteria which would included a base set of IETF RFCs, and other technical standards. If IDNs are offered, applicants must comply with relevant IETF standards and ICANN IDN guidelines.**

**Applicants must comply with ICANN consensus policies.**

**Applicants must offer a clearly differentiated domain name space with respect to defining purpose. Applicants must have mechanisms to ensure compliance with the charter of the TLD, and addressing violations.**

**Thirdly, “applicant” criteria which must demonstrate that applicants have the financial and operational resources to execute their plans.**

**The GNSO is interested in input on the pros and cons of other criteria which more closely match the intent of the 2004 gTLD round and which had support from several, but not a majority, of constituencies. The additional criteria may include “applicants for a new gTLD must represent a well defined community and registrants are limited to members of that community”; “a new gTLD applicant must establish a charter that addresses a defined purpose with eligibility criteria, and registrants must meet the eligibility criteria”; “accurate verification of registrant eligibility”; and, “applicants must explain how the new TLD maximized benefits for the global Internet community”.**

## Term of Reference 3: Recommendations

### Term of Reference 3. Allocation Methods for New Top Level Domains

- a) *Using the experience gained in previous rounds, develop allocation methods for selecting new top-level domain names.*
- b) *Examine the full range of allocation methods including auctions, ballots, first-come first-served and comparative evaluation to determine the methods of allocation that best enhance user choice while not compromising predictability and stability.*
- c) *Examine how allocation methods could be used to achieve ICANN's goals of fostering competition in domain name registration services and encouraging a diverse range of registry services providers.*

1. This Term of Reference was the subject of detailed discussion at the Wellington, New Zealand meetings. It was clear that allocation methods are an integral part of developing “process” criteria as applicants should know what kind of allocation method will be used prior to submitting an application for a new TLD. It was also clear that selection criteria form a large part of any allocation method. Clearly defined selection criteria provide a “natural selection” method for applicants and specific, extra allocation methods would only be required where there was a contest over the same application, for example, if there were two applications for .abc, or if there are more applications than could be managed at one time by ICANN staff resources.

2. The record of the full discussion about allocation methods can be found in the reference below<sup>12</sup>. In summary, it was clear that the criteria for choosing an allocation method should be timely, objective, predictable and facilitate the ongoing introduction on new TLDs. It was also clear that a first come first served system is the most efficient way to process new applications, where applicants comply with an application process which has been clearly defined.
3. It was also clear that only where duplicate or confusingly similar strings appeared, should special allocation methods be used and that these methods should be defined well in advance.
4. The GNSO Committee applied the same methodology that had been used for the previous two terms of reference for determining where consensus had emerged for policies on allocation methods. There was strong support for the first come, first served process with either an auction<sup>13</sup> or lottery to deal with competing applications that had already met the other baseline criteria of technical competence and the provision of sufficient evidence of operational and financial capacity.
5. There was strong support for ensuring that ICANN provided sufficient resources to support any application round, particularly where a large number of applications were received.

---

<sup>12</sup> See Bruce Tonkin's 27 March 2006 <http://forum.icann.org/lists/gtld-council/msg00059.html>.

<sup>13</sup> Doubt was expressed by numerous Constituency Representatives about the fairness of either auctions or lotteries. On the one hand, it was thought that auctions would favour those with the most financial resource. On the other, lotteries would leave important decisions about registry operations to chance.

6. It was clear that comparative evaluations were still a necessary part of any new TLD application process particularly where there were limited resources to deal with any application round and where applicants had proposed similar strings with similar purposes for similar communities of interest.
7. Some participants in the GNSO Committee considered the creation of categories of gTLDs (for example, commercial, non-commercial, unsponsored, sponsored, open and unrestricted, restricted and chartered) and then select the appropriate selection criteria and allocation method for each category, should there be a competition for the same TLD. Further work is required to ensure a full understanding of the definition of any proposed category for new TLDs and the selection of the appropriate selection criteria and allocation method.
8. **Recommendation on Term of Reference 3: There was strong support for a first-come, first-served approved to processing applications. Where there was contention for either the same string or limited staff resources to process applications, there were two main alternatives proposed which each had roughly equal support. These were:**
  - **Objective (auction or lottery)**
  - **Subjective (comparative evaluations of the applications to identify the best applications)**
9. **The GNSO is seeking broader community input on the two main approaches, and whether the approach chosen should be based on some categorization of gTLDs.**

## Term of Reference 4: Recommendations

### Term of Reference 4. Policy to Guide Contractual Conditions for New Top Level Domains

a) *Using the experience of previous rounds of top level domain name application processes and the recent amendments to registry services agreements, develop policies to guide the contractual criteria which are publicly available prior to any application rounds.*

b) *Determine what policies are necessary to provide security and stability of registry services.*

c) *Determine appropriate policies to guide a contractual compliance programme for registry services.*

1. This Term of Reference was the subject of detailed discussion during a three day face-to-face meeting between 11 & 13 May 2006 in Brussels<sup>14</sup>. The first day of the meetings was a tutorial day conducted by ICANN's Deputy General Counsel designed to enable participants – both Committee members and observers -- to get a better understanding of the nature of ICANN's existing registry agreements. The subsequent two days followed the same format as the Washington DC and Wellington meetings with constituency representatives explaining their positions as they related to ICANN's Mission and Core Values.
2. The discussion about this Term of Reference is closely related to another policy development process on policies for contractual

---

<sup>14</sup> See Bruce Tonkin's 18 May 2006 email note which sets out the results of the meeting. <http://forum.icann.org/lists/gtld-council/msg00131.html>

conditions for existing registries. The *Preliminary Taskforce Report* has been produced and the work of the Taskforce will proceed in parallel with the work found here<sup>15</sup>.

3. The GNSO Committee has referred to other expert analysis in the area of selection criteria, allocation methods and contractual conditions to ensure this process meets adjacent industry standards. It is worthwhile to quote, for example, some of the work done on behalf of the World Bank on mobile license renewals<sup>16</sup> that has many parallels to this work.
4. For example<sup>17</sup>, the World Bank Report recognizes that a “major challenge facing regulators in developed and developing countries alike is the need to strike the right balance between ensuring certainty for market players and preserving flexibility of the regulatory process to accommodate the rapidly changing market, technological and policy conditions”.
5. It is clear that “promoting regulatory certainty and predictability through a fair, transparent and participatory renewal process” is critical. These conditions echo the priorities of the GNSO Committee. The World Bank Report refers in detail to public

---

<sup>15</sup> The Taskforce Report can be found at <http://forum.icann.org/lists/pdp-pcceg-feb06/msg00085.html>.

<sup>16</sup> The full report can be found at [http://econ.worldbank.org/external/default/main?pagePK=64165259&theSitePK=469372&piPK=64165421&menuPK=64166093&entityID=000016406\\_20050923113019](http://econ.worldbank.org/external/default/main?pagePK=64165259&theSitePK=469372&piPK=64165421&menuPK=64166093&entityID=000016406_20050923113019)

<sup>17</sup> The World Bank is used here as an example only. Regulatory agencies such as Singapore's Infocomm Development Agency (<http://www.ida.gov.sg>), the Australian Competition and Consumer Commission (<http://www.accc.com.au>), and the UK's Office of Communications (<http://www.ofcom.co.uk/>) all suggest similar standards in various documents relating to licensing terms and conditions and the nexus between those standards and sound competition policy. The European Commission provides useful materials that can also guide this work ([http://ec.europa.eu/comm/competition/general\\_info/m\\_en.html](http://ec.europa.eu/comm/competition/general_info/m_en.html))

consultation procedures and systems for establishing and renewing “license” rights. It also spells out clear conditions under which any “application round” could be established and the way in which any process would be run. Those suggestions are consonant with what is proposed here.

6. A set of policies for contractual conditions got strong support from GNSO Committee members. Top line principles, articulated in particular by the Registries’ Constituency, were that policies to guide contractual criteria should not compromise private sector participation and that the application process (and resulting contractual conditions) should encourage long term investment with optimal opportunities for innovation and competition. The Committee supported the need for a gTLD registry to comply with new or changed ICANN consensus policies to one or more of the following areas during the term of the agreement with ICANN:
  - i. Issues for which uniform or coordinated resolution is reasonably necessary to facilitate interoperability, security and/or stability of the Internet
  - ii. Functional and performance specifications for the provision of registry services (as defined below)
  - iii. Security and stability of the registry database for the TLD
  - iv. Registry policies reasonably necessary to implement consensus policies relating to registry operations or registrars

- v. Resolution of disputes regarding the registration of domain names (as opposed to the use of domain names)
7. It is clear that the predictability of a pre-published “base” or “framework” contract is important to GNSO Committee members. Those contracts need to be consistent in their treatment of different types of registry businesses and several Committee members indicated that the current .jobs agreement provides a good starting point. Several Committee representatives stressed the need for fair treatment amongst registries with equal obligations imposed on moperators (for example, with respect to technical standards and business viability). It was also clear that a “registry compliance program” with graded measures for enforcement would be useful.
8. It is also clear that a public comment process on contractual negotiations is desirable but it is recognized that there are limits to which commercial in confidence information should be made available.
9. The tutorial session and subsequent discussions identified some key areas that could benefit from further investigation. Comments along this line related particularly to the establishment of ICANN fees; the fees charged for a registry within any new agreement and the way in which fees are used by ICANN. The Committee supported ICANN providing a consistent approach with respect to registry fees, taking into account differences in regional, economic and business models. The GNSO Committee suggested that ICANN was not

necessarily the appropriate organization to determine price controls on the fees charged to registrars within contracts.

10. In summary, there should be a frame agreement to provide some level of consistency (for example, as in the case of the ICANN Registrars' agreement) with the ability for staff to have delegated authority to approve final contracts. The term of the agreements should be of commercially reasonable length (perhaps ten years but reviewed on a case by case basis).
11. There should be renewal expectancy. Operators could expect renewal of their agreements provided that they had not been in material breach of the contract or repeatedly failed to perform to the standard required in the contract. There should be mechanisms to terminate the contract if the operator has been found in repeated breach of the contract.
12. Any material alterations to the frame agreement should be subject to a public comment period before approval by the ICANN Board. Any new framework contract would take into account ICANN consensus policies current at the time. Any deviation from consensus policies should be explicitly stated and justified in the agreement.
13. Where a registry provides internationalized domain names, the contract should require the registry operator to adhere to IDN standards and ICANN's IDN Guidelines<sup>18</sup>.

---

<sup>18</sup> The most recent version of the Guidelines can be found at <http://www.icann.org/topics/idn/implementation-guidelines.htm>.

14. The contracts should strike a balance between ensuring certainty for market participants and preserving flexibility for ICANN to accommodate a rapidly changing market.
15. With respect to the use of personal data, the Committee supported limited use (only for the purpose for which it was collected) of any personal data and supported requiring the gTLD registry to define the extent to which personal data would be made available to third parties. With respect to other forms of registry data, further information would be required before the Committee could reach any recommendations.
- 16. Recommendations on Term of Reference 4: Further work needs to be done on the establishment of a suitable compliance regime that would operate in tandem with the base registry agreements.**

## Next steps

1. This *Initial Report* is the result of comprehensive consultation and discussion in wide range of settings and has included a very diverse group of stakeholders. The appendices which follow set out in more detail how the conclusions found here have been established.
2. Following the GNSO's Policy Development Processes<sup>19</sup>, the work is now at Stage 8. (<http://www.icann.org/general/archive-bylaws/bylaws-28feb06.htm#AnnexA>)
3. The GNSO Council will meet at Marrakech to give presentations to the Governmental Advisory Committee and other Supporting Organisations. The Council will also provide a briefing to the ICANN Board on the progress it has made.
4. Between the Marrakech meeting and the December meeting in Brazil, the GNSO Council will complete its *Initial Report* and release it for a formal Public Comment Period.

---

<sup>19</sup> Found at <http://www.icann.org/general/archive-bylaws/bylaws-28feb06.htm#AnnexA>.

## Appendix A -- Background

- a. The call for public comments on the PDP's Terms of Reference was announced on 6 December 2005 on the ICANN website (<http://www.icann.org/announcements/announcement-06dec06.htm>.)
- b. At its 21 December 2005 GNSO Council conference call, it was decided to extend the deadline for Public Comments and Constituency Statements until 31 January 2006. In addition, a decision was taken to launch a Call for Papers to further inform the process. The Call for Papers was announced on 3 January 2006 on the ICANN website (<http://icann.org/announcements/announcement-03jan06.htm>). To give further impetus to the Call for Papers, it was also advertised in some major international newspapers and magazines in January 2006 including the *Financial Times*, the *Asian Wall Street Journal* and *The Economist*.
- c. The first version of this report (<http://icann.org/topics/gns0-initial-rpt-new-gtlds-19feb06.pdf>) reflected a wide range of input received from interested stakeholders including Constituency Statements, Public Comments and submissions in response to a Call for Papers about the possible introduction of new gTLDs. This updated report benefits from further inputs received at the GNSO Council's new gTLD PDP Committee Meeting held on Friday 24 and Saturday 25 February 2006 in Washington DC.

- d. All the face to face meetings have been attended by at least one representative from each of the Constituencies. At each of the meetings a number of observers attended and participation was open to the public. Teleconference facilities were provided at each of the meetings and for the Brussels meeting, the group used the Shinkuro ([www.shinkuro.com](http://www.shinkuro.com)) file sharing technology to facilitate document exchange, presentation sharing and on-line participation. meeting was attended by a range of GNSO Councilors, Constituency representatives and other members of the community<sup>20</sup>. The meeting was recorded and people were able to join the meeting via teleconference. The meeting benefited from the presentation of papers (<http://gns0.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm>) and a question and answer session with respondents to the Call for Papers.
- e. The most important element of the Committee meeting was to expose the PDP's Terms of Reference to further input, in the context of ICANN's Bylaws, Mission and Core Values that constrain the GNSO's policy development activities. Particular effort was made to ensure that lessons were learnt from the previous rounds of new top-level domain expansions in 2000 and 2004 and assignments of the .org and .net contracts.

---

ICANN Staff included: Williams, Farrell, Pritz and de Saint Gery. Halloran attended the GNSO Council meeting by teleconference. Miriam Sapiro attended in person.

- 2) General consensus<sup>21</sup> has developed around the first term of reference – whether there should be new top-level domains. This “yes” answer is conditional for some constituencies on the appropriate development of robust selection criteria, allocation methods and contractual conditions<sup>22</sup>. In addition, there was little disagreement from the public comments or call for papers contributors about whether new TLDs should be introduced.
- 3) There is also some consensus around the treatment of allocation methods in the written submissions. However, this issue requires further examination in the discussion about allocation methods which will take place at the March 2006 Wellington meetings.
- 4) The consideration of appropriate policy for the development of new contractual conditions needs to be undertaken in the near future, after discussions of selection criteria and allocation methods are completed. This work needs to refer, in part, to the new policy development process which was initiated in February 2006. A public comment period on the issues raised by the new PDP’s Terms of Reference is now being conducted (<http://icann.org/announcements/announcement-06mar06.htm>).
- 5) The next step is to develop the findings on these issues through further work and consultations within the GNSO itself at the Wellington

---

<sup>21</sup> See Bruce Tonkin’s 26 February 2006 (04:12h) email (<http://forum.icann.org/lists/gtld-council/msg00027.htm>) which says “...rough consensus...taking into account the lessons learnt from the limited introduction of new TLDs since 2000, the GNSO supports the continued introduction of new gTLDs...Note that there was no formal vote taken on the statement above, and the intent of identifying ‘rough consensus’ was to allow the committee to move forward to the topic of selection criteria”.

<sup>22</sup> See Bruce Tonkin’s 26 February 2006 (04:09h) email (<http://forum.icann.org/lists/gtld-council/msg00026.html>) that outlines each constituency’s views about supporting the continued introduction of new gTLDs.

meetings, in the first instance, and then through further rounds of consultation and public comment periods as defined by the PDP rules.

- 6) In addition, co-operation with other ICANN Supporting Organizations and Advisory Committees and consultation with the wider Internet community is a necessary part of the policy development process.
- 7) It is proposed to release the final version of this *Initial Report*, which will include input from the Wellington meetings, on 2 May 2006. At that time, a twenty-day public comment period can commence. It is expected that the final version of the *Initial Report* will be sent to other Supporting Organizations, the Governmental Advisory Committee and the ALAC for their formal input.

## ***Early Recommendations***

1. Given that this *Initial Report* is an evolving draft, this section is intended to enable open interaction as further drafting work progresses through the Wellington meetings. Current findings and unresolved issues are outlined. These will be further developed through work and consultations within the GNSO itself, in co-operation with other ICANN Supporting Organizations and Advisory Committees and in consultation with the wide Internet community through scheduled public comment periods.
2. It appears that there is support for the introduction of new gTLDs. No submission argued that there should be no additional gTLDs, even if views on the addition rate and conditions for adding new gTLDs vary widely. Most submissions recognize that new additions to the root are within the scope of ICANN's technical mandate, are necessary if ICANN is to meet its core mission and values (particularly with respect to competition and usability) and are part of ICANN's normal operations.
3. There is disagreement about how many new gTLDs should be introduced and at what pace. There is also disagreement about whether gTLDs should be sponsored or unsponsored and how new strings should be allocated. While the constituencies use these distinctions, it is equally important to address whether new gTLDs should be restricted or unrestricted
4. There is general agreement that standardized contractual conditions for registry operations should be published prior to any agreement being signed. There ought to be an improved compliance regime and there should be minimal interference with consensus policy positions.

5. Further analysis and discussions could be pursued along two slightly different scenarios. The first is a very limited introduction which is restricted to one kind of gTLDs. The other would feature a broader process which could accommodate a more diverse range of applications.
6. Secondly, further analysis is required about the operational impact on ICANN of introducing new gTLDs. This would enable a better understanding of the full costs of introducing new TLDs including, for example, legal counsel, operational and policy inputs and Board consideration time.
7. Thirdly, fact-based market analysis would be useful to inform decisions about the desirability of introducing new gTLDs from an end user perspective. Such analysis could provide better understanding of unmet demand patterns and potential effects on competition.
8. Fourthly, specific ideas and input that have not been addressed by others should probably be tested early on for potential consensus. The proposal from Rader & Noss to reclassify gTLDs into “chartered” and “unchartered” could be such an example.
9. A particular aspect introduced by the IPC is to bring a subset of the WIPO-2 recommendations, notably protection of IGO names and abbreviations, into modified UDRP provisions. This relates to contractual conditions and could be allocated to a dedicated work group to finalize as a separate track.
10. Further work still needs to be done on some elements of the Terms of Reference as not all questions were answered in the submissions. It would be helpful if the Council could identify areas where further work is necessary and advise about how it would like those areas addressed.

## Appendix B – Constituency Statements

This appendix sets out a summary of the Constituency Statements which were used as the basis for the face-to-face consultations in Washington DC, Wellington and Brussels.

1. Formal Constituency Statements were received from the Non-Commercial Users Constituency (NCUC), the gTLD Registry Constituency (RyC), the Intellectual Property Constituency (IPC), the Internet Service and Connectivity Providers Constituency (ISPCP) and from a subset of the Registrars' Constituency (RC) by 31 January 2006. A draft statement was received from the Business and Commercial Users' Constituency (BC). The Business Constituency submitted its final position on 8 March 2006. The RC submitted its final position on 2 March 2006.
2. The At Large Advisory Committee (ALAC), observer to the GNSO, also submitted a statement. In the next section, the findings in the Constituency Statements and the discussions at the Washington DC meetings are mapped to the issue areas identified in the Terms of Reference. For the full text of each of the Statements, see <http://gns0.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm>.

### C.1 Whether to introduce new gTLDs

1. The Washington DC meeting confirmed that constituencies support the introductions of new gTLDs. Views diverge, however, on what kinds of gTLDs ought to be introduced; the pace of introduction and the selection criteria for gTLD name strings. Some constituencies make their support conditional upon the nature of the gTLDs envisaged, while claiming that

conditions relating to competition, differentiation, good faith, diversity and business certainty must be fulfilled to introduce a new gTLD.

2. The Washington meeting notes<sup>23</sup> indicate that there were a wide variety of reasons to be cautious including “ [the] selection and implementation process was time consuming, expensive and unpredictable; [the] limitation on the number added caused problems for other applicants that met selection criteria; some selection criteria were not objective, clearly defined, and measurable enough to allow independent evaluation to be effective...”.
3. Multiple reasons for supporting the introduction of new gTLDs were put forward in the Constituency Statements and Call for Papers responses. These included enhancement of competition at the registry level; increased choice for registrants or end-users, innovative new services for both existing and emerging markets and avoidance of the proliferation of alternative roots.
4. The Washington DC meeting (see reference above) showed that there were additional reasons for introducing new gTLDs including “small TLDs are OK if it meets the needs of the community that has put [the idea] forward and doesn’t exclude others that are within that community; the new gTLDs introduced so far do not yet cater for parts of the international community that use characters sets other than the limited set from the ASCII character range; a policy is required for the introduction of IDNs at the top level, and [we] need to consider the political and cultural environments as demand for these IDNs is increasing...”.

---

<sup>23</sup> See the full text of notes at <http://forum.icann.org/lists/gtld-council/msg00030.html>.

5. There were some common elements articulated by meeting participants which indicated that the following selection criteria “baskets” were useful<sup>24</sup>:
  - a. Sound business, technical and operational plans
  - b. Operational stability, reliability, security and global interoperability
  - c. Simplicity and predictability of domain name registration rules
6. The consistent underpinning of the discussion was that, whatever action is taken, it is consistent with ICANN's limited technical co-ordination mission; that an enabling and competitive environment for the provision of domain name management be fostered and that domain name registration rules are clear.
7. The Registry Constituency (RyC) supports the introduction of new gTLDs as a way to facilitate competition at the registry level, to increase choice for Internet users, to grow the Internet usage, to test user demand for specific TLDs and to increase public benefit by better serving specific communities. The RyC also states that both the depth and range of its members and the experience from previous rounds prove that there is market demand for launching new gTLDs.
8. The Registrars are in favor of a predictable ongoing introduction of new gTLDs in order to promote market dynamism, innovation and competition, to enable services for additional communities and to pre-empt uncontrolled alternate roots. The Registrars propose a limit of new gTLDs “in the hundreds, possibly thousands but not tens of thousands.”
9. The IPC lends conditional support to the introduction of new gTLDs, focused on sponsored gTLDs and performed in a slow and controlled manner. Any introduction should be guided by principles of differentiation, certainty, good faith, competition and diversity. Public interest is served by

---

<sup>24</sup> See the full notes at <http://forum.icann.org/lists/gtld-council/msg00028.html>.

adding value to the name space. To keep an introduction limited would also limit the risk of registry failure<sup>25</sup>.

10. The ISPCP conditionally supports a cautious introduction of new gTLDs provided they add value and competition while promoting the public interest (although this public interest is not clearly defined) in the name space. The ISPCP believes that only sponsored gTLDs can accomplish these objectives. The ISPCP states that guidelines should be adopted on how to establish the need for new gTLDs. The ISPCP further states the same five principles as the IPC.
11. The NCUC is in favor of introducing new gTLDs as quickly and broadly as possible in order to keep the market dynamic, foster competition and facilitate end-user choice, wherever Internet users may be located. A well-defined, fair and efficient process is called for and ICANN should accommodate applications for new gTLDs as long as there are no adverse technical consequences.
12. The BC statement recommends that the priority should be to introduce new IDN top-level domains, while no other gTLDs should be introduced at this point in time. Only sponsored gTLDs should be introduced according to the BC. The BC calls for safe harbor provisions in case of registry failure and re-bidding for existing gTLDs.
13. The ALAC is in favor of an open-ended introduction of new gTLDs governed primarily by the market as expressed by the gTLD applicants. The ALAC recommends that there be no explicit limits on the total number or frequency of gTLD additions other than the processing limits of ICANN. As to the types of new gTLDs preferred, views seem to differ somewhat among ALAC members, with a majority supporting unrestricted gTLDs.

---

<sup>25</sup> There was no discussion of 'restricted' registry introduction as a form of differentiation by any constituency

## C.2 Selection Criteria

1. It was clear from the Constituency Statements that significant discussion about each element of the Terms of Reference had taken place. For example, the Registry Constituency identified that 11 out of 13 of its members had been involved in the drafting of their Statement. It was also clear that all of the Constituencies had had long discussion over several years about introduction of new gTLDs and had participated actively in the discussion of the 2000 and 2004 rounds.
2. The NCUC argues that "ICANN has no mandate its mission or core values to 'expand the use and usability of the Internet'". The promotion of competition is, however, one of ICANN's core values. The NCUC argues that the best way for ICANN to do that is to make "selection criteria as simple, predictable and content-neutral as possible". The RyC, the ISPCP and the IPC all argue that the selection criteria used in previous rounds are a good starting point for new gTLDs with a focus on compliance with technical standards and network stability. The ALAC stated "ICANN should accept all applications from qualified entities that either benefit the public interest or enhance competition in the registration of domain names".
3. There is very limited agreement across the Constituency Statements on which historical selection criteria ought to be included. However, there is some agreement about principles of differentiation (of name spaces), certainty (of business operations), good faith (registration of names), competition (between different registry providers) and diversity (of usability). The RyC includes a detailed set of questions which could be used to determine what selection criteria could be removed. This analysis

is based on whether particular selection criteria meet ICANN's technical objectives, provide objectivity, encourage different users and different uses of the Internet, allow market forces some element of influence and enable policy decisions to be made in the best interests of all stakeholders.

Comment [KP1]: not clear what you mean

4. The NCUC argues that the only relevant criteria are those that would determine whether an application meets minimum technical standards established to safeguard against harm to the domain name system.
5. There are divergent views on whether to introduce sponsored or unsponsored gTLDs. The concepts of “sponsored/unsponsored”, “chartered/unchartered”, “open/closed” TLDs needs further clarification as it was clear at the Washington meeting that different views are held.
6. The NCUC argues that there should be as much opportunity as possible for users to determine what new gTLDs should be introduced. The RyC also argues that there is little evidence to indicate that sponsored gTLDs are better than unsponsored in encouraging “new and innovative ways of addressing the needs of Internet users”. The IPC claimed that “...The introduction of unsponsored gTLDs such as .info and .biz added little if anything to competition at the registry level...”. The ISPCP states that “...any new gTLD proposal should be sponsored”. A part of the ALAC submission says that “restricted TLDs would cause unsolvable conflicts” but it is unclear whether there is an agreed position from the ALAC on this and other issues in its submission.
7. The ALAC suggests that gTLD strings should be proposed by applicants, not pre-selected. A public notice period should be launched for each application with a possibility to challenge the chosen string and a dispute resolution procedure should be established to resolve differences. Strings

should not indicate a scope wider than the remit of the applicant. The principle of non-discrimination should govern selection. Application fees should be affordable and staggered and should reflect a cost recovery model for ICANN's administrative processes.

8. There is consensus on security and stability as primary objectives although how that could be achieved through selection criteria should be determined through future discussion with other experts. The NCUC suggests a "simple and objective 'registry accreditation' process, similar to the registrar accreditation process". This element is discussed further in the Call for Information on technical criteria.
9. Clarification is required for other selection criteria including those that relate to "adding value to the name space" and selection criteria that would support IDN architecture compatible with IETF standards.
10. To summarize, there is a need to seek further convergence on views on selection criteria. To develop selection criteria that meet the objectives and needs of a diverse user community requires prioritization along the following lines:
  - a. technical parameters: now the subject of a call for additional information from constituencies with input due at the Wellington meeting
  - b. sponsored or restricted TLDs: whether to have sponsored gTLDs with strict registration requirements or open gTLDs with minimal requirements

### **C.3 Allocation Methods**

1. The Constituencies' views on allocation methods differ considerably and further discussion of allocation methods is needed at the Wellington meeting. The sections below also need further discussion in relation to

more detailed selection criteria and proposed policy for contractual conditions.

2. A starting point for some statements is that first-come first-served (FCFS) is a natural choice as an appropriate allocation method. This approach assumes that there is sufficient operational processing capacity and domain name space available for new gTLDs. It also assumes that other allocation methods are only necessary in situations where the number of applications is greater than the available slots or where there is more than one applicant for the same gTLD string (for example, as in the 2004 round where there were two applications for .tel). Logically, the viability of FCFS would primarily depend on the number of available slots for new gTLDs compared to the number of potential applicants. At the Washington DC meetings, it was indicated that ICANN operational capacity for processing applications and providing registry liaison support should not be limiting factors in selecting allocation methods.
  
3. The IPC doubts the viability of FCFS on the basis of experience with “land rush” in domain name registrations, while, for example, some Registrars see FCFS as viable and regard other allocation methods as only needed for situations where there are two or more applications for the same string.
  
4. The comparative evaluation method, of which ICANN does have considerable experience, is the preferred method of the IPC, supported in this view by the ISPCP and by the BC statement. The BC also argues that no new gTLDs should be introduced unless they are sponsored and IDN enabled.

5. The NCUC suggests that comparative evaluations have numerous disadvantages and are, by their nature, at odds with requirements for objectivity. The RyC emphasizes objectivity and predictability from the applicant's perspective as grounds to minimize the use of comparative evaluations. No statements elaborate on whether comparative evaluations (or elements thereof) should be undertaken by in-house staff or external parties. The 2000 round, the .net reassignment and the 2004 round serve as examples of different approaches in this respect.
  
6. The original statements from Constituencies and others reflect mixed attitudes to auction models as a methodology for allocating new gTLDs. Further discussion at the Washington DC meetings indicated that auction models were not the best way to make decisions about contested applications but this view needs clarification.
  
7. Lotteries also meet objectivity criteria and are one of NCUC's preferred solutions. There are, however, downsides to this method including dissatisfaction with leaving important choices to mere chance and the risk for a "secondary market" with undue profits for winners. It is also noted that lotteries are highly regulated and may not be a viable option from a legal point of view.
  
8. Ballots are mentioned to have superficial appeal as they are based on democratic principles, but doubts are raised as to how to establish an appropriate voting constituency.

9. Both the NCUC and the Registrars mention a tiered approach as a possible solution to the dilemma of choosing allocation methods. The NCUC proposes a combination of auctions for “commercial” applicants and random selections for “non-commercial”. The Registrars propose a mix of, for example, 4 auction slots, 4 random selection slots and 2 ballot slots per “round”.
  
10. Closely associated with the discussion of allocation methods is the issue of whether to proceed in “rounds” with defined time slots for application, selection and allocation or to perform allocation as an ongoing process. For example, the RyC preference for FCFS is accompanied by a preference for an ongoing procedure, while the IPC preference for a comparative evaluation by nature is more akin to a “round” approach.
  
11. The ALAC says that ICANN “should accept and evaluate applications on their merits, against objective criteria, as soon as practicable given the natural constraints of ICANN’s time, budget, and available personnel”. ICANN’s operational limits are seen as a factor in determining how many applications should be considered, how often and against which criteria. However, ICANN staff have indicated that operational capacity for processing applications and providing registry liaison support should not be limiting factors in selecting allocation methods.
  
12. The RyC highlights the need for timeliness, objectivity and predictability in the allocation process. FCFS is the preferred allocation method and comparative evaluations should only be used to choose between applicants with confusingly similar gTLD strings.

13. The IPC favors improved comparative evaluations to enable due consideration of the advantages and drawbacks of each proposal. FCFS is seen as unworkable in view of land rush experiences. The IPC doubts the usefulness of auctions, in view of risks for dominance, bias and overbidding, but a verdict would ultimately depend on the specific auction method. Lotteries are undesirable as a mere chance instrument and also for potential legal reasons. Ballots raise difficult questions on how to constitute an appropriate electorate. The IPC also states that "...the ICANN Board should not abdicate its ultimate responsibility for gTLD allocation".
  
14. The NCUC rejects the comparative evaluation model as slow, politicized and unpredictable, as shown by experience. Lotteries and auctions are preferred, for non-discrimination, neutrality and objectivity. Auctions would be appropriate for commercial entities and lotteries for non-commercial.
  
15. The BC calls for a structured allocation method with assessment by a neutral and professional team, thus implicitly a comparative evaluation, to be guided by experience from previous rounds. Auctions are not seen as a satisfactory allocation method.
  
16. The ALAC prefers FCFS and finds that auctions are in conflict with public interest goals and undesirable for allocation purposes in this context.

## **C.4 Contractual Conditions**

1. There is agreement on several principles regarding contractual conditions for new registry agreements. In essence, this includes that terms and conditions should be published before the application process and, according to the NCUC submission, “a simple, template registry contract that is uniformly applicable to all registries”. This view is in line with the RyC statement which says that “applicants should be provided the base contract in advance.” The IPC “recommends policies to guide contractual criteria which are publicly available and go beyond the technical aspects of the DNS”.
  
2. The IPC provides detailed commentary on policy compliance arguing that “self-regulation is not the complete answer” and that ICANN should “increase staffing and funding resources to its contractual compliance section in the event registries fail to meet their contractual obligations”. Commentary in the ALAC statement says that there should be closer attention to ICANN’s Bylaws in developing explicit contractual conditions “including but not limited to those provisions concerning openness, transparency, procedures designed to ensure fairness, and independent review”.
  
3. One particular aspect introduced by the IPC is to bring a subset of the WIPO-2 Recommendations, notably protection of IGO names and abbreviations, into modified UDRP provisions. This area relates to contractual conditions, but could possibly be allocated to a dedicated task force to finalize as a separate track.

4. The NCUC provides a summary of approaches to contractual conditions which says "...We believe that the GNSO should set general policy guiding the contracts . . .The addition of new TLDs should be predictable in timing and procedure, transparent and rule-driven".
  
5. The RyC argues that "the terms of the latest ICANN-Registry/Sponsor agreements that invoke the GNSO consensus policy recommendations of the process for the approval of registry services fill the void of previous ambiguities with regard to security and stability of registry services. There is minimal, if any, need to develop additional policies to guide the contractual criteria of registry services".
  
6. The BC calls for policy being developed regarding registry fees, for refinement of the public consultation for proposed contracts and for fair treatment of registries in proportion to their demands on ICANN resources.
  
7. The ALAC suggests introducing a binding reference to ICANN Bylaw provisions in all gTLD registry agreements with delegated policy-making.
  
8. In summary, there seems to be converging views calling for predictable and published standard contracts that conform to existing policy on the delivery of registry services.

## Appendix C – Public Comments

This appendix sets out a summary of the Public Comments which were used as the basis for developing consensus positions which reflected input from a wide variety of sources.

1. Public comments on the Terms of Reference for the PDP on introduction of new gTLDs were sought as required in the PDP procedures. The public comment period ended on 31 January 2006 and comments received are posted on the ICANN web site at <http://forum.icann.org/lists/new-gtlds-pdp-comments/>. An overview of public input received has also been posted on the GNSO web site at <http://gnso.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm>. This overview includes discussions on the General Assembly (GA) list posted at <http://gnso.icann.org/mailing-lists/archives/ga/>. Entries on an ALAC wiki web page are posted at [http://www.icannwiki.org/ALAC\\_on\\_New\\_TLDs](http://www.icannwiki.org/ALAC_on_New_TLDs).
2. The following sections analyze the public comments. In addition, the Call for Papers presenters at the Washington DC meeting added texture and diversity to the views expressed, by email, to the public comment period. The presentations are available at <http://gnso.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm>.
3. Additional public comment periods will be conducted throughout the PDP process and commentary will be included in further iterations of any reports.

## D.1 Whether to introduce new gTLDs

1. The public comments generally support the initiative to introduce new gTLDs. Of the seven public comments that appeared to directly or implicitly address the question of whether to introduce new gTLDs, five favored the introduction, while two said the need was not sufficiently strong. Comments by Matthias Jungbauer, Jeff Williams, Chris McElroy, Danny Younger, Elmar Knipp and Thomas Lowenhaupt expressed varying degrees of support for the introduction of new gTLDs.
2. George Kirikos, on the other hand, said the need for new gTLDs is not yet evident, and the current gTLDs could not be characterized as 'full'. He criticized the previous introduction of "hobbyist" gTLDs and proposed that actual use of the existing gTLDs (as opposed to 'parked' names) be measured to indicate how necessary new gTLDs really are. Kirikos also proposed a system of allocation he called the 'Ascension Allocation Method'.
3. Paul Tattersfield also opposed the immediate introduction of new gTLDs, arguing that introducing new gTLDs "could actually decrease competition by reinforcing .com's dominance".
4. Danny Younger, summarizing discussions on the GA list from 5 - 31 December 2005, pointed to interest in establishing new gTLDs amongst various communities, institutions and groups. He said the artificial limitation of new gTLDs has limited the opportunities of small business,

non-profits and individuals and entrenched the “dominant corporate players”. From this point of view, new gTLDs are necessary to increase opportunities for different types of player.

5. Thomas Lowenhaupt said it was important for cities that these geographic entities be recognized by the DNS. New gTLDs – presumably those using geographic terms such as city names – would, he said, strengthen local economies, create a sense of community, improve safety and give better access to local Internet resources.
6. Other commenters that favored the introduction of new gTLDs said new gTLDs would support database development, and that Internet users are capable of adapting to and determining the value of new gTLDs.
7. The public comments on the draft *Initial Report* added more implicit support for the introduction of new gTLDs, mostly by suggesting particular strings. Kirk Humphreys proposes to introduce domain names following the three-letter city codes for airports, like OKC for Oklahoma City. Fuad Firudinbayli proposes to use .inaz for various services including education establishments. Alex Ospiov advocates the introduction of the .web. Matthias Jungbaur raises the question of whether IDN strings are considered.
8. On a different note, Mike Norton recommends against having company names as gTLDs and suggests, to counter possible confusion, that introducing a directory function as a gTLD named .icann or .w3c would be useful.

## D.2 Selection Criteria

1. The public comments address, in different ways, the selection criteria which could be used in any new round of gTLD applications. GA list commentator Danny Younger indicates that the group had to prioritize its input and focused on “objectionable” criteria which should be removed from consideration. The GA List illustrated views that showed “...it’s probably safe to say that most list participants favored an approach that limits criteria only to the technical ability to run a TLD (as the overall broad sentiment with a few exceptions seemed to support the ‘let-the-market-decide principle’)”. This view mapped quite closely to arguments in some Constituency Statements.
2. The GA List also contains commentary that disagreed with the Constituencies that propose to introduce only sponsored gTLDs. The GA List touches on alternate root concerns and domain name collisions or the problems of confusingly similar domains.

## D.3 Allocation Methods

1. Amongst the commenters who explicitly considered allocation methods, most appeared to oppose the use of auctions as an allocation method.
2. Danny Younger submitted a summary of excerpts from the GA list discussion on allocation methods, following a week-long discussion of this section of the draft Terms of Reference. He found that “none of the allocation methods reviewed by the group garnered any real measure of support, although each had its own advocates”.

3. On the whole, participants in the GA list opposed the use of auctions. The arguments against auctions were that auctions – particularly auctions of strings - may tend to concentrate control, that organizations with greater financial resources could outbid organizations which have shown previous interest in a TLD (for example, .web), and that the highest bidder is not necessarily the best organization to run a TLD. The GA list commenters appeared to explicitly favor a free-market approach to allocation, but also felt that auctions would not deliver the most competitive results.
4. Elmar Knipp argued that comparative evaluations should be used in an auction situation where “startups with fresh ideas would have much lower chances [of success]”.
5. As mentioned in section D.1 above, George Kirikos proposed an elaborate allocation method called the Ascension Allocation Method which relies upon Coase Theorem. The rather complex series of string and trademark claims and renunciations required by the method appear likely to increase transaction costs overall. This method did not receive broad support from other commenters.

#### **D.4 Contractual Conditions**

1. Submissions from the public comment process also address contractual conditions in some detail. Jeff Williams’ submission agreed with that of the ALAC and NCUC in arguing that there should not be “...rounds for applying for new TLDs”.

2. Like the RyC and NCUC, public comments advocate the use of “thin” contracts and that there could be some improvements made to ICANN’s registry agreement compliance program.
  
3. Some public comments were diametrically opposed to the position set out by the IPC. They rejected intellectual property owners’ “priority rights with respect to generic words, and participants further expressed their ongoing dissatisfaction with ICANN’s failure to establish a compliance program”. In essence, public commentators wanted to facilitate freer market choice in the selection of new gTLDs; wanted limited selection criteria and simplified contractual arrangements.

## Appendix D - Submissions on Call for Papers

This appendix sets out a summary of the responses to the Call for Papers which were used as the basis for developing the recommendations found here. The Call for Papers respondents were invited to give oral presentations at the Washington DC meetings.

1. In total, 11 submissions were received in response to the Call for Papers. These submissions are summarized below in relation to the issue areas. The full texts of all submissions are available at <http://gns0.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm>.
2. In addition, many of the respondents to the Call for Papers gave presentations at the Washington DC meeting, adding further explanations to the views expressed. The presentations are available at <http://gns0.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm>.

### E.1 Whether to introduce new gTLDs

1. John Levine, Paul Hoffman (et al) advocate an annual release of 50 new gTLDs at once, stating that such timing wouldn't give any applicant an advantage over the others except in the inherent semantics of the chosen string. They also claim that technical qualifications could be handled separately, in line with other proposals calling for a separate registry operator accreditation scheme. Mr Levine made a presentation at the Washington DC meeting which amplified his views.
2. Dirk Krischenowski (.berlin) sees a multitude of reasons to introduce new gTLDs. These include views also found in other contributions, including

avoidance of alternate root scenarios; to diversify ICANN's funding base and to promote local development (which maps to some public comments received). In addition, new gTLDs would increase diversity and choice with decreasing speculative pressure as a possible consequence. Finally, Krischenowski states that there is explicit demand from the community, claims that there is no risk of a land rush for new gTLDs and does not see a need for a limit on the total number of gTLDs, unlike the IPC community who foresees exactly the opposite scenario. Mr Krischenowski reiterated his views in his presentation to the Washington DC meetings.

3. Angela Stanton supports introducing new gTLDs and proposes to redesign the gTLD structure in line with the original taxonomic purpose as a directory. This would call for introducing constraints in registrations for currently unrestricted gTLDs but would substantially reduce the need for defensive registrations. It may enable using the same domain name strings for different registrants in different gTLDs. Ms Stanton made a presentation to the Washington DC meeting to expand on her views.
  
4. Rahul Goel and Ashutosh Meta support a measured introduction of new gTLDs with increased user choice as their main rationale. To further increase choice for users in developing countries, they advocate that a company with an existing domain in one gTLD should not be allowed to register in any other gTLD, an approach somewhat similar to Stanton's above. Messrs Goel and Meta made a presentation to the Washington DC meeting and explained to the Committee the importance of domain name affordability.

5. Hedd Gwynfor (DotCym) supports the introduction of new gTLDs and advocates that priority be given to sponsored TLDs for cultural purposes. DotCym is an organization interested in establishing a gTLD for Welsh cultural and language interests. Gwynfor refers to the .cat gTLD as “a significant step toward the allocation of sponsored TLDs for single language communities...and is a precedent to which other minority or stateless language based groups can now aspire...”.
  
6. K Bhonsle argues for a limited introduction of new gTLDs with a particular focus on previously deprived users and applications catering to basic needs in a primarily agricultural environment.
  
7. Peter Gerrand is in favor of introducing new sponsored gTLDs and finds reasons to revert to the originally intended structuring of the domain name space with distinctive, defined purposes for each gTLD. Dr Tonkin gave an overview of Mr Gerrand’s paper at the Washington DC meeting.
  
8. Danny Younger, who also made a presentation to the Washington DC meeting, makes an analogy between the DNS and the “zoning” of city areas. The ICANN Board is seen as the equivalent to a zoning board of such a city. Younger claims that as the need for new zones inevitably appears, zoning is necessarily done in a measured manner after considerable consultation and experiences should be drawn from successful zoning management in the physical world. He also acknowledges that experimentation in zoning is a necessary aspect when applying this model to the DNS. ICANN’s primary responsibility to act in the public interest should be focused towards the public at-large rather

than towards separate communities or organizations. Inspiration for future zoning could well be drawn from ICANN's Strategic Planning Issues Paper. Younger also makes reference to a paper by Stewart & Gil-Egui on application of the Public Trust Doctrine to Internet resources, implying the obligation to preserve resources that are crucial for intergenerational equity.

9. CORE supports the introduction of new gTLDs for similar reasons to other submissions including counteracting the proliferation of alternate roots; ensuring that .com doesn't become the de-facto or "virtual" root and promoting innovation and creative new paradigms. The CORE submission also advises using lessons learned from earlier rounds of new gTLD introductions. Mr Staub, on behalf of CORE, made a presentation to the Washington DC meeting.
  
10. Ross Rader & Elliot Noss (TUCOWS) support the introduction of new gTLDs. They propose a new distinction between chartered and unchartered gTLDs to replace current distinctions. They foresee migration of existing gTLDs to new categories. They provide a detailed proposal for a process introducing a gTLD from application to renewal of a registry agreement. Mr Noss presented his views, with Mr Rader, to the Washington DC meeting.
  
11. Bret Fausett supports the introduction of new gTLDs as an ongoing process with a taxonomy determined by market forces. The rationale for his stance include the desirability to increase registry-level competition; to cater for the needs of prospective registrants; to enable the evolution of

the Internet and to better provide for underserved markets. An array of suggested principles is provided to guide various aspects of the introduction.

## **E2 Selection criteria**

1. Levine & Hoffman explicitly recommend avoiding string exclusivity and allowing parallel strings that are essentially synonymous, like .tooth and .teeth. They also state that a directory approach is bound to fail, especially as search engines are the preferred way of approaching the Internet for a chosen topic, rather than looking up by TLD. A few more unrestricted gTLDs would be welcome and also some certified gTLD for particular purposes, where certification matters (similar to .edu). Creativity in usefulness should be the objective. This approach can be seen as a mix between the IPC proposals and those of the NCUC.
2. Krischenowski supports the selection criteria used in previous rounds and suggests adding supporting criteria like positive recognition by government, potential to foster economic development, potential to promote technical development and socially desirable effects (for example, SME promotion, education and support of local culture). Support of local culture is also recommended by Gwynfor above.
3. Goel & Meta put an emphasis on selection criteria and other aspects that would support less developed countries; differentiated registration fees, country-wise assignment of IP addresses and geographic redistribution of the root servers. This view is in direct contrast with the RyC claim that there is little evidence to support preferential criteria for new gTLDs

without “research that supports their claim including the research methodology supplied”. The NCUC’s view is that “...the best way to do this [expand the use of domain names] is to make ICANN’s selection criteria as simple, predictable and content-neutral as possible. Such a politics-free environment would make it much easier for innovators, from whatever locations, social origins or economic status, to propose and implement new ideas”.

4. Gwynfor claims that the ISO 639-2 three letter codes for languages should be reserved for future gTLDs for the respective languages.
5. Gerrand recommends that more emphasis be put on the integrity with which the sponsored gTLDs enforce their eligibility condition and lists suitable selection criteria. This comment is equally valid for section E.4 contractual conditions. As to the gTLD strings, he suggests reviewing the policy on ISO 3166-A3 three letter country codes which are currently reserved. He also recommends enabling the use of ISO 639-3 three letter language codes for future gTLDs.
6. Younger sees a development where new gTLD applications are viewed on a case-by-case basis, only being deemed acceptable when the rationale for each proposed gTLD becomes self-evident.
7. CORE illustrates its reasoning with four hypothetical gTLDs for specific applications and with clearly defined gTLD communities. The applicant would need to be representative of this community as an obvious criterion. As the examples go, the presence of a sizeable community is a criterion

that demands case-by-case analysis, price per registration is irrelevant as a criterion while productive use of the DNS at the top-level is most relevant. Inherent security requirements in a particular gTLD application may modify the desired score for other plausible selection criteria. In short, the examples are sponsored gTLDs calling for case-by-case judgments.

8. Rader & Noss introduce a distinction between “Delegant”, coordinating the activities of a gTLD and “Registry Service Provider”, taking care of the technical operation of the gTLD. This idea would mean that the Delegant applies for the gTLD and, if approved, would have it operated by an accredited Registry Service Provider. This would formalize an established practice and would call for different selection criteria for the two separate businesses. In a similar way to the established accreditation of Registrars, the Registry Service Provider should be subject to ICANN accreditation, by applying the current technical selection criteria with a few amendments. This is consistent with other proposals about separate registry accreditation. The Delegant should be requested to abide by chosen aspects of RFC 1591, without restrictions or preferences imposed concerning business plans. These parties would both have agreements between themselves as well as with ICANN. In addition, gTLD string restrictions would apply with no digits allowed and with no confusing similarities to existing strings. Noss and Rader recommend special rules for trademarks as gTLDs which accord with the IPC’s ideas.
  
9. Fausett sees a well-defined market, be it large or small, as a criterion while adding that an application from an able and willing provider is a main

indication that such a market exists. Free market entry should be a guiding principle to the greatest extent possible, while recognizing that user confusion and defensive registration are undesirable.

### **E.3 Allocation methods**

1. Levine & Hoffman see both auctions and lotteries as viable allocation methods, while indicating that ICANN should not profit by windfall gains from allocating new gTLDs. They acknowledge that there will be secondary trading in allocated gTLDs. An auction with the [N] highest bids getting their [N] favorite domain strings is a possibility, with the proceeds going to a worthy cause. This may be combined with trademark limits so that only IBM can get .ibm while still needing a winning bid to do so. This can be combined in a tiered approach with a lottery for five or ten names with only non-profits eligible.
2. Krischenowski prefers revolving application windows, preferably 2-4 each year, and a predictable timeframe for the approval process, not surpassing 6 months. He sees no need to structure gTLDs in different classes and contends there should only be an "open" class of gTLDs. Allocation should rely on comparative evaluation and FCFS once the evaluation is positive. Auctions and lotteries are to be avoided and he includes a reference to the effects of the UMTS auctions.
3. Goel & Meta state that comparative evaluation is the most appropriate allocation method, with short-listing of all that satisfy the minimum criteria followed by prioritization based on stability and price.

4. CORE, basing its statement on four examples of sponsored gTLDs, is clearly in favor of comparative evaluations and sees little or no scope for other allocation methods. The allocation process should be recurring, with at least two application windows per year, linked to ICANN meetings. CORE suggests that a standing gTLD applications task force is established to avoid bottlenecks. It ways that preliminary applications should be received for publishing, without review, as a step to enable possible consolidation of similar applications.
  
5. Rader & Noss advocate an ongoing, self-financed allocation process. They suggest that applications would be received at any time. FCFS should be used as the main allocation method with sealed bid auctions to resolve string contention. Fee adjustments could be used to manage an applications flood and a development fund, built from fee surpluses, could provide financial assistance to deserving applicants.
  
6. Fausett does not address allocation methods explicitly but it is inherent in the submission that FCFS is foreseen in an ongoing allocation process, for the applications that meet the selection criteria.

#### **E.4. Contractual conditions**

1. Krischenowski supports the idea of a separate process for accreditation of registry operators. This is consistent with ideas suggested by others.
  
2. Both Bhonsle and Goel & Meta propose that sun-rise periods be compulsory for all new gTLDs in order to safeguard IP holders' interests.

3. CORE finds the current contractual framework for sponsored gTLDs is an appropriate model. It highlights the need for a stable system of checks and balances for the sponsored gTLD's delegated policy-making authority.
  
4. Rader & Noss propose omit price controls for new gTLDs and to relax, and eventually eliminate, price controls for existing gTLDs in reverse chronological order from their initial delegation. Presumptive renewal should be a standard provision, with remaining cancellation powers for ICANN in case of breach of the contractual terms. A sanctions program should be developed for handling contract violations regarding all agreements. Sunrise periods are discouraged. Presumptive renewal of agreements should be the rule.
  
5. Fausett suggests regular use of escrowing registration data. Back-up registries should be selected through market mechanisms and published migration plans are useful provisions that may lessen the impact of registry failure.

28 July 2006

---

**GNSO Initial Report Introduction of New Generic Top-Level Domains**

28 July 2006

**Table of Contents**

**Executive Summary**

**Term of Reference 1: Recommendations**

**Term of Reference 2: Recommendations**

**Term of Reference 3: Recommendations**

**Term of Reference 4: Recommendations**

**Next steps**

**Bibliography**

---

**Executive Summary**

1. This document is the final draft of the *Initial Report* of the GNSO's Policy Development Process on the introduction of new top level domains (new TLDs). The *Report* sets out the key findings that have emerged from a multi-phase policy development process. The key elements of that process have been formal Constituency Statements submitted by each of the GNSO's constituencies, a Call for Expert Papers and a Public Comment Period. In addition, the GNSO Council's new top-level domains Committee (new TLDs Committee) has conducted three separate face-to-face consultations (in Washington DC, Wellington and Brussels) to discuss each Term of Reference. These meetings have been open to observers. In addressing the Terms of Reference, very close attention has been paid to understanding ICANN's Bylaws, Mission and Core Values. The GNSO Council met with the Governmental Advisory Committee (GAC) at ICANN's June 2006 Marrakech meeting to share with the GAC progress made so far and to hear about the development of a set of GAC principles on the introduction of new top level domains.

2. The following sections set out each Term of Reference, the findings that have emerged and, at the end of each section, offer some recommendations for the next steps which could take place. A full list of Constituency Statements, copies of the responses to Calls for Expert Papers and the Public Comment archives can be found in the GNSO's section of the ICANN website at <http://gnso.icann.org/issues/new-gtlds>.
3. There are two other GNSO policy development processes that have a direct bearing on the work here: the PDP Feb 06 on Policies for Contractual Conditions for Existing TLDs<sup>1</sup> and the work which has been undertaken on internationalized domain names (IDNs)<sup>2</sup>. The final *IDN Issues Report* was released on 13 July 2006 and can be found at <http://gnso.icann.org/mailing-lists/archives/council/msg02677.html>. The results of this PDP (since it is in a more advanced stage) will inform the two additional work streams and will need to be taken into account when making final recommendations about the two other PDPs. Some early finding that there are some key principles which are important including consistency of treatment, equitable treatment of registry operators. The PDP Feb 06 will inform and will be co-coordinated with the two additional work streams before the Dec 05 work final report. We do not expect delays.
4. Any policy development process calls for implementation planning to be established to ensure that appropriate resources are made available. Early work is underway by ICANN staff to facilitate a timely implementation of the policy outcomes.
5. The GNSO's Committee on new TLDs met to discuss this Report on Thursday 15 June 2006 to prepare a version of the Report for discussion at the June 2006 ICANN meeting in Marrakech. This document reflects discussions at the Marrakech meeting and will be used to facilitate discussion with the full range of ICANN Supporting Organisations, the Governmental Advisory Committee and the broader community.
6. A formal Public Comment Period will commence in late July 2006. The ICANN Advisory Committees and Supporting Organisations will be invited to respond to the *Initial Report*. A further face-to-face meeting is scheduled for late August 2006 in Amsterdam for the GNSO Committee to consider responses to the public comment period and inputs from other ICANN stakeholders in addition to any further GNSO constituency views.
7. It is planned that the *Final Report* will be completed during October 2006, prior to ICANN's December 2006 meeting in Sao Paulo, Brazil. It is expected that the *Final Report* will contain guidance on a reference *Request for Proposal* for new top level domain applications and a base contract to which applicants can refer prior to completing the application process.

### **Term of Reference 1: Recommendations**

#### Term of Reference 1. Should new generic top level domain names be introduced?

Given the information provided here and any other relevant information available to the GNSO, the GNSO should assess whether there is sufficient support within the Internet community to enable the introduction of new top level domains. If this is the case the following additional terms of reference are applicable.

1. This Term of Reference was the subject of detailed discussion at the 24 & 25 February 2006 face-to-face consultations held in Washington DC. It was clear from the results of that meeting, and the subsequent discussion which has taken place about the three other Terms of Reference, that there is support to introduce new top-level domains. Additionally, at the 31 March 2006 ICANN Board meeting in Wellington, the Board made clear its intention to proceed with the introduction of new top level domains<sup>3</sup>.

2. The GNSO Committee's Washington DC meeting notes<sup>4</sup> indicate that there were a wide variety of reasons to be cautious about the introduction of new TLDs including "[the] selection and implementation process was time consuming, expensive and unpredictable; [the] limitation on the number added caused problems for other applicants that met selection criteria; some selection criteria were not objective, clearly defined, and measurable enough to allow independent evaluation to be effective..." These concerns have been discussed in subsequent consultations about selection criteria, allocation methods and policies for contractual conditions.
3. Multiple reasons for supporting the introduction of new gTLDs were put forward in the Constituency Statements and Call for Papers responses. These included enhancement of competition at the registry level; increased choice for registrants or end-users, innovative new services for both existing and emerging markets and avoidance of the proliferation of alternative roots.
4. The Washington DC meetings showed that there were additional justifications for introducing new gTLDs including "[a] small TLDs [is] OK if it meets the needs of the community that has put [the idea] forward and doesn't exclude others that are within that community; the new gTLDs introduced so far do not yet cater for parts of the international community that use characters sets other than the limited set from the ASCII character range; a policy is required for the introduction of IDNs at the top level, and [we] need to consider the political and cultural environments as demand for these IDNs is increasing...". Part of this work is being addressed through the *IDN Issues Report* referred to earlier.
5. There were some common elements articulated by meeting participants which indicated that the following selection criteria "baskets" were useful<sup>5</sup>: sound business, technical and operational plans; operational stability, reliability, security and global interoperability; and simplicity and predictability of domain name registration rules.
6. The underpinning of the discussion was that, whatever consensus policy is developed, it must be consistent with ICANN's limited technical co-ordination mission; that an enabling and competitive environment for the provision of domain name management be fostered and that domain name registration rules are clear. GNSO new TLDs Committee Chairman, Bruce Tonkin, released the following GNSO statement after the Washington DC meeting which enabled the Committee to move forward with consideration of the remaining Terms of Reference, "...taking into account the lessons learnt from the limited introduction of new TLDs since 2000, the GNSO supports the continued introduction of new gTLDs. Prior to introducing new TLDs, the GNSO recognizes that the lessons learnt, the submissions made in response to PDP-Dec05 [this PDP] and further input, should be taken into account to identify and develop [C]onsensus on the selection criteria, allocation methods, and implementation processes. Note that there was no formal vote taken on the statement above, and the intent of identifying a "rough consensus" was to allow the committee to move forward to the topic of selection criteria." <sup>6</sup>
7. The Committee used several other expert reports to inform its decision making including the work of the OECD on domain names and the introduction of new TLDS, the Summit Strategies Report on application and evaluation processes and the World Bank Report on issues about licensing and application procedures. In particular, the Committee used expert work about selection criteria and requests for proposals from the Asian Development Bank, the OECD and the World Bank. The bibliography found at the end of the document contains a full list of references.
8. **Recommendation on Term of Reference 1: That new generic top-level domains should be introduced and work should proceed to enable the introduction of new top level domains,**

**taking into account the recommendations found in the following sections.**

## **Term of Reference 2: Recommendations**

### Term of Reference 2. Selection Criteria for New Top Level Domains

a) Taking into account the existing selection criteria from previous top level domain application processes and relevant criteria in registry services re-allocations, develop modified or new criteria which specifically address ICANN's goals of expanding the use and usability of the Internet. In particular, examine ways in which the allocation of new top level domains can meet demands for broader use of the Internet in developing countries.

b) Examine whether preferential selection criteria (e.g. sponsored) could be developed which would encourage new and innovative ways of addressing the needs of Internet users.

c) Examine whether additional criteria need to be developed which address ICANN's goals of ensuring the security and stability of the Internet.

1. This Term of Reference was the subject of detailed discussion during two day face-to-face meetings on 24 & 25 February 2006 in Washington DC and on 25 & 26 March 2006 in Wellington, New Zealand, as part of ICANN's regular round of meetings. There was consensus around both the principles for developing selection criteria that map directly to ICANN's Bylaws, Mission and Core Values and the impact of providing appropriate policy guidance to the Board about criteria that could be used in further rounds of new top-level domain applications<sup>7</sup>.

There was agreement that further work needed to be done with respect to technical criteria and a supplementary Call for Information from Constituencies was made on 8 March 2006<sup>8</sup>. It is important to comprehensively evaluate technical competence for any registry services operator. In addition, it is also important to evaluate that competence in the context of broader commercial capacity to, for example, adequately fund and operate a registry services business. The latter two criteria below fit into both technical and operational evaluation areas.

2. The Call for Information listed questions regarding four specific areas including:

- whether the minimum technical criteria for registry operations should be set according to the current registry requirements of, for example, .NET registry;
- whether the minimum technical criteria should make some reference to the proposed size of a new registry;
- whether a separate registry operators' accreditation scheme be established and, if so, what should that scheme look like; and
- whether other business operations criteria continue to be included in a registry operator's application to ensure that any registry operator is adequately funded and professionally managed.

3. At the Washington DC meeting, responses to the selection criteria questions were mapped closely to a review of ICANN's Mission and Core Values. The selection criteria used in the 2000 and 2004 rounds for new top level domains were used as reference points<sup>9</sup>. Constituency representatives were asked to clarify the positions taken in the Constituency Statements but no attempt was made to reach consensus positions prior to the Wellington meeting.

4. The main area of agreement was that selection criteria should reflect ICANN's limited technical mission. It was clear that any selection criteria should be objective and that any selection process would be published prior to an application round beginning. Some Constituency representatives

said that provision of a sound operational plan which demonstrated an ability to comply with ICANN policy (where appropriate) and meet minimum technical standards was important. "Objectivity" was a consistent thread throughout the discussions and it was thought that following this principle would encourage participation in any new selection round. This would also enable competitive provision of registry services where an open market environment was most beneficial to end-users.

5. The continuing stability and security of the Internet was another recurring theme which included the treatment of internationalized domain names where compliance with ICANN's evolving IDN guidelines was seen as important. The final *IDN Issues Report* has identified a series of questions about technical compliance which are important and are related to the work here<sup>10</sup>. It was clear that compliance with best practice technical standards was necessary within any registry.
6. Discussion of stability issues also showed that the ongoing use of ICANN accredited registrars as sole retailers of gTLD domains was desirable. Registrar compliance with contractual provisions that promote interoperability contributes to DNS stability.
7. The Wellington meeting provided further opportunities to refine the outputs of the Washington meeting. The GNSO Committee Chairman released a copy of the presentations made at the Wellington meeting and these are summarized below<sup>11</sup>.
8. The Committee members then developed more detailed positions at the Wellington meetings. After a further day of discussion it was clear that there was strong support for continuing to apply robust technical criteria through any application round. In addition, if applicants wished to offer internationalized domain names at the second level, then compliance with ICANN's IDN guidelines was required. There was strong support for supplying a list of Requests for Comment (RFCs) and other technical standards relevant to registry operators. These views are reflected in the *IDN Issues Report* found at <http://gns0.icann.org/issues/idn-tlds/issues-report-17jul06.htm>
9. There was strong support for the levying of an application fee to participate in any new TLD round. In addition, there was discussion on the 15 June 2006 Committee conference call about whether differentiated application fee structures would serve a useful purpose in encouraging more applications for new top level domains. This last idea must be balanced with the presumption that the application process would remain cost neutral to ICANN.
10. There was also strong support for applicants being required to demonstrate financial viability and a robust operational plan. These criteria fit into a basket of requirements around the application process itself including the production of an application time line, compliance with probity requirements, a pre-published base contract<sup>12</sup> and a pre-published set of objective and measurable criteria against which applications would be evaluated. There is not yet a consensus position which balances the desire for robust business plans versus allowing ideas to be tried (and perhaps fail) in an open market. ICANN's role in ensuring the ongoing operation of registry services providers requires further discussion particularly with respect to managing any negative impact on end user registrants. Data escrow arrangements and other technical approaches to the transfer of registrant data are only part of the equation and more discussion about the nexus between selection criteria, allocation methods and ongoing registry services operation needs to be facilitated.
11. There was strong support for applicants being able to demonstrate that their application aimed at a clearly differentiated domain name space and that the purpose of the new TLD was clearly understood. Further discussion is needed on the definition of clearly differentiated domain name space and whether this means the continued distinction between open, sponsored, chartered and

any other kinds of registry. This discussion should balance the goal of enhancing competition with the reality that limiting innovation also limited competition between registry services offerings

12. Committee members supported maintaining the use of ICANN accredited registrars to register domain names. They also supported the ongoing compliance with ICANN consensus policies (more discussion of this element is found in section on contractual conditions).
13. There was also strong support for ensuring compliance with, in the case of sponsored TLDs, the charter of the TLD and for addressing domain name registration violations. No agreement was reached about whether the current model of sponsored/unsponsored; restricted/unrestricted; chartered/unchartered would continue.
14. There was discussion of other selection criteria which did not get the full support of the group.
15. **Recommendations on Term of Reference 2: The criteria with strong support can be divided into several areas.**

**Firstly, "process" criteria which would guide the establishment and conduct of any application round. These criteria include a mandatory application fee; application round probity rules and clear timelines for application completion.**

**Secondly, a "technical" criterion which includes compliance with a minimum set of technical criteria which would include a base set of IETF RFCs, and other technical standards. If IDNs are offered, applicants must comply with relevant IETF standards and ICANN IDN guidelines. Further discussion is necessary about the consistent treatment of any new TLD application whether the applicant proposes an ASCII based string or one that uses any other script.**

**Applicants must comply with ICANN consensus policies.**

**Applicants must offer a clearly differentiated domain name space with respect to defining the purpose of the application. The effect of requiring differentiation on IDN top-level domains has not been fully discussed and further input is required.**

**Applicants must have mechanisms in place to ensure compliance with the purpose of a chartered or sponsored TLD, and to address domain name registrations violations.**

**Finally, criteria which must be met by applicants to show that that they have the financial and operational resources to execute their plans but the degree to which ICANN plays a**

**role in ensuring a business model that will "guarantee" ongoing operations is not settled.**

**The GNSO is interested in input on the pros and cons of sponsorship criteria which more closely match the intent of the 2004 gTLD round and which had support from several, but not a majority of, constituencies. The sponsorship criteria may include "applicants for a new gTLD must represent a well defined community and registrants are limited to members of that community"; "a new gTLD applicant must establish a charter that addresses a defined purpose with eligibility criteria, and registrants must meet the eligibility criteria"; "accurate verification of registrant eligibility"; and, "applicants must explain how the new TLD maximized benefits for the global Internet community".**

### **Term of Reference 3: Recommendations**

#### Term of Reference 3. Allocation Methods for New Top Level Domains

- a) Using the experience gained in previous rounds, develop allocation methods for selecting new top-level domain names.
- b) Examine the full range of allocation methods including auctions, ballots, first-come first-served and comparative evaluation to determine the methods of allocation that best enhance user choice while not compromising predictability and stability.
- c) Examine how allocation methods could be used to achieve ICANN's goals of fostering competition in domain name registration services and encouraging a diverse range of registry services providers.

1. This Term of Reference was the subject of detailed discussion at the Wellington, New Zealand meetings. It was clear that allocation methods are an integral part of developing "process" criteria as applicants should know what kind of allocation method will be used prior to submitting an application for a new TLD. It was also clear that selection criteria form a large part of any allocation method. Clearly defined selection criteria provide a "natural selection" method for applicants and specific, extra allocation methods would only be required where there was a contest over the same application, for example, if there were two applications for .abc, or if consideration of applications had to be prioritized.
2. The record of the full discussion about allocation methods can be found in the reference below<sup>13</sup>. In summary, it was clear that the criteria for choosing an allocation method should be timely, objective, predictable and facilitates the ongoing introduction on new TLDs. It was clear in the GNSO Committee's discussion that there is a preference for a first come first served system which seems to be the most efficient way to process new applications. This approach assumes that applicants comply with an application process which has been clearly defined and that there is not a serious backlog of applications which need to be processed. A FCFS system assumes a continual round of assessment and implementation. This means that there is a minimal amount of subjective analysis of applications which requires detailed "intervention".
3. Alternatively, it has been suggested that a "batch processing" system would be useful, as long as the duration of the process allowed enough time for sound applications to be prepared and that the length of the batch process did not excessively delay the evaluation and launch of new top level domains. It may be that a two-step approach is required and that a transition from a batch processing system to an ongoing FCFS process is necessary if new TLD applications were to be accepted on a continuous basis. Further understanding is required about the different impacts

that FCFS and batch processing may have on any application round and the implementation of new top-level domains.

4. It was also clear through the GNSO Committee's consultations that only where duplicate or confusingly similar strings appeared, should special allocation methods be used and that these methods should be defined well in advance. Further discussion is required about what key stakeholders perceive as ICANN's role in determining the success, or otherwise, of registry services beyond a robust application and evaluation system.
5. The GNSO Committee applied the same methodology that had been used for the previous two terms of reference for determining where consensus had emerged for policies on allocation methods. There was strong support for the first come, first served process with some support for either an auction<sup>14</sup> or lottery to deal with competing applications that had already met the other baseline criteria of technical competence and the provision of sufficient evidence of operational and financial capacity.
6. There was strong support for ensuring that ICANN provided sufficient resources to support any application round, particularly where a large number of applications were received.
7. It was evident to some Committee members that comparative evaluations were still a necessary part of any new TLD application process particularly where there were limited resources to deal with any application round and where applicants had proposed similar strings with similar purposes for similar communities of interest.
8. Some participants in the GNSO Committee considered the creation of categories of gTLDs (for example, commercial, non-commercial, unsponsored, sponsored, open and unrestricted, restricted and chartered) and then select the appropriate selection criteria and allocation method for each category, should there be a competition for the same TLD. Further work is required to ensure a full understanding of the definition of any proposed category for new TLDs or if the differentiation of TLD should be abolished and the selection of the appropriate selection criteria and allocation method.
9. **Recommendation on Term of Reference 3: There was strong support for a first-come, first-served approved to processing applications. Where there was contention for either the same string or limited staff resources to process applications, there were two main alternatives proposed which each had roughly equal support. These were:**
  - **Objective (auction or lottery)**
  - **Subjective (comparative evaluations of the applications to identify the best applications)**
10. **The GNSO is seeking broader community input on the two main approaches, and whether the approach chosen should be based on some categorization of gTLDs.**

#### **Term of Reference 4: Recommendations**

##### Term of Reference 4. Policy to Guide Contractual Conditions for New Top Level Domains

- a) Using the experience of previous rounds of top level domain name application processes and the recent amendments to registry services agreements, develop policies to guide the contractual criteria which are publicly available prior to any application rounds.
- b) Determine what policies are necessary to provide security and stability of registry services.

- c) Determine appropriate policies to guide a contractual compliance programme for registry services.
1. This Term of Reference was the subject of detailed discussion during a three day face-to-face meeting between 11 & 13 May 2006 in Brussels<sup>15</sup>. The first day of the meetings was a tutorial day conducted by ICANN's Deputy General Counsel designed to enable participants — both Committee members and observers -- to gain an understanding of the content of and reasoning behind ICANN's existing registry agreements. The subsequent two days followed the same format as the Washington DC and Wellington meetings with constituency representatives explaining their positions as they related to ICANN's Mission and Core Values.
  2. The discussion about this Term of Reference is closely related to another policy development process on policies for contractual conditions for existing registries. The *Preliminary Taskforce Report* has been produced and the work of the Taskforce will proceed in parallel with the work found here<sup>16</sup>. The issues to be addressed in that Taskforce are being addressed in this PDP and there is a very close connection between the two work streams. In addition, the *IDN Issues Report* refers to policies for contractual conditions for IDN related services<sup>17</sup>.
  3. The GNSO Committee has referred to other expert analysis in the area of selection criteria, allocation methods and contractual conditions to ensure this process meets adjacent industry standards. It is worthwhile to quote, for example, some of the work done on behalf of the World Bank on mobile license renewals<sup>18</sup> that has many parallels to this work. For example<sup>19</sup>, the World Bank Report recognizes that a "major challenge facing regulators in developed and developing countries alike is the need to strike the right balance between ensuring certainty for market players and preserving flexibility of the regulatory process to accommodate the rapidly changing market, technological and policy conditions".
  4. It is clear that "promoting regulatory certainty and predictability through a fair, transparent and participatory renewal process" is critical. These conditions echo the priorities of the GNSO Committee. The World Bank Report refers in detail to public consultation procedures and systems for establishing and renewing "license" rights. It also spells out clear conditions under which any "application round" could be established and the way in which any process would be run. Those suggestions are consonant with what is proposed here.
  5. A set of policies for contractual conditions got strong support from GNSO Committee members. Top line principles, articulated in particular by the Registries' Constituency, were that policies to guide contractual criteria should not compromise private sector participation and that the application process (and resulting contractual conditions) should encourage long term investment with optimal opportunities for innovation and competition.
  6. The Committee supported the need for a gTLD registry to comply with new or changed ICANN consensus policies to one or more of the following areas during the term of the agreement with ICANN:
    1.
      - i. Issues for which uniform or coordinated resolution is reasonably necessary to facilitate interoperability, security and/or stability of the Internet
      - ii. Functional and performance specifications for the provision of registry services (as defined below)
      - iii. Security and stability of the registry database for the TLD
      - iv. Registry policies reasonably necessary to implement consensus policies relating to registry operations or registrars

- v. Resolution of disputes regarding the registration of domain names (as opposed to the use of domain names)
2. It is clear that the predictability of a pre-published "base" or "framework" contract is important to GNSO Committee members. Those contracts need to be consistent in their treatment of different types of registry businesses and several Committee members indicated that the current .jobs agreement provides a good starting point. Several Committee representatives stressed the need for fair treatment amongst registries with equal obligations imposed on operators (for example, with respect to technical standards and business viability). It was also clear that a "registry compliance program" with graded measures for enforcement would be useful.
  3. It is also clear that a public comment process on contractual negotiations is desirable but it is recognized that there are limits to which commercial in confidence information should be made available.
  4. The tutorial session and subsequent discussions identified some key areas that could benefit from further investigation. Comments along this line related particularly to the establishment of ICANN fees; the fees charged for a registry within any new agreement and the way in which fees are used by ICANN. The Committee supported ICANN providing a consistent approach with respect to registry fees, taking into account differences in regional, economic and business models. The GNSO Committee suggested that ICANN was not necessarily the appropriate organization to impose price controls on the fees charged to registrars within contracts.
  5. In summary, there should be a frame agreement to provide some level of consistency with the ability for staff to have delegated authority to approve final contracts. The term of the agreements should be of commercially reasonable length (perhaps ten years but reviewed on a case by case basis).
  6. There should be renewal expectancy. Operators could expect renewal of their agreements provided that they had not been in material breach of the contract or repeatedly failed to perform to the standard required in the contract. There should be mechanisms to terminate the contract if the operator has been found in repeated breach of the contract.
  7. Any material alterations to the frame agreement should be subject to a public comment period before approval by the ICANN Board. Any new framework contract would take into account ICANN consensus policies current at the time. Any deviation from consensus policies should be explicitly stated and justified in the agreement.
  8. Where a registry provides second-level internationalized domain names, the contract should require the registry operator to adhere to IDN standards and ICANN's IDN Guidelines<sup>20</sup>.
  9. The contracts should strike a balance between ensuring certainty for market participants and preserving flexibility for registries to accommodate a rapidly changing market.
  10. With respect to the use of personal data, the Committee supported limited use (only for the purpose for which it was collected) of any personal data and supported requiring the gTLD registry to define the extent to which personal data would be made available to third parties. With respect to other forms of registry data, further information would be required before the Committee could reach any recommendations.
  11. **Recommendations on Term of Reference 4: Further work needs to be done on the establishment of a suitable compliance regime that would operate in tandem with the base registry agreements.**

## Next steps

1. This *Initial Report* is the result of comprehensive consultation and discussion in wide range of settings and has included a very diverse group of stakeholders such as the GAC and other ICANN Supporting Organisations.
2. This document will now be subject to a formal Public Comment Period after which the ICANN Staff Manager will prepare the *Final Report*, (PDP Step 9.c) and the GNSO Council will deliberate on the *Final Report* (PDP Step 10), and the Staff Manager will prepare the *Board Report* (PDP Step 11) so as to allow sufficient time for the Board to take action not later than January 2007.
3. This approach is consistent with the ICANN Board resolution passed at the Marrakech meeting (found at <http://www.icann.org/minutes/resolutions-30june06.htm>).

GNSO PDP-Dec05

Introduction of new TLDs — Initial Report

---

**EXHIBIT JJN-35**

## DRAFT GNSO Recommendation Summary

Last Updated:31 August 2009

**Date:**

14 September 2006

---

**Table of Contents**

## PRINCIPLES

## RECOMMENDATIONS

## 1 WHETHER TO INTRODUCE NEW TOP LEVEL DOMAINS

## 2 SELECTION CRITERIA

## 3 ALLOCATION METHODS

## 4 CONTRACTUAL CONDITIONS

**Principles**

The following Recommendations have been derived from the work of the GNSO Committee on the introduction of new top level domains in accordance with the Terms of Reference set by the GNSO, with reference to ICANN's Mission and Core Values.

- a) That new generic top level domains (gTLDs) will be introduced in an orderly and predictable way.
- b) That some new generic top level domains will be internationalised domain names (IDNs). IDNs use characters drawn from a large repertoire (Unicode). There is a mechanism called Internationalizing Domain Names in Applications (IDNA) that allows the non-ASCII characters to be representing using only the ASCII characters already allowed in so-called host names today (see RFC3490).
- c) That the principal objective of the introduction of new top level domains is to permit market mechanisms to support competition and consumer choice in the technical management of the DNS. This competition will lower costs, promote innovation, and enhance user choice and satisfaction.
- d) That a set of "technical criteria" for a new gTLD registry applicant minimises the risk of harming the operational stability, reliability, security, and global interoperability of the Internet.
- f) That a set of "business capability criteria" for a new gTLD registry applicant provides an assurance that an applicant has the capability to meet its business ambitions.

**Recommendations**

## 1 Whether to introduce new top level domains

1.1 Additional new generic top-level domains should be introduced and work should proceed to enable the introduction of new generic top level domains, taking into account the recommendations found in the following sections.

### 2 Selection Criteria

2.1 The process for introducing new top level domains will follow a prepublished application system including the levying of an application fee to recover the costs of the application process. The application process will also include probity rules and clear timelines.

2.2 Application fees will be set at the start of the process and application materials will be available prior to any application round. Some applications may cost different amounts to evaluate. Therefore, different fees may be levied depending on what stage in the process the application reaches. If applicants find the application fee a barrier to entry, ICANN could have a system of grants to assist applicants. This grant would only allow the applicant to apply, without any presumption that the application would be successful. Grant applications would go through an evaluation process. ICANN should evaluate options for

funding the grants.

2.3 Technical criteria will include compliance with a minimum set of technical standards that would include IETF Requests for Comment related to the operation of the DNS and other technical standards. Standards may include RFC3730-3735, RFC2246, RFC1035, RFC2181, RFC2182, and the ICANN Guidelines for the Implementation of Internationalized Domain Names.

2.4 Applicants must comply with all ICANN consensus policies as and when they are developed.

2.5 Applicants must choose a string of characters for the new generic top level domain name that complies with the process for string checks below.

2.5.1 ICANN will use the following process for TLD string checks.

2.5.1.1 ICANN will make a preliminary determination on whether the application complies with the string requirements and may seek expert advice in order to make its preliminary determination.

2.5.1.2 ICANN will establish public comment processes (which may include input from governments or the Governmental Advisory Committee) that are specific to the criteria for the new string.

2.5.1.3 In the event that ICANN reasonably believes that the application for a particular string may not be compliant with the string requirements, ICANN will refer the issue to a panel of experts with appropriate backgrounds.

2.5.2 String Criteria

2.5.2.1 The gTLD string should not be confusingly similar to an existing TLD string. Confusingly similar means there is a likelihood of confusion on the part of the relevant public.

2.5.2.2 The string must not infringe the legal rights of any third party (consistent with the current requirements of Registered Name Holders – see Clause 3.7.7.9 of the gTLD Registrar Accreditation Agreement).

2.5.2.3 The string should not cause any technical issues, for example, .localhost and .exe would be unacceptable name strings.

2.5.2.4 The string should not be in conflict with national or international laws or cause conflicts with public policy [for example, controversial, political, cultural religious terms]. (Develop text related to public policy issues with GAC assistance).

2.5.2.5 The string should not be a reserved word (for example, RFC2606).

### 2.5.3 Dispute resolution with respect to ICANN accepting a new string.

2.5.3.1 ICANN must establish a dispute resolution process, using independent arbitrators, where existing registry operators could challenge a decision made by ICANN regarding whether a new gTLD string is confusingly similar to an existing gTLD string. If a string application is successfully challenged as being confusingly similar, then no other operator may subsequently apply for it.

2.5.3.2 ICANN may establish a new dispute resolution process, using independent arbitrators, where existing trademark holders could challenge an ICANN decision regarding a string. This new dispute resolution process would be modeled on use existing Uniform Domain-Name Dispute Resolution Processes (UDRP).

2.6 An applicant for a new gTLD must use ICANN accredited registrars to provide registration services to Registered Name Holders (registrants). The registry shall not act as a registrar with respect to the TLD (consistent with the current registry-registrar structural separation requirements, for example, see clause 7.1 (b) and (c) of the .jobs registry agreement). An organization wishing to become a registrar for a new gTLD would need to become accredited using ICANN's existing accreditation process.

2.7 An applicant must demonstrate that they have the capability to operate a new gTLD that meets the minimum technical criteria to preserve the operational stability, reliability, security, and global interoperability of the Internet.

2.8 The applicant must provide a financial and business plan that provides an assurance that the applicant has the capability to meet its business ambitions.

## 3 Allocation Methods

3.1 To ensure an orderly introduction of new TLDs, the applications should be accessed in rounds to allow issues of contention between applicants for the same string to be resolved. First come first served (FCFS) is the preferred method of assessing applications within an initial round. Subsequently, processes may be developed that would enable an "apply as you go" system.

3.1.1 The start date for the round should be at least four months after the ICANN Board has issued the Request for Applications. ICANN must promote the opening time and details of the

new round of applications to the broader worldwide Internet community.

3.1.2 Applications will be date stamped as they are received and will form a queue with the ability to work on multiple applications in parallel.

3.1.3 The closing date for the first round of new applications should be at least thirty days after the start date.

3.1.4 Applications for strings are not published until after the closing date.

3.2 The following process should be used to resolve contention between multiple applicants for the same new gTLD.

3.2.1 Ensure each application for the same gTLD (or a set of gTLDs that may be considered to be confusingly similar) is compliant with the selection criteria (with some flexibility to correct minor application form errors).

3.2.2 Establish a timeframe for a mediation process amongst the applicants to identify a solution amongst competing applications. A possible solution is for the applicants to choose different TLD strings to avoid the conflict, or for the applicants to combine their resources.

3.2.3 If there is no agreement between the applicants, ICANN will evaluate the additional criteria of the level of support of the community of potential registrants within that TLD to resolve contention. Both applicants would have a timeframe (e.g 90 days) to supply this additional material for evaluation. ICANN will determine what evidence is acceptable, and the evidence must be measurable and verifiable. An applicant that is not successful will need to wait until the next application round to submit a new application.

3.2.4 If ICANN staff are unable to distinguish between the level of support for each applicant for the gTLD, then the Board will make a choice based on the ICANN Mission and Core Values which include introducing and promoting competition in the registration of domain names where practicable and beneficial in the public interest; and supporting the functional, geographic and cultural diversity of the Internet. An applicant that is not successful will need to wait until the next application round to submit a new application.

3.3 An applicant who is granted a gTLD string has an obligation to begin using it within an appropriate time-frame.

#### **4 Contractual Conditions**

4.1 There should be a frame agreement to provide some level of consistency (for example, as for the registrars accreditation agreement) amongst gTLD agreements, with the ability for staff to have delegated authority to approve. Any material alterations to the frame agreement, will be subject to public comments before approval by the ICANN Board.

4.2 The contract should strike the right balance between ensuring certainty for market players and preserving flexibility of ICANN to accommodate the rapidly changing market, technological and policy conditions.

4.3 The initial term of the new gTLD agreement should be of commercially reasonable length (for example, default 10 years, although may be changed on a case-by-case basis).

4.4 There should be renewal expectancy. A contract would be renewed provided that the license holder is not in material breach of the contract, or has not been found in repeated non-performance of the contract, and provided the license holder agrees to the any new framework contract conditions that are reasonably acceptable. Any new framework contract would take into account the consensus policies in place at that time.

4.5 There should be a clear sanctions process outlined within the frame agreement to terminate a contract if the new gTLD operator has been found in repeated non-performance of the contract.

4.6 During the term of the agreement, the registry must comply with new or changed consensus policies to one or more of the following areas: ICANN Policy Development

- (1) issues for which uniform or coordinated resolution is reasonably necessary to facilitate interoperability, security and/or stability of the Internet or DNS;
- (2) functional and performance specifications for the provision of Registry Services (as defined in Section 3.1(d)(iii) below);
- (3) security and stability of the registry database for the TLD;
- (4) registry policies reasonably necessary to implement Consensus Policies relating to registry operations or registrars;
- or (5) resolution of disputes regarding the registration of domain names (as opposed to the use of such domain names).

4.7 Any deviation from consensus policies should be explicitly stated and justified in the agreement.

4.8 Where a registry provides IDNs, the contract should require that the registry adhere to IDN standards, and ICANN guidelines for IDNs.

4.9 Initially rely on the appropriate external competition/anti-trust Government authorities to ensure compliance with laws relating to market power or pricing power. This can be reviewed after an initial term.

4.10 ICANN should take a consistent approach with respect to registry fees ♦V taking into account differences in regional, economic and business models

4.11 Use of Personal Data: limit it to the purpose for which it is collected, and the registry operator must define the extent to which it is made available to third parties.

<b>CONSULTATION &amp; PARTICIPATION .....</b>	<b>2</b>
<b>ANNEX ONE – PARTICIPATION TABLE.....</b>	<b>2</b>
<b>REFERENCE MATERIALS.....</b>	<b>2</b>

# INTRODUCTION

1. This is the draft *Final Report* of the Generic Names Supporting Organisation's Policy Development Process (GNSO PDP) on the introduction of new top-level domains (new TLDs). The *Report* sets out the key findings that have emerged from a multi-phase, multi-stakeholder policy development process that has taken place during 2006.
2. In each of the sections below the Committee's Recommendations are discussed in more detail with an explanation of the rationale for the decisions and the method by which those decisions have been reached. The Recommendations have been the subject of numerous public comment periods and intensive discussion across a range of stakeholders including ICANN's GNSO Constituencies, ICANN Supporting Organisations and Advisory Committees and members of the broader Internet-using public that is interested in ICANN's work.
3. The key elements of the PDP have been formal Constituency Statements submitted by each of the GNSO's constituencies, a *Call for Expert Papers* and a Public Comment Period about the *Initial Report*. In addition, all the comments made to the various public forums, discussion lists and directly to ICANN have been taken into account. Those views and ideas have been balanced with positions and discussions that have taken place over a year-long process. The range of opinions reflects the diversity of the stakeholders within the ICANN community. The decisions reached show that, through detailed discussion and analysis, it is possible to arrive at recommendations that balance the interests of all stakeholders.
4. The GNSO Committee conducted four separate face-to-face consultations, in Washington DC, Wellington, Brussels and Amsterdam, to discuss each of the

Terms of Reference. Many of the Recommendations that have emerged from those discussions received majority Committee support. It is expected that those Recommendations with limited support will be included in the GNSO Committee's *Board Report* as minority recommendations.

5. In addressing the Terms of Reference, very close attention has been paid to mapping the discussion and the resulting recommendations to ICANN's Bylaws, Mission and Core Values. A full list of all the Constituency Statements, copies of the responses to Calls for Expert Papers and the Public Comment archives can be found in the GNSO's section of the ICANN website at <http://gnso.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm>.
6. This *Report* will be discussed with other Supporting Organisations and Advisory Committees at ICANN's December 2006 Sao Paulo, Brazil meeting. The results of these discussions and further public comments, along with additional input from ICANN's operational staff, will be taken into account as the Committee works towards achieving supermajority support for its Recommendations. That support will be reflected in the GNSO Council's *Board Report*. In particular, the Committee expects to consider public policy principles from the Governmental Advisory Committee. As part of the PDP process, the Committee may choose to consult expert advisors to comment on the Recommendations to enhance the content of the Board Report.
7. This *Report* reflects another stage in the ICANN's progress towards introducing new top-level domains. The series of changes and approach to the introduction of new TLDs, most notably during 2000 and then again in 2003-2004, is found on ICANN's background information section on the top-level domains (<http://www.icann.org/topics/gtld-strategy-areaa.html>).

8. The following sections set out the Committee's draft Recommendations and the discussion that the Committee undertook to reach the findings contained in the *Report*.

## PRINCIPLES & RECOMMENDATIONS

### Principles

The following Recommendations have been derived from the work of the GNSO Committee on the introduction of new top-level domains in accordance with the Terms of Reference set by the GNSO, with reference to ICANN's Mission and Core Values.

- a) That new generic top-level domains (gTLDs) should be introduced in an orderly, timely and predictable way.
- b) That some new generic top-level domains will be internationalised domain names (IDNs).
- c) That the principal objectives of the introduction of new top-level domains are to permit market mechanisms to support useful online identities that permeate international markets as well as to support competition, innovation and consumer choice.
- d) That a set of technical criteria for a new gTLD registry applicant be used to minimise the risk of harming the operational stability, security and global interoperability of the Internet.
- e) That a set of business capability criteria for a new gTLD registry applicant be used to provide an assurance that an applicant has the capability to meet its business ambitions.

## TERM OF REFERENCE ONE: DISCUSSION

### Whether to introduce new top-level domains

Additional new generic top-level domains should be introduced and work should proceed to enable the introduction of new generic top-level domains, taking into account the recommendations found in the following sections.

1. This section sets out the way in which the Committee arrived at their Recommendation to proceed with the introduction new top-level domains.
2. ICANN's policy development process is a multi-stage process that includes the production of an *Issues Report* (found at <http://gnso.icann.org/issues/new-gtlds/gnso-issues-rpt-gtlds-05dec05.pdf>). The *Report* included comprehensive information about the main documents and decisions on new top-level domains since the 2000 round of new top-levels domains which included, for example, .biz, .info, and the 2004 round of sponsored top-level domains which included, for example, .cat and .asia. In addition, the process for the re-bids of the .net and .org agreements was used to inform the *Report*.
3. A full compilation of all the materials the Committee used is found in the Reference Materials section at the end of the document. In particular, the Committee used the *New TLD Evaluation Process Planning Task Force*. The Report (<http://www.icann.org/committees/ntepptf/final-report-31jul02.htm>) described four aspects to evaluate including technical, business, legal and process that have, subsequently, informed the development of all the Recommendations within the *Report*.

4. In its request to the ICANN staff to produce an *Issues Report*, the Committee also made a request to produce a background report on internationalised domain names (IDNs). This work is now reflected in the current draft of the proposed Terms of Reference to discuss internationalised domain names in the context of the introduction of new top-level domains ([http://gnso.icann.org/issues/idn-tlds/idn\\_tor\\_draft-12oct06.htm](http://gnso.icann.org/issues/idn-tlds/idn_tor_draft-12oct06.htm)). The broad body of work on internationalised domain names taking place within, for example, the President's Committee on IDNs (<http://www.icann.org/committees/idnpac/>), the IETF (<http://www.ietf.org/>) and other technical organisations has been taken into account when developing the *Recommendations* contained here.
5. For the purposes of this *Report*, the discussion at and outcomes of the February 2006 Washington DC are the key determinants of the recommendation to proceed with establishing a permanent policy for and method of accepting applications for new TLDs.
6. There were some strong themes to support a decision to enable the introduction of new TLDs. These included the facilitation of a competitive environment for registry services; a "public choice" benefit for end users and the potential for expansion of innovative Internet use in a wide variety of markets that have may have been underserved in the past. A summary of the discussion on whether to introduce new top-level domains can be found at <http://forum.icann.org/lists/gtld-council/msg00026.html>. In addition, the respondents to the *Call for Papers* set out a variety of arguments to support the introduction of new TLDs. These ideas were consistent with those found in, for example, the Summit Strategies sponsored top level domain name round and earlier work that resulted from the 2000 round of new gTLDs.

7. After a day of detailed discussions and presentations from eight external stakeholders and in considering Constituency Statements and Public Comments, there was rough consensus that the Committee should proceed with consideration of the other three Terms of Reference. The online summary can be found at <http://forum.icann.org/lists/gtld-council/msg00027.html>.
8. At the 31 March 2006 ICANN Board meeting in Wellington, the Board made clear its intention to proceed with the introduction of new top-level domains<sup>1</sup>. The Board reaffirmed its commitment to introducing new top-level domain registries at its 30 June 2006 meeting in Marrakech<sup>2</sup>.
9. The general principle underpinning the wide ranging discussions was that, whatever consensus policy was developed, it must be consistent with ICANN's limited technical co-ordination mission and be in line with ICANN's Mission and Core Values  
(<http://www.icann.org/general/archive-bylaws/bylaws-28feb06.htm#l>)

---

<sup>1</sup> See Board resolution at <http://www.icann.org/minutes/resolutions-31mar06.html>.

<sup>2</sup> See Board resolution at found at <http://www.icann.org/minutes/resolutions-30jun06.htm>.

## TERM OF REFERENCE TWO: DISCUSSION

### Selection Criteria

- 2.1 The process for introducing new top-level domains will follow a pre-published application system including the levying of an application fee to recover the costs of the application process. The application process will also include probity rules and clear timelines for applicants that will be published prior to the beginning of any application cycle.
- 2.2 Application fees will be set at the start of the process and application materials will be available prior to any application cycle. The cost to evaluate individual applications may differ. Therefore, different fees may be levied depending on what stage in the process the application reaches. It should also be noted that the possible extra costs that might result from the differences in the applicant's working language as well as legal systems should not be held against the applicant.

In order to reduce the effect of the application fee becoming a barrier to entry, ICANN could have a system of grants to assist applicants. This grant would only allow the applicant to apply, without any presumption that the application would be successful. Grant applications would go through an evaluation process. ICANN should evaluate options for funding the grants.

In addition to considering grant options, other options for ICANN to address should be organizing periodic awareness and training workshops for interested stakeholders on new top-level domains; reducing avoidable indirect costs for the applicant (including shortening and improving the approval process with fixed timelines, standardized contracts and public pre-evaluation hearings).

- 2.3 Technical criteria will include compliance with a minimum set of technical standards such as IETF *Request for Comments* related to the operation of the DNS and other technical standards. Standards may include RFC3730-3735, RFC2246, RFC1035, RFC2181, RFC2182, and the ICANN *Guidelines for the Implementation of Internationalized Domain Names*.

- 2.4 Applicants must comply with all current ICANN Consensus Policies and new Consensus Policies that are approved by the ICANN Board. [move this to contractual conditions section]
- 2.5 The character strings of new top-level domains must comply with the string requirements listed below.
- 2.5.1 ICANN will use the following process for TLD string checks.
- 2.5.1.1 ICANN Staff may make a preliminary determination on whether the application complies with the string requirements and may engage appropriate expert advice in order to make a preliminary determination.
- 2.5.1.2 ICANN will establish public comment processes (which may include input from governments or the Governmental Advisory Committee) that are specific to the criteria for the proposed string.
- 2.5.1.3 In the event that ICANN reasonably believes that the application for a particular string is not compliant with the string requirements, ICANN will notify the applicant immediately and the application will be eliminated from consideration pending any reconsideration process that might apply. If ICANN is unable to make a definitive determination whether or not a string is compliant with the string requirements, then ICANN will refer the issue to a panel of experts with appropriate backgrounds.
- 2.5.2 String Criteria
- 2.5.2.1 The gTLD string should not be visually or [phonetically] confusingly similar to an existing TLD string.
- 2.5.2.2 The applicant must warrant that the proposed string does not infringe the legal rights of any third party (consistent with the current requirements of Registered Name Holders – see Clause 3.7.7.9 of the gTLD Registrar Accreditation Agreement).
- 2.5.2.3 The string should not cause any technical issues that have an impact on the stability and security of the Internet.
- 2.5.2.4 The string should not be contrary to public policy or accepted principles of morality or be of such a nature as to deceive the public. [The Committee expects to receive advice from the GAC on this draft recommendation and the policy recommendation should be consistent with GAC principles.]

2.5.2.5 The string should not be a reserved word (for example, as set out in RFC2606).

2.5.3 Dispute resolution with respect to ICANN accepting a new string.

2.5.3.1 ICANN must establish a dispute resolution process, using independent arbitrators, where existing registry operators could challenge a decision made by ICANN regarding whether a new gTLD string is confusingly similar to an existing gTLD string. If a string application is successfully challenged as being confusingly similar, then no other operator may subsequently apply for it except in cases where affected parties mutually agree to terms allowing such registration.

2.5.3.2 ICANN may establish a new dispute resolution process, using independent arbitrators, where existing trademark holders could challenge an ICANN decision regarding a string. This new dispute resolution process could be modelled on the existing Uniform Domain Name Dispute Resolution Processes (UDRP).

2.6 An applicant for a new gTLD must use ICANN accredited registrars to provide registration services to Registered Name Holders (registrants).  
[move to contractual conditions section]

2.7 An applicant must demonstrate that they have the capability to operate a new gTLD that meets the minimum technical criteria to preserve the operational stability, reliability, security, and global interoperability of the Internet.

2.8 The applicant must provide a financial and business plan demonstrating that the applicant has the capability to meet its business ambitions.

1. The development of selection criteria for new top-level domains has been the subject of intense discussion throughout the Committee's work. That work is an iterative process and, in the coming months, will benefit from consultation with ICANN's other Supporting Organisations and Advisory Committees. The Committee relied heavily on ICANN's Mission and Core Values to guide its

work and, in tandem, referred frequently to the Consensus Policy guidelines (found at <http://www.icann.org/general/consensus-policies.htm>) with which ICANN registries are required to comply. The Committee used, for example, at the Amsterdam meetings a mixture of Constituency Statements and responses to a request for further comments on the *Initial Report*. A full set of public comments were provided to Committee members by ICANN Staff to assist them in balancing the views of the group with those interested stakeholders. The full comment archive can be found at <http://forum.icann.org/lists/newgtlds-comments/>.

2. The first part of the discussion took place at the Washington DC meetings; the second review of the proposed selection criteria took place at the March 2006 Wellington meetings; the findings were reviewed and refined again in Brussels and, finally, at the Amsterdam meeting. These meetings were augmented by intensive teleconference discussions, email exchanges and inputs from a wide variety of external stakeholders including potential new TLD applicants and the Governmental Advisory Committee.
3. During the preparation of the selection criteria the Committee focused particularly on ensuring consistency with previous new TLD application rounds and with developing selection criteria that reflected industry best practice for services procurement.
4. Committee members are urged to read the ICANN Feedback section at the beginning of the document. That section sets out the questions ICANN has posed in relation to the draft Recommendations. Each section has been marked \*\* where further discussion would be beneficial.
5. *\*\*Recommendation 2.1, 2.2 and 2.3*. These three Recommendations deal with the application process. The intention of the Recommendations is to

make explicit expectations about how any future TLD application process would be conducted. These Recommendations are consistent with ICANN's openness and transparency requirements (and most particularly with ICANN's initiatives to improve its operations

<http://www.icann.org/announcements/announcement-16oct06.htm> consistent with the new *Affirmation of Responsibilities*). In addition, Recommendation 2.3 recognises the fundamental requirement to ensure the stable and secure operation of the domain name system.

6. *\*\*Recommendation 2.4:* It was clear from the discussions throughout the policy development process that compliance with ICANN's Consensus Policies was important to Committee members. This is consistent with discussions that are taking place in the context of another policy development process on *Policies for Contractual Conditions for Existing Registries* (PDP Feb06).
7. *\*\*Recommendation 2.5:* All the Recommendations in contained in 2.5 refer to the ways in which applications for new TLDS may be checked. *Recommendations 2.5.1, 2.5.1.1, 2.5.1.2 and 2.5.1.3* have been subjected to detailed analysis to ensure consistency with previous applications rounds; understanding the potential for applications for new TLDs and recognizing that ICANN will set up an appropriate process for dealing with the policy recommendations the Committee has developed. Several Constituencies<sup>3</sup>

---

<sup>3</sup> For example, the IPC submitted comments on 20 October 2006, in response to the 18 October Draft Recommendations Summary document. Those comments (on selection criteria, new dispute resolution processes, pre-registration mechanisms and contractual conditions in relation to WHOIS) need to be discussed in more detail with the full Committee to determine whether the IPC's views have the support of other Constituencies.

BC Rapporteur Philip Shepherd submitted comments on 23 October 2006 to the full Committee on the notion of "pre-evaluation hearings" in response to comments from Committee observers

submitted comments directly to ICANN Staff for consideration in the preparation of the recommendations. In addition, the ALAC representative<sup>4</sup> suggested, in his posting to the gtld-council listing, that “we ought to be able to create a ...turnkey “registry-in-a-box” that would speed the evaluation and reduce the cost to applicants. ...I wonder whether we can make the new gTLD evaluation process faster and less costly by providing some pre-approved choices for applicants. For example, we might say that if you pledge to implement a certain pre-approved technical model...[and] an applicant chooses the pre-approved model, the only questions for evaluation become whether the string is appropriate and the applicant competent...”.

8. The Committee has focused strongly on engaging with other Supporting Organisations, especially with the GAC, which will contribute input on the public policy aspects of new top-level domains. The Committee Chair submitted formal correspondence to the GAC Chair and to the Chair of the GAC GNSO Working Group, explicitly requesting the GAC share its draft Public Policy Principles as quickly as possible, and inviting the GAC to actively participate in any public comment processes about new TLD applications. This approach is consistent with the GAC’s June 2006 Marrakech communiqué which said “...The GAC endorses the Communications Timeline document (attached), which should improve the GAC’s participation in ICANN’s policy development processes by earlier

---

Ray Fassett and Werner Staub. Further discussion about the impact of pre-evaluation hearings continued and Committee Chair Dr Bruce Tonkin suggested the removal of that text.

Observer Chuck Gomes contributed many comments to the Committee’s list which can be found in part at <http://forum.icann.org/lists/gtld-council/msg00219.html> and in full through using the thread index for comments.

<sup>4</sup> <http://forum.icann.org/lists/gtld-council/p7mnLhxBpKcGl.p7m>

engagement with the relevant ICANN constituencies, as well as secure timely and precise routine communication.”<sup>5</sup>

9. The use of appropriately qualified expert panels to resolve differences throughout the application process is consistent with ICANN's practice in previous rounds. The Committee suggested that using expert panels would ensure that resolving disputes throughout the application process would be as objective, predictable and timely as possible.
10. *\*\*Recommendations 2.5.2, 2.5.2.1, 2.5.2.2, 2.5.2.3, 2.5.2.4 and 2.5.2.5:* All these draft Recommendations are designed to be objective, contribute to the stability and security of the Internet and be consistent with existing international law. These draft Recommendations would benefit from further detailed discussion between ICANN's legal and operational staff to ensure that the Committee's intentions are implementable and do not impose undue risks on the organisation.
11. The reasoning behind *Recommendation 2.5.2.1* stems from the recognition that, in the first instance, a judgment should be made by the ICANN staff department responsible for processing applications. Where the department has a doubt they will refer the application to an expert standing three-person tribunal established by the GNSO Chair for this purpose. The tribunal should be established prior to the application cycle commencing, with clear guidelines and criteria that constrain its activities and remit. An applicant refused by the staff department may insist on referral to the panel upon payment of the appropriate cost-recovery fee.

---

<sup>5</sup> All of the GAC's Communiqués are found at <http://gac.icann.org/web/communiqués/index.shtml>.

12. The concept of “confusingly similar” is used to mean that there is a likelihood of confusion on the part of the relevant public. The prospect of IDN new TLD applications makes this criterion vital. There is broad agreement in international and national law the concept of “confusingly similar”. In international trade mark law, confusion may be visual, phonetic or conceptual. A small Committee working group developed the following explanations for the approach to resolve confusingly similar string conflicts. The Committee needs to consider further how to manage this area of Recommendations, especially where there is a wide variety of potential interpretations, many of which are subjective and open to legal challenge.
13. In broader international law, the concept of creating confusion is contained in the 1883 Paris Convention and says “to create confusion by any means whatever” {Article 10bis (3) (1)} and, further, being “liable to mislead the public” {Article 10bis (3) (3)}. The treatment of confusingly similar is also contained in European Union law and is structured as follows -- “because of its identity with or similarity to...there exists a likelihood of confusion on the part of the public...; the likelihood of confusion includes the likelihood of association..” {Article 4 (1) (b) of the 1988 EU Trade Mark directive 89/104/EEC}. Article 8 (1) (b) of the 1993 European Union Trade Mark regulation 40/94 is also relevant.
14. In the United States, existing trade mark law states that “...to the best of the verifier's knowledge and belief, no other person has the right to use such mark in commerce either in the identical form thereof or in such near resemblance thereto as to be likely, when used on or in connection with the goods of such other person, to cause confusion, or to cause mistake, or to deceive...” which is contained in Section 1051 (3) (d) of the US Trademark Act 2005 (found at <http://www.bitlaw.com/source/15usc/1051.html>.)

15. In Australia, the Australian Trade Marks Act 1995 Section 119 says that  
“...For the purposes of this Act, a trade mark is taken to be deceptively similar to another trade mark if it so nearly resembles that other trade mark that it is likely to deceive or cause confusion” (found at [http://www.ipaustralia.gov.au/resources/legislation\\_index.shtml](http://www.ipaustralia.gov.au/resources/legislation_index.shtml))
16. The European Union Trade Mark Office provides guidance on how to interpret confusion. *“...confusion may be visual, phonetic or conceptual. A mere aural similarity may create a likelihood of confusion. A mere visual similarity may create a likelihood of confusion. Confusion is based on the fact that the relevant public does not tend to analyse a word in detail but pays more attention to the distinctive and dominant components. Similarities are more significant than dissimilarities. The visual comparison is based on an analysis of the number and sequence of the letters, the number of words and the structure of the signs. Further particularities may be of relevance, such as the existence of special letters or accents that may be perceived as an indication of a specific language. For words, the visual comparison coincides with the phonetic comparison unless in the relevant language the word is not pronounced as it is written. It should be assumed that the relevant public is either unfamiliar with that foreign language, or even if it understands the meaning in that foreign language, will still tend to pronounce it in accordance with the phonetic rules of their native language. The length of a name may influence the effect of differences. The shorter a name, the more easily the public is able to perceive all its single elements. Thus, small differences may frequently lead in short words to a different overall impression. In contrast, the public is less aware of differences between long names. The overall phonetic impression is particularly influenced by the number and sequence of syllables.”* (found at <http://oami.europa.eu/en/mark/marque/direc.htm>).

17. An extract from the United Kingdom's Trade Mark Office's Examiner's Guidance Manual is useful in explaining further the Committee's approach to developing its Recommendation. *"For likelihood of confusion to exist, it must be probable, not merely possible that confusion will arise in the mind of the average consumer. Likelihood of association is not an alternative to likelihood of confusion, "but serves to define its scope". Mere association, in the sense that the later mark brings the earlier mark to mind is insufficient to find a likelihood of confusion, unless the average consumer, in bringing the earlier mark to mind, is led to expect the goods or services of both marks to be under the control of one single trade source. "The risk that the public might believe that the goods/services in question come from the same undertaking or, as the case may be, from economically-linked undertakings, constitutes a likelihood of confusion..."*. (found at <http://www.patent.gov.uk/tm/t-decisionmaking/t-law/t-law-manual.htm>)
18. **\*\*Recommendation 2.5.1.2:** The Committee recommended that, in the first instance, a judgment should be made by the ICANN staff responsible for assessing applications. Where there is doubt, the assessors may refer the application to a standing three-person tribunal established for that purpose by the GAC Chairman. The tribunal should be established before the application cycle begins and maintained by rotation. An applicant refused on these grounds by the staff department may insist on referral to the panel upon payment of the appropriate cost-recovery fee. This particular section needs further consideration, as set out in the ICANN Feedback document.
19. The Committee spent considerable time considering the public policy aspects of new top-level domains. In particular, concerns about "public policy and morality" were raised. The small working group mentioned above conducted more detailed research on the phrase "contrary to public policy or accepted

principles of morality”. This phrasing is consistent with international laws including Article 3 (1) (f) of the 1988 European Union Trade Mark Directive 89/104/EEC and within Article 7 (1) (f) of the 1993 European Union Trade Mark Regulation 40/94. In addition, the phrasing “contrary to morality or public order and in particular of such a nature as to deceive the public” comes from Article 6quinques (B)(3) of the 1883 Paris Convention. The reference to the Paris Convention remains relevant to domain names even though, when it was drafted, domain names were completely unheard of.

20. The concept of “morality” is captured in Article 19 United Nations Convention on Human Rights (<http://www.unhchr.ch/udhr/lang/eng.htm>) says “...Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.” Article 29 continues by saying that “...In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society”.
21. The EU Trade Mark Office’s Examiner’s guidelines provides assistance on how to interpret morality and deceit. “...Contrary to morality or public order. Words or images which are offensive, such as swear words or racially derogatory images, or which are blasphemous are not acceptable. There is a dividing line between this and words which might be considered in poor taste. The latter do not offend against this provision.” The further element is deception of the public which is treated in the following way. “...Deceive the public. To deceive the public, is for instance as to the nature, quality or

geographical origin. For example, a word may give rise to a real expectation of a particular locality which is untrue.” For more information, see Sections 8.7 and 8.8 at <http://oami.europa.eu/en/mark/marque/direc.htm>

22. The UK Trade Mark office provides similar guidance in its Examiner’s Guidance Manual. “Marks which offend fall broadly into three types: those with criminal connotations, those with religious connotations and explicit/taboo signs. Marks offending public policy are likely to offend accepted principles of morality, e.g. illegal drug terminology, although the question of public policy may not arise against marks offending accepted principles of morality, e.g. taboo swear words. If a mark is merely distasteful, an objection is unlikely to be justified, whereas if it would cause outrage or would be likely significantly to undermine religious, family or social values, then an objection will be appropriate. Offence may be caused on matters of race, sex, religious belief or general matters of taste and decency. Care should be taken when words have a religious significance and which may provoke greater offence than mere distaste, or even outrage, if used to parody a religion or its values. Where a sign has a very sacred status to members of a religion, mere use may be enough to cause outrage.” For more information, see <http://www.patent.gov.uk/tm/t-decisionmaking/t-law/t-law-manual.htm>)

23. *Recommendation 2.5.2.3*: This Recommendation is consistent with existing provisions regarding reserved names that may cause technical problems within the domain name system. The reserved name list is found in existing registry agreements at, for example, <http://www.icann.org/tlds/agreements/mobi/mobi-appendix6-23nov05.htm>. Applicants for new TLDs would be advised immediately if their application featured one of these names.

24. *Recommendation 2.5.2.5:* Similar to Recommendation 2.5.2.3, this Recommendation is consistent with technical standards as set out by the Internet Engineering Task Force (IETF) and with other technical standards such as ICANN's IDN Guidelines (found at <http://www.icann.org/topics/idn/implementation-guidelines.htm>).
25. *Recommendation 2.5.3:* Dispute resolution processes modelled on the existing Uniform Dispute Resolution Process (UDRP) were used by the Committee to analyse whether new dispute resolution processes should be developed for the new TLDs application process for two separate purposes. The first was to resolve contention between competing applications vying for the same string; the second was to resolve contention between existing registry operators or trademark owners with applicants proposing a string similar to either an existing registry or to an existing trademark.
26. *Recommendation 2.6:* The Recommendation to continue to mandate the use of ICANN accredited registrars is not only consistent with current policy but also addresses the stability and security questions which the Committee considered. The Committee Chair clarified further this draft Recommendation in his posting to the gtld-council list<sup>6</sup> which said in part "...The outcome of the discussion on this topic was to treat the requirement to provide an operational plan as part of the application demonstrating that they have the resources required to meet the other selection requirements. The process for accrediting registrars is an example of such a process, where ICANN staff require a plan to determine whether a registrar is capable of

---

<sup>6</sup> <http://forum.icann.org/lists/gtld-council/msg00191.html>

meeting the requirements of a registrar. See for example:  
<http://www.icann.org/registrars/accreditation-application.htm...><sup>7</sup>

*27. Recommendation 2.7 and 2.8:* The Committee discussed the necessity for applicants to provide technical and operational plans that would be used during the application process to assess the capacity of an applicant to successfully provide registry services. There was consistent disagreement whether this information was either relevant or necessary and how that information would be assessed, using objective measures. On balance, the Committee decided that, as has been the case in previous rounds to introduce new TLDs, it would remain a requirement that an applicant's business ambitions be substantiated by the provision of technical and operational plans that could be verified by ICANN or by a panel of appropriately qualified experts.

---

<sup>7</sup> GA list participant and Committee observer Danny Younger expressed reservation about the legality of insisting on the use of ICANN-only accredited registrars and the Registry Constituency suggested, in comments submitted for use at the Amsterdam meeting, that "the requirement to use only ICANN-accredited registrars may be used should be modified to allow some flexibility in cases where registrar support does not meet some mutually agreed-to service level criteria for a given gTLD. The underlying premise of this position is that gTLD registries or sponsors should not be held hostage by registrars who are not willing to or are unqualified to service the applicable registrant community".

## TERM OF REFERENCE THREE: DISCUSSION

### Allocation Methods

- 3.1 To ensure an orderly introduction of new TLDs, the applications should be assessed in rounds to allow issues of contention to be resolved between applicants for the same string. First come first served (FCFS) is the preferred method of assessing applications within an initial round. Subsequently, processes may be developed that would enable an “apply as you go” system. This could be decided after an evaluation period.
  - 3.1.1 The start date for the round should be at least four months after the ICANN Board has issued the *Request for Proposal*. ICANN must promote the opening time and details of the new round of applications to the broader worldwide Internet community.
  - 3.1.2 Applications will be date stamped as they are received and will form a queue, giving ICANN the ability to work on multiple applications in parallel.
  - 3.1.3 The closing date for the first cycle of new applications should be at least thirty days after the start date.
  - 3.1.4 Applications for strings are not published until after the application cycle closing date.
- 3.2 The following process should be used to resolve contention between multiple applicants for the same new gTLD string.
  - 3.2.1. Establish a timeframe for a mediation process amongst the applicants to identify a solution amongst competing applications. Possible solutions are for the applicants to choose different TLD strings to avoid the conflict, or for the applicants to combine their resources.
  - 3.2.2 If there is no agreement between the applicants, ICANN will evaluate the additional criteria of the level of support of the community of potential registrants within that TLD to resolve contention. Both applicants would have a timeframe (for example, ninety days) to supply this additional material for evaluation. ICANN will determine what evidence is acceptable, and the evidence must be measurable and verifiable. An applicant that is not successful will need to wait until the next application cycle to submit a new application.

3.2.3 If ICANN staff are unable to distinguish between the level of support for each applicant for the gTLD, then the Board will make a choice based on the ICANN Mission and Core Values which include introducing and promoting competition in the registration of domain names where practical and beneficial in the public interest; and supporting the functional, geographic and cultural diversity of the Internet. An applicant that is not successful will need to wait until the next application cycle to submit a new application.

3.3 An applicant who is granted a gTLD string has an obligation to begin using it within an appropriate time-frame. [needs further clarification about what constitutes 'use' and 'appropriate time frames']

1. The development of recommendations for allocation methods was conducted in the same way as that for selection criteria. The comprehensive discussion about allocation methods has taken place through analysis of the formal Constituency Statements; public comments and email discussions which were used to modify and clarify the language of the Recommendations.
2. Early results of the discussion show that the Committee decided that a first come first served principle was fair and practical (discussion found at <http://forum.icann.org/lists/gtld-council/msg00058.html>). However, it is necessary to ensure a complete understanding of the FCFS principle as it would be implemented in the application cycle. Further discussion with the Committee and ICANN Staff on the practical implementation of this Recommendation would be useful.
3. Comparative evaluations have been a consistent theme throughout the policy development process with some discussants suggesting that auctions were a more suitable method of resolving conflict between applicants with similar string ideas or similar purposes for their business ideas. These diverging ideas need further discussion, especially in the context of balancing the Committee's expectations for a predictable, objective and timely process and

the impact comparative evaluations have had on the organisation in the recent past.

4. The draft Recommendations recognize past experiences with comparative evaluations in the ICANN environment, particularly those relating to sponsored top-level domains where measures of “community” support need to be determined. The evaluations, for example in the case of the .net and .org rebids and the introduction of new sTLDs like .jobs and .travel, show that the Internet-using community takes a keen interest in ICANN’s decision making process. In addition, ICANN’s Supporting Organisations and Advisory Committees outside the GNSO play a key role in determining the success of potential applications.
5. Further consideration is necessary of the involvement of the ICANN Board in the formal ratification of any new top-level domain. Past experience shows that the Board takes a keen interest in all the decisions of the organisation. This involvement has a direct bearing on any evaluation process.
6. It is clear that the draft Recommendations on allocation methods have a direct relationship to the establishment of robust selection criteria. The Recommendations on allocation methods focus, in the main, on establishing a pre-published application process and on implementing practical solutions for resolving contention between applicants with similar ideas about new TLDs.
7. The Committee was clear in its intention to ensure that any new TLD application opportunity was widely advertised prior to the application cycle commencing. This was intended to encourage applications from geographic areas or communities who had previously not had the opportunity to participate in ICANN’s TLD opportunities.

8. Discussion about more widespread notification of new top-level domain applications to resolve string contention may also be useful. More detailed ideas about this proposal are contained in the ICANN Staff Memorandum released with this document.

## TERM OF REFERENCE FOUR: DISCUSSION

### Policies for Contractual Conditions

- 4.1 There should be a base contract to provide some level of consistency (for example, as for the Registrars' Accreditation Agreement) amongst gTLD agreements, with the ability for staff to have delegated authority to approve. Any material alterations to the base contract, will be subject to public comments before approval by the ICANN Board.
- 4.2 The contract should strike the right balance between ensuring certainty for market players and preserving flexibility of ICANN to accommodate the rapidly changing market, technological and policy conditions.
- 4.3 The initial term of the new gTLD agreement should be of commercially reasonable length (for example, default ten years, although that may be changed on a case-by-case basis).
- 4.4 There should be renewal expectancy. A contract would be renewed provided that the contracted party is not in material breach of the contract or has not been found in repeated non-performance of the contract, and provided the registry or sponsor agrees to any new base contract conditions that are reasonably acceptable. Any new base contract would take into account the Consensus Policies in place at that time.
- 4.5 There should be a clear sanctions process outlined within the base contract to terminate a contract if the new gTLD operator has been found in repeated non-performance of the contract.
- 4.6 During the term of the agreement, the registry must comply with [existing] new or changed consensus policies to one or more of the following areas:
  - (1) issues for which uniform or coordinated resolution is reasonably necessary to facilitate interoperability, security and/or stability of the Internet or DNS;
  - (2) functional and performance specifications for the provision of Registry Services
  - (3) security and stability of the registry database for the TLD;
  - (4) registry policies reasonably necessary to implement Consensus Policies relating to registry operations or registrars, or

(5) resolution of disputes regarding the registration of domain names (as opposed to the use of such domain names)

- 4.7 Any deviation from consensus policies should be explicitly stated in the agreement.
- 4.8 Where a registry provides IDNs, the contract should require that the registry adhere to IDN standards, and ICANN guidelines for IDNs.
- 4.9 ICANN may rely on the appropriate external competition and anti-trust authorities to ensure compliance with applicable competition law in particular, laws relating to market power or pricing power.
- 4.10 ICANN should take a consistent approach with respect to registry fees, taking into account differences in regional, economic and business models.
- 4.11 Use of personal data is limited to the purpose for which it is collected, and the registry operator must define the extent to which it is made available to third parties.

1. This section sets out discussion of the policies for contractual conditions for new top-level domains. This discussion has taken place in the context of the negotiation of the new .com agreement and the related Verisign settlement (<http://www.icann.org/announcements/announcement-28feb06.htm>; the renewal of the arrangements between ICANN and the US Department of Commerce (<http://www.icann.org/announcements/announcement-29sep06.htm>) and the conduct of an associated ICANN PDP (PDP Feb 06) on Policies for Contractual Conditions for Existing Registries (<http://gns0.icann.org/issues/gtld-policies/>).
2. The Recommendations found in this section were developed through the Brussels face-to-face consultations and the meetings held in Amsterdam to confirm the draft Recommendations.

3. The Committee in its work on policies for contractual conditions has focused on the key principles of consistency, openness and transparency. It has also determined that a scalable and predictable process is consistent with industry best practice standards for services procurement. The Committee referred, in particular, to standards within the broadcasting, telecommunications and Internet services industries to examine how regulatory agencies in those environments conducted, for example, spectrum allocations, broadcasting licenses and media ownership frameworks<sup>8</sup>.
4. The GNSO Constituencies provided input to the discussions through the formal Constituency Statements and again at the Brussels meeting, a summary of which can be found at <http://forum.icann.org/lists/gtld-council/msg00131.html>.
5. The Business Constituency has focused on process transparency and public comment processes throughout contractual negotiations. In addition, it has advocated consistency amongst new TLD contracts with equitable treatment of registries, proportional to the obligations imposed by ICANN with respect to the payment of fees to the organization. The Business Constituency did not support a presumption of contract renewal.
6. The Registry Constituency suggested that policies for contractual conditions should recognize that predictable terms and conditions for new top-level registries would enable greater investor certainty and provide an optimal opportunity for innovation and creativity. Any applicable consensus policy should be constrained to the five relevant elements of

---

<sup>8</sup> See also principles articulated in the World Bank report on licensing guidelines in the References section.

- the GNSO's policy development processes. The Registry Constituency argued that a base contract should be provided before the start of the application process that could be customized to suit the specific commercial conditions of each new registry.
7. At the Brussels meeting, the ISP Constituency were undecided about the presumption of renewal discussion and were concerned about the requirement for registries to use only ICANN-accredited registrars.
  8. Like the Registry Constituency, the Non-Commercial Users Constituency argued that renewal expectancy provided longer term investment views, stable business environments and predictability of registry operation. The NCUC supported three other key elements of this area of discussion including the facilitation of competition at the registrar level; compliance with ICANN Consensus Policies and the reliance by ICANN on the appropriate competition authorities for advice on, for example, market pricing and market power issues. The NCUC consistently opposed access by third parties to personally identifiable information.
  9. The Intellectual Property Constituency supported compliance with Consensus Policies and the development of a registry compliance program that enabled the implementation of graduated sanctions for non-performing registries.
  10. The Committee found a number of expert reports<sup>9</sup> beneficial. In particular, the World Bank report on mobile licensing conditions provides some guidance on best practice principles for considering broader market investment conditions. "...A major challenge facing regulators in

---

<sup>9</sup> The full list of reports are found in the Reference section at the end of the document.

developed and developing countries alike is the need to strike the right balance between ensuring certainty for market players and preserving flexibility of the regulatory process to accommodate the rapidly changing market, technological and policy conditions. As much as possible, policy makers and regulators should strive to promote investors' confidence and give incentives for long-term investment. They can do this by favoring the principle of 'renewal expectancy', but also by promoting regulatory certainty and predictability through a fair, transparent and participatory renewal process. For example, by providing details for license renewal or reissue, clearly establishing what is the discretion offered to the licensing body, or ensuring sufficient lead-times and transitional arrangements in the event of non-renewal or changes in licensing conditions. Public consultation procedures and guaranteeing the right to appeal regulatory decisions maximizes the prospects for a successful renewal process. As technological changes and convergence and technologically neutral approaches gain importance, regulators and policy makers need to be ready to adapt and evolve licensing procedures and practices to the new environment."

11. The Recommendations which the Committee have developed with respect to the introduction of new TLDs are consistent with the World Bank principles outlined above.
12. The outcome of the Brussels meeting discussion on contractual conditions can be found at <http://forum.icann.org/lists/gtld-council/msg00133.html>.

## CONSULTATION & PARTICIPATION

1. This section provides an overview of the progress of the policy development process and the documentation produced throughout the series of teleconferences and face-to-face consultations that have taken place during 2006. All of the meetings were open to observers and many different stakeholders attended the meetings taking an active part in the discussion. In addition, all meetings were open to remote participation by teleconference and through the use of the Shinkuro ([www.shinkuro.com](http://www.shinkuro.com)) file-sharing technology. A full table found at Annex One illustrates participation by GNSO Constituencies and other observers.
2. The *Issues Report* was released on 5 December 2005. The *Report* sets out an early collation of issues that the GNSO wished to take into account in developing the Terms of Reference for future rounds. For example, the selection criteria used in previous application rounds for new top-level domains were used to guide the development of Term of Reference Two in this PDP. An evaluation of the selection criteria and methods used in the re-bidding of the .org and .net registry contracts was also conducted. The *Issues Report* contained Staff Recommendations about potential terms of reference and, in the majority, those Recommendations were adopted by the GNSO Council. The *Report* is found at <http://gns0.icann.org/issues/new-gtlds/gns0-issues-rpt-gtlds-05dec05.pdf>.
3. A Public Comment Period was launched on 6 December 2005 to solicit input from the ICANN community about the proposed Terms of Reference (found at <http://www.icann.org/announcements/announcement-06dec05.htm>). The

Public Comment Period ran until 31 January 2006. For this PDP public comment periods have been used in different ways than in the past. In general, public comment calls have been far more targeted and highly structured to get responses on particular areas of concern to the Committee. This was a successful initiative enabling information to be collected in a consistent way that improved the quality of subsequent *Reports*. The archive of comments can be found at <http://forum.icann.org/lists/new-gtlds-pdp-comments/>).

4. In addition to a Public Comment Period, a *Call for Expert Papers* was announced on 3 January 2006 (found at <http://icann.org/announcements/announcement-03jan06.htm>). The request for input was advertised widely in the international press and yielded eleven responses from a diverse range of stakeholders. The authors of the papers were invited to present their papers and participate in a question and answer session at the 23 - 25 February 2006 Washington meeting. A full listing of all the inputs, including the *Expert Papers*, can be found at <http://gns0.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm>.
5. The ICANN Board has been regularly updated on the progress of and taken a keen interest in the work of the new TLDs Committee. For example, the Board meeting of 10 January 2006 shows discussion within the Board about its involvement in new TLDs policy development process (found at <http://www.icann.org/minutes/minutes-10jan06.htm>)
6. A draft *Initial Report* was released on 19 February 2006 (found at <http://icann.org/topics/gns0-initial-rpt-new-gtlds-19feb06.pdf>) and a request for

public comments was announced at the same time that was open between 20 February 2006 and 13 March 2006. The archives for those comments are found at <http://forum.icann.org/lists/new-gtlds-pdp-initial-report/>. The draft *Initial Report* was used to facilitate discussion at subsequent Committee meetings and to give some guide to the broader community about the Committee's progress in its early stages.

7. The GNSO's new TLDs Committee held a three day meeting in Washington DC between 23 and 25 February 2006. The meeting notes can be found on the GNSO's Committee archive at (<http://forum.icann.org/lists/gtld-council/msg00030.html>). A central element of the discussion focused on re-visiting ICANN's Mission and Core Values to ensure that the deliberations on the Terms of Reference were tightly constrained. The substantive discussion over the three-day meeting also included discussion on whether to introduce new top-level domains (<http://forum.icann.org/lists/gtld-council/msg00027.html>) and potential selection criteria which could be used in a new round of top-level domain applications (<http://forum.icann.org/lists/gtld-council/msg00026.html>).
8. Analysis of the lessons learned from previous TLD rounds was included in the broader discussions held in Washington DC (<http://forum.icann.org/lists/gtld-council/msg00030.html>). In addition to discussing general selection criteria, detailed discussion of technical requirements also took place (<http://forum.icann.org/lists/gtld-council/msg00028.html>). Following the Washington meetings, it was clear that further information about technical criteria was necessary to inform the Committee's work. On 15 March 2006 a formal call was made for additional information on technical criteria (found at

<http://gnso.icann.org/issues/new-gtlds/tech-criteria-15mar06.htm>). No responses were received to that specific call but, in the resulting recommendations, particular attention has been paid to addressing relevant technical standards across the full range of registry operations, including those that relate to Internationalised Domain Names.

9. In response to the Committee's work and to discussions at the March 2006 Wellington meeting, the Board indicated its intention to facilitate the implementation of new top-level domains (found at <http://www.icann.org/minutes/minutes-31mar06.htm>.)
10. The new TLDs Committee met in Brussels between 11 and 13 May 2006 to discuss, in further detail, the work that had been undertaken on refining the selection criteria and allocation methods. In addition, a full day was spent on discussing policies for contractual conditions with a special presentation from ICANN's Deputy General Counsel. The Committee has archived, on 18 May 2006, records of the Brussels discussion and output from the meeting can be found at <http://forum.icann.org/lists/gtld-council/msg00133.html>
11. At the Brussels meeting, a revised work plan was devised (found at <http://forum.icann.org/lists/gtld-council/msg00130.html>) which include a high level commitment to producing an *Initial Report* in time for discussion at ICANN's June 2006 Marrakech meeting.
12. A draft *Initial Report* was released on 15 June 2006 (found at <http://gnso.icann.org/issues/new-gtlds/issues-report-15jun06.pdf>) and further

discussion took place on the Committee's mailing list prior to the Marrakech meeting.

13. The ICANN Board meeting of 30 June 2006 showed, again, the Board's interest in facilitating the policy development process on new top-level domains, particularly in encouraging ongoing discussions with the GAC. (found at <http://www.icann.org/minutes/resolutions-30jun06.htm>). After inputs from the Marrakech meeting a final version of the *Initial Report* was released on 28 July 2006 (found at <http://gns0.icann.org/drafts/newgtlds-issues-report-01-28jul06.htm>).

14. The Committee conducted another set of face-to-face consultations in Amsterdam between 29 and 31 August 2006 to further refine the Committee's findings and to develop a set of draft *Recommendations*. Prior to the Amsterdam meeting, a comprehensive public comment period was conducted. These public comments (found at <http://forum.icann.org/lists/gtld-council/msg00189.html>) were used as working materials for the Committee to consider, in addition to Constituency Statements, the previous set of Expert Papers and comprehensive commentary for a wide variety of observers to the meetings.

15. The Committee met with the GAC on two occasions during the course of the consultations – in Wellington and again in Marrakech – where progress on the Committee's work was shared with GAC members.

16. The most important aspects of the discussion were further clarification about:

- a. string differentiation (<http://forum.icann.org/lists/gtld-council/msg00190.html>);
- b. proposed requirements to provide an operational plan (<http://forum.icann.org/lists/gtld-council/msg00191.html>)
- c. treatment of application fees (<http://forum.icann.org/lists/gtld-council/msg00194.html>)
- d. allocation methods (<http://forum.icann.org/lists/gtld-council/msg00202.html>); and
- e. string checking (<http://forum.icann.org/lists/gtld-council/msg00203.html>)

17. Considering all the materials derived from the face-to-face meetings, discussions on email lists, expert materials and expert papers, on 14 September 2006 a set of draft *Recommendations* was released by the Committee for broader consideration (found at <http://gnso.icann.org/issues/new-gtlds/recom-summary-14sep06.htm>).

18. Between 14 September and 5 October 2006 email discussion took place that improved and clarified the language of the *Recommendations* and ensured that Constituencies had sufficient time to rework their recommendations where necessary.

19. On 5 October 2006, the Committee conducted a two hour teleconference to discuss the draft *Recommendations* (the MP3 recording can be found at <http://forum.icann.org/lists/gtld-council/msg00224.html>). The purpose of the meeting was to confirm that the *Recommendations* reflected the intentions of the Committee and to conduct further work on refining elements of the

*Recommendations*, particularly with respect to the selection criteria and allocation methods to resolve contention between string applications.

20. On 11 October 2006, the GNSO Committee Chairman and GNSO Chair, Dr Bruce Tonkin, sent formal correspondence to the Chair of the Governmental Advisory Committee and the Chair of GAC Working Group I, requesting the GAC's assistance with the public policy impacts of the introduction of new TLDs (found at <http://gns0.icann.org/mailling-lists/archives/council/msg02891.html>).
21. Based on the substantive nature of the Committee's email traffic on the draft *Recommendations*, a further update was released to the Committee on 18 October 2006 (found at <http://forum.icann.org/lists/gtld-council/msg00234.html>) for consideration whilst the drafting of the *Final Report* takes place.

## ANNEX ONE – PARTICIPATION TABLE

## name="\_Toc25123613">EXECUTIVE SUMMARY

The Executive Summary sets out, in a high-level form, the principles, policies and implementation guidelines that the GNSO Council's Committee on the introduction of new top level domains has developed through the policy development process.

### Principles:

- a) That new generic top-level domains (gTLDs) should be introduced in an orderly, timely and predictable way.
- b) That some new generic top-level domains will be internationalised domain names (IDNs).
- c) That the principal objectives of the introduction of new top-level domains are to permit market mechanisms to support useful online identities that permeate international markets as well as to support competition, innovation and consumer choice.
- d) That a set of technical criteria for a new gTLD registry applicant be used to minimise the risk of harming the operational stability, security and global interoperability of the Internet.  
style='mso-special-character:line-break'>
- e) That a set of business capability criteria for a new gTLD registry applicant be used to provide an assurance that an applicant has the capability to meet its business ambitions.

Term of Reference One: Policy Recommendation:

Term of Reference 1: Whether to introduce new top level domains

Additional new generic top-level domains should be introduced and work should proceed to enable the introduction of new generic top-level domains, taking into account the recommendations found in the following sections

Term of Reference Two: Selection

Criteria - String Criteria

- i)
  - Strings
  - should not be confusingly similar to an existing top level domain
- ii)
  - Strings
  - should not infringe the legal rights of others
- iii)
  - Strings
  - should not cause any technical instability
- iv)
  - Strings
  - should not be a Reserved Wordstyle='mso-footnote-id:ftn1' href="#\_ftn1" name="\_ftnref1" title="">[1]
- v)
  - Strings
  - should not be contrary to public policy (as set out in advice from the Governmental Advisory Committee)

TOR 2: Selection Criteria -

Applicant Criteria

- vi)
  - Applicants
  - should be able to demonstrate their technical capability
- vii)
  - Applicants
  - should be able to demonstrate their financial and operational capability

TOR 2: Selection Criteria - Process Conditions

- viii) There will be a clear and pre-published process using objective and measurable criteria
- ix)
  - There
  - will be a base contract provided to applicants at the beginning of the process
- x)
  - Staff

will be used to make preliminary determinations about applications as part of a process which includes the use of expert panels to make decisions

xi)

Dispute

resolution and challenge processes will be established prior to the start of the process

#### Term of Reference Three: Allocation Methods

i)

Applications

will be assessed in rounds

ii)

Applications

for strings will be published after the closing date

iii)

If

there is contention for strings

(1)

Applicants

may resolve contention between themselves within a pre-established timeframe

(2)

If

there is no mutual agreement, a process will be put in place to enable efficient resolution of contention

(3)

The

ICANN Board may be used to make a final decision, using advice from staff and expert panels

#### Term of Reference Four: Policies for Contractual Conditions

i.

A

base contract will be provided as part of the Request For Proposal

ii.

The

initial term should be a commercially reasonable length

iii.

There

should be renewal expectancy

iv.

A

clear compliance and sanctions process should be set out in the base contract which could lead to contract termination

v.

Registries

will be required to apply existing Consensus Policies<sup>[2]</sup> and commit to adopting new Consensus Policies as they are developed

vi.

If

an applicant offers an IDN service, then ICANN's IDN guidelines must be followed

vii.

Registries

will be required to use ICANN accredited registrars

Implementation guidelines:

i)

There

will be a cost-recovery based application fee and application fees may differ for applicants

ii)

First

come first served within the round for processing order only between rounds and for an ongoing process if applicable

iii)

Applications

will be time and date stamped

iv)

The

application submission date will be at least four months after the issue of the Request for Proposal

v)

ICANN

will promote the opening of the application round

vi)

The

application round will close at least thirty days after the start date

vii)

An applicant granted a TLD string must use it within an appropriate timeframe.

viii) The base contract should balance market certainty and flexibility for ICANN to accommodate a rapidly changing market place

ix)

ICANN

should take a consistent approach to the establishment of registry fees

x)

The

use of personal data is limited to the purpose for which it is collected

**style='page-break-before:always'>**

**name="\_Toc33183275">INTRODUCTION**

- 1) This is an updated draft style='mso-bidi-font-style:normal'>Final Report from the GNSO Council's Committee on the introduction of new top level domains. This version incorporates commentary from the GNSO's public forum on new top level domains held at the ICANN Sao Paulo meeting[3]. The meeting included a further phase in the ongoing consultations with ICANN's Governmental Advisory Committee on public policy principles for new top level domains style='mso-footnote-id:ftn4' href="#\_ftn4" name="\_ftnref4" title="">[4].
- 2) The 14 November 2006 draft style='mso-bidi-font-style:normal'>Final Report was released in conjunction with the *ICANN Staff Discussion Points* style='mso-footnote-id:ftn5' href="#\_ftn5" name="\_ftnref5" title="">[5] document that set out a wide range of further questions and commentary on the Committee's draft recommendations. The consultations and negotiations around the impact of the issues raised by ICANN staff have been incorporated into an intensive and ongoing implementation process and are manifest here in an updated set of recommendations which take account of the Committee's response to the staff input.
- 3) Additional comments were received on the 14 November 2006 draft Constituencies and observers which are referenced below and which have been incorporated, where possible, into this draft. style='mso-footnote-id:ftn6' href="#\_ftn6" name="\_ftnref6" title="">[6]
- 4) The major changes captured in this version of the *Report* are to re-emphasise the Committee's key principles that reflect ICANN's Mission and Core Values; clarification of the Committee's draft policy recommendations and the further explanation of the Committee's implementation guidelines which are designed to assist ICANN staff to implement the policy recommendations in a transparent and cohesive manner.

- 5) The *Report* sets out the key findings from a multi-phase, multi-stakeholder policy development process that has taken place during 2006 and which will continue through 2007. The Committee have been guided by the GNSO's policy development process requirements which are part of ICANN's ByLaws<sup>[7]</sup>.  

The Committee have been guided by the GNSO's policy development process requirements which are part of ICANN's ByLaws<sup>[7]</sup>.
- 6) In each of the sections below the Committee's recommendations are discussed in more detail with an explanation of the rationale for the decisions. The recommendations have been the subject of numerous public comment periods and intensive discussion across a range of stakeholders including ICANN's GNSO Constituencies, ICANN Supporting Organisations and Advisory Committees and members of the broader Internet-using public that is interested in ICANN's work<sup>[8]</sup>. In particular, detailed work has been conducted through the Internationalised Domain Names Working Group (IDN-WG)<sup>[9]</sup> and the Reserved Names Working Group (RN-WG)<sup>[10]</sup> to comprehensively examine important elements of new TLDs. A working group to examine the protection of the rights of others (PRO-WG) is being formed with a draft statement of work yet to be implemented<sup>[11]</sup>. Each of these additional groups are due to complete their work prior to ICANN's March 2007 meeting in Portugal.
- 7) The GNSO Committee has conducted four separate face-to-face consultations, in Washington DC, Wellington, Brussels and Amsterdam, to discuss each of the Terms of Reference. The final face-to-face meeting of the Committee is due to take place on 22 and 23 February 2007 in Los Angeles. This meeting will confirm the draft policy recommendations, articulate proposed implementation plans from ICANN operational and legal staff and finalise the next steps of the policy development process through June 2007.
- 8) In addressing the Terms of Reference, very close attention has been paid to mapping the discussion and the resulting recommendations to ICANN's Bylaws, Mission and Core Values. A full list of all the Constituency Statements, copies of the responses to Calls for Expert Papers and the Public Comment archives can be found in the GNSO's section of the ICANN website at <http://gns0.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm>.
- 9) This *Report* reflects another stage in the ICANN's progress towards introducing new top-level domains. The history of the introduction of new TLDs, most notably during 2000 and then again in 2003-2004, is found on ICANN's background information section on the top-level domains (<http://www.icann.org/topics/gtld-strategy-areaa.html>).

style='page-break-before:always'>

## PRINCIPLES

The following principles have guided the work of the GNSO Committee on the introduction of new top-level domains in accordance with the Terms of Reference set by the GNSO, with reference to ICANN's Mission and Core Values.

- a) That new generic top-level domains (gTLDs) should be introduced in an orderly, timely and predictable way.
  - b) That some new generic top-level domains will be internationalised domain names (IDNs).
  - c) That the principal objectives of the introduction of new top-level domains are to permit market mechanisms to support useful online identities that permeate international markets as well as to support competition, innovation and consumer choice.
  - d) That a set of technical criteria for a new gTLD registry applicant be used to minimise the risk of harming the operational stability, security and global interoperability of the Internet.
- style='mso-special-character:line-break'>
- e) That a set of business capability criteria for a new gTLD registry applicant be used to provide an assurance that an applicant has the capability to meet its business ambitions.

name="\_Toc25123614">**TERM OF REFERENCE ONE: DISCUSSION**

name="\_Toc25129554">name="\_Toc25122984">name="\_Toc22794192">Whether to introduce new top-level domains

name="\_Toc25123538">**Additional new generic top-level domains should be introduced and work should proceed to enable the introduction of new generic top-level domains, taking into account the recommendations found in the following sections.**

1. This section sets out the way in which the Committee arrived at their Recommendation to proceed with the introduction new top-level domains.

2. ICANN's policy development process is a multi-stage process that includes the production of an *Issues Report* (found at <http://gnso.icann.org/issues/new-gtlds/gnso-issues-rpt-gtlds-05dec05.pdf>). The *Issues Report* included comprehensive information about the main documents and decisions on new top-level domains since the 2000 round of new top-level domains which included, for example, .biz, .info, and the 2004 round of sponsored top-level domains which included, for example, .cat and .asia. In addition, the process for the re-bids of the .net and .org agreements was used to inform the *Report*.
3. A full compilation of all the materials the Committee used is found in the Reference Materials section at the end of the document. In particular, the Committee used the *New TLD Evaluation Process Planning Task Force*. The Report (<http://www.icann.org/committees/ntepptf/final-report-31jul02.htm>) described four aspects to evaluate including technical, business, legal and process that have, subsequently, informed the development of all the Recommendations within the *Report*.
4. In its request to the ICANN staff to produce an *Issues Report*, the Committee also made a request to produce a background report on internationalised domain names (IDNs). This work is now reflected in the progress of the IDN-WG in its discussions on internationalised domain names in the context of the introduction of new top-level domains ([http://gnso.icann.org/issues/idn-tlds/idn\\_tor\\_draft-12oct06.htm](http://gnso.icann.org/issues/idn-tlds/idn_tor_draft-12oct06.htm)). The broad body of work on internationalised domain names taking place within, for example, the President's Committee on IDNs (<http://www.icann.org/committees/idnpac/>), the IETF (<http://www.ietf.org/>) and other technical organisations has been taken into account when developing the *Recommendations* contained here. A joint ccNSO and GAC IDN Working Group<sup>[12]</sup> has been formed and a GAC IDN Working Group is also examining IDN issues as they relate to governments<sup>[13]</sup>. The ICANN Board, at the Sao Paulo meeting, urged the various working groups to continue their efforts and to collaborate as closely as possible<sup>[14]</sup>.
5. The outcomes of the February 2006 meeting in Washington DC were the key determinants of the recommendation to proceed with establishing a permanent policy for and method of accepting applications for new TLDs.
6. There were some strong themes to support a decision to enable the introduction of new TLDs. These included the facilitation of a

competitive environment for registry services; a "public choice" benefit for end users and the potential for expansion of innovative Internet use in a wide variety of markets that have may have been underserved in the past. A summary of the discussion on whether to introduce new top-level domains can be found at <http://forum.icann.org/lists/gtld-council/msg00026.html>. In addition, the respondents to the *Call for Papers* set out a variety of arguments to support the introduction of new TLDs.

7. After a day of detailed discussions and presentations from eight external stakeholders and in considering Constituency Statements and Public Comments, there was rough consensus that the Committee should proceed with consideration of the other three Terms of Reference[\[15\]](#).
8. At the 31 March 2006 ICANN Board meeting in Wellington, the Board made clear its intention to proceed with the introduction of new top-level domains[\[16\]](#). The Board reaffirmed its commitment to introducing new top-level domain registries at its 30 June 2006 meeting in Marrakech[\[17\]](#).
9. The general principle underpinning the wide ranging discussions was that, whatever consensus policy was developed, it must be consistent with ICANN's limited technical co-ordination mission and align with ICANN's Mission and Core Values[\[18\]](#).

**style='page-break-before:always'>**

**name="\_Toc25123617">TERM  
OF REFERENCE TWO: DISCUSSION  
style='mso-special-character:line-break'>**

1. This section sets the results of the discussion about the draft policy recommendations for selection criteria for new top level domains[\[19\]](#). There are three main elements of the selection criteria including "string" criteria, "applicant" criteria and "process" criteria. The following sections simplify the policy recommendations and shift some previous recommendations to more appropriate sections such as contractual conditions or implementation guidelines. The recommendations have been re-numbered to reflect substantial changes to the ordering and positioning of the previous set of draft recommendations.
2. Selection Criteria - "Strings":

i.  
Strings  
should not be confusingly similar to an existing top level domain

ii.  
Strings  
should not infringe the legal rights of others

iii.  
Strings  
should not cause technical instability

iv.  
Strings  
should not be a reserved word

v.  
Strings  
should not be contrary to public policy principles (as set out in the  
Governmental Advisory Committee's draft set of principles)

3. Selection Criteria - "Applicants"

i.  
Applicants  
should be able to demonstrate their technical capability

ii.  
Applicants  
should be able to demonstrate their financial and operational capability

4. Selection Criteria - "Process"

i.  
There  
will be a clear and pre-published process using objective and measurable  
criteria

ii.  
There  
will be a base contract provided to applicants at the beginning of the process

iii.  
Staff

will be used to make preliminary determinations about applications as part of a process which includes the use of expert panels

iv.

Dispute

resolution and challenge processes will be established prior to the start of the process

5. The Committee decided that the "process"

criteria for introducing new top-level domains would follow a pre-published application system including the levying of an application fee to recover the costs of the application process. This is consistent with ICANN's approach to the introduction of new TLDs in the previous 2000 and 2004 round for new top level domains.

6.

The

Committee decided that application fees should be set at the start of the process and application materials would be made available prior to any application cycle. The Committee agreed that the cost to evaluate individual applications may differ depending on the stages of the application evaluation process that the applicant reached. Therefore, different fees may be levied depending on what stage in the process the application reaches. This approach is explained in more detail in the implementation guidelines and in the ICANN staff-developed draft implementation plan which addressed the Committee's proposed recommendations. This plan is under ongoing development by an internal team including operational, legal, policy and technical staff. It is proposed to present a high level implementation plan to the Committee at the Los Angeles meetings to enable Committee members to see, in a practical form, how the *ICANN Staff Discussion Points* document, the input from the Sao Paulo meeting and the ongoing internal implementation planning have addressed the Committee's policy recommendations and broader guidance.

7.

The Committee agreed that the technical requirements for applicants would include compliance with a minimum set of technical standards and that this requirement would be part of the new registry operator's contractual conditions included in the proposed base contract. The more detailed discussion about technical requirements has been moved to the contractual conditions section.

8.

The Committee engaged in detailed discussion of the string requirements which have now been simplified, after reference to the *Staff Discussion Points* and to external experts who have provided their input into the process. ICANN would, to implement the

policy, develop

an implementation plan that included staff being able to make preliminary determinations on whether the application complies with the string requirements and that ICANN may engage appropriate expert advice in order to make a determinations about string contention.

9.

It was

clear from Committee discussions and from staff input that ICANN would continue to conduct public comment processes including input from the full range of ICANN Advisory Committees.

10. The following sections deal specifically with

"string" criteria and include the results of intensive discussion about what kinds of string criteria were appropriate, practical to implement and which reasonably balanced divergent Constituency interests. For example, the NCUC argued in its December

2006 comments on the 14 November 2006 draft that the "proposal is [also] fundamentally flawed in that it falsely assumes there is a [sic] agreed-upon global standard of morality, religion, or expression that can be imposed on the entire world through ICANN policy. The draft recommendations would be practically impossible to enforce due to this fundamental...premise in the proposed policy."

After detailed discussion about the intent of the recommendation, study of the draft GAC public policy principles and the commitment to using already existing bodies of well-established international law, ICANN staff have proposed an implementation process which addresses and balances the views of a wide range of participants.

11. The Committee agreed that strings should not be

visually confusingly similar to an existing TLD string and that the string did not infringe the legal rights of others, as set out in recognised international law. This proposal is consistent with the current requirements of Registered Name Holders in the existing gTLD Registrar Accreditation Agreement (see Clause 3.7.7.9).

12. The concept of "confusingly similar"

is used to mean that there is a likelihood of confusion on the part of the relevant public. The prospect of IDN new TLD applications makes this criterion vital.

There is broad agreement in international and national law the concept of "confusingly similar". In international trade mark law, confusion may be visual, phonetic or conceptual but the recommendation here is limited to visual confusion.

13. In broader international law, the

concept of creating confusion is contained in the 1883 Paris Convention and says "to create confusion by any means whatever" {Article 10bis (3) (1)} and, further, being "liable to mislead the public" {Article 10bis (3) (3)}. The treatment of confusingly similar is also contained in European Union law and is structured as follows -- "because of its identity with or

similarity

to...there exists a likelihood of confusion on the part of the public...; the likelihood of confusion includes the likelihood of association..." {Article 4 (1) (b) of the 1988 EU Trade Mark directive 89/104/EEC}. Article 8 (1) (b) of the 1993 European Union Trade Mark regulation 40/94 is also relevant.

14. In the United States, existing trade

mark law states that "...to the best of the verifier's knowledge and belief, no other person has the right to use such mark in commerce either in the identical form thereof or in such near resemblance thereto as to be likely, when used on or in connection with the goods of such other person, to cause confusion, or to cause mistake, or to deceive..." which is contained in Section 1051 (3) (d) of the US Trademark Act 2005 (found at <http://www.bitlaw.com/source/15usc/1051.html>)

15. In Australia, the Australian Trade

Marks Act 1995 Section 119 says that "...For the purposes of this Act, a trade mark is taken to be deceptively similar to another trade mark if it so nearly resembles that other trade mark that it is likely to deceive or cause confusion" (found at [http://www.ipaustralia.gov.au/resources/legislation\\_index.shtml](http://www.ipaustralia.gov.au/resources/legislation_index.shtml))

16. The European Union Trade Mark Office

provides guidance on how to interpret confusion. "...*confusion may be visual, phonetic or conceptual. A mere aural similarity may create a likelihood of confusion. A mere visual similarity may create a likelihood of confusion. Confusion is based on the fact that the relevant public does not tend to analyse a word in detail but pays more attention to the distinctive and dominant components. Similarities are more significant than dissimilarities. The visual comparison is based on an analysis of the number and sequence of the letters, the number of words and the structure of the signs. Further particularities may be of relevance, such as the existence of special letters or accents that may be perceived as an indication of a specific language. For words, the visual comparison coincides with the phonetic comparison unless in the relevant language the word is not pronounced as it is written. It should be assumed that the relevant public is either unfamiliar with that foreign language, or even if it understands the meaning in that foreign language, will still tend to pronounce it in accordance with the phonetic rules of their native language. The length of a name may influence the effect of differences. The shorter a name, the more easily the public is able to perceive all its single elements. Thus, small differences may frequently lead in short words to a different overall impression. In contrast, the public is less aware of differences between long names. The overall phonetic impression is particularly influenced by the number and sequence of syllables.*" (found at <http://oami.europa.eu/en/mark/marque/direc.htm>)

17. An extract from the United Kingdom's Trade

Mark Office's Examiner's Guidance Manual is useful in explaining further the Committee's approach to developing its Recommendation. *"For likelihood of confusion to exist, it must be probable, not merely possible that confusion will arise in the mind of the average consumer. Likelihood of association is not an alternative to likelihood of confusion, "but serves to define its scope". Mere association, in the sense that the later mark brings the earlier mark to mind is insufficient to find a likelihood of confusion, unless the average consumer, in bringing the earlier mark to mind, is led to expect the goods or services of both marks to be under the control of one single trade source. "The risk that the public might believe that the goods/services in question come from the same undertaking or, as the case may be, from economically-linked undertakings, constitutes a likelihood of confusion..."*. (found at <http://www.patent.gov.uk/tm/t-decisionmaking/t-law/t-law-manual.htm>)

18. The IPC, in its 20 December 2006 additional

comments, "believes there must be some mechanism to challenge to eligibility for consideration of strings that are confusingly similar to trademarks". The proposed implementation plan deals with a comprehensive range of potentially controversial (for whatever reason) string applications which balances the need for reasonable protection of existing legal rights and the capacity to innovate with new uses for top level domains that may be attractive to a wide range of users.

19. It was agreed by the Committee that the string should not cause any technical issues that threatened the stability and security of the Internet. As the policy development process proceeds, further detailed technical assistance will be sought from both ICANN expert committees and advisors.

20. There was detailed discussion about a general category of potential strings which may have public policy impacts of interest to national governments. In response to correspondence from the GNSO Council Chair, the Governmental Advisory Committee<sup>[20]</sup> have responded to a request to provide guidance on public policy issues. The 17 October 2006 draft is found in full at Annex Three. It is expected that these principles will be finalised at the ICANN meeting in March 2007. After those guidelines are formalised, the ICANN staff proposed implementation plan may be modified to take into account ways to address the public policy concerns of governments in relation to the introduction of new top level domains.

21. The

Committee discussed proposed text to address the concerns of governments that was based on existing international law with respect to strings that may be contrary to public policy or accepted principles of morality or be of such a nature to deceive the public.

22. The Committee spent considerable time considering the public policy aspects of new top-level domains<sup>[21]</sup>. In particular, concerns about "public policy and morality" were raised. This phrasing is consistent with international laws including Article 3 (1) (f) of the 1988 European Union Trade Mark Directive 89/104/EEC and within Article 7 (1) (f) of the 1993 European Union Trade Mark Regulation 40/94. In addition, the phrasing "contrary to morality or public order and in particular of such a nature as to deceive the public" comes from Article 6quinques (B)(3) of the 1883 Paris Convention. The reference to the Paris Convention remains relevant to domain names even though, when it was drafted, domain names were completely unheard of.
23. The concept of "morality" is captured in Article 19 United Nations Convention on Human Rights (<http://www.unhchr.ch/udhr/lang/eng.htm>) says "... Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers." Article 29 continues by saying that "...In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society".
24. The EU Trade Mark Office's Examiner's guidelines provides assistance on how to interpret morality and deceit. "...Contrary to morality or public order. Words or images which are offensive, such as swear words or racially derogatory images, or which are blasphemous are not acceptable. There is a dividing line between this and words which might be considered in poor taste. The latter do not offend against this provision." The further element is deception of the public which is treated in the following way. "...Deceive the public. To deceive the public, is for instance as to the nature, quality or geographical origin. For example, a word may give rise to a real expectation of a particular locality which is untrue." For more information, see Sections 8.7 and 8.8 at <http://oami.europa.eu/en/mark/marque/direc.htm>
25. The UK Trade Mark office provides similar guidance in its Examiner's Guidance Manual. "Marks which offend fall broadly into three types: those with criminal connotations, those with religious connotations and explicit/taboo signs. Marks offending public policy are likely to offend accepted principles of morality, e.g. illegal drug terminology, although the question of public policy may not arise against marks offending accepted principles of morality, for example, taboo swear words. If a mark is merely distasteful, an objection is unlikely to be justified, whereas if it would cause outrage or would be likely significantly to undermine religious, family

or social values, then an objection will be appropriate. Offence may be caused on matters of race, sex, religious belief or general matters of taste and decency. Care should be taken when words have a religious significance and which may provoke greater offence than mere distaste, or even outrage, if used to parody a religion or its values. Where a sign has a very sacred status to members of a religion, mere use may be enough to cause outrage." For more information, see <http://www.patent.gov.uk/tm/t-decisionmaking/t-law/t-law-manual.htm>)

26. Detailed discussion was conducted about application process dispute resolution process as part of the original string criteria discussion. This text has been moved to the implementation guidelines section found below.

27. In summary, the development of selection criteria for new top-level domains has been the subject of intense discussion throughout the Committee's work. This work has now been clarified and simplified and further guidance will be sought at the Los Angeles meetings on any outstanding questions from either the Committee or ICANN staff.

**style='page-break-before:always'>**

**name="\_Toc25123630">TERM OF REFERENCE THREE: DISCUSSION**  
**style='mso-special-character:line-break'>**

#### 1. Allocation

methods for new top level domains have been the subject of detailed discussion within the Committee and with ICANN operational staff. The draft recommendations have been distilled into the following key areas, some of which require further clarification from the Committee:

i.  
Applications  
will be assessed in rounds, in the first instance

ii.  
Applications  
for strings will be published after the closing date

iii.  
If  
there is contention for strings

1. Applicants may resolve contention  
between themselves within a pre-established timeframe

2. If there is no mutual agreement, a process will be put in place to enable efficient resolution of contention
  3. The ICANN Board may be required make a final decision, using advice from staff and expert panels
2. The development of recommendations for allocation methods was conducted in the same way as that for selection criteria. The comprehensive discussion about allocation methods has taken place through analysis of the formal Constituency Statements; public comments and email discussions which were used to modify and clarify the language of the Recommendations.
  3. Comparative evaluations have been a consistent theme throughout the policy development process with some discussants suggesting that auctions were a more suitable method of resolving conflict between applicants with similar string ideas. On balance, a comparative evaluation system will be used to analyse all applications and, where there is string contention between applicants for the same string, a different process may be necessary.
  4. ICANN staff have received some detailed advice about the utility and practicality of using auctions to resolve string contention at particular points in the application process. The key features of auctions<sup>[22]</sup> are, properly designed, they are objective and stand up well to challenge; they are administratively efficient; they assign resources to the highest valued use and they generate revenue.
  5. The draft Recommendations recognize past experiences with comparative evaluations in the ICANN environment, particularly those relating to sponsored top-level domains where measures of "community" support needed to be determined. The evaluations, for example in the case of the .net and .org rebids and the introduction of new sTLDs like .jobs and .travel, show that the Internet-using community takes a keen interest in ICANN's decision making process. In addition, ICANN's Supporting Organisations and Advisory Committees outside the GNSO play a key role in determining the success of potential applications.
  6. Further discussion within the Committee is necessary to confirm its draft Recommendations and to ensure that the implementation plan includes clear instructions to applicants about how strong contention between them (if they are applying for the same string) can be resolved.

**name="\_Toc25123641">TERM OF REFERENCE FOUR: DISCUSSION**  
 style='mso-special-character:line-break'>

1. Policies for Contractual  
Conditions - Summary

i.

A

base contract will be provided as part of the Request For Proposal

ii.

The

initial term should be a commercially reasonable length

iii.

There

should be renewal expectancy

iv.

A

clear compliance and sanctions process should be set out in the base contract

v.

Registries

will be required to apply existing Consensus Policies<sup>[23]</sup> and commit to adopting new Consensus Policies as they are developed

vi.

If

an applicant offers an IDN service, then ICANN's IDN guidelines must be followed

vii.

Registries

will be required to use ICANN accredited Registrars

This section sets out the discussion

of the policies for contractual conditions for new top level domain registry operators.

The recommendations were developed

through the Brussels and Amsterdam face-to-face consultations. The Committee has focused on the key principles of consistency, openness and transparency. It was also determined that a scalable and predictable process is consistent with industry best practice standards for services procurement. The Committee

referred in particular to standards within the broadcasting, telecommunications and Internet services industries to examine how regulatory agencies in those environments conducted, for example, spectrum auctions, broadcasting licence distribution and media ownership frameworks.

The Committee found a number of

expert reports<sup>[24]</sup>

beneficial. In particular, the World

Bank report on mobile licensing conditions provides some guidance on best practice principles for considering broader market investment conditions. "...A major challenge facing regulators in

developed and developing countries alike is the need to strike the right balance between ensuring certainty for market players and preserving flexibility of the regulatory process to accommodate the rapidly changing market, technological and policy conditions.

As much as possible, policy makers and regulators should strive to promote investors' confidence and give incentives for long-term investment. They can do this by favoring

the principle of 'renewal expectancy', but also by promoting regulatory certainty and predictability through a fair, transparent and participatory renewal process. For example, by

providing details for license renewal or reissue, clearly establishing what is the discretion offered to the licensing body, or ensuring sufficient lead-times and transitional arrangements in the event of non-renewal or changes in licensing conditions. Public

consultation procedures and guaranteeing the right to appeal regulatory decisions maximizes the prospects for a successful renewal process. As technological changes and convergence and

technologically neutral approaches gain importance, regulators and policy makers need to be ready to adapt and evolve licensing procedures and practices to the new environment."

The Recommendations which the

Committee have developed with respect to the introduction of new TLDs are consistent with the World Bank principles.

## IMPLEMENTATION GUIDELINES

1) At the Sao Paulo meeting, it became clear that some of the Committee's recommendations could more properly be termed "implementation guidelines" designed to assist ICANN staff with implementation of the formal policy recommendations.

2) These guidelines are consistent with ICANN's openness and transparency requirements<sup>[25]</sup>.

There  
will be a cost-recovery based application fee and application fees may differ  
for applicants

ii.  
First  
come first served within the round for processing order only between rounds and  
for an ongoing process if applicable

iii.  
Applications  
will be time and date stamped

iv.  
The  
application submission date will be at least four months after the issue of the  
Request for Proposal

v.  
ICANN  
will promote the opening of the application round

vi.  
The  
application round will close at least thirty days after the start date

vii.  
An  
applicant granted a TLD string must use it within an appropriate timeframe.

viii.  
The  
base contract should balance market certainty and flexibility for ICANN to  
accommodate a rapidly changing market place

ix.  
ICANN  
should take a consistent approach to the establishment of registry fees

x.  
The  
use of personal data is limited to the purpose for which it is collected

style='page-break-before:always'>

name="\_Toc33183283">ANNEX ONE - CONSULTATION

1.

This section provides an overview of the progress of the policy development process and the documentation produced throughout the series of teleconferences and face-to-face consultations that have taken place during 2006. All of the meetings were open to observers and many different stakeholders attended the meetings taking an active part in the discussion. In addition, all meetings were open to remote participation by teleconference and through the use of the Shinkuro ([www.shinkuro.com](http://www.shinkuro.com)) file-sharing technology. A full table found at Annex One illustrates participation by GNSO Constituencies and other observers.

2.

The style='mso-bidi-font-style:normal'>Issues Report was released on 5 December 2005. The *Report* sets out an early collation of issues that the GNSO wished to take into account in developing the Terms of Reference for future rounds. For example, the selection criteria used in previous application rounds for new top-level domains were used to guide the development of Term of Reference Two in this PDP. An evaluation of the selection criteria and methods used in the re-bidding of the .org and .net registry contracts was also conducted. The *Issues Report* contained Staff Recommendations about potential terms of reference and, in the majority, those Recommendations were adopted by the GNSO Council. The *Report* is found at <http://gnso.icann.org/issues/new-gtlds/gnso-issues-rpt-gtlds-05dec05.pdf>.

3.

A Public Comment Period was launched on 6 December 2005 to solicit input from the ICANN community about the proposed Terms of Reference (found at <http://www.icann.org/announcements/announcement-06dec05.htm>). The Public Comment Period ran until 31 January 2006. For this PDP public comment periods have been used in different ways than in the past. In general, public comment calls have been far more targeted and highly structured to get responses on particular areas of concern to the Committee. This was a successful initiative enabling information to be collected in a consistent way that improved the quality of subsequent *Reports*. The archive of comments can be found at <http://forum.icann.org/lists/new-gtlds-pdp-comments/>.

4.

In addition to a Public Comment Period, a *Call for Expert Papers* was announced on 3 January 2006 (found at <http://icann.org/announcements/announcement->

03jan06.htm"><http://icann.org/announcements/announcement-03jan06.htm>). The request for input was advertised widely in the international press and yielded eleven responses from a diverse range of stakeholders.

The authors of the papers were invited to present their papers and participate in a question and answer session at the 23 - 25 February 2006 Washington meeting. A full listing of all the inputs, including the *Expert Papers*, can be found at [href="http://gnso.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm">http://gnso.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm](http://gnso.icann.org/issues/new-gtlds/new-gtld-pdp-input.htm).

5.

The ICANN Board has been regularly updated on the progress of and taken a keen interest in the work of the new TLDs Committee. For example, the Board meeting of 10 January 2006 shows discussion within the Board about its involvement in new TLDs policy development process (found at [href="http://www.icann.org/minutes/minutes-10jan06.htm">http://www.icann.org/minutes/minutes-10jan06.htm](http://www.icann.org/minutes/minutes-10jan06.htm))

6.

A draft Initial Report was released on 19 February 2006 (found at [href="http://icann.org/topics/gnso-initial-rpt-new-gtlds-19feb06.pdf">http://icann.org/topics/gnso-initial-rpt-new-gtlds-19feb06.pdf](http://icann.org/topics/gnso-initial-rpt-new-gtlds-19feb06.pdf)) and a request for public comments was announced at the same time that was open between 20 February 2006 and 13 March 2006. The archives for those comments are found at [href="http://forum.icann.org/lists/new-gtlds-pdp-initial-report/">http://forum.icann.org/lists/new-gtlds-pdp-initial-report/](http://forum.icann.org/lists/new-gtlds-pdp-initial-report/). The draft Initial Report was used to facilitate discussion at subsequent Committee meetings and to give some guide to the broader community about the Committee's progress in its early stages.

7.

The GNSO's new TLDs Committee held a three day meeting in Washington DC between 23 and 25 February 2006. The meeting notes can be found on the GNSO's Committee archive at (<http://forum.icann.org/lists/gtld-council/msg00030.html>). A central element of the discussion focused on re-visiting ICANN's Mission and Core Values to ensure that the deliberations on the Terms of Reference were tightly constrained. The substantive discussion over the three-day meeting also included discussion on whether to introduce new top-level domains ([href="http://forum.icann.org/lists/gtld-council/msg00027.html">http://forum.icann.org/lists/gtld-council/msg00027.html](http://forum.icann.org/lists/gtld-council/msg00027.html)) and potential selection criteria which could be used in a new round of top-level domain applications ([href="http://forum.icann.org/lists/gtld-council/msg00026.html">http://forum.icann.org/lists/gtld-council/msg00026.html](http://forum.icann.org/lists/gtld-council/msg00026.html)).

8.

Analysis of the lessons learned from previous TLD rounds was included in the broader discussions held in Washington DC ([href="http://forum.icann.org/lists/gtld-council/msg00030.html">http://forum.icann.org/lists/gtld-council/msg00030.html](http://forum.icann.org/lists/gtld-council/msg00030.html)). In addition to discussing general selection criteria, detailed discussion of technical

requirements also took place (<http://forum.icann.org/lists/gtld-council/msg00028.html>). Following the Washington meetings, it was clear that further information about technical criteria was necessary to inform the Committee's work. On 15 March 2006 a formal call was made for additional information on technical criteria (found at <http://gnso.icann.org/issues/new-gtlds/tech-criteria-15mar06.htm>). No responses were received to that specific call but, in the resulting recommendations, particular attention has been paid to addressing relevant technical standards across the full range of registry operations, including those that relate to Internationalised Domain Names.

9.

In response to the Committee's work and to discussions at the March 2006 Wellington meeting, the Board indicated its intention to facilitate the implementation of new top-level domains (found at <http://www.icann.org/minutes/minutes-31mar06.htm>.)

10.

The new TLDs

Committee met in Brussels between 11 and 13 May 2006 to discuss, in further detail, the work that had been undertaken on refining the selection criteria and allocation methods. In addition, a full day was spent on discussing policies for contractual conditions with a special presentation from ICANN's Deputy General Counsel. The Committee has archived, on 18 May 2006, records of the Brussels discussion and output from the meeting can be found at <http://forum.icann.org/lists/gtld-council/msg00133.html>

11.

At the Brussels

meeting, a revised work plan was devised (found at <http://forum.icann.org/lists/gtld-council/msg00130.html>) which include a high level commitment to producing an *Initial Report* in time for discussion at ICANN's June 2006 Marrakech meeting.

12.

A draft *Initial Report* was released on 15 June 2006 (found at <http://gnso.icann.org/issues/new-gtlds/issues-report-15jun06.pdf>) and further discussion took place on the Committee's mailing list prior to the Marrakech meeting.

13.

The ICANN Board

meeting of 30 June 2006 showed, again, the Board's interest in facilitating the policy development process on new top-level domains, particularly in encouraging ongoing discussions with the GAC. (found at <http://www.icann.org/minutes/resolutions-30jun06.htm>). After inputs

from the Marrakech meeting a final version of the *Initial Report* was released on 28 July 2006 (found at <http://gnso.icann.org/drafts/newgtlds-issues-report-01-28jul06.htm>).

14.

The Committee conducted another set of face-to-face consultations in Amsterdam between 29 and 31 August 2006 to further refine the Committee's findings and to develop a set of draft *Recommendations*. Prior to the Amsterdam meeting, a comprehensive public comment period was conducted. These public comments (found at <http://forum.icann.org/lists/gtld-council/msg00189.html>) were used as working materials for the Committee to consider, in addition to Constituency Statements, the previous set of Expert Papers and comprehensive commentary for a wide variety of observers to the meetings.

15.

The Committee met with the GAC on two occasions during the course of the consultations - in Wellington and again in Marrakech - where progress on the Committee's work was shared with GAC members.

16.

The most important aspects of the discussion were further clarification about:

differentiation (<http://forum.icann.org/lists/gtld-council/msg00190.html>);

requirements to provide an operational plan (<http://forum.icann.org/lists/gtld-council/msg00191.html>)

of application fees (<http://forum.icann.org/lists/gtld-council/msg00194.html>)

methods (<http://forum.icann.org/lists/gtld-council/msg00202.html>); and

checking

(<http://forum.icann.org/lists/gtld-council/msg00203.html>)

17.

Considering all the materials derived from the face-to-face meetings, discussions on email lists, expert materials and expert papers, on 14 September 2006 a set of draft *Recommendations* was released by the Committee for broader consideration (found at <http://gnso.icann.org/issues/new-gtlds/recom-summary-14sep06.htm>).

18.

Between 14

September and 5 October 2006 email discussion took place that improved and clarified the language of the *Recommendations* and ensured that Constituencies had sufficient time to rework their recommendations where necessary.

19.

On 5 October

2006, the Committee conducted a two hour teleconference to discuss the draft [Recommendations](http://forum.icann.org/lists/gtld-council/msg00224.html) (the MP3 recording can be found at <http://forum.icann.org/lists/gtld-council/msg00224.html>). The purpose of the meeting was to confirm that the *Recommendations* reflected the intentions of the Committee and to conduct further work on refining elements of the *Recommendations*, particularly with respect to the selection criteria and allocation methods to resolve contention between string applications.

20.

On 11 October

2006, the GNSO Committee Chairman and GNSO Chair, Dr Bruce Tonkin, sent formal correspondence to the Chair of the Governmental Advisory Committee and the Chair of GAC Working Group I, requesting the GAC's assistance with the public policy impacts of the introduction of new TLDs (found at <http://gnso.icann.org/mailing-lists/archives/council/msg02891.html>).

21.

Based on the

substantive nature of the Committee's email traffic on the draft [Recommendations](http://forum.icann.org/lists/gtld-council/msg00234.html), a further update was released to the Committee on 18 October 2006 (found at <http://forum.icann.org/lists/gtld-council/msg00234.html>) for consideration whilst the drafting of the Final Report takes place.

## OUTCOMES REPORT OF THE GNSO INTERNATIONALIZED DOMAIN NAMES WORKING GROUP (IDN WG)

Last Updated:02 April 2018

**Date:**

22 March 2007

**OUTCOMES REPORT OF THE GNSO INTERNATIONALIZED DOMAIN NAMES WORKING GROUP (IDN WG)**

<http://gns0.icann.org/issues/idn-tlds/>

**Wiki:** <http://idn.wat.ch>

**Working Group Chair:** Ram Mohan

**ICANN Staff:** Olof Nordling, Maria Farrell

### SUMMARY

This is the final version of the GNSO IDN Working Group Outcomes Report. This report provides a written summary of areas of broad agreement, support and discussions of the GNSO IDN-WG on issues for consideration of the GNSO Council regarding further GNSO policy development activities on IDN issues for the generic top level domain (gTLD) space.

The report concludes the work of the GNSO IDN WG on the Terms of Reference as specified by the GNSO Council.

1 Contents.. 3

4.2 Areas of Support 11

4.3 Agreement and Support Matrix, by Topic. 17

5 GNSO IDN WG Membership.. 23

6 Working definitions.. 25

**Objective of the IDN-WG:** The GNSO IDN Working Group (IDN-WG) was chartered to address policy issues that may arise from the impending introduction of Internationalized Domain Names at the top level (IDN TLDs). Specifically, the IDN-WG was chartered to provide a report to the ICANN GNSO Council with a view to assessing further steps to take, including the possible need for the creation of a Policy Development Process (PDP) on IDN issues for the top-level.

**Methodology of the IDN-WG:** The IDN-WG conducted its deliberations in a variety of ways: face-to-face meetings, teleconferences (transcripts and MP3 available [here](#)), an e-mail discussion list and a [wiki](#).

The first IDN-WG meetings held in December 2006 in Sao Paulo brought up some fifteen issues for discussion. These were compiled in a draft issues list at: <http://gnso.icann.org/issues/idn-tlds/draft-idn-issue-list-22dec06.htm> . Following discussions during the first conference calls of the Working Group, the issues were regrouped into seven issue areas. The WG decided that its time and attention should be allocated in proportion to the relative priority of these issue areas. The IDN-WG made no qualitative decisions regarding the importance of each issue. The following issue areas were prioritized for discussion:

- Aspects on introduction of IDN gTLDs in relation to new non-IDN gTLDs
- IDN aspects on Geo-Political Details
- Aspects relating to existing gTLD strings and existing IDN SLDs
- Aspects relating to existing SLD Domain Name Holders
- Specific Techno-Policy Details relating to IDN gTLDs

The following topics were accorded a lower priority and were only discussed initially by the Working Group:

- Particular IDN aspects relating to Privacy & Whois Details
- IDN aspects on Legal Details

This report describes the outcomes of the discussions on issues brought up following the above steps. For the expression of views, the Working Group agreed on the following conventions:

- **Agreement** there is broad agreement within the Working Group (largely equivalent to rough consensus as used in the IETF)

- **Support** there is some gathering of positive opinion, but competing positions may exist and broad agreement has not been reached

- **Alternative view** a differing opinion that has been expressed, without garnering enough following within the WG to merit the notion of either Support or Agreement.

This report also provides some references to consultations with the GNSO Reserved Names Working Group, where IDN-related topics were discussed, and where the IDN-WG provided both liaison and expert advice.

The GNSO IDN Working Group was chartered at a meeting of the GNSO Council on 16 November, 2006, minutes at <http://gnso.icann.org/meetings/minutes-gnso-16nov06.html> , when the earlier proposed Terms of Reference, available at: [http://gnso.icann.org/issues/idn-tlds/idn\\_tor\\_draft-12oct06.htm](http://gnso.icann.org/issues/idn-tlds/idn_tor_draft-12oct06.htm), were refined to a Charter for the Working Group, available at [http://gnso.icann.org/issues/idn-tlds/idn\\_working\\_group-18nov06.htm](http://gnso.icann.org/issues/idn-tlds/idn_working_group-18nov06.htm)

The Working Group was tasked to provide a report to the GNSO Council and conclude its work by the ICANN meeting in Lisbon, Portugal on 26-30 March 2007. Ram Mohan of the GNSO Registry Constituency was elected Chair by the Working Group members. Following a face to face meeting held during the ICANN meeting in Sao Paulo in December, 2006, as well as a joint meeting with the ccNSO IDN WG at the same location, the Working Group was convened 14 times in conference calls. Initially, weekly paired conference calls were organized to accommodate members in different time zones. The paired calls were eventually replaced by single calls each week, with alternating times to facilitate participation from different time zones. The members of the Working Group are listed in section 5. Observers were also invited to attend and contribute to the discussions.

The Working Group reviewed the following four key documents, in line with the Terms of Reference:

- Draft Recommendations from the New gTLD PDP Committee
- Draft IDN Issues Report
- RFC 4690 of the IETF
- ICANN IDN Guidelines

Pertinent excerpts of these documents were compiled in a document for the WG, available at: [http://gnso.icann.org/issues/idn-tlds/idn\\_wg\\_readers\\_digest.pdf](http://gnso.icann.org/issues/idn-tlds/idn_wg_readers_digest.pdf)

The IDN-WG deliberated on the topics as outlined in Section 2. The outcomes of its discussions are detailed in this section. The IDN-WG suggests that the GNSO Council review all outcomes. Outcomes in Section 4.1 (Areas of Agreement) are especially pointed out for review. Outcomes that have Support, with or without Alternative Views, also provide the Council input for deliberations on the potential need for, feasibility of and scope of any future IDN focused Policy Development Process (PDP) or other future steps.

#### 4.1 Areas of Agreement

**Definition:**

**Agreement** there is broad agreement within the Working Group (largely equivalent to rough consensus as used in the IETF).

The IDN-WG did not use the word consensus since that term has a particular meaning as used by the GNSO Council.

The IDN-WG reached Agreement on the following areas:

#### **4.1.1 Avoidance of ASCII-Squatting:**

**Agreement** to avoid ASCII-squatting situations where applications for new non-IDN gTLD strings, if accepted for insertion in the root at an earlier stage than IDN gTLDs, could pre-empt later applications for IDN gTLDs.

E.g. a new non-IDN gTLD .caxap, if accepted, would prohibit the acceptance of a later application for an IDN gTLD .caxap (in Cyrillic script and meaning sugar in Russian).

#### **4.1.2. GAC Consultation on Geo-political Impact:**

**Agreement** that, within the process for new gTLD consideration, the process for determining whether a string has a geo-political impact is a challenge, and that GAC consultation may be necessary but may not provide comprehensive responses.

#### **4.1.3. Language Community Input for Evaluation of new IDN gTLD Strings:**

**Agreement** that a suitable process for consultation, including with relevant language communities, is needed when considering new IDN gTLD strings.

#### **4.1.4. One String per new IDN gTLD:**

**Agreement** that the approach of the New gTLD PDP with one string for each new IDN gTLD application is relevant, except in the rare cases when there is a need to cover script-specific character variants of an IDN gTLD string.

#### **4.1.5. Limit Variant Confusion and Collision:**

**Agreement** that measures must be taken to limit confusion and collisions due to variants (i.e. substitutable characters/symbols within a script/language) while reviewing and awarding new IDN gTLDs.

#### **4.1.6. Limit Confusingly Similar Strings:**

**Agreement** that measures be taken to ensure that an IDN gTLD string with variants (see 4.1.4 and 4.1.5 above) be treated in analogy with current practice for IDN SLD labels, i.e. strings that only differ from an IDN gTLD string by variants (see above) are not available for registration by others.

Note: This is equivalent in effect to the provisions against confusingly similar strings foreseen in the New gTLD recommendations.

#### **4.1.7. Priority Rights for new gTLD strings and new domain names:**

**4.1.7a. Agreement** that priority rights for new strings on the top-level do not derive from existing strings.

**4.1.7b. Agreement** that applications for IDN gTLDs may face challenges/objections, for instance based on claims of intellectual property rights (IPR).

**4.1.7c. Agreement** that priority rights for new domain names do not derive from existing domain name strings as such, but may, for instance, derive from established IPR.

#### **4.1.8. Suggested Approach towards Aliasing:**

**Agreement** to address aliasing as a policy issue, rather than in terms of any specific technical mode for implementation of such a feature.

#### **4.1.9. Single Script Adherence:**

**4.1.9a. Agreement** to not require single script adherence across all levels in an IDN gTLD. Single script adherence across all levels in an IDN gTLD is not a technical requirement, only a potential policy requirement, especially since it would be difficult to enforce uniformly beyond the second level.

Note: Single script adherence across levels is not a requirement in existing gTLDs. Second-level IDNs have been introduced in those gTLDs in accordance with ICANN Guidelines.

**4.1.9b. Agreement** that there should be single script adherence within a label at the levels where registries maintain control. Where script mixing occurs or is necessary across multiple levels, registries must implement clear procedures to prevent spoofing and visual confusion for users. New gTLD registries must conform to the ICANN IDN Guidelines, and must publish their language tables in the IANA Registry. Registries should be required to limit the number of scripts across labels.

**4.1.9c. Agreement** that new gTLDs should observe the following guidelines:

1. Mix-in of ASCII characters in other scripts should be allowed as a special case, when justified.
2. Where the accepted orthographic practice for a language requires script mixing, such mixing must be allowed.

Note: Only scripts that have Unicode support are available for gTLDs.

**4.1.9d. Agreement** that other considerations in limiting scripts are:

1. Official/significant languages in a country exist.
2. An IDN gTLD registry should limit the degree of script mixing and have a limit for the number of scripts allowed for its domain names. Such limits, with justifications, should be proposed by the IDN gTLD applicant and be evaluated for reasonableness.
3. In all IDN gTLD applications, the applicant should adequately document its consultations with local language authorities and/or communities. See also 4.1.3.
4. The way to define language communities is not in the purview of the IDN-WG, but CNDC and INFITT (representing Chinese and Tamil language communities, respectively) are some models to consider.
5. ICANN should consult with the relevant language communities if in doubt whether an IDN gTLD string is in compliance with relevant tables.

#### 4.1.10. Dispute Resolution for Domain Names in new IDN gTLDs:

**Agreement** that UDRP proceedings regarding IDN SLDs show no deficiencies to date and that a review of the current UDRP would not be a prerequisite for accepting IDN gTLD applications.

## 4.2 Areas of Support

### Definitions:

**Support** there is some gathering of positive opinion, but competing positions may exist and broad agreement has not been reached

**Alternative view** a differing opinion that has been expressed, without getting enough following within the WG to merit the notion of either Support or Agreement.

### 4.2.1

**Support** for a first application round open to both non-IDN gTLDs and IDN gTLDs, if possible.

### 4.2.2

**Support** for avoiding hostage situations in planning a new non-IDN gTLD application round; neither non-IDN gTLDs nor IDN gTLDs should be delayed due to the other.

### 4.2.3

**Support** for promoting public awareness of IDN gTLD application opportunities at an early stage.

### 4.2.4

**Support** for prioritizing languages/scripts for the IDN gTLD launch according to demand/need, possibly using a notion of distance to ASCII (for example, by giving priority to right-to-left scripts).

#### 4.2.5

**Support** for preferential treatment of applications for particular communities in need of IDN gTLDs, for example through lower entry barriers, while safeguarding adequate levels of service to the relevant communities.

**Alternative view**; prioritize according to number of potential users. **Alternative view**; resolve policy before developing priority criteria. **Alternative view**; follow the approach of the new gTLD Recommendations, i.e. no priority provisions.

#### 4.2.6

**Support** for resolving IDN policy issues before launch of application round.

**Alternative view**; prioritize launch of IDN gTLD over non-IDN gTLDs.

**Alternative view**; provide opportunities to reserve IDN gTLD strings in case the first application round can only address non-IDN gTLD applications fully.

Note: Whether there will be a timing issue or not depends on the progress of the new gTLD policy, including IDN policy aspects, as well as on the progress of the protocol revisions and technical tests regarding IDN at the top-level. They all need to have advanced sufficiently before a decision can be made to go ahead with IDN TLD deployment.

#### 4.2.7

**Support** for avoiding further entrenchment of the usage of keyword[1] solutions.

#### 4.2.8

**Support** for the view to consider input from local/regional pre-existing developments regarding IDN at the top-level, for example the experimental IDN systems supported by the Arab league and other countries, when considering introduction of new IDN gTLDs.

#### 4.2.9

**Support** for a countrys rights to define/reserve IDN strings for the country name.

**Alternative view**; to also accept a countrys responsibility/right to approve any IDN gTLD strings featuring its particular script, if unique for that country.

**Alternative view**; to also acknowledge a countrys right to influence the definitions/tables of its scripts/languages.

**Alternative view**; to require a countrys support for an IDN gTLD string in its script, in analogy with the considerations for geo-political names.

**Alternative view:** recognition that countries rights are limited to their respective jurisdictions.

Note: There are potential political issues in the use of scripts, as some countries/regions claim rights to the standards for their scripts. This has also been expressed as a need to prove the support of the respective community for accepting a TLD in its particular script.

#### 4.2.10

In reference to the development of a suitable process for consultation (See previous section on Agreement that a suitable process for consultation, including with relevant language communities, is needed when considering new IDN gTLD strings); **Support** for a suitably convened language committee, fairly representing the geographic distribution of the respective language community worldwide, to review the selection/adoption of an IDN gTLD string in that particular language.

#### 4.2.11

**Support** for developing policy of general applicability regarding geo-political aspects.

**Alternative view;** to develop a set of circumstance-dependent policies, with input from relevant language communities on a case by case basis.

#### 4.2.12

**Support** for review of migration/exemption possibilities for existing IDN SLDs when reducing the number of allowed code points in the IDN protocol revision, while weeding out non-script/non-language characters, if possible.

**Alternative view;** to afford latitude for gTLDs to set policy for IDN SLDs within the limits of desirable consistency.

Note: The IDN protocol revision with an inclusion-based approach that is more restrictive regarding allowed code points, may affect some of today's around 2 million IDN SLDs.

#### 4.2.13

**Support** for addressing the topic of potential specific provisions regarding applications for IDN top-level strings from legacy gTLDs.

#### 4.2.14

**Support** for treating existing gTLD registries equally in cases when they apply for IDN gTLD strings.

**Alternative view;** to consider preferential rules for existing sponsored gTLD registries in the above context.

#### 4.2.15

**Support** for deferring the question of particular treatment of sponsored gTLDs to the New gTLD Committee, while recognizing that sponsored gTLDs differ with regard to the geographical and language scope of their sponsoring organizations.

#### 4.2.16

**Support** for not offering new IDN gTLDs the option to have a single extra LDH label for aliasing purposes.

**Alternative view:** to offer such an option for new IDN gTLDs..

Note: Such an extra LDH label would be different from, and in addition to, the standard (punycode) A-label for the IDN gTLD.

#### 4.2.17

**Support** for measures to protect the rights of others, for example through sunrise periods.

#### 4.2.19

**Support** for the view that aliasing provides protection of and reduce confusion for existing domain name holders, while recognizing that there may also be disadvantages.

**Support** for the view that aliasing does not alleviate confusion and should be struck from a list of potential solutions.

Note: The same result for domain name holders as aliasing provides could be achieved by normal DNS means. Aliasing per se is not an IDN specific feature, even if aliasing has raised much interest in the IDN context.

#### 4.2.20

**Support** for enabling a choice for an IDN gTLD registry with a string that has variants (i.e. substitutable characters/symbols within a script/language) to use variants for aliasing purposes.

#### 4.2.21

**Support** for elimination of non-language characters, as foreseen in the IDN protocol revision.

**Alternative view:** to signal concerns about symbols that may be eliminated but would potentially be needed for human communications.

#### 4.2.22

**Support** for regarding confusingly similar as visually confusingly similar or typographically confusingly similar.

**Alternative view:** to give confusingly similar a wider interpretation, including phonetic similarity.

#### 4.2.23

**Support** for IDN considerations for extension of reserved names list, possibly by introducing a notion of reserved concepts (for example; the concept of example as expressed in other languages/scripts).

Note: This was part of the input from the IDN WG to the RN WG for its considerations.

#### 4.2.24

**Support** for recognizing a current practice to display the registrant in local script and at least one of the contacts in ASCII.

**Alternative view;** to prescribe that both local script and ASCII versions of Whois should be available.

**Alternative view;** to recognize that there may be further IDN aspects on Whois issue to investigate, including but not limited to the debate on open Whois access versus privacy concerns.

Note: There are multiple solutions already in use today for Whois regarding IDNs. There have not been many complaints on Whois for IDNs yet, but that may change with increased IDN use and improved IDN support in browsers and other software.

### 4.3 Agreement and Support Matrix, by Topic

#### 4.3.1 Aspects on introduction of IDN gTLDs in relation to new non-IDN gTLDs

---

##### Agreement:

---

**Agreement** to avoid ASCII-squatting situations where applications for new non-IDN gTLD strings, if accepted for insertion in the root at an earlier stage than IDN gTLDs, could pre-empt later applications for IDN gTLDs. 4.1.1

---

---

##### Support (alternative views may exist):

---

**Support** for a first application round open to both non-IDN gTLDs and IDN gTLDs, if possible. 4.2.1

---

**Support** for avoiding hostage situations in planning a new non-IDN gTLD application round; neither non-IDN gTLDs nor IDN gTLDs should be delayed due to the other. 4.2.2

---

**Support** for promoting public awareness of IDN gTLD application opportunities at an early stage. 4.2.3

---

**Support** for prioritizing languages/scripts for the IDN gTLD launch according to demand/need, possibly using a notion of distance to ASCII (for example, by giving priority to right-to-left scripts). 4.2.4

---

---

**Support** for preferential treatment of applications for particular communities in need of IDN gTLDs, for example through lower entry barriers, while safeguarding adequate levels of service to the relevant communities. 4.2.5

---

**Support** for resolving IDN policy issues before launch of application round. 4.2.6

---

**Support** for avoiding further entrenchment of the usage of keyword solutions. 4.2.7

#### 4.3.2 IDN aspects on Geo-Political Details

---

**Agreement:**

---

**Agreement** that, within the process for new gTLD consideration, the process for determining whether a string has a geo-political impact is a challenge, and that GAC consultation may be necessary but may not provide comprehensive responses. 4.1.2

---

**Agreement** that a suitable process for consultation, including with relevant language communities, is needed when considering new IDN gTLD strings. 4.1.3

---

**Support** (alternative views may exist):

---

**Support** for the view to consider input from local/regional pre-existing developments regarding IDN at the top-level, for example the experimental IDN systems supported by the Arab league and other countries, when considering introduction of new IDN gTLDs. 4.2.8

---

**Support** for a countrys rights to define/reserve IDN strings for the country name. 4.2.9

---

In reference to the development of a suitable process for consultation (See previous section on Agreement that a suitable process for consultation, including with relevant language communities, is needed when considering new IDN gTLD strings); **Support** for a suitably convened language committee, fairly representing the geographic distribution of the respective language community worldwide, to review the selection/adoption of an IDN gTLD string in that particular language. 4.2.10

---

**Support** for developing policy of general applicability regarding geo-political aspects. 4.2.11

#### 4.3.3 Aspects relating to existing gTLD strings and existing IDN SLDs

---

**Agreement:**

---

**Agreement** that the approach of the New gTLD PDP with one string for each new IDN gTLD application is relevant, except in the rare cases when there is a need to cover script-specific character variants of an IDN gTLD string. 4.1.4

---

**Agreement** that priority rights for new strings on the top-level do not derive from existing strings. 4.1.7a

---

**Agreement** that applications for IDN gTLDs may face challenges/objections, for instance based on claims of intellectual property rights (IPR). 4.1.7b

---

**Support** (alternative views may exist):

---

**Support** for review of migration/exemption possibilities for existing IDN SLDs when reducing the number of allowed code points in the IDN protocol revision, while weeding out non-script/non-language characters, if possible. 4.2.12

---

**Support** for addressing the topic of potential specific provisions regarding applications for IDN top-level strings from legacy gTLDs. 4.2.13

---

**Support** for treating existing gTLD registries equally in cases when they apply for IDN gTLD strings. 4.2.14

---

**Support** for deferring the question of particular treatment of sponsored gTLD to the New gTLD Committee, while recognizing that sponsored gTLDs differ with regard to the geographical and language scope of their sponsoring organizations. 4.2.15

---

**Support** for not offering new IDN gTLDs the option to have a single extra LDH label for aliasing purposes. 4.2.16

#### 4.3.4 Aspects relating to existing SLD Domain Name Holders

---

**Agreement:**

---

**Agreement** that priority rights for new domain names do not derive from existing domain name strings as such, but may, for instance, derive from established IPR. 4.1.7c

---

**Agreement** to address aliasing as a policy issue, rather than in terms of any specific technical mode for implementation of such a feature. 4.1.8

---

**Support** (alternative views may exist):

---

**Support** for measures to protect the rights of others, for example through sunrise periods. 4.2.17

---

---

**Support** for the view that aliasing provides protection of and reduces confusion for existing domain name holders, while recognizing that there may also be disadvantages.

**Support** for the view that aliasing does not alleviate confusion and should be struck from a list of potential solutions. 4.2.19

---

#### 4.3.5 Specific Techno-Policy Details relating to IDN gTLDs

---

**Agreement:**

---

**Agreement** that the approach of the New gTLD PDP with one string for each new IDN gTLD application is relevant, except in the rare cases when there is a need to cover script-specific character variants of an IDN gTLD string. 4.1.4

---

**Agreement** that measures must be taken to limit confusion and collisions due to variants (i.e. substitutable characters/symbols within a script/language) while reviewing and awarding new IDN gTLDs. 4.1.5

---

**Agreement** that measures be taken to ensure that an IDN gTLD string with variants (see 4.1.4 and 4.1.5 above) be treated in analogy with current practice for IDN SLD labels, i.e. strings that only differ from an IDN gTLD string by variants (see above) are not available for registration by others. 4.1.6

---

**Agreement** to not require single script adherence across all levels in an IDN gTLD. Single script adherence across all levels in an IDN gTLD is not a technical requirement, only a potential policy requirement, especially since it would be difficult to enforce uniformly beyond the second level. 4.1.9a

---

**Agreement** that there should be single script adherence within a label at the levels where registries maintain control. Where script mixing occurs or is necessary across multiple levels, registries must implement clear procedures to prevent spoofing and visual confusion for users. New gTLD registries must conform to the ICANN IDN Guidelines, and must publish their language tables in the IANA Registry. Registries should be required to limit the number of scripts across labels. 4.1.9b

---

**Agreement** that new gTLDs should observe the following guidelines:

1. Mix-in of ASCII characters in other scripts should be allowed as a special case, when justified.
2. Where the accepted orthographic practice for a language requires script mixing, such mixing must be allowed. 4.1.9c

---

**Agreement** that other considerations in limiting scripts are:

1. Official/significant languages in a country exist.
2. An IDN gTLD registry should limit the degree of script mixing and have a limit for the number of scripts allowed for its domain names. Such limits, with justifications, should be proposed by the IDN gTLD applicant and be evaluated for reasonableness.
3. In all IDN gTLD applications, the applicant should adequately document its consultations with local language authorities and/or communities. See also 4.1.3.

4. The way to define language communities is not in the purview of the IDN-WG, but CNDC & INFITT are some models to consider.

5. ICANN should consult with the relevant language communities if in doubt whether an IDN gTLD string is in compliance with relevant tables. 4.1.9d

---

**Support** (alternative views may exist):

---

**Support** for enabling a choice for an IDN gTLD registry with a string that has variants (i.e. substitutable characters/symbols within a script/language) to use variants for aliasing purposes. 4.2.20

---

**Support** for elimination of non-language characters, as foreseen in the IDN protocol revision. 4.2.21

---

**Support** for regarding confusingly similar as visually confusingly similar or typographically confusingly similar. 4.2.22

---

**Support** for IDN considerations for extension of reserved names list, possibly by introducing a notion of reserved concepts (for example; the concept of example as expressed in other languages/scripts). 4.2.23

#### 4.3.6 Particular IDN Aspects relating to Privacy & Whois Details

---

**Agreement:**

---

**Support** (alternative views may exist):

---

**Support** for recognizing a current practice to display the registrant in local script and at least one of the contacts in ASCII. 4.2.24

#### 4.3.7 IDN Aspects on Legal Details

---

**Agreement:**

---

**Agreement** that UDRP proceedings regarding IDN SLDs show no deficiencies to date and that a review of the current UDRP would not be a prerequisite for accepting IDN gTLD applications. 4.1.10

---

**Support** (alternative views may exist):

Olof Nordling ICANN Staff

In order to get a common understanding of terminology during the WG discussions, the following glossary [with sources in square brackets] was developed jointly by ICANN staff and the WG members on a dedicated wiki page for the WG.

#### A-label

An "A-label" is the ASCII-Compatible (ACE) form of an IDNA-valid string. It must be valid as output of ToASCII, regardless of how it is actually produced. This means, by definition, that every A-label will begin with the IDNA ACE prefix, "xn--", followed by a string that is a valid output of the Punycode algorithm and hence a maximum of 59 ASCII characters in length. The prefix and string together must conform to all requirements for an IDN that can be stored in the DNS including conformance to the LDH rule. [IDNAbis, Klensin, Internet draft 23 Feb 2007]

#### Alias

- An alias is a pseudonym and may refer to multiple names for the same data location. [Wikipedia] (Review needed; Aliasing in the context of our discussions refers to the practice of making multiple domains effectively identical by means of using DNAME records or other policy / operational means.)

-

#### Character

- A member of a set of elements used for the organization, control, or representation of data. [The tables for all known languages are maintained by ISO/IEC 10646. See also Unicode.]

### DNAME records

- DNAME is a DNS Resource Record type. DNAME provides redirection from a part of the DNS name tree to another part of the DNS name tree. [RFC2672]

-

### Existing gTLD

- A gTLD that has been approved to be added to the root. [proposal]

### gTLD

- A generic top-level domain, directly under the top-level root of the domain name hierarchy. Most TLDs with three or more characters are referred to as "generic" TLDs, or "gTLDs". They can be subdivided into two types, "sponsored" and "unsponsored, (as well as into restricted and unrestricted). [ICANN Glossary (addition)]

### IDN ccTLD (or icTLD)

- A ccTLD (country code top-level domain, corresponding to a country, territory, or other geographic location) with a label that contains at least one character not appearing in LDH set. The lists of alpha-2 and alpha-3 codes allocated to countries and territories are maintained by the ISO 3166/MA. The ISO 3166-1:2006 document provides names of countries and territories in corresponding administrative languages.

### IDN gTLD

- A gTLD with a label that contains at least one character not appearing in the "LDH" set.

### Keyword

A keyword in an Internet search is one of the words used to find matching web pages. It was popularized during the early days of search engine development, as it was not possible to ask natural language questions and find the desired sites. Searches gave the best results if only a few keywords were chosen and searched for. These "keywords" captured the essence of the topic in question and were likely to be present on all sites listed by the search engine. [Wikipedia] In the IDN context, keywords usually refer to ISP-specific look-up functions in a local environment with a non-Latin script.[proposal]

### Label string

- A generic term referring to a string of characters that is a candidate for registration in the DNS or such a string, once registered. A label string may or may not be valid according to the rules of this specification and may even be invalid for IDNA use. The term "label", by itself, refers to a string that has been validated and may be formatted to appear in a DNS zone file. [RFC3743]

### Label

- A label is an individual part of a domain name. Labels are usually shown separated by dots; for example, the domain name "www.example.com" is composed of three labels: "www", "example", and "com". [RFC3490]

-

#### Language

- A language is a way that humans interact. The use of language occurs in many forms, including speech, writing, and signing. [RFC 4690]. The lists of alpha-2 and alpha3 codes allocated to languages are maintained by the ISO 639-2/RA.

-

#### LDH

- Letters-Digits-Hyphen, with 26 possible Latin Letters, upper and lower case alike, [a,b,c,d,e,f,g,h,i,j,k,l,m,n,o,p,q,r,s,t,u,v,w,x,y,z], 10 possible Digits [0,1,2,3,4,5,6,7,8,9], and Hyphen "-" (minus).

#### new gTLD (in GNSO parlance;)

- A gTLD that will ensue as a consequence of the implementation of the results of the New gTLD PDP. [proposal] (In practice, the WG increasingly used the expressions new non-IDN gTLDs and new IDN gTLDs to make clear distinctions.)

#### Normal delegation records (or NS records, name server records)

- An NS record or name server record maps a domain name to a list of DNS servers authoritative for that domain. Delegations depend on NS records. [Wikipedia]

-

#### Punycode

Punycode is a bootstring encoding of Unicode for Internationalized Domain Names in Applications (IDNA). [RFC3492]

Punycode, defined in RFC 3492, is the self-proclaimed "bootstring encoding" of Unicode strings into the limited character set permitted in host names. The encoding is used as part of IDNA, which is a system enabling the use of internationalized domain names in all languages that are supported by Unicode, where the burden of translation lies entirely with the user application (a web browser for example). The encoding is applied separately to each component of a domain name which is not represented solely within the ASCII character set, and a reserved prefix 'xn--' is added to the translated Punycode string. For example, bcher becomes bcher-kva in Punycode, and therefore the domain name bcher.ch would be represented as xn--bcher-kva.ch in IDNA. [Wikipedia]

#### Script

- A script is a set of graphic characters used for the written form of one or more languages. [RFC 4690 and ISO/IEC 10646]

### Source script label

A source script label is the form of a label that is displayed to the end user. [proposal] This expression can be used in the IDN context to distinguish a label that the end user sees in a local script from the other forms of this label, notably A-label and U-label, which are for system internal use by software applications and the DNS.

-

### TLD: Top Level Domain

- A generic term used to describe both gTLDs and ccTLDs that exist under the top-level root of the domain name hierarchy. [RFC3375]

- TLDs are the names at the top of the DNS naming hierarchy. They appear in domain names as the string of letters following the last (rightmost) ".", such as "net" in "www.example.net". The administrator for a TLD controls what second-level names are recognized in that TLD. The administrators of the "root domain" or "root zone" control what TLDs are recognized by the DNS. Commonly used TLDs include .com, .net, .edu, .jp, .de, etc. [ICANN Glossary]

-

### Transcription

- Transcription maps the sounds of one language to the script of another language. [Wikipedia]

### Transliteration

- Transliteration is the practice of transcribing a word or text written in one writing system into another writing system. It is also the system of rules for that practice. Technically, from a linguistic point of view, it is a mapping from one system of writing into another. Transliteration attempts to be exact, so that an informed reader should be able to reconstruct the original spelling of unknown transliterated words. To achieve this objective transliteration may define complex conventions for dealing with letters in a source script which do not correspond with letters in a goal script. Romaji is an example of a transliterating method. [Wikipedia]

### U-label

A "U-label" is an IDNA-valid string of Unicode-coded characters that is a valid output of performing ToUnicode on an A-label, again regardless of how the label is actually produced. A Unicode string that cannot be generated by decoding a valid A-label is not a valid U-label. [IDNAbis, Klensin, Internet draft 23 Feb 2007]

-

### Unicode

- Unicode is a coded character set containing tens of thousands of characters. A single Unicode code point is denoted by "U+" followed by four to six hexadecimal digits, while a range of Unicode code points is denoted by two hexadecimal numbers separated by "..", with no prefixes. [Unicode Character Code Charts and RFC3490].

### Variants

- Characters that can substitute for each other in a given language without changing the meaning of a word.  
[proposal, drawing on RFC3743]

---

[1] See section 6 Working Definitions for an explanation.

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

## A. EXECUTIVE SUMMARY

1. This report summarizes the work of the GNSO Reserved Name Working Group including recommendations regarding nine subcategories of reserved names. It is presented to the GNSO Council for its consideration. Each subcategory was examined by a small subgroup, whose full reports are included in Appendices C through J. Members of the Working Group are listed in Appendix B. The Statement of Work for the Group is given in Appendix A. A description of the classifications of reserved names is presented in Appendix K.
2. This executive summary is intended for the GNSO and ICANN community generally and does not substitute for the actual recommendations in the report which follows.
3. Where the working groups were unable to come to rough consensus, the usual recommendation was for more work to be done. What follows is the *briefest possible* summary of the outcomes for each category or relevant subdivision thereof of the ASCII versions of reserved names, and selected IDN versions. Please refer to Section 4 and the individual subreports for the definitive version of the recommendations and those pertaining to IDNs. In some cases the recommendations are too complex to be usefully summarized and the reader is directed to the relevant section of the report.

### A very brief table of recommendations of ASCII and selected IDN reserved names

*See the actual tables for the complete recommendations*

Table	Reserved Name Category	Domain Name Level(s)	Abbreviated Recommendation
4.1	ICANN and IANA	All	More work
4.2	Symbols	All	Maintain reservation
4.3	Single character names, letters	Top	More work
	Single character names, numbers	Top	More work, concern for technical issues
	Single character IDNs	Top	More work
	Single character names	Second	Release, contingent upon creation of a suitable allocation framework
		Third	No recommendation, subgroup did not address

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

<b>Table</b>	<b>Reserved Name Category</b>	<b>Domain Name Level(s)</b>	<b>Abbreviated Recommendation</b>
4.4	Two-character names, letters	Top	Maintain reservation based on the ISO-3166 list, no further work
4.4	Two-character IDNs	Top	More work
	Two-character names, numbers and letter-number combinations	Top	More work
	Two character names, letters and numbers	Second	Registries may propose release provided that measures to avoid confusion with any corresponding country codes are implemented.
	Two character names	Third	No recommendation, subgroup did not address
4.5	Tagged names	Top	Maintain reservation
		Second	Modify terms of reservation
4.6	Nic,whois,www	All	Maintain reservation
	Geographic and geopolitical		See actual recommendations in Section 4 or in Appendix G
	Three-character reserved names at the third level	Third	Maintain reservations
4.7	gTLD names at the second level	Second and third	More work
4.8	Controversial	Top	Create such a category. See Table 4.8 for details
		Second and third	Registry operators must comply with local laws and regulations

**Table A-1: Recommendation Table**

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

## B. BACKGROUND

### *Statement of Work*

1. In its meeting on 18 January 2007, the GNSO Council approved the formation of the Reserved Name Working Group (RN-WG) for the purpose of performing “an initial examination of the role and treatment of reserved domain names at the first and second level, with the goal of providing recommendations for further consideration by the TF or Council.”<sup>1</sup> The statement of work for the RN-WG is provided in Appendix A; it lists the following tasks for the WG:
  - a. Providing an initial examination of reserved names at both the top and second level for both existing and new gTLDs to include:
    - i. Reviewing the present treatment and process for reservation of names at all levels
    - ii. Reviewing any other discussions to date that have occurred related to reserved names for top level strings for new gTLDs including IDN gTLDs
    - iii. Reviewing any ICANN staff reports related to reserved names
    - iv. Liaising with the ICANN staff as needed, including legal and operational, to identify and review any existing work or relevant experiences related to reserved names processes and procedures
    - v. Reviewing any relevant technical documents
    - vi. Liaising with the ccNSO and the ccTLD community in general as needed regarding the two letter names issues
    - vii. Defining the role of reserved strings
    - viii. Prioritizing sub-elements of the broad topic of reserved names in a manner that would facilitate breaking the broad topic of reserved names into smaller parts that could then be divided into separate policy efforts of a more manageable size and that might also allow some less complicated issues to be resolved in a more timely manner so that some policy changes might be included in the introduction of new gTLDs
    - ix. Recommending how to proceed with a full examination of issues and possible policy recommendations.

---

<sup>1</sup> Minutes of the meeting can be found at <http://gns0.icann.org/meetings/minutes-gns0-18jan07.shtml>.

## **Working Group Membership**

The Working Group was open for membership to GNSO Councilors and to GNSO Constituency members. ICANN advisory committees (e.g., ALAC, GAC) were allowed to appoint non-voting liaisons to the working group. The addition of WG members was allowed by the constituencies and the advisory groups at any time. Individual observers were also allowed to participate in the group.

Consistent with the terms of the Statement of Work, the GNSO Council appointed Chuck Gomes, a representative of the gTLD Registry Constituency from VeriSign, as Interim Chair of the WG. Mr. Gomes was subsequently elected chair by the WG in its initial meeting.

Table 1 summarizes the number of participants by organization. A complete list of WG members can be found in Appendix B.

**Table 1 Number of RN-WG Participants by Organization**

<b>Constituency/Organization</b>	<b>Role</b>	<b># of Participants</b>
Business Constituency	Regular Members	4
Intellectual Property Constituency	Regular Members	4
Internet Service & Connectivity Providers Constituency	Regular Members	0
Non-Commercial User Constituency	Regular Members	2
Registrars Constituency	Regular Members	3
gTLD Registries Constituency	Regular Members	4
GNSO Council Nominating Committee Representatives	Regular Members	1
Individual	Observer	2
ccNSO and GNSO IDN Working Group *	Liaisons	2
ICANN Staff **	Staff Support	7

### **Table B-1: Participant Information**

- \* Invitations were sent to the ccNSO, the GAC and the GNSO IDN Working Group to provide liaisons. The ccNSO and the IDN WG in fact provided liaisons while the ALAC was made aware of the opportunity to provide a liaison via their participation on the GNSO Council.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

\*\* Includes: Timothy Denton, consultant hired by the ICANN Policy Development team to support the WG; extensive administrative support by the GNSO Secretariat, Glen de Saint Gerry, and Victoria Tricamo; Patrick Jones of the Operational Staff; Policy Development team members; IDN program office; and General Counsel's Office.

## **Methodology**

As much as possible, the working group operated using a rough consensus approach. Every effort was made to arrive at positions that most or all of the full group or subgroup members were willing to support. In any case where there was disagreement with the consensus view, members were asked to submit minority statements.

The following steps were performed by the WG to accomplish its tasks:

1. A mailing list was established and used for communication within the WG. Archives of the list can be found at <http://forum.icann.org/lists/gnso-idn-wg/>.
2. Relevant documents were identified and reviewed.
3. A comparison of gTLD Registry reserved name requirements in all 16 gTLD registry agreements was prepared and reviewed. (See Appendix K)
4. Reserved names were divided into eight categories and subgroups were formed to work on each category. Each subgroup did the following:
  - a. Reviewed any relevant documents and provided summaries for the full WG (see Section 5 of each subgroup's report)
  - b. Wrote a background statement that described the reserved name category (see Section 1 of each subgroup's report)
  - c. Identified possible experts and consulted with those experts as a subgroup or arranged for a consultation with the full WG if needed (see Section 4 of each subgroup's report)
  - d. Developed a brief statement defining the role of the reserved names in their category (see Section 2 of each subgroup's report)
  - e. Attempted to reach rough consensus on what were referred to as 'straw recommendations' for consideration by the full working group
  - f. Prepared a report containing the following elements:
    - i. Background
    - ii. Role of reservations requirement (if any)
    - iii. 'Straw' recommendations for the entire WG
    - iv. Consultation with Experts
    - v. Summary of Relevant Information Sources
5. The full working group held consultations with experts as necessary.
6. The full working group reviewed all subgroup reports, suggested modifications as necessary and approved the final subgroup reports, including changing subgroup 'straw' recommendations into "WG recommendations".

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

7. The approved subgroup reports were used to create this final WG report.

### ***Meetings***

Weekly teleconference meetings were held starting on 25 January, continuing through 15 March with two extra meetings added in March. One in-person meeting (with dial-in capability) was held in conjunction with the policy development process meetings held in Marina del Rey, California 22-24 February. A total of eleven full working group meetings were held. In addition, many meetings were held by subgroups.

This is a working document and has no official status.

## C. SUMMARY OF RESERVED NAME CATEGORIES

Table 2 provides an abbreviated overview of nine reserved name categories considered by the RN-WG. (Note that the Single/2-Character category was divided into two separate categories in this table.) This summary is intended to be for easy understanding of the overall categories of reserved names and as such does not contain all details of the registry agreement requirements. For full details, see the registry agreements or the comparison of the reserved name requirements found in Appendix K.

**Table 2 Summary of Existing Reserved Name Requirements**

<b>Category of Names</b>	<b>TLD Levels</b>	<b>Reserved Names</b>	<b>Applicable gTLDs</b>
ICANN & IANA related	2 <sup>nd</sup> (and 3 <sup>rd</sup> if applicable)	ICANN: aso, gnso, icann, internic, ccNSO IANA: afrinic, apnic, arin, example, gtld-servers, iab, iana, iana-servers, iesg, ietf, irtf, istf, lacnic, latnic, rfc-editor, ripe, root-servers	All 16 gTLDs
Single Character	2 <sup>nd</sup> level	All 36 alphanumeric ASCII characters (e.g., a.biz, b.aero)	All 16 gTLDs (some of these were registered prior to the requirement)
Two Character	2 <sup>nd</sup> level	1296 combinations of ASCII letters and digits(e.g., xy.org, b2.info)	All 16 gTLDs (with some exceptions for certain gTLDs)
Tagged	2 <sup>nd</sup> (and 3 <sup>rd</sup> if applicable)	All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")	All 16 gTLDs
NIC, Whois, www	2 <sup>nd</sup> level	Nic, Whois, www (reserved for registry operations only)	All 16 gTLDs

Author: Chuck Gomes

This is a working document and has no official status.

## D. ROLES OF RESERVED NAMES

Table 3 shows the definition of roles as determined by the RN-WG for each of nine reserved name categories considered by the WG.

**Table 3 Roles of Reserved Names**

Category of Names	Reserved Names	Role
ICANN & IANA related	<b>ICANN:</b> aso, gnso, icann, internic, ccNSO <b>IANA:</b> afrinic, apnic, arin, example, gTLD-servers, iab, iana, iana-servers, iesg, ietf, irtf, istf, lacnic, latnic, rfc-editor, ripe, root-servers	The role of the reserved names held by IANA and ICANN has been to maintain for those organizations the exclusive rights to the names of ICANN (icann), its bodies (aso, ccnso, pso, etc.) or essential related functions (internic) of the two organizations.
Single Character	All 36 alphanumeric ASCII characters (e.g., a.biz, b.aero)	It appears that the original purpose for reserving the single characters was driven by technical concerns.
Two Character	1296 combinations of ASCII letters and digits(e.g., xy.org, b2.info)	Two letter reservations appear to have been based on concerns about confusion with two letter country codes.
Tagged	All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")	The role of the tagged name reservation requirement is to be able to provide a way to easily identify an IDN label in the DNS and to avoid confusion of non-IDN ASCII labels. Implicit in this role is the need to reserve tagged names for future use in case the ASCII IDN prefix is changed.
NIC, Whois, www	Nic, Whois, www (reserved for registry operations only)	The rationale for the reservation of these names for use by registry operators is based upon long standing and well established use of these strings by registry operators (both gTLD and ccTLDs) in connection with normal registry operations.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

<b>Category of Names</b>	<b>Reserved Names</b>	<b>Role</b>
Geographic & Geopolitical	All geographic & geopolitical names in the ISO 3166-1 list (e.g., Portugal, India, Brazil, China, Canada) & names of territories, distinct geographic locations (or economies), and other geographic and geopolitical names as ICANN may direct from time to time	Protection afforded to Geographic indicators is an evolving area of international law in which a one-size fits all approach is not currently viable. The proposed recommendations in this report are designed to ensure that registry operators comply with the national laws for which they are legally incorporated/organized.
Third Level	See Section 1.B of the subgroup report in Appendix H.	The role of the names specifically reserved at the third level is primarily to combat security concerns (e.g., a party registering www.med.pro could pose as the registrar for that domain). As a secondary matter, they may be needed to overcome technical challenges presented by 'double' addresses (e.g., www.www.med.pro) and, to a lesser extent, consumer confusion.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

Category of Names	Reserved Names	Role
Other 2 <sup>nd</sup> Level	See the section titled 'Other names reserved at the 2 <sup>nd</sup> level' in Appendix I.	1) reservation of gTLD strings at the second level was put in place by ICANN in order to avoid consumer confusion in relation to TLD.TLD addresses; 2) the reservation of registry-related names came about during contract negotiations and are in place in order to protect the Registries and their successors and to avoid consumer confusion; 3) for the .name, .mobi, .coop, .travel and .job Registries, certain non-ICANN reserved names directly benefit the communities that they represent and / or the reserved names are an integral part of the Registry's business model.
Controversial	N/A	There is no apparent role for controversial names among the existing categories of names reserved at the second level within gTLDs. The role of controversial second level names within several ccTLDs varies and includes an array of concepts such as the protection of national interests, illegal activities, obscenity, and social disorder.

**Table D-1: Role of Reserved Names**

## **E. RN-WG RECOMMENDATIONS**

1. The recommendations of the RN-WG for each of the reserved name categories considered by the WG are provided below. Note that for clarity some of the original eight categories were broken down into smaller categories. For some of the categories, recommendations are shown in tables; in those cases the recommendations are provided according to the level of the domain name (top, 2<sup>nd</sup>, 3<sup>rd</sup>) and within each of those levels they are broken down into any recommendations regarding ASCII domain names

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

and IDN domain names. The column titled ‘More Work?’ indicates whether or not the WG recommends that additional work be done before making final recommendations. Additional information regarding the recommendations including guidelines for additional work, if applicable, is provided following each table.

2. The recommendations listed are those for which at least rough consensus was reached by the full WG. For any categories for which there are views different from the rough consensus of the WG, minority views are provided following the table or the narrative recommendations.

3 <sup>rd</sup>	IDN	No, except for "example"	For gTLDs with registrations at the third level: 1. For all but "example", do not try to translate into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist. 2. In the case of "example", we recommend the IDN working group be consulted with regard to whether the term "example" be reserved in corresponding versions of Unicode.

**Table E-1: ICANN & IANA Related Reserved Names**

Some members of the RN-WG wished to express the following personal views on the subject of ICANN and IANA reserved names.

Avri Doria wrote:

"These TLDs should be available to the appropriate organizations for registration; e.g. the IAB should be allowed register .iab or .irtf, ISOC should be able to register .ietf or .iesg and Afrinic should be able to register .afrinic - assuming, of course, they meet all the other requirements for registration and want to do so.

"The review, comment and challenge procedures that are being developed by the GNSO new gTLD process to deal with registration of a label by an entity that does not have the right to so register the label should be sufficient to prevent these names from being registered by organizations other than those who would have the right to do so.

"Note: the discussion of the reservation at the second and third levels should be subject to similar constraints as at the first level, though the processes for review and challenge would be different."

Michael Palage offered the following points:

"In accordance with Article I, Section 2 subparagraph 8 of the ICANN bylaws it states that in performing its mission, the following core values should guide the decisions and actions of ICANN "[m]aking decisions by

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

applying documented policies neutrally and objectively, with integrity and fairness." Unlike other reservations that are based upon long standing and well established principles, ICANN/IANA staff has sought to continue reservation of a compilation of strings in which they have been unable to provide any documentation regarding the legal authority for such reservation. For ICANN/IANA to continue to reserve these names while similarly situated parties, in this case sovereign national governments (country names), IGOs and nationally recognized trademark holders, are not provided equal protection appear to be a clear violation of the bylaw provision cited above. More detailed discussion regarding the legal concerns regarding these reservation have been documented on the working groups mailing list, see <http://forum.icann.org/lists/gnso-rn-wg/msg00169.html>.

"In order for this or any other working group to make a determination based upon documented fact, the following inquiries should be explored:

- ICANN should make available to the group all written and historical references to the original basis of these reservations;
- ICANN should contact all organizations that have had their name reserved, and ask for documentation in connection with any actual confusion or security/stability concerns that have arisen in connection with the use of these strings in legacy gTLD (.com, .net and .org);
- ICANN should ask these organizations if they would prefer to have ICANN continue to reserve these names in existing and future TLDs, and the basis of this reservation request; and
- ICANN should undertake an analysis to determine any third parties that may have rights in the reserved strings (i.e. nationally registered trademarks, etc) and how this reservation potentially negatively impacts those rights."

Mike Rodenbaugh stated the following:

It appears obvious that these names were reserved to avoid end-user confusion if an entity other than the corresponding entity (ICANN, IANA, etc.) were to register a domain such as icann.info, iana.biz, afnic.travel, etc. Such problem is far more severe in the case of well-known brands (Yahoo!, Citibank, eBay, etc.) who receive exponentially more traffic to their websites and collect personal and financial information from users, making them far more frequent and severe targets for cybersquatting, phishing and other illegal activities.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

ICANN and related entities' brands should not receive any greater protection than more well-known brands. Rather, ICANN should determine methods to better protect all users and brands from these problems, taking into account the many years of experience that non-ICANN related brands have suffered in this regard.

**Table 4.2 Recommendations regarding Symbols**

<b>Description of Current Reserved Name Requirement</b>			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
ALL	N/A	No	We recommend that current practice be maintained, so that no symbols other than the '-' [hyphen] be considered for use at any level, unless technology at some time permits the use of symbols.

**Table E-2: Symbols**

Minority statement from Avri Doria

I have a minority statement for symbols. I do not buy the blanket technical argument for all symbols, especially in IDNs.

There should be actual technical proof that symbols cause problems in the DNS. The prohibition should only be for those that are shown to prove harmful. Any symbols not found harmful should be released after technical testing.

I recommend that the use of symbols in the DNS be tested to see which cause problems.

**Table 4.3 Recommendations regarding Single Character Names**

<b>Description of Current Reserved Name Requirement</b>			
All 36 alphanumeric ASCII characters (e.g., a.biz, b.aero, 9.com)			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
Top	ASCII	Yes	Letters: We recommend further work to confirm that there are no technical reasons to prohibit single letter TLDs.
			Numbers: We recommend that further work be done on single numbers at the top level. There may be technical issues in that some programs may read such a string as a partial IP address.
Top	IDN	Yes	We recommend further work on the subject of one-character IDN TLDs, including outreach to experts and

<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
			discussion related to policies for IDNs.
2 <sup>nd</sup>	ASCII	Yes	Letters and numbers: We recommend that single ASCII letters and numbers be released at the second level in future TLDs, and that those currently reserved in existing TLDs should be released. This release should be contingent upon the development of an appropriate allocation framework.
2 <sup>nd</sup>	IDN	Yes	We recommend further work on the subject of two-character IDNs, including outreach to experts and discussion related to policies for IDNs.
3 <sup>rd</sup>	ASCII	No	The subgroup did not address single-letters and numbers at the third level for gTLDs that offer registrations at that level.
3 <sup>rd</sup>	IDN	No	The subgroup did not address single-character IDNs at the third level for gTLDs that offer registrations at that level.

### **Table E-3: Single Character Names**

#### Minority Statement from Mike Rodenbaugh

According to recent research conducted by IANA, out of 9540 possible combinations of single-character ASCII names at the second level (containing 26 letters, 10 numbers, but not symbols, across 265 TLDs), 1225 delegations of single-character ASCII names exist in the zone. 63 TLDs have at least one single-character ASCII delegation (see <http://forum.icann.org/lists/gnso-rn-wg/msg00039.html>). Given that single letter and number domains are widely in use at the second level in country codes and as IDNs (Unicode renderings of ACE forms of IDNA valid strings (“A-labels”)), it seems reasonable to examine how to release and allocate single letter and number top level names, both in ASCII and IDN.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

**Table 4.4 Recommendations regarding 2-Character Reserved Names**

<b>Description of Current Reserved Name Requirement</b> 1296 combinations of ASCII letters and digits (e.g., xy.org, b2.info, 29.biz)			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
Top	ASCII	No	Letters only: We recommend that the current practice of allowing two-letter ASCII names at the top level, only for ccTLDs, remain at this time. *
		Yes	One letter and one number or two numbers: We recommend further work regarding letter/number or 2-number TLDs including outreach to experts. This area needs further study, including discussion with technical experts before any recommendation is made.
Top	IDN	Yes	Two-character IDNs need further work including outreach to experts and discussion related to policies for two-character IDNs and IDN versions of the ISO 3166 list. This is a possible area for further work by the IDN WG.
2nd	ASCII	No	We recommend that registries may propose release of two letter and/or number strings at the second level, provided that measures to avoid confusion with any corresponding country codes are implemented. A standardized approach should be used which ensures consultation with appropriate parties, including the ccNSO and ISO-3166 Maintenance Agency, and where security and stability issues are identified, RSTEP. **
2nd	IDN	Yes	We recommend further work on the subject of two-character IDNs, including outreach to experts and discussion related to policies for IDNs.
3rd	ASCII	No	The subgroup did not address two-character letters and numbers at the third level.
3rd	IDN	No	The subgroup did not address two-character IDNs at the third level.

**Table E-4: Two Character Reserved Names**

\* The subgroup was encouraged by the ccNSO not to consider removing the restriction on two-letter ASCII names at the top level. IANA has based its allocation of two-letter names at the top level on the ISO 3166 list. There is a risk

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

of collisions between any interim allocations, and ISO-3166 assignments which may be desired in the future.

\*\* The existing gTLD registry agreements provide for a method of potential release of two-character ASCII names at the second level. In addition, two letter and/or number ASCII strings at the second level may be released through the process for new registry services, which process involves analysis of any technical or security concerns and provides opportunity for public input. Technical issues related to the release of two-letter and/or number strings have been addressed by the RSTEP Report on GNR's proposed registry service. The GAC has previously noted the WIPO II Report statement that "If ISO 3166 alpha-2 country code elements are to be registered as domain names in the gTLDs, it is recommended that this be done in a manner that minimises the potential for confusion with the ccTLDs."

#### Minority Statement by Mike Rodenbaugh

"I recommend that two letter ASCII gTLDs be allowed, provided that measures to avoid confusion with any corresponding country codes are implemented. A standardized approach should be used which ensures consultation with appropriate parties, including the ccNSO and ISO-3166 Maintenance Agency, and where security and stability issues are identified, RSTEP. While there may be political reasons, there appears no strong policy reason to withhold every possible two-letter TLD from use, on the assumption that some of them may be desired by countries that may be created in the future. In addition, this concern would diminish if countries were able to use their own name as a TLD, including in its IDN form, or in an IDN two letter ccTLD.

"I recommend that single and two IDN character names continue to be released at the second level in future TLDs in accord with ICANN IDN Guidelines, as they have already been released in existing TLDs."

**Table 4.5 Recommendations regarding Tagged Reserved Names**

To avoid user confusion that might result in not being able to tell the difference between a legitimate IDN name and an illegitimate one and to provide maximum flexibility in the unlikely case that the xn-- prefix should ever need to be changed, we make the recommendations shown in the following table.

<b>Description of Current Reserved Name Requirement</b>			
All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
Top	ASCII	No	<ol style="list-style-type: none"> <li>1. In the absence of standardization activity and appropriate IANA registration, all labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n") must be reserved.<sup>2</sup></li> <li>2. For each IDN gTLD proposed, applicant must provide both the "ASCII compatible (ACE) form of an IDNA valid string" ("A-label") and in local script form (Unicode) of the top level domain ("U-label").<sup>3</sup></li> </ol>
Top	IDN	No	N/A
2 <sup>nd</sup>	ASCII	No	The current reservation requirement be reworded to say, " <i>In the absence of standardization activity and appropriate IANA registration, all labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n") must be reserved.</i> " <sup>4</sup> – added words in <i>italics</i> . (Note that names starting with "xn--" may only be used if the current ICANN IDN Guidelines are followed by a gTLD registry.)
2 <sup>nd</sup>	IDN	No	N/A
3 <sup>rd</sup>	ASCII	No	Same as for the 2 <sup>nd</sup> -level for any gTLDs for which registrations occur at the 3 <sup>rd</sup> -level
3 <sup>rd</sup>	IDN	No	N/A

<sup>2</sup> Considering that the current requirement in all 16 registry agreement reserves "All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")", this requirement reserves 1296 names (36x36).

<sup>3</sup> Internet Draft IDNAbis Issues: <http://www.ietf.org/internet-drafts/draft-klensin-idnabis-issues-01.txt> (J. Klensin), Section 3.1.1.1

<sup>4</sup> Considering that the current requirement in all 16 registry agreement reserves "All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")", this requirement reserves 1296 names (36x36).

This is a working document and has no official status.

### **Table E-5: Tagged Reserved Names**

The Tagged Name Subgroup relied exclusively on Ram Mohan, and Tina Dam as experts and did not believe that additional expert consultation was needed for the topic of tagged name reservations, but did recommend scheduling of a full WG consultation with Ram, Tina and Cary Karp to assist in the finalization of reports for other reserved name categories with regard to IDNs. That WG consultation occurred on 1 March 2007.

**Table 4.6 Recommendations regarding Reservation of NIC, Whois and www for Registry Operations**

<b>Description of Current Reserved Name Requirement</b> NIC, Whois, www			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
Top	ASCII	No	The following names must be reserved: nic, whois, www.
Top	IDN	No	Do not try to translate nic, whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist.
2 <sup>nd</sup>	ASCII	No	The following names must be reserved for use in connection with the operation of the registry for the Registry TLD: nic, whois, www. Registry Operator may use them, but upon conclusion of Registry Operator's designation as operator of the registry for the Registry TLD, they shall be transferred as specified by ICANN.
2 <sup>nd</sup>	IDN	No	Do not try to translate nic, whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist, except on a case by case basis as proposed by given registries.
3 <sup>rd</sup>	ASCII	No	For gTLDs with registrations as the third level, the following names must be reserved for use in connection with the operation of the registry for the Registry TLD: nic, whois, www. Registry Operator may use them, but upon conclusion of Registry Operator's designation as operator of the registry for the Registry TLD, they shall be transferred as specified by ICANN.
3 <sup>rd</sup>	IDN	No	For gTLDs with registrations as the third level, do not try to translate nic, whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist, except on a case by case basis as proposed by given registries.

## **Recommendations regarding Geographic & Geopolitical Reserved Names**

### **Top Level (ASCII and Unicode strings):**

In order to approve the introduction of new gTLDs using geographic identifiers, ICANN shall require the solicitation of input from GAC members(s) and/or government(s) associated with the potential geographic string (ASCII and/or Unicode).

Additionally, Registries incorporated under the laws of those countries that have expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly (“Member States”), or have other related applicable national laws must take appropriate action to comply with those guidelines and those national laws. Registries incorporated under the laws of those countries that have not expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly (“Non-Member States”) must take appropriate action to comply with any related applicable national laws.

### **Second Level (ASCII and Unicode strings):**

Registries incorporated under the laws of those countries that have expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly (“Member States”) must take appropriate action to promptly implement protections that are in line with these WIPO guidelines and are in accordance with the relevant national laws of the applicable Member State.

### **Third Level (ASCII and Unicode strings):**

Registries that register names at the third level and are incorporated under the laws of those countries that have expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly (“Member States”) must take appropriate action to promptly implement protections that are in line with these WIPO guidelines and are in accordance with the relevant national laws of the applicable Member State.

If any of the above recommendations are not supported by the community, it is recommended that further consultation with WIPO, the ccNSO and the GAC be conducted. Proposed questions for such consultation can be

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

found in Section 5, Consultation with Experts, in the Geographic and Geopolitical Reserved Names Report in Appendix G.

### **Recommendations regarding 3-Character Reserved Names at the 3<sup>rd</sup>-Level**

We do not recommend any change in the treatment of “prohibited third level labels” and “patterns of names staying with the registry.” While recognizing the right of registries to reserve names for a variety of technical, security and/or business reasons, the registry operators should provide some documentation for the basis of these reservations. The ICANN and IANA reserved names at the third level should be harmonized with the recommendations regarding those names at the second level.

If these or other registries reserving names at the third level are considering offering IDNs, the registry may wish to reserve IDN versions of the registry’s reserved names, except where those name are abbreviations or acronyms.

**Table 4.7 Recommendations regarding Reserved gTLD Strings**

<b>Description of Current Reserved Name Requirement</b>			
gTLD names at the 2 <sup>nd</sup> level			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
Top	ASCII	No	N/A
Top	IDN	Yes	More work is recommended. (See guidelines below.)
2 <sup>nd</sup>	ASCII	Yes	More work is recommended. (See guidelines below.)
2 <sup>nd</sup>	IDN	Yes	More work is recommended. (See guidelines below.)
3 <sup>rd</sup>	ASCII	Yes	Recommendations for the 2 <sup>nd</sup> level, if any, could likely be applied at the third level for gTLDs registering names at the 3 <sup>rd</sup> level.
3 <sup>rd</sup>	IDN	Yes	Recommendations for the 2 <sup>nd</sup> level, if any, could likely be applied at the third level for gTLDs registering names at the 3 <sup>rd</sup> level.

**Table E-7: Reserved gTLD Strings**

### **Guidelines for Additional Work**

Three alternative recommendations were considered by the subgroup:

[ALT1] The provision be retained in order to avoid consumer confusion.

[ALT2] The reservation requirement is overly restrictive and seems to create an unfair advantage for some existing registries over new registries. Thus, the reservation requirement should be removed.

[ALT3] The reservation requirement should be retained unless the two Registries in question come to agreement between themselves to release the names.

Section 4 (Consultation with Experts) summarizes the feedback received from about half of the existing gTLD registries. The opinions expressed are mixed so it might be helpful to solicit responses from the remaining gTLD registries.

It might also be helpful to attempt to collect data regarding ccTLD practices regarding use of gTLD strings at the second level.

Finally, there are at least three considerations regarding IDNs that need to be investigated: 1) should Unicode versions of existing ASCII strings be reserved in any scripts at the top level; 2) should ASCII and/or Unicode strings of future gTLDs be reserved; and 3) if it is decided that ASCII gTLD strings should be

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

reserved at the second level, should corresponding Unicode strings be reserved in any scripts? Much of this work possibly should be done by the GNSO IDN working group or similar groups with IDN expertise.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

## **Recommendations regarding Reserved Registry-Specific Names**

Further consideration of this particular reservation requirement is advised. It does not appear that this issue clearly fits within the remit of the PRO WG and so future work is required by an alternative working group.

### **Guidelines for Further Work**

The subgroup considered the following alternative recommendations:

[ALT1] Registries may propose such reservations during contract negotiations with the standard comment period to apply, allowing for input from all interests.

[ALT2] Registries should be allowed to reserve *and register* such names.

[ALT3] Referral to the Protecting Rights of Others (PRO) Working Group for further consideration in light of potential infringement of rights issues.

Other alternatives are possible and should be further investigated along with the above. For example, this type of reservation requirement could be handled strictly via the new gTLD application process with opportunity for public comments in that process.

Finally, if further work is done for this category of names, it would be helpful to obtain input from NeuStar regarding the .biz list of reserved names in this category.

## **Recommendations regarding Other Reserved Names**

It is recommended that more work be done on this subcategory of names. With regard to that work, the following recommendation was supported by several people in the working group and should be further considered in any follow-on work:

It was the group's observation that each gTLD's list of reserved names and its business model may be unique. There may not be any one-size-fits-all approach for all gTLDs. For new gTLDs, applicant's approach to this category of reserved names (if applicable) must continue to be set during contract process and must include an opportunity for public comment by all interested parties.

The following information must be included in new gTLD applications that involve names in this category:

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

1. A proposed list of reserved names from the registry, and a proposed procedure for opposing any names on such list, including a proposed administrator of such dispute resolution service (e.g., dotMobi's Premium Name Application Process for Trademark Holders which was administered by WIPO)
2. An overview as to why the various groups of names are being reserved and how this serves the community or forms part of the Registry's business model
3. An outer time limit, five years or less, as to how long the names will be reserved
4. A proposed procedure for releasing the names (e.g., an allocation method).

It is important to note that innovation should not be stifled and Registries should be allowed a degree of flexibility - provision should be allowed for Registry learning over time (e.g., as per the .name example). Therefore, the Registry Service Approval Process must be capable of handling such change requests or appropriate guidelines should be in place as regards notice given on any upcoming public comment period.

#### Minority Statement by Victoria McEvedy

I refer to my minority report in relation to Controversial Names and the comments of that Subgroup. For many of the same reasons I do not support any proposal that allows Registries to unilaterally deny applications at their discretion, without transparent and objective criteria, and without allowing for a proper external legal remedy by which the applicant can challenge the decision. Obviously there are concerns as to Freedom of Expression issues here. I support further work being undertaken on this issue.

#### Minority Statement by Marilyn Cade

This will be short. I think Greg/others identified an area that this group can make rapid progress on but which needs more work to determine how names are reserved, and then released by the registry.

I understand it may be a unique category but for now, addressing it will be most efficient by the present group who has some expertise.

#### Minority Statement from Caroline Greer

If Registries submit a list of reserved names for public comment during contract negotiations they should not also be required to provide for an opposition procedure administered by a third party. Such an opposition procedure may not

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

be necessary or appropriate depending on the gTLD / names proposed and any opposition could be voiced during the public comment period. dotMobi's Premium Name Application Process for Trademark Holders was a unique process appropriate for that Registry (and developed after contract execution).

 GNSO Council Report 16 March 2007

This is a working document and has no official status.

<b>Definition of Controversial Names used in this report</b>			
1. Qualifies as a TLD under the then prevailing String Criteria 2. Does not fall under any other Reserved Name category 3. Is disputed for reasons other than: i) It falls under any other Reserved Name category; ii) It infringes on the prior legal rights of others			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
			4. The process [or lack thereof] described in 2 above could also be applied to new or existing strings that fall under other reserved name categories, for example, geographic and geopolitical names. The process may apply equally well to names at the second level.
Top	IDN	Yes	These recommendations may apply equally well to IDNs at the top level, but more work needs to be done.
2 <sup>nd</sup>	ASCII	No	Processes, if any, to deal with controversial names at the second level should be left to the discretion of the gTLD Registry Operator with the exception that Registry Operators must comply with applicable local laws and regulations.
2 <sup>nd</sup>	IDN	No	Processes, if any, to deal with controversial IDN names at the second level should be left to the discretion of the gTLD Registry Operator with the exception that Registry Operators must comply with applicable local laws and regulations.
3 <sup>rd</sup>	ASCII	No	Same as for the 2nd-level for any gTLDs for which registrations occur at the 3rd-level.
3 <sup>rd</sup>	IDN	No	Same as for the 2nd-level for any gTLDs for which registrations occur at the 3rd-level.

**Table E-8: Controversial Reserved Names**

**Comments of Avri Doria (In consultation with Victoria McEvedy, Solicitor, International Dispute Resolution Practice Consultant.):**

This report is concerned to identify comprehensively the issues raised by the principles and to examine them.

**Trade Mark Laws and ccTLDs as models**

It should be noted that both Nation States' trade mark laws, which are territorially limited and ccTLDs are premised on the assumption that a Nation is monocultural with a unitary legal system and a generally accepted standard of morality and taste often with only one or two dominant religions.

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

Issues arise from attempts to extrapolate standards globally in a multicultural context is clearly problematic. These analogies must be considered with this limit in mind.

Trade mark laws also give inadequate weight to Freedom of Expression concerns which are relevant in an internet context given that much of the use is non-commercial. Consideration must also be given to the special considerations arising from the government sanction and exclusivity involved in trade marks which may not be applicable to the internet.

### **International Law**

. . . Arts 19 and 29 of the UN Convention on Human Rights . . . together subject Freedom of Expression to only such limitations as are determined by law. The ECHR provides similarly at Art. 10. Considerations arise as to the desirability of improving on such standards and questions as to the availability of other options.

Most nations have some restrictions on speech and inciting racial hatred or discrimination and crime tend to be included. It may be that common standards can be extracted after a review. Criticism of other religions is a tenant of Freedom of Expression in the West but prohibited in the Middle East. A full and proper study of the appropriateness of imposing the Eastern standards on the West should be considered.

### **Content v Strings**

Another issue that arises is the possibility that no action should be taken as to the strings on the basis that content is regulated by all nations so that for example, while .Nazi itself would not infringe French or German laws against glorification of the Nazi – the issue would be content related and depend on the content. See for example the Yahoo litigation.

### **The Veto**

The ability of any one nation to block an application requires serious consideration.

Comments of Marilyn Cade:

While the GAC is developing public policy principles, these are presently not available in final version to the Working Group, or GNSO Council. It is therefore not possible to fully consider the GAC's principles, although earlier draft versions are being discussed. Indications are that there will be some guidance from the GAC regarding criteria. Ideally, in the future, ongoing discussion and dialogue about draft principles will be undertaken in a 'multi stakeholder' discussion, before principles are finalized. Changes and improvements in sharing of information by the GNSO with the GAC should be considered as work in progress and undertaken during the

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

GNSO improvements process. All such changes should accommodate the interests and perspectives of the GAC.

The GAC's advisory role to the ICANN processes is based on consensus of the GAC members. The Working Group should provide its best judgment, and provide for consultation and dialogue with the GAC, in conjunction with the GNSO Council, once the GAC principles are available for discussion. Ideally, the GAC will engage in dialogue with the GNSO Council, its Task Forces/Working Groups, and other ICANN expert bodies, before finalizing principles.

In my view, the establishment of the controversial/disputed names category is largely as a placeholder, where a name can be parked, and the disputed or controversial issues be addressed, in an established time frame. It is not my view that all strings that are proposed will be ultimately approved. Some will be denied for technical or political reasons, e.g. the name of a country proposed as a string by someone other than the country itself. While some believe that a TLD should be a matter of freedom of speech, I am not inclined to expect such lofty goals of a simple TLD. It is important to remember that second level registrations remain available to registrants, and the operating a registry is an obligation, not a right. The availability of second, third level registrations, and the ability to register for access to the Internet via ISPs for web pages and email addresses remains a core mechanism for users. Of today's 1 billion users, the vast majority use email addresses, web pages from ISPs, for their access and identity on the Internet.

#### Comments of Tim Ruiz:

The basis for my support of the straw recommendation is the desire that all applications for a new gTLD registry should be evaluated against transparent and predictable criteria, fully available to the applicants prior to the initiation of the process, and that it is impossible for ICANN to pre-determine all terms that may be morally offensive or of national, cultural or religious significance for all of the world's cultures and create predictable criteria for applicants.

It is my view that 2.v. of TOR two in the draft final report should be applied more as a warning to applicants, not as a criteria that ICANN can actually proactively apply when considering applications. The warning is that any string applied for may be contested as something contrary to public policy. If contested, the application will be moved to a holding status as 'controversial' until the public policy claims can be further investigated.

The only exception might be the seven words banned by the US Federal Communication Commission. While I have not asked that this be added to the straw recommendation, it is my belief that the US Department of Commerce, who has ultimate approval of all additions to the root, would

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

never allow a gTLD string that exactly matches one of the seven banned words into the root.

#### Minority Statement by Victoria McEvedy

I wish to supplement the work of the Committee by adding these comments.

It is my view that any general Principle which seeks to prohibit any gTLD promoting hatred, racism, discrimination, crime or any abuse of religions or cultures is fundamentally flawed insofar as it fails to include any reference to Freedom of Expression.

GACs own Operating Principles, as amended at Mar del Plata, April 2005, provide at §6.3 that ICANN's decision making should take into account public policy objectives including, among other things:

- secure, reliable and affordable functioning of the Internet, including uninterrupted service and universal connectivity;
- the robust development of the Internet, in the interest of the public good, for government, private, educational, and commercial purposes, world wide;
- *transparency and non-discriminatory practices in ICANN's role in the allocation of Internet names and address;*
- effective competition at all appropriate levels of activity and conditions for fair competition, which will bring benefits to all categories of users including, greater choice, lower prices, and better services;
- fair information practices, including respect for personal privacy and issues of consumer concern; and
- *freedom of expression.*

Given that one of GACs overall policy objectives is Freedom of Expression, it is critical that it be referred to in any statement the GAC may make on the new gTLDs. It is more significant than the concerns of Rights' claimants.

The internet is not solely concerned with commercial use and speech and it is critical that proper consideration be given to Freedom of Expression.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

This is a consumer concern and is why trade mark law is so often an inadequate analogy.<sup>5</sup>

It is now well established in international jurisprudence that Freedom of Expression should only be subject to limits prescribed by law. A classic example is the balance in Article 10 of the European Convention on Human Rights. E.g.:

“(1) Everyone has the right to freedom of expression. This right shall include freedom to hold opinions and to receive and impart information and ideas without interference by public authority and regardless of frontiers...(2) The exercise of these freedoms, since it carries with it duties and responsibilities, *may be subject to such formalities, conditions, restrictions or penalties as are prescribed by law and are necessary in a democratic society*, in the interests of national security, territorial integrity or public safety, for the prevention of disorder or crime, for the protection of health or morals, for the protection of the reputation or rights of others, for preventing the disclosure of information received in confidence, or for maintaining the authority and impartiality of the judiciary.”

Freedom of Expression is therefore predominant and subject only to those limits both prescribed by law *and* necessary in a democratic society for one of the enumerated purposes.

I propose that any GAC policy statement or Principles reflect a similar balance. The predominant concern should be Freedom of Expression, subject only to those limits supplied by law and in the interests of preventing the promotion of hatred, racism, discrimination etc. Most nations do have laws preventing this type of speech so this should not be problematic.

In relation to “abuse of specific religions or cultures,” unless that abuse would fall within one of the laws aforementioned, then presumably in the delicate balancing act between Freedom of Expression and limits prescribed, this conduct is deemed by a given society to fall within the right to Freedom of Expression.

Different societies have reached different answers to these difficult questions. Whose should prevail? The danger is that the nation with the most restrictive approach would drag the rest down to its standards.

---

<sup>5</sup> Not only does trade mark law contain many compromises in its complex defences which are not reflected in the Domain System, but entry on the register, for registered marks, was at the government’s discretion and thus contained an element of state sanction –allowing it to impose a Victorian “taste and decency” approach.

Certainly in democratic traditions, it has never been acceptable to have secret closed committees, accountable to no-one, decide what can be said or published based on criteria known only to them and not subject to law or of law –this is censorship. This is the problem with the first stage of the “disputed application” approach as recommended. Arguably pre-determined criteria or restricted lists are more transparent.

ICANN should defer to the law but whose law? The choices are broadly Country of Origin or Countries of Destination. Destination is not feasible -- -unless, if the proposed name would infringe a law in a nation state which objects to the application—the application could be granted with conditions restricting or preventing its use in the objecting state(s). I understand however that this may not be technically possible. It would however prevent one State imposing its laws on others. The technical issues should be investigated.

An alternative might be agreed rules for jurisdiction and choice of law. Experts should be consulted.

This applies similarly to names at the second level, and other levels, where it should not be left to the discretion of the Registrars.

## F. RESERVED NAME TOPICS NOT CONSIDERED BY THE RN-WG

Because of limited time constraints, the RN-WG was not able to spend much time on the following topics related to reserved names that were suggested as possible topics for consideration in the statement of work:

1. Whether reserved name requirements need to be the same for all gTLDs and, if not, which ones might vary
2. Whether there should be a procedure by which staff publishes new categories of reserved names before adding them to registry agreements
3. Processes by which names could be put into reserved status at the top level
4. Processes by which names can be unreserved at the **top level** and made available for allocation, including discussion of whether there are unique treatments in allocation for names that are reserved
5. Whether and how categories of names can be unreserved and allocated at the **second level** from the existing categories
6. Should there be a process by which new names or categories are added to the reserved status in the second level (e.g., should we assume that all new strings allocated for operation as registries are reserved at the second level when they are awarded?)

It may be useful for the GNSO Council to consider whether separate working groups should be established to consider any of the above topics either independently or in combination with related topics.

It should also be noted that the RN-WG did not consider whether trademark names should have any reserved status because it was assumed that the Protecting the Rights of Others Working Group (PRO-WG) recently formed by the GNSO Council will cover this area.

## G. REPORTS FOR RESERVED NAME CATEGORIES

As stated earlier in the Methodologies subsection of this document, a separate report was written and approved for each of the reserved name categories considered by the RN-WG. The roles of reserved names and recommendations for all eight categories come directly from those reports. The basis used by the WG in arriving at the roles and recommendations can be better understood by reviewing the full reports for each category. Each report contains:

- Important background information to facilitate understanding of the reserved name category along with some historical information where applicable (Section 1 of each report)
- A listing of possible experts and a summary of the results of any consultations done with experts (Section 4 of each report)
- A summary of relevant sources of information (Section 5 of each report).

Because of the large number of information sources used for each report, they will not be repeated here. Please refer to Section 5 of each report to see the list of all sources reviewed for each category along with links or references as applicable. The following information sources were reviewed by the full RN-WG at the beginning of the process:

- gTLD Registry Agreement Reserved Names Appendices
  - URL for agreements:  
<http://www.icann.org/registries/agreements.htm>
    - Attachment 11 - .aero, .coop, .museum<sup>6</sup>
    - Appendix 6 - .asia, .biz, .cat, .com, .info, .jobs, .mobi, net, .org, .tel, .travel
    - Appendix K - .name, .pro
- Relevant RFCs which discuss reserved names
  - RFC 2606 (<http://www.rfc-editor.org/rfc/rfc2606.txt>)<sup>7</sup>
  - RFC 2141 (<http://www.ietf.org/rfc/rfc2141.txt>)
  - RFC 3491 (<http://www.rfc-editor.org/rfc/rfc3491.txt>)

Table 6.1 lists the appendices where individual subgroup reports for each reserved name category can be found.

### Table 6.1 List of Appendices for Subgroup Reports

---

<sup>6</sup> Note that ICANN posted a revised .museum sTLD agreement for comment on 2 March 2007. That agreement contains a reserved names list in Appendix 6 that can be found here: <http://www.icann.org/tlds/agreements/museum/draft-proposed-museum-appendices-02mar07.pdf>. This report does not include details of the revised reservation requirements because they have not yet been approved by the ICANN Board.

<sup>7</sup> Note that RFC 2606 has the most relevance to reserved names of the three RFCs listed.

Category of Names	Reserved Names	Appendix
ICANN & IANA related	<b>ICANN:</b> aso, gnso, icann, internic, ccNSO <b>IANA:</b> afrinic, apnic, arin, example, gtld-servers, iab, iana, iana-servers, iesg, ietf, irtf, istf, lacnic, latnic, rfc-editor, ripe, root-servers	C
Single Character	All 36 alphanumeric ASCII characters (e.g., a.biz, b.aero)	D
Two Character	1296 combinations of ASCII letters and digits(e.g., xy.org, b2.info)	D
Tagged	All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")	E
NIC, Whois, www	Nic, Whois, www	F
Geographic & Geopolitical	All geographic & geopolitical names in the ISO 3166-1 list (e.g., Portugal, India, Brazil, China, Canada) & names of territories, distinct geographic locations (or economies), and other geographic and geopolitical names as ICANN may direct from time to time	G
Third Level	All three-character labels	H
Other 2 <sup>nd</sup> Level	See the section titled 'Other names reserved at the 2 <sup>nd</sup> level' in Appendix K	I
Controversial	N/A	J

### Table G-1: Appendices for Sub-Group Reports

The full RN-WG consulted with two IDN experts on 1 March 2007: **Ram Mohan** (Chair of the GNSO IDN Working Group); **Cary Karp** (Member of the ICANN President's IDN Committee). Individual subgroups consulted with many experts who are listed in their reports.

## H. OTHER CONCLUSIONS FROM THE WORK

The conclusions of each separate working group report speak for themselves and no additions or modifications are made here. In this section we add some observations to the report that arise from the nature of the process we were engaged in.

### **The role of technology**

One thought which the Working Group had arose from the role of technology in justifying the reservation of names. It is quite predictable that technology may change in ways that would undermine the continuing rationale for some names to be reserved. In that case, the WG thought that there needs to be some ongoing thought given to the role of technology.

It is recommended that, for names which continue to be reserved for technological reasons, ICANN should continue to monitor the rationales for keeping them reserved. It should put in place a process whereby names thus reserved would be released in an orderly way as technological evolution permits. Further work needs to be done to consider what an orderly process would consist of.

# APPENDIX A – STATEMENT OF WORK

## I. Formation of the Working Group

The Working Group (WG) is chartered by the GNSO Council with an approved statement of work, as defined below. This Statement of Work is intended to guide the work of the group.

### 1. Voting:

In general, the working group should operate using a rough consensus approach. Every effort should be made to arrive at positions that most or all of the group members are willing to support. "Straw poll voting" should be used to determine whether there is rough consensus on particular issues. In order to ensure that each constituency does not have to provide the same number of members, constituencies, regardless of number of representatives, can hold 3 votes, and each individual nominating committee councilor hold one vote. Liaisons are non voting.

### 2. Membership

The Working Group is open for membership to Councilors and to GNSO Constituency members; advisory committees (e.g., ALAC, GAC) may appoint non-voting liaisons to the working group. Members may be added by the constituencies and the Advisory groups at any time during the work of the WG. The ccNSO could be invited to have representatives participate as observers because there may be implications for the treatment of the two letter country codes, which are presently reserved at all levels. The WG may invite external experts as speakers or advisors (in the role of observer) that may be able to constructively contribute to the effort.

Every effort should be made to ensure that the working group include and consider the varying points of view on key issues. It is more important that all varying points of view are examined and reflected than for every constituency or group to have representation or equal numbers of members. If this goal is achieved and recommendations are developed that have rough consensus of the group, then the full Council, with balanced representation from all constituencies and NomCom appointees, will then have opportunity to act.

Members should be selected who can commit sufficient time during the next three-four months to facilitate achievement of the targeted accomplishments describe in the next section (Working Timeline).

The Council will appoint an initial or interim chair [or co-chairs] and the Working Group should, at its initial meeting, elect or confirm the chair and co-chair(s).

### 3. Working Timeline

The Working Group is asked to convene at the earliest possible time and to achieve the following targets:

1. Progress report in the upcoming intercessional working sessions of Dec05 PDP committee and the Feb06 PDP task force, scheduled for February 22-25
2. Deliver written recommendations for next steps forward to the GNSO Council at least one week prior to the start of the Lisbon ICANN meetings (16 March 2007), at which time the working group would end unless otherwise decided by the GNSO Council.
3. Provide any follow-up actions requested by the Council within 30 days after the Lisbon meetings.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

As appropriate, the Working Group should coordinate throughout with the Dec05 PDP Committee, the Feb06 PDP Task Force and the GNSO Council.

## **II. Purpose of the Working Group**

The purpose of the WG will be to perform an initial examination of the role and treatment of reserved domain names at the first and second level., with the goal of providing recommendations for further consideration by the TF or Council. This working group should focus initially on defining the role of reserved strings, and how to proceed with a full examination of issues and possible policy recommendations. This will include prioritizing sub-elements of the broad topic of reserved names in a manner that would facilitate breaking the broad topic into smaller parts that could then be divided into separate policy efforts of a more manageable size and that might also allow some less complicated issues to be resolved in a more timely manner so that some policy changes might be included in the introduction of new gTLDs.

The treatment of reserved names is a matter of contract for existing gTLDs and will be a matter of contract for future gTLDs. As such it relates to the work of both the Dec05 PDP regarding the Introduction of New gTLDs including IDNs and the Feb06 PDP regarding Contractual Conditions for Existing Registries, Therefore the WG needs to provide an initial examination of reserved names at both the top and second level for both existing and new gTLDs. Should it be determined that the ToR for Feb 06 does not allow for addressing contractual conditions, the WG report to the Council regarding relevant recommendations.

## **III. Working Group Responsibilities, Tasks and Proposed Working Approach**

A. To perform its initial examination of the role and treatment of reserved domain names at the first (top) level, WG responsibilities and tasks should include but need not be limited to the following:

1. Review the present treatment and process for reservation of names at all levels (using Appendix 6 in the latest gTLD Registry Agreements as examples), including reviewing treatment of reserved names that may differ in existing contracts – link provided in Background Section
2. Review any other discussions to date that have occurred related to reserved names for top level strings for new gTLDs including IDN gTLDs (e.g., the GNSO's Task Force on new gTLDs; constituency comments, etc.)
3. Review any ICANN staff reports related to reserved names – see Background Section
4. Review any relevant technical documents ,e.g., relevant RFCs –see Background Section and determine what technical outreach (IETF, IAB, SSAC, etc.) is needed and complete.
5. Liaise with the ICANN staff as needed, including legal and operational, to identify and review any existing work or relevant experiences related to reserved names processes and procedures
6. Liaise with the ccNSO and the ccTLD community in general as needed regarding the two letter names issues, including whether the present approach, as outlined in Appendix 6, is sufficient or necessary

B. Proposed Working Approach for Working Group:

1. Initially, examine the sub-elements of the broad topic of reserved names to consider breaking the broad topic into smaller parts
2. Estimate the complexity of issues associated with each of the sub-elements and briefly describe the elements of complexity (e.g., more controversial issues involving multiple stakeholder groups with competing views might be rated more complex; consultation with the GAC might be rated as more complex; etc.)
3. Prioritize the sub-elements according to these two factors:

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

- a. Estimated level of complexity (less complex to higher)
- b. Importance/relevance to complete any future policy work prior to the introduction of new gTLDs
- c. Other {to be developed}
4. Identify any sub-elements for which any needed policy work may be able to be completed in time for the introduction of new gTLDs and develop recommendations about how that might best be accomplished/launch development of recommendations
5. Identify the remaining sub elements and establish a working plan to address these, including considering parallel work tracks, if feasible and resources permit, versus sequential work.
6. Prepare and submit an interim report to the relevant PDP group and/or the Council so that any additional policy work needed could be started as soon as possible referencing the Time Line provided by the Council
7. Prepare and submit a final report regarding all of the above for both PDP groups and the Council upon conclusion of work..

Regular progress reports should be provided for both PDP groups and the Council corresponding to scheduled meetings of those groups and the Council.

#### IV. Example of Topics for Reserved Names

*This section provides an example of a work plan outline for the work of the Working Group. It is provided as an initial resource for potential use by the Working Group and to attempt to help to launch the Working Group quickly, due to the pressures of time limitations. It is not intended to be comprehensive nor prescriptive. It should be assumed that the work will need to ask the question of how reserved names apply to IDNs at both second and first levels, as well as Latin character gTLDs.*

7. Identify possible roles and purposes for reserved names at the top level and review and examine those roles and purposes, including how to address the role of reserved names in IDNs
8. Identify and develop proposals to address any policy issues that should be or are under consideration by the existing GNSO PDPs regarding policy considerations related to the role, use, reservation, and release and allocation of reserved names at the top and second level
9. Determine:
  - a. The various roles that reserved names may play in new gTLDs in addressing controversial categories of names, including whether trademark names and country/geopolitical names should have initial or permanent reserved status; etc.
  - b. Whether existing reserved names at the second level should automatically be included at the first level or
  - c. Whether there is different treatment proposed for existing reserved names at the second level, in the first level
  - d. Whether reserved name requirements need to be the same for all gTLDs and, if not, which ones might vary
  - e. Whether there should be a procedure by which staff publishes new categories of reserved names before adding them to registry agreements
10. Discuss and review processes by which names could be put into reserved status at the top level
11. Discuss and propose processes by which names can be unreserved at the **top level** and made available for allocation, including discussion of whether there are unique treatments in allocation for names that are reserved
12. Discuss whether and how categories of names can be unreserved and allocated at the **second level** from the existing categories, including second level reservations in single

 GNSO Council Report 16 March 2007

This is a working document and has no official status.

character<sup>8</sup> and two character labels, and reservations for geographic and geopolitical names, to include examination of any existing technical concerns

13. Reconfirm whether there should be a process by which new names or categories are added to the reserved status in the second level (e.g., should we assume that all new strings allocated for operation as registries are reserved at the second level when they are awarded?)

## APPENDIX B -- BACKGROUND MATERIALS AND RELEVANT INITIATIVES

Background:

- 1) Existing Registry Agreements Reserved Names (Annex 6 and other examples)  
<http://www.icann.org/registries/agreements.htm>
- 2) Relevant RFCs which discuss reserved names  
<http://www.rfc-editor.org/rfc/rfc2606.txt>  
<http://www.ietf.org/rfc/rfc2141.txt>  
<http://www.rfc-editor.org/rfc/rfc3491.txt>
- 3) Status report on single letter names – to be provided

Relevant Initiatives:

- (1) PDP 05: developing policy recommendations on new gTLDs, as part of a policy development process called PDP-Dec05.  
<http://www.gnso.icann.org/issues/new-gtlds/>
- (2) PDP 06 [need link]
- (3) IDN Working Group  
<http://www.gnso.icann.org/issues/idn-tlds/issues-report-02aug06.htm>

Submitted by: Marilyn Cade and Chuck Gomes

### **Attachment 1:**

#### **Additional considerations:**

For a policy issue to warrant a policy development process it must Meet the following criteria:

- (A) Is within the scope of ICANN's mission statement;
- (B) is broadly applicable to multiple situations or organizations;
- (C) is likely to have lasting value or applicability, albeit with the need for occasional updates;
- (D) Will establish a guide or framework for future decision-making; or
- (E) Implicates or affects an existing ICANN policy.

# APPENDIX D -- ICANN & IANA RELATED RESERVED NAMES

Prepared Timothy Denton and Mawaki Chango

## 1. Background

This report provides an overview and assesses the current status of the category of reserved names related to ICANN and IANA. As such, the reserved names are not available for registration by members of the public.

More specifically, the Registry Agreements negotiated by ICANN state that “the following names shall be reserved at the second level and at all other levels within the TLD at which Registry Operator makes registrations”.

The two tables below present the set of reserved names for two organizations: ICANN and IANA. In the case of ICANN, there are five reserved names for each registry. In the case of the IANA, they are seventeen (17) for each registry.

**Table 1: ICANN-related names,  
in order of year of ICANN-Registry agreement**

.travel		ripe
	root-servers	

### Justification for ICANN reserved names

The words reserved by ICANN are mostly acronyms that basically relate to the organization structures (bodies) and functions, as it has evolved, and the justification for reservation is equally obvious.

The "schedule of reserved names" was born with the new TLD registry agreements in early 2001. A consultation with ICANN officials yielded the same result: no one recalls any record of any public or private document that describes the rationale for having a scheduled names list, or that describes the reasons why particular strings were included (or excluded).

Some members of the Working Group on Reserved Names believe that ICANN and IANA should not be able to reserve if other entities must register names in order to keep them from public use.

A further point was made by Patrick Jones of ICANN, in relation to ICANN- and IANA-reserved names.

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

“... just to clarify that IANA/ICANN names are reserved, provided that if ICANN/IANA or the related entities whose names are on reserve wanted to use one of the names, those names could be registered by the requesting entity. For example, ICANN registered and paid for the registration costs to un-reserve ICANN.jobs. If ICANN wanted to use ICANN.info in the future, it should be able to un-reserve the name.”

### **Justification for IANA's reserved names**

There has been little need in the past to justify decisions about some reserved names, some of which must date from the days of John Postel. A search has revealed only a few paragraphs here and there of justification.

The IANA-reserved names relate to functions and institutions within the purview of IANA: subordinate nameservers, IANA's regional nodes, the request for comment editor, and so forth.

The standard explanation offered to those seeking to register such names is basically given by IANA along the following lines.

General responses to other reserved domains:

Thank you for your enquiry.

Domain names reserved by the Internet Assigned Numbers Authority are not available for sale, registration or transfer. These have been reserved on policy grounds, and include single letter domains, domains with hyphens in the third and fourth positions, and other reserved words.

Should the policies regarding these rules change, they will be released from IANA's registration according to revised policy.

### **A note on http, https, and html**

In the course of the work of the Working Group, the question of whether the following names should also be reserved has come up. They are:

*http*, *https* and *html*

A review of the *whois* sites showed that, as of March 5, *http.org* had been registered. All three names are currently registered in *.com* and there appear to be no issues with them.

*https.com* since 1999 (monetized)

*http.com* since 1995 (not currently resolving)

*html.com* since 1993 (hosting company)

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

As of March 8, consultations with IANA or other authorities had not taken place about these three names.

The view of the working group was that no further work needed to be done in relation to these three additional names, and that there was no persuasive reason to reserve them. Since they have never been reserved, no further recommendations have been made in relation to them.

## 2. Role

The role of the reserved names held by IANA and ICANN has been to maintain for those organizations the exclusive rights to the names of ICANN (icann), its bodies (aso, ccnsso, pso, etc.) or essential related functions (internic) of the two organizations.

## 3. Recommendations regarding ICANN and IANA reserved Names

<b>Description of Current Reserved Name Requirement</b>			
<b>ICANN:</b> aso, gnso, icann, internic, ccNSO			
<b>IANA:</b> afrinic, apnic, arin, example, gtld-servers, iab, iana, iana-servers, iesg, ietf, irtf, istf, lacnic, latnic, rfc-editor, ripe, root-servers			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
Top	ASCII	Yes	More work is recommended. (See discussion below of what that work might entail).
Top	IDN	No, except for "example"	<ol style="list-style-type: none"> <li>1. For all but "example", do not try to translate into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist.</li> <li>2. In the case of "example", we recommend the IDN working group be consulted with regard to whether the term "example" be reserved in corresponding versions of Unicode.</li> </ol>
2 <sup>nd</sup>	ASCII	Yes	More work is recommended. (See discussion below of what that work might entail).
2 <sup>nd</sup>	IDN	No, except for "example"	<ol style="list-style-type: none"> <li>1. For all but "example", do not try to translate into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist.</li> </ol>

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

<b>Description of Current Reserved Name Requirement</b>			
<b>ICANN:</b> aso, gnso, icann, internic, ccNSO			
<b>IANA:</b> afrinic, apnic, arin, example, gTLD-servers, iab, iana, iana-servers, iesg, ietf, irtf, istf, lacnic, latnic, rfc-editor, ripe, root-servers			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
			2. In the case of “example”, we recommend the IDN working group be consulted with regard to whether the term “example” be reserved in corresponding versions of Unicode.
3 <sup>rd</sup>	ASCII	Yes	For gTLDs with registrations at the third level, more work is recommended. (See discussion below of what that work might entail).
3 <sup>rd</sup>	IDN	No, except for “example”	For gTLDs with registrations at the third level: 1. For all but “example”, do not try to translate into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist. 2. In the case of “example”, we recommend the IDN working group be consulted with regard to whether the term “example” be reserved in corresponding versions of Unicode.

Some members of the RN-WG wished to express the following personal views on the subject of ICANN and IANA reserved names.

Avri Doria wrote:

“These TLDs should be available to the appropriate organizations for registration; e.g. the IAB should be allowed register .iab or .irtf, ISOC should be able to register .ietf or .iesg and Afrinic should be able to register .afrinic - assuming, of course, they meet all the other requirements for registration and want to do so.

“The review, comment and challenge procedures that are being developed by the GNSO new gTLD process to deal with registration of a label by an entity that does not have the right to so register the label should be sufficient to prevent these names from being registered by organizations other than those who would have the right to do so.

“Note: the discussion of the reservation at the second and third levels should be subject to similar constraints as at the first level, though the processes for review and challenge would be different.”

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

Michael Palage offered the following points:

“In accordance with Article I, Section 2 subparagraph 8 of the ICANN bylaws it states that in performing its mission, the following core values should guide the decisions and actions of ICANN “[m]aking decisions by applying documented policies neutrally and objectively, with integrity and fairness.” Unlike other reservations that are based upon long standing and well established principles, ICANN/IANA staff has sought to continue reservation of a compilation of strings in which they have been unable to provide any documentation regarding the legal authority for such reservation. For ICANN/IANA to continue to reserve these names while similarly situated parties, in this case sovereign national governments (country names), IGOs and nationally recognized trademark holders, are not provided equal protection appear to be a clear violation of the bylaw provision cited above. More detailed discussion regarding the legal concerns regarding these reservation have been documented on the working groups mailing list, see <http://forum.icann.org/lists/gnso-rn-wg/msg00169.html>.

“In order for this or any other working group to make a determination based upon documented fact, the following inquiries should be explored:

- ICANN should make available to the group all written and historical references to the original basis of these reservations;
- ICANN should contact all organizations that have had their name reserved, and ask for documentation in connection with any actual confusion or security/stability concerns that have arisen in connection with the use of these strings in legacy gTLD (.com, .net and .org);
- ICANN should ask these organizations if they would prefer to have ICANN continue to reserve these names in existing and future TLDs, and the basis of this reservation request; and
- ICANN should undertake an analysis to determine any third parties that may have rights in the reserved strings (i.e. nationally registered trademarks, etc) and how this reservation potentially negatively impacts those rights.”

Mike Rodenbaugh stated the following:

It appears obvious that these names were reserved to avoid end-user confusion if an entity other than the corresponding entity (ICANN, IANA, etc.) were to register a domain such as icann.info, iana.biz, afnic.travel,

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

etc. Such problem is far more severe in the case of well-known brands (Yahoo!, Citibank, eBay, etc.) who receive exponentially more traffic to their websites and collect personal and financial information from users, making them far more frequent and severe targets for cybersquatting, phishing and other illegal activities.

ICANN and related entities' brands should not receive any greater protection than more well-known brands. Rather, ICANN should determine methods to better protect all users and brands from these problems, taking into account the many years of experience that non-ICANN related brands have suffered in this regard.

### **3. Consultation with Experts**

Both Dan Halloran and Kurt Pritz have been approached to supply a rationale for the continuing reservation of these names. Kurt Pritz wrote:

“Regarding the reasoning for making the name reservation on these 17 names: present staff at ICANN were not involved in the decision making process. We have started the documentation search regarding these reservations and will make contact with those involved with making the reservation. We have had discussions regarding this issue but will not be able to generate a formal report in the near-term.

“In the meantime, it is ICANN's position [is] that these names continue to be reserved.”

Other members of ICANN have supplied information to this report.

Dan Halloran has pointed out that if IANA's or ICANN's current set of reserved names were ever disputed, the entire UDRP process is under the aegis of ICANN. This would have the effect of making it appear that ICANN was sitting in judgment of its own interests. The better way to avoid this possibility was to keep them reserved.

#### **IDN Implications**

As regards the IDN implications of these two categories of names, both Cary Karp and Ram Mohan were consulted in a teleconference of March 1, 2007. The advice received was that these names were “integral designators” to be used “without translation”. In other words, there was no need to reserve these strings in other languages. Ram Mohan also agreed that they should not be reserved in foreign languages or scripts. “Find the equivalent and reserve them at that time”, he suggested. “Don't try to translate them”, referring to the acronyms.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

The one possible exception to the general advice was in relation to the single word “example”, which was capable of being used in translated form in many languages.

#### **4. Summary of Relevant Information Sources**

The [ICANN registry agreements](http://www.icann.org/registries/agreements.htm) set forth the reserved names in question (<http://www.icann.org/registries/agreements.htm>).

We have been unable to find directly relevant RFCs or other documents pertaining to this class of reserved name.

# APPENDIX E -- SINGLE AND DUAL CHARACTER RESERVED NAMES

## Report regarding Single- and Dual Character Domains

Prepared by Patrick Jones, Marilyn Cade, Mike Rodenbaugh, Alistair Dixon, Neil Blair and Timothy Denton

### 1. Background

This report addresses the Reserved Names that contain one or two characters. "Characters" include letters, numbers and symbols (such as #, \$, &, !, \*, -, \_, +, =). For purposes of this discussion, five subcategories will be addressed:

- Single and two character symbols at the first and second level
- Single letters and numbers at the first level
- Single letters and numbers at the second level
- Two letters and numbers at the first level
- Two letters and numbers at the second level

This report will examine each of the above categories, recognizing that the technical and policy issues may differ across each of the sub categories. The purpose of this report is to examine whether there are any technical, policy or practical concerns about releasing these names. Domain names are defined in RFC 1034 (published in November 1987 and recognized as an Internet Standard, <ftp://ftp.rfc-editor.org/in-notes/rfc1034.txt>).

The initial treatment of using a 'reservation' developed with Jon Postel and involved both single and two character strings. Some discussion about reserved names can be traced back to specific RFCs, while the 'reservation category' has also evolved via gTLD registry agreements. The reserved names list was created during the proof-of-concept round of new TLDs in 2001. The reserved names list was a topic of discussion during the ICANN Meeting in Melbourne, Australia in March 2001. An information page on the registry agreement appendices was first posted in February 2001 (<http://www.icann.org/melbourne/new-tld-agreements-topic.htm>). Subsequently, the category of Geographical and Geopolitical names were added as a category to the 'standard appendix for reserved names, beginning with .info.

#### 1.1 Single and two character symbols at the first and second level:

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

Only ASCII characters are permitted in the DNS – limiting the characters to the letters a-z; the numbers 0-9, and the hyphen-dash (-). "." has a special status: it is permitted by the DNS but used as a "separator" for labels. No other symbols are permitted in the DNS, to the left of the TLD.

Discussions with technology experts indicate that there would not be support for making any changes to allow the release of symbols in one or two character domain names, at any level. .

## **1.2 Single characters (letters or numbers) – Top Level:**

Single-character TLDs have never been released by ICANN. In 2000, ICANN received an application for .i. This application was not approved (see <http://www.icann.org/tlds/i1/>).

RFC 1035 (see <http://www.ietf.org/rfc/rfc1035.txt>) states that domain names “must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphen. There are also some restrictions on the length. Labels must be 63 characters or less.”

There may be potential user confusion from mistyping single characters or numbers at the top level (i.e., .l versus .1, .m versus .n, .q versus .g). There may be other “technical” issues as yet unidentified, particularly as to single numbers.

Some businesses own trademarks in single letters, such as Overstock, Nissan Motors, T-Mobile and Yahoo! [Examples are provided merely for illustration and discussion]. Such trademark owners may be interested in registering a corresponding TLD.

According to recent research conducted by IANA, out of 9540 possible combinations of single-character ASCII names at the second level (containing 26 letters, 10 numbers, but not symbols, across 265 TLDs), 1225 delegations of single-character ASCII names exist in the zone. 63 TLDs have at least one single-character ASCII delegation (see <http://forum.icann.org/lists/gnso-rn-wg/msg00039.html>).

Given that single letter and number domains are widely in use at the second level in country codes and as IDNs (Unicode renderings of ACE forms of IDNA valid strings (“A-labels”)), it seems feasible to examine how to release and allocate single letter and number top level names, both in ASCII and IDN.

The release and allocation of single letters has been subject of some discussion during the PDPs regarding contractual terms for TLD registries.

GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

### 1.3 Single characters (letters and numbers) – Second Level

Currently, all 16 gTLD registry agreements (.aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel) provide for the reservation of single-character names at the second level. ICANN's gTLD registry agreements contain the following provision on single-character names. See, e.g., Appendix 6 of the .TEL Registry Agreement, <http://www.icann.org/tlds/agreements/tel/appendix-6-07apr06.htm> ("the following names shall be reserved at the second-level:... All single-character labels.").

Letters, numbers and the hyphen symbol are allowed within second level names in both top level and country code TLDs. Single letters and numbers also are allowed as IDNs -- as single-character Unicode renderings of ASCII compatible (ACE) forms of IDNA valid strings.

Before the current reserved name policy was imposed, in 1993, Jon Postel took steps to register all available single character letters and numbers at the second level, purportedly to reserve them for future extensibility of the Internet (see 20 May 1994 email from Jon Postel, <http://ops.ietf.org/lists/namedroppers/namedroppers.199x/msg01156.html>). All but six (q.com, x.com, z.com, i.net, q.net, and x.org) of the possible 144 single-letter or numbers at the second-level in .COM, .EDU, .NET and .ORG were registered and remain reserved by IANA. Those six registrations have been grandfathered, and several have been used for various purposes and/or transferred amongst different registrants. Under current policy, these names would be placed on reserve if the registrations were allowed to expire.

Since the initial registration of single-letter names by IANA, IANA has uniformly turned down all offers by third parties to purchase the right to register these names, and has advised these parties that the names are reserved for infrastructure purposes to help ensure stable operation of the Internet.

An email of 27 May 2000 to the then DNSO-GA list provides further background on single-letter names (see <http://www.dnsso.org/clubpublic/ga/Arc04/msg00442.html>).

According to recent research conducted by IANA, out of 9540 possible combinations of single-character ASCII names (containing 26 letters, 10 numbers, but not symbols, across 265 TLDs), 1225 delegations of single-character ASCII names exist in the zone. 63 TLDs have at least one single-character ASCII delegation (see <http://forum.icann.org/lists/gnso-rn-wg/msg00039.html>).

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

We understand that some businesses **may** own trademarks in single letters, such as Overstock, Nissan Motors, T-Mobile and Yahoo! [Examples have been provided merely for illustration and discussion]. These trademark owners, if they have not already registered their single-character trademarks as domain names, may be interested in doing so across a number of TLDs.

There may be potential user confusion from mistyping single characters or numbers at the top level (i.e., 1.com versus l.com, m.com versus n.com, q.com versus g.com).

Given that single letter and number second level domains are widely used in country codes and as IDNs (Unicode renderings of ACE forms of IDNA valid strings (“A-labels”)), and six letters are used in the existing legacy generic top level domains, it seems feasible to examine how to release and allocate single letter and number second level names, both in ASCII and IDN. (RFC 1035 definition of domain names would seem to preclude domains that start with numbers, but there is much existing use of such domain names.)

The release and allocation of single letters has been subject of some discussion during the PDPs regarding contractual terms for TLD registries.

#### **1.4 Two characters (letters and numbers) – Top Level**

To date, two-character TLDs have been released only as two-letter ccTLDs. No combinations of letters and numbers, and no two-number strings have been allocated at the top level. The sub-group is conducting expert outreach to examine any implications of release of such combination or two-number TLDs.

An early RFC issued in October 1984 (RFC 920) defined country codes as the “The English two letter code (alpha-2) identifying a country according the ISO Standard for ‘Codes for the Representation of Names of Countries’”. This RFC was issued before ccTLDs had been established (see <ftp://ftp.rfc-editor.org/in-notes/rfc920.txt>, page 7).

RFC 1032, issued in November 1987, states that “countries that wish to be registered as top-level domains are required to name themselves after the two-letter country code listed in the international standard ISO-3166.”

Two character/letter strings at the top level are now identified with the ISO 3166 list, which has a two letter code associated with all of the over 200 countries and recognized economies. Country code or ccTLDs correspond directly to the two character letters on the ISO 3166 list. The ISO 3166-Maintenance Agency governs the list of country codes. Further information on the ISO 3166 list is available at <http://www.iso.org/iso/en/prods-services/iso3166ma/index.html>. According to RFC 1591, “IANA is not in the business of deciding what is and is

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

not a country” (<http://www.rfc-editor.org/rfc/rfc1591.txt>). “The selection of the ISO 3166 list as a basis for country code top-level domain names was made with the knowledge that ISO has a procedure for determining which entities should be and should not be on that list.”

Further, RFC 1591 defines a country code as “a domain in the top level of the global domain name system assigned according to a two-letter code based on the ISO 3166-1 standard ‘Codes for the Representation of Names of Countries and Their Subdivisions.’”

In the 2000 round, ICANN received an application for .GO. This string was not allocated on the ISO 3166 list to a country. This application was rejected.

The GAC Principles and Guidelines for the Delegation and Administration of Country-Code Top Level Domains (5 April 2005) contains a statement on ccTLDs:

4.1.2. Every country or distinct economy with a government or public authority recognised in accordance with article 3.8 above should be able to ask for its appropriate country code to be represented as a ccTLD in the DNS and to designate the Registry for the ccTLD concerned.

A 27 February 2007 email from Kim Davies provides context to support the reservation of two-letter strings at the top level for use as future ccTLDs (see <http://forum.icann.org/lists/gnso-rn-wg/msg00163.html>).

A 4 March 2007 email from Chris Disspain states in part:

“gTLDs in ASCII – there is, if I understand it correctly, a current prohibition on issuing new gTLDs with 2 characters. I imagine the vast majority of the ccTLD community would be in favour of this prohibition being retained. Apart from anything else, reservation of 2 characters at the top level is the only way of ensuring that a new ccTLD code will be available for new territories.”

There may be potential user confusion from mistyping combinations of letters and numbers (eg. .c0 versus .co, .t0 versus .to, .1l versus .li, m0 versus .mo), with two-number strings (.00 versus .oo, .11 versus .ll, .l0 versus .lo), and with two-letter strings (ll versus li, .vy versus .yv, .pq vs. .pg).

Some businesses own trademarks in single letters, such as Overstock, Nissan Motors, T-Mobile and Yahoo! [Examples are provided merely for illustration and discussion]. Such trademark owners may be interested in registering a corresponding TLD.

GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

The release and allocation of single letters has been subject of some discussion during the Dec05 PDP regarding the introduction of new gTLDs.

## **1.5 Two characters (letters and numbers) – Second Level**

In 2001, in considering a proposal from .AERO for the limited release of two-letter airline codes, a GAC Communique (<http://www.icann.org/committees/gac/communique-09sep01.htm>) noted that the WIPO II report addressed this category of names and recommended that “If ISO 3166 alpha-2 country code elements are to be registered as domain names in the gTLDs, it is recommended that this be done in a manner that minimizes the potential for confusion with the ccTLDs.” This recommendation has been incorporated into the reserved names appendix of 14 of ICANN’s current, gTLD registry agreements.

The WIPO II Report is available at <http://www.wipo.int/amc/en/processes/process2/report/html/report.html> and included in this report under Section 5(k).

Fourteen out of sixteen of the present gTLD registry agreements (.aero, asia, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .pro, .tel and .travel) provide for the reservation of two-character names at the second level, via the following provision. (See, e.g., Appendix 6 of the .TEL Registry Agreement, <http://www.icann.org/tlds/agreements/tel/appendix-6-07apr06.htm>.)

Except to the extent that ICANN otherwise expressly authorizes in writing, the Registry Operator shall reserve names formed with the following labels from initial (i.e. other than renewal) registration within the TLD: ... All two-character labels shall be initially reserved. The reservation of a two-character label string shall be released to the extent that the Registry Operator reaches agreement with the government and country-code manager, or the ISO 3166 maintenance agency, whichever appropriate. The Registry Operator may also propose release of these reservations based on its implementation of measures to avoid confusion with the corresponding country codes.

Two of the sixteen present gTLD strings, .BIZ and .ORG registry agreements say only “Registry Operator shall reserve names formed with the following labels from initial (i.e. other than renewal) registration within the TLD: ... All two-character labels shall be initially reserved.” See

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

<http://www.icann.org/tlds/agreements/biz/appendix-06-08dec06.htm> and <http://www.icann.org/tlds/agreements/org/appendix-06-08dec06.htm>).

There may be potential user confusion between the combination of letters and numbers (eg. c0.com versus co.com; t0.com versus to.com; 1l.com versus li.com, m0.com versus mo.com), with two-number strings (00.com versus oo.com, 11.com versus ll.com), and with two-letter strings (ll.com versus li.com, vy.com versus yv.com).

At the second level, two-character names have been registered, re-sold directly or via auction, and/or transferred by a wide variety of parties for many years. The GNR RSTEP report noted that there have been 18 UDRP cases involving two-character names at the second level.

Some businesses use two letter identifiers or two-character abbreviations, such as FT for Financial Times, GM for General Motors, DT for Deutsche Telecom, BT for British Telecom, HP for Hewlett-Packard, or have corporate names of characters and number, such as 3M. [Examples are provided merely for illustration and discussion]. These trademark owners, if they have not already registered their two-character trademarks as domain names, may be interested in doing so across a number of TLDs.

In the past, ICANN has approved the release of certain two-character names from the reserved names lists through one-on-one communication with the requesting registry operator. There are no public information sources on the release of these names, but in the past ICANN has agreed to the release of e8.org, a2.coop, nz.coop and uk.coop. NZ.coop and UK.coop were released with the approval of the UK and NZ government representatives and ccTLD managers. A2.coop and e8.org were released without objection from the ISO 3166-Maintenance Agency. On 25 May 2004, the ICANN Board approved the limited release of two-character airline codes in .AERO (<http://www.icann.org/minutes/resolutions-25may04.htm>). On 16 January 2007, the ICANN Board approved the limited use of two-character names in .NAME (<http://www.icann.org/minutes/prelim-report-16jan07.htm>) (see summary of relevant information sources below for further information on the GNR proposal).

On 21 February 2007, Fundació puntCAT proposed release of three two-character names from the .CAT Sponsorship Agreement. .CAT has proposed release of UB.cat, UV.cat and UA.cat. Only UA.cat corresponds to a country code TLD (Ukraine). ICANN has approved this release.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

The existing registry agreement provisions provide a mechanism for the release of two-character names at the second level, as set forth above. In addition, registries may submit a proposal for the release of two-character names through the process for new registry services (also known as the “Funnel”), which was approved as a GNSO Consensus Policy on 8 November 2005 (<http://www.icann.org/minutes/resolutions-08nov05.htm>) and implemented 25 July 2006 (<http://www.icann.org/announcements/rsep-advisory-25jul06.htm> and <http://www.icann.org/registries/rsep/rsep.html>).

## 2. Role of the Name Reservation Requirement

It appears that the original purpose for reserving the single characters was driven by technical concerns. Two letter reservations appear to have been based on concerns about confusion with two letter country codes.

## 3. Recommendations

**Table 3.1 Recommendations regarding Symbols**

Description of Current Reserved Name Requirement			
Level	Type	More Work?	Recommendations
ALL	N/A	No	We recommend that current practice be maintained, so that no symbols other than the ‘-’ [hyphen] be considered for use at any level, unless technology at some time permits the use of symbols.

Minority statement from Avri Doria

I have a minority statement for symbols. I do not buy the blanket technical argument for all symbols, especially in IDNs.

There should be actual technical proof that symbols cause problems in the DNS. The prohibition should only be for those that are shown to prove harmful. Any symbols not found harmful should be released after technical testing.

I recommend that the use of symbols in the DNS be tested to see which cause problems.

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

**Table 3.2 Recommendations regarding Single Character Names**

<b>Description of Current Reserved Name Requirement</b>			
All 36 alphanumeric ASCII characters (e.g., a.biz, b.aero, 9.com)			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
Top	ASCII	Yes	Letters: We recommend that further work be done to confirm that there are no technical reasons to prohibit single letter TLDs.
			Numbers: We recommend that further work be done on single numbers at the top level. There may be technical issues in that some programs may read such a string as a partial IP address.
Top	IDN	Yes	We recommend further work on the subject of one-character IDN TLDs, including outreach to experts and discussion related to policies for IDNs.
2 <sup>nd</sup>	ASCII	Yes	Letters and numbers: We recommend that single ASCII letters and numbers be released at the second level in future TLDs, and that those currently reserved in existing TLDs should be released. This release should be contingent upon the development of an appropriate allocation framework.
2 <sup>nd</sup>	IDN	Yes	The subgroup did not have time to address single-character IDNs at the second level. This is also an area that could be addressed by the IDN WG.
3 <sup>rd</sup>	ASCII	No	The subgroup did not address single-letters and numbers at the third level for gTLDs that offer registrations at that level.
3 <sup>rd</sup>	IDN	No	The subgroup did not address single-character IDNs at the third level for gTLDs that offer registrations at that level.

Minority Statement from Mike Rodenbaugh:

According to recent research conducted by IANA, out of 9540 possible combinations of single-character ASCII names at the second level (containing 26 letters, 10 numbers, but not symbols, across 265 TLDs), 1225 delegations of single-character ASCII names exist in the zone. 63 TLDs have at least one single-character ASCII delegation (see <http://forum.icann.org/lists/gnso-rn-wg/msg00039.html>). Given that single letter and number domains are widely in use at the second level in country codes and as IDNs (Unicode renderings of

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

ACE forms of IDNA valid strings (“A-labels”)), it seems reasonable to examine how to release and allocate single letter and number top level names, both in ASCII and IDN.

**Table 3.3 Recommendations regarding 2-Character Reserved Names**

<b>Description of Current Reserved Name Requirement</b> 1296 combinations of ASCII letters and digits (e.g., xy.org, b2.info, 29.biz)			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
Top	ASCII	No	Letters only: We recommend that the current practice of allowing two-letter ASCII names at the top level, only for ccTLDs, remain at this time. *
		Yes	One letter and one number or two numbers: We recommend further work regarding letter/number or 2-number TLDs including outreach to experts. This area needs further study, including discussion with technical experts before any recommendation is made.
Top	IDN	Yes	Two-character IDNs need further work including outreach to experts and discussion related to policies for two-character IDNs and IDN versions of the ISO 3166 list. This is a possible area for further work by the IDN WG.
2nd	ASCII	No	We recommend that registries may propose release of two letter and/or number strings at the second level, provided that measures to avoid confusion with any corresponding country codes are implemented. A standardized approach should be used which ensures consultation with appropriate parties, including the ccNSO and ISO-3166 Maintenance Agency, and where security and stability issues are identified, RSTEP. **
2nd	IDN	Yes	We recommend further work on the subject of two-character IDNs, including outreach to experts and discussion related to policies for IDNs.
3rd	ASCII	No	The subgroup did not address two-character letters and numbers at the third level.
3rd	IDN	No	The subgroup did not address two-character IDNs at the third level.

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

\* The subgroup was encouraged by the ccNSO not to consider removing the restriction on two-letter ASCII names at the top level. IANA has based its allocation of two-letter names at the top level on the ISO 3166 list. There is a risk of collisions between any interim allocations, and ISO-3166 assignments which may be desired in the future.

\*\* The existing gTLD registry agreements provide for a method of potential release of two-character ASCII names at the second level. In addition, two letter and/or number ASCII strings at the second level may be released through the process for new registry services, which process involves analysis of any technical or security concerns and provides opportunity for public input. Technical issues related to the release of two-letter and/or number strings have been addressed by the RSTEP Report on GNR's proposed registry service. The GAC has previously noted the WIPO II Report statement that "If ISO 3166 alpha-2 country code elements are to be registered as domain names in the gTLDs, it is recommended that this be done in a manner that minimises the potential for confusion with the ccTLDs."

#### Minority Statement by Mike Rodenbaugh

"I recommend that two letter ASCII gTLDs be allowed, provided that measures to avoid confusion with any corresponding country codes are implemented. A standardized approach should be used which ensures consultation with appropriate parties, including the ccNSO and ISO-3166 Maintenance Agency, and where security and stability issues are identified, RSTEP. While there may be political reasons, there appears no strong policy reason to withhold every possible two-letter TLD from use, on the assumption that some of them may be desired by countries that may be created in the future. In addition, this concern would diminish if countries were able to use their own name as a TLD, including in its IDN form, or in an IDN two letter ccTLD.

"I recommend that single and two IDN character names continue to be released at the second level in future TLDs in accord with ICANN IDN Guidelines, as they have already been released in existing TLDs."

#### **4. Consultations with Experts**

In some cases the working group was able to consult with experts and in other cases we recommend that certain experts might be consulted if further work is to be done.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

#### **4.1 Single letters and numbers – Top level:**

Single letters and numbers are widely delegated at the second level, in 63 TLDs and as IDN (U-label) versions. Further work is required to examine potential user confusion and unidentified technical issues.

#### **4.2 Single letters and numbers – Second level**

Single letters and numbers are widely delegated at the second level, in 63 TLDs and as IDN (U-label) versions. Therefore, we presume there is no technical reason why remaining letters, at least, should remain reserved. Further work may be required before any recommendations can be drafted on potential release of single numbers at the second level, due to the definition of 'domain name' in RFC 1035 ("must start with a letter").

While it appears that single letters and numbers at the second can be released, further examination of allocation options is needed.

#### **4.3 Two letters and/or numbers – Top level:**

Two-letter strings at the top level have only been allowed for country codes as defined by the ISO 3166 list. Chris Disspain, Chair of the ccNSO, believes the vast majority of the ccTLD community would be in favour of this practice being retained. Kim Davies, IANA Technical Liaison believes the current practice should be continued, as a policy matter, due to potential need for some two-letter strings by future countries.

#### **4.4 Two letters and/or numbers – Second level:**

Second level strings with two letters and/or numbers have been widely used for a long time. Therefore we presume there is no technical reason why remaining strings should remain reserved. There may be other policy or political reasons to maintain the present reservation process, unless registries follow the previously given GAC advice and propose release of two-character names using methods to avoid confusion with any corresponding country codes.

In 2001 the GAC addressed potential release of two-character names at the second level as part of its consideration of a request from .AERO for the limited release of two-letter airline codes. This issue has been addressed in 14 registry

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

agreements as set forth above. Two-number or letter-number combinations, and two-letter combinations that are not likely to correspond to country codes, should be possible at the second level.

#### **4.5 Possible experts**

The Working Group identified the following people who could act as experts in these issues.

- Lyman Chapin, Chair of the Registry Services Technical Evaluation panel

- Glenn Kowack, Chair of the RSTEP Review Team for the GNR two-character proposal
- Patrik Falstrom
- Lars Liman
- Steve Bellovin
- Ram Mohan/Tina Dam
- Steve Crocker
- Kim Davies
- Others as necessary

## 5. Summary of Relevant Information Sources

GNSO Council Report 16 March 2007

This is a working document and has no official status.

.com in 1993 to implement a policy designed to enhance the extensibility of the domain-name space.

Since then, these names have been continuously under registration by the IANA. The IANA has received many inquiries from people seeking to register these names. As required by the existing policy, the IANA advises those inquiring that these names are already registered to the IANA and reserved for infrastructure purposes to help ensure stable operation of the Internet. The IANA has uniformly turned down all offers by third parties to purchase the right to register these names.

Four of the single-character names under .com were registered by other parties before the IANA entered its registration of these names. The registrations of these names have been (and are) grandfathered for the time being. Recently some of these registrations have been transferred from one third party to another. Those transfers are consistent with the grandfathering policy.

Having assumed the responsibility for operating the IANA, and for overall technical management of the Internet, ICANN is following the same policies for the operation of the IANA as were followed by Dr. Postel and his colleagues at the Information Sciences Institute. ICANN's charter and bylaws, together with its obligations under its various agreements with the United States Government, establish consensus-based procedures for modification of existing policies, fostering participation by affected parties. Until the policy is changed by the established procedures, ICANN is required to continue its registration of the single-letter .com domain names for the benefit of the Internet community.”

Email correspondence from Kim Davies, IANA Technical Liason, to Patrick Jones, posted on RN WG list 27 February 2007: <http://forum.icann.org/lists/gnso-rn-wg/msg00163.html>:

RFC 1591, sect 2 reads:

"In the Domain Name System (DNS) naming of computers there is a hierarchy of names. The root of system is unnamed. There are a set of what are called "top-level domain names" (TLDs). These are the generic TLDs (EDU, COM, NET, ORG, GOV, MIL, and INT), and the two letter country codes from ISO-3166."

As any possible two-letter combination is eligible to be allocated or reserved in the ISO 3166-1 alpha-2 standard in the future, the working group is strongly encouraged not to consider using these possibilities for other applications. There is a risk of collisions between such allocations, and future ISO-3166 assignments, and in such cases would mean ICANN is unable to grant a ccTLD to a valid country.

IANA has, since the introduction of the DNS, relied upon the determinations within the ISO-3166 standard to identify what constitutes a country, and what is the appropriate two-letter code for that country. This shields the organisation from making value judgements that would be very political, and instead lets and independent third party decide (the ISO 3166 Maintenance Agency, which is guided by the United Nations Statistics Office). On this matter, RFC 1591 is clear:

"The IANA is not in the business of deciding what is and what is not a country."

The selection of the ISO 3166 list as a basis for country code top-level domain names was made with the knowledge that ISO has a procedure for determining which entities should be and should not be on that list."

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

The ISO-3166 standard is not static, and evolves with changes to countries and their territories. Most importantly, new codes are added for new regions and countries. Just this year "AX", "ME" and "RS" have been new additions. One can assume there will be more changes in the future that we can not predict.

If a conflict is introduced between a newly created ccTLD code, and an allocated gTLD, IANA's neutrality would be compromised. It would either need to deprive a country of a country-code top-level domain, or it would need to stop adhering to the ISO 3166 standard which would be problematic. It would represent a key divergence from one of the most central tenets of ccTLD policy.

i.) email from Chris Disspain to Patrick Jones, dated March 4, 2007]

I am copying this to the ccNSO members and council lists. Those who wish to comment, will you please send your comments to Gabi ([gabriella.schittek@icann.org](mailto:gabriella.schittek@icann.org)) who will collate them and forward to Patrick.

I am unclear as to whether the draft report is intended to deal only with reserved names/characters in ASCII and so I'd like to make the following general points in respect to reserved names/characters at the top level. I believe this issue splits into 2 categories:

gTLDs in ASCII – there is, if I understand it correctly, a current prohibition on issuing new gTLDs with 2 characters. I imagine the vast majority of the ccTLD community would be in favour of this prohibition being retained. Apart from anything else, reservation of 2 characters at the top level is the only way of ensuring that a new ccTLD code will be available for new territories.

IDNs – here is where the problems start. I won't go into details here of the myriad challenges of .idn but the issue of reserved names serves to illustrate my serious concerns about the gNSO's decision to couple new gTLD policy with IDN policy. What is a relatively simple issue for new ASCII gTLDs (see paragraph above) becomes a minefield in respect to .idn. This is because there are currently no rules and no precedents.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

So, for example, we could say that all 2 character names at the top level are reserved for ccTLD registrations in both ASCII and IDN characters but that assumes that new .idn ccTLDs will be limited to 2 characters and that is an assumption which cannot be made at this stage. It might end up being the case but we can't assume it now.

Further, the ccTLD community cannot sensibly create ccTLD .idn policy on an issue by issue basis. Reserved names is but one issue of many and whilst we can sensibly comment on it in regard to ASCII names we cannot in regard to IDNs.

If the report on single and dual characters is intended to cover only ASCII (and if that is the case then it needs to say so clearly) then I imagine that you will be able to get input from the cc community within a reasonable time. However, if it is also intended to cover IDNs the ccNSO will, I suspect, be unable to respond at this stage and the matter will need to be placed in the 'further time and research' category that you have outlined below.

Finally, I believe that this situation is not isolated and my response above is likely to arise time and time again with respect to IDNs where there are cc and g crossover issues.

j) GAC Principles and Guidelines for the Delegation and Administration of Country-Code Top Level Domains (5 April 2005)

4.1.2. Every country or distinct economy with a government or public authority recognised in accordance with article 3.8 above should be able to ask for its appropriate country code to be represented as a ccTLD in the DNS and to designate the Registry for the ccTLD concerned.

k) WIPO II Report (Second WIPO Internet Domain Name Process, published 3 September 2001), <http://www.wipo.int/amc/en/processes/process2/report/html/report.html>.

19. The ccTLDs are those top-level domains which bear two letter codes essentially derived from the International Organization for Standardization's (ISO) Standard 3166.

GNSO Council Report 16 March 2007

This is a working document and has no official status.

### **ISO 3166 Country Code Elements**

254. The origin of the codes reflecting country top-level domains is the International Organization for Standardization (ISO). ISO, which was established in 1947 as a non-governmental organization, is a worldwide federation of national standards bodies from 137 countries. Its mission is to promote the development of standardization and related activities in the world with a view to facilitating the international exchange of goods and services, and to developing cooperation in the spheres of intellectual, scientific, technological and economic activity.[\[244\]](#) One of ISO's most famous standards is Part 1 of ISO 3166 concerning codes for the representation of names of countries and their subdivisions. Part 1 of ISO 3166 contains two letter country codes (alpha-2 codes; for example, au for Australia) and three letter country codes (alpha-3 codes, for example, aus for Australia). It is on the basis of the alpha-2 codes that the country code top-level domains (ccTLDs) were created by the Internet Authority for Assigned Names and Numbers (IANA) during the late eighties and early nineties.[\[245\]](#) Since the creation of the ccTLDs, registrations in the country domains have flourished, as the use of the Internet has spread throughout the world. It is expected that the importance of the ccTLDs will continue to grow in the future.

255. A phenomenon concerning ccTLDs that merits attention is the registration at the second level in the gTLDs of the country code elements (for example, *uk.com*). Often these domain names are registered by persons or entities in order to make them available to the public for the registration of names at the third level (for example, *company.uk.com*).[\[246\]](#) The implications of such practices are discussed below.

### **ISO 3166 Country Code Elements**

268. The Interim Report recommended the exclusion of the ISO 3166 alpha-2 country code elements from registration as domain names in the new gTLDs, in the absence of an agreement to the contrary from the relevant competent authorities. Furthermore, the Interim Report recommended that persons or entities who have registered such codes at the second level in the existing gTLDs and who accept registrations of names under them should take measures to render the UDRP applicable to such lower level registrations.

269. Several commentators favored the exclusion mechanism proposed in the Interim Report for the ISO 3166 alpha-2 country code elements,[\[278\]](#) while others opposed it.[\[279\]](#) Some of the entities offering the possibility of registrations under the codes in the existing gTLDs have expressed a willingness to adopt the UDRP or a similar procedure, as recommended in the Interim Report.[\[280\]](#) Few administrators of ccTLDs submitted comments on the Interim Report's recommendations in this area. Trademark owners have expressed concerns that

the exclusion mechanism proposed in the Interim Report would prevent the legitimate registration of two-letter trademarks or acronyms of trademarks.[\[281\]](#)

### ***ISO 3166 Alpha-2 Country Code Elements***

290. The Interim Report formulated two recommendations in relation to ISO 3166 country code elements. First, it proposed that these codes be excluded from registration in the new gTLDs, unless the relevant authorities grant permission for their registration. Secondly, it recommended that persons or entities who have registered such codes at the second level in the existing gTLDs and who accept registrations of names under them take measures to ensure that the UDRP applies to such lower level registrations.

291. In connection with the first recommendation, we note that the current version of Appendix K to the Registry Agreements between ICANN and the sponsors and operators of the new gTLDs states that [a]ll two-character labels shall be initially reserved. The reservation of a two-character label string shall be released to the extent that the Registry Operator reaches agreement with the government and country-code manager, or the ISO 3166 maintenance agency, whichever appropriate. The Registry Operator may also propose release of these reservations based on its implementation of measures to avoid confusion with the corresponding country codes.[\[292\]](#)

*Exclusions for ISO 3166 Country Code Elements.* A number of factors, highlighted in the comments and reactions received on the Interim Report, have lead us to re-consider our recommendation that the ISO 3166 alpha-2 country code elements should be excluded from registration as domain names in the gTLDs. These factors are as follows:

(i) While, on the Internet, the ISO 3166 codes have been associated in particular with country code top-level domains, in the physical world they find broad application and use throughout a wide variety of industries. This is consistent with the nature and purpose of the standard, which itself states that [it] provides *universally applicable* coded representations of names of countries and that [it] is intended for use *in any application* requiring the expression of current country names in coded form. (*Emphasis added*)[\[293\]](#) We observe that some of the industries which traditionally have used the ISO 3166 codes to structure themselves in the physical world are migrating some aspects of their operations to the online world, and that this trend may intensify in the future. As they move to the Internet, these industries may wish to rely on the same codes to replicate their structures in the networked environment, including the DNS. Excluding the registration of the ISO 3166 codes as domain names may, under certain circumstances, unfairly hamper those industries in their on-line activities, by establishing an overly exclusive linkage between the codes in question and the country domains.

(ii) Certain ISO 3166 country codes correspond to the acronyms of other identifiers, in particular trademarks. Excluding the codes from registration in the DNS would prevent such other identifiers from being registered as domain names without seeming justification.

292. In light of the above considerations, we no longer subscribe to the view that the ISO 3166 country code elements should be excluded from registration in the new gTLDs under all circumstances. Nonetheless, we remain concerned that, depending on the manner in which these codes are registered and used in the DNS, confusion may be created with the ccTLDs. That being the case, we believe that the proper focus should be on the avoidance of confusion with regard to those codes, rather than on an absolute prohibition of their registration and use.

293. If ISO 3166 alpha-2 country code elements are to be registered as domain names in the gTLDs, it is recommended that this be done in a manner that minimizes the potential for confusion with the ccTLDs.

# APPENDIX F -- TAGGED NAME RESERVED NAMES

Prepared by Chuck Gomes and Patrick Jones

## 1. Background

All existing ICANN registry agreements as of the date of this report contain the requirement for gTLD registries to reserve all labels with hyphens in the third and fourth positions (e.g., “xn--ndk061n”). This requirement comes directly from the approved technical standards for Internationalized Domain Names (IDNs). Note that this reservation requirement does not specify any domain name level, so it is assumed that it applies to all levels of names registered by a given gTLD registry.

Only ASCII characters are permitted in the Domain Name System (DNS) thereby limiting characters to the letters a-z, the numbers 0-9 and the hyphen-dash (-), the last of which cannot be the first or last character of a domain name. Consequently, to be able to allow representation of domain names in non-ASCII characters, standards were developed in the Internet Engineering Task Force (IETF) that map international scripts to strings of ASCII characters. Those standards require that all ASCII representations of IDNs begin with a 4-character prefix with hyphens in the third and fourth positions.

The current prefix is “xn--”. To avoid confusion of IDNs with ASCII names having the same prefix, it is necessary to reserve the “xn--” prefix. Prior to the finalization of the IDN standards, other prefixes were used, the most recent of which was “bq--”. At that time, speculators started registering ASCII names with the “bq--” prefix. To avoid this possibility with future prefixes, it was decided to reserve all prefixes of this form.

It is also important to note that the current prefix might need to be changed in the future. If that happens, confusion will be avoided by the fact that all labels with hyphens in the third and fourth positions are reserved.

For further information regarding IDNs, please refer to the ICANN Internationalized Domain Names (IDN) information area: <http://www.icann.org/topics/idn/> .

## 2. Role of tagged name reservation requirement

The role of the tagged name reservation requirement is to be able to provide a way to easily identify an IDN label in the DNS and to avoid confusion of non-IDN ASCII labels. Implicit in this role is the need to reserve tagged names for future use in case the ASCII IDN prefix is changed.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

### 3. WG Recommendations

- a. To avoid user confusion that might result in not being able to tell the difference between a legitimate IDN name and an illegitimate one and to provide maximum flexibility in the unlikely case that the xn-- prefix should ever need to be changed, we make the recommendations shown in the following table.

<b>Description of Current Reserved Name Requirement</b>			
All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")			
<b>Level</b>	<b>Type</b>	<b>More Work?</b>	<b>Recommendations</b>
Top	ASCII	No	<ol style="list-style-type: none"> <li>1. In the absence of standardization activity and appropriate IANA registration, all labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n") must be reserved.<sup>9</sup></li> <li>2. For each IDN gTLD proposed, applicant must provide both the "ASCII compatible (ACE) form of an IDNA valid string" ("A-label") and in local script form (Unicode) of the top level domain ("U-label").<sup>10</sup></li> </ol>
Top	IDN	No	N/A
2 <sup>nd</sup>	ASCII	No	The current reservation requirement be reworded to say, " <i>In the absence of standardization activity and appropriate IANA registration, all labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n") must be reserved.</i> " <sup>11</sup> – added words in <i>italics</i> . (Note that names starting with "xn--" may only be used if the current ICANN IDN Guidelines are followed by a gTLD registry.)
2 <sup>nd</sup>	IDN	No	N/A
3 <sup>rd</sup>	ASCII	No	Same as for the 2 <sup>nd</sup> -level for any gTLDs for which registrations occur at the 3 <sup>rd</sup> -level
3 <sup>rd</sup>	IDN	No	N/A

<sup>9</sup> Considering that the current requirement in all 16 registry agreement reserves "All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")", this requirement reserves 1296 names (36x36).

<sup>10</sup> Internet Draft IDNabis Issues: <http://www.ietf.org/internet-drafts/draft-klensin-idnabis-issues-01.txt> (J. Klensin), Section 3.1.1.1

<sup>11</sup> Considering that the current requirement in all 16 registry agreement reserves "All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")", this requirement reserves 1296 names (36x36).

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

- b. The Tagged Name Subgroup relied exclusively on Ram Mohan, and Tina Dam as experts and did not believe that additional expert consultation was needed for the topic of tagged name reservations, but did recommend scheduling of a full WG consultation with Ram, Tina and Cary Karp to assist in the finalization of reports for other reserved name categories with regard to IDNs. That WG consultation occurred on 1 March 2007.

#### 4. Consultation with Experts

Since this category of reserved names is relatively straight forward and has little if any controversy, it was decided that only minimal consultation with experts is necessary. The authors of this report consulted with Ram Mohan, Chair of the GNSO IDN Working Group and Tina Dam, ICANN IDN Program Director.

The following questions were asked of Tina Dam and Ram Mohan:

- Would it be possible to only reserve a subset of the tagged names of the form character-character-dash-dash instead of all 1296 variations?
  - If so, how big a subset would be needed?
  - Would we need feedback from the technical community in this regard?
  - If so, who do you think we should contact in that regard?

Here is Ram's response:

"The IETF has defined "xn--" for IDNA, as you know. It is safe to say that questions of defining a subset of the available CCHH range should definitely be run by the IAB, with a note sent to the IAB Chair (Leslie).

"To your question regarding how big a subset would be "needed", the fact is that all CCHH names are restricted so that we don't have charlatans who sell unwitting customers some other CCHH name(s) that will absolutely not work with the existing technical protocols for resolving IDN names worldwide. Therefore, my sense is that it is much safer to restrict all CCHH combinations than to allow just a few, because the end-user is just not going to be able to tell the difference between a legitimate IDN name and an illegitimate one."

Here is Tina's response:

". . I agree with Ram. There is no reason currently to believe that the xn prefix will change but I still think it might be a good pre-caution to keep all labels with "--" in third and fourth place reserved.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

One additional comment. The reservation of these kinds of labels must include a process for allowing such reserved labels to be registered (at the time where internationalized top level labels are available for registration) and possible some reference to the Unicode version of that label (following the IDNA protocol) is reserved as well. The latter is to make sure that both the stored and displayed names are reserved together. More specific and clear terminology for the stored/displayed label will come for the protocol revision work. As soon as this is available I will send you another note for potential inclusion in the RN-WG work.”

Numerous exchanges occurred involving Tina and Ram to clarify Tina’s suggestion regarding Unicode versions of labels. Rather than pasting all of the email, we report that the basic suggestion is that, for any IDN gTLDs that are proposed, the applicant should be required to provide the "ASCII compatible (ACE) form of an IDNA valid string" representations along with the corresponding Unicode representation to ensure that there is a one-to-one mapping between the "ASCII compatible (ACE) form of an IDNA valid string" and Unicode representations.

Tina also reported that clearer terminology will come from the protocol revision group and suggests that all IDN related WGs incorporate this terminology. It is expected that the protocol revision, soon to be released, will likely recommend against the use of the term "punycode string" and instead recommend the use of "ASCII compatible (ACE) form of an IDNA valid string". She went on to clarify that “an IDNA valid string is a string that fulfills the requirements of the IDNA protocol” and noted that “the protocol document goes into further details of what this means”. She suggested using the following term: "ASCII compatible (ACE) form of an IDNA protocol valid string”. Finally, she stated that under the revised protocol, “Every ACE label will begin with the IDNA ACE prefix, ‘xn--’.”

## 5. Summary of Relevant Information Sources

### a. ICANN Registry Agreement Requirements

All 16 existing gTLD registry agreements posted on ICANN’s website as of 2 February 2007 (.aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel) contain the following requirement<sup>12</sup>

Except to the extent that ICANN otherwise expressly authorizes in writing, the Registry Operator shall reserve names formed with the following labels from initial (i.e. other than renewal) registration within the TLD:

---

<sup>12</sup> See “Comparison of gTLD Registry Reserved Names” prepared for the RN-WG and ICANN Registry Agreements located at (<http://www.icann.org/registries/agreements.htm>).

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

C. Tagged Domain Names. All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n").

ICANN also has ccTLD Sponsorship Agreements and MOUs in place with 12 ccTLD managers.<sup>13</sup> Each of those agreements contain the following requirement on tagged names:

4. Tagged Domain Names. In addition, domain names in the Delegated ccTLD (excluding subdomain names under domains registered to third parties) having labels with hyphens in the third and fourth character positions (e.g., "rq--1k2n4h4b") are reserved from initial (i.e. other than renewal) registration, except as authorized by ICANN policy or by written exception from ICANN.<sup>14</sup>

b. RFC 3490, Internationalizing Domain Names in Applications (IDNA)<sup>15</sup>

The Introduction of RFC 3490 says:

“IDNA works by allowing applications to use certain ASCII name labels (beginning with a special prefix) to represent non-ASCII name labels.

“To allow internationalized labels to be handled by existing applications, IDNA uses an "ACE label" (ACE stands for ASCII Compatible Encoding). An ACE label is an internationalized label that can be rendered in ASCII and is equivalent to an internationalized label that cannot be rendered in ASCII . . . Every ACE label begins with the ACE prefix specified in section 5.”

Section 5 (ACE Prefix) reads:

“The ACE prefix, used in the conversion operations (section 4), is two alphanumeric ASCII characters followed by two hyphen-minuses. It cannot be any of the prefixes already used in earlier documents, which includes the following: "bl--", "bq--", "dq--", "lq--", "mq--", "ra--", "wq--" and "zq--". . . .

“The ACE prefix for IDNA is "xn--" or any capitalization thereof. This means that an ACE label might be "xn--de-jg4avhby1noc0d", where "de-jg4avhby1noc0d" is the part of the ACE label that is generated by the encoding steps in [PUNYCODE].

---

<sup>13</sup> ICANN ccTLD Agreements located at (<http://www.icann.org/cctlds/agreements.html>).

<sup>14</sup> .AU ccTLD Sponsorship Agreement, Attachment F, <http://www.icann.org/cctlds/au/sponsorship-agmt-attf-25oct01.htm>. The identical provision appears in the other 11 ccTLD agreements.

<sup>15</sup> <http://www.ietf.org/rfc/rfc3490.txt?number=3490> (P. Faltstrom and P. Hoffman)

“While all ACE labels begin with the ACE prefix, not all labels beginning with the ACE prefix are necessarily ACE labels. **Non-ACE labels that begin with the ACE prefix will confuse users and SHOULD NOT be allowed in DNS zones.**” (Bold font added – this is the primary reason for reserving the ACE prefix.)

- c. RFC 3492, Punycode: A Bootstring encoding of Unicode for Internationalized Domain Names in Applications (IDNA), March 2003<sup>16</sup>

The Introduction of this RFC says the following:

“[IDNA] describes an architecture for supporting internationalized domain names. Labels containing non-ASCII characters can be represented by ACE labels, which begin with a special ACE prefix and contain only ASCII characters. The remainder of the label after the prefix is a Punycode encoding of a Unicode string satisfying certain constraints. For the details of the prefix and constraints, see [IDNA] and [NAMEPREP].”

- d. GNSO Preliminary Issues Report Policy Issues relating to IDN at the top-level, 28 May 2006<sup>17</sup>

An introduction of PUNYCODE is provided in this document:

“Punycode is a bootstring encoding that will convert the local characters in a domain name into the limited character set that is supported by the DNS. The encoding is applied to each component of a domain name and a prefix 'xn--' is added to the translated Punycode string. For example, the first component of the domain name rødgrødmedfløde.dk becomes 'xn--rdgrdmedflde-vjbdg', and the domain will be represented as xn--rdgrdmedflde-vjbdg.dk. This kind of encoding would apply for top-level labels with characters from non-Latin scripts.”

- e. Informational RFC 4690, Review and Recommendations for Internationalized Domain Names (IDNs), September 2006<sup>18</sup>

The following excerpt relates to the possibility of the need to change the Punycode prefix:

Author: Chuck Gomes

GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

“It is worth noting that sufficiently extreme changes to IDNA would require a new Punycode prefix, probably with long-term support for both the old prefix and the new one in both registration arrangements and applications. An alternative, which is almost certainly impractical, would be some sort of “flag day”, i.e., a date on which the old rules are simultaneously abandoned by everyone and the new ones adopted. However, preliminary analysis indicates that few, if any, of the changes recommended for consideration elsewhere in this document would require this type of version change. For example, suppose additional restrictions, such as those implied above, are imposed on what can be registered. Those restrictions might require policy decisions about how labels are to be disposed of if they conformed to the earlier rules but not to the new ones. But they would not inherently require changes in the protocol or prefix.”

- f. Internet Draft, Proposed Issues and Changes for IDNA - An Overview, October 16, 2006<sup>19</sup>

Section 5, The Question of Prefix Changes, says the following:

“The conditions that would require a change in the IDNA “prefix” (“xn--” for the version of IDNA specified in [RFC3490]) have been a great concern to the community. A prefix change would clearly be necessary if the algorithms were modified in a manner that would create serious ambiguities during subsequent transition in registrations. This section summarizes our conclusions about the conditions under which changes in prefix would be necessary.

#### “5.1. Conditions requiring a prefix change

“An IDN prefix change is needed if a given string would resolve or otherwise be interpreted differently depending on the version of the protocol or tables being used. Consequently, work to update IDNs would require a prefix change if, and only if, one of the following four conditions were met:

1. The conversion of a Punycode string to Unicode yields one string under IDNA2003 (RFC3490) and a different string under IDNA200x.
2. An input string that is valid under IDNA2003 and also valid under IDNA200x yields two different Punycode strings with the different versions. This condition is believed to be essentially equivalent to the one above.

---

<sup>19</sup> <http://www.ietf.org/internet-drafts/draft-klensin-idnabis-issues-00.txt> (J. Klensin)

Note, however, that if the input string is valid under one version and not valid under the other, this condition does not apply. See the first item in Section 5.2, below.

3. A fundamental change is made to the semantics of the string that is inserted in the DNS, e.g., if a decision were made to try to include language or specific script information in that string, rather than having it be just a string of characters.
  5. Sufficient characters are added to Unicode that the Punycode mechanism for offsets to blocks does not have enough capacity to reference the higher-numbered planes and blocks. This condition is unlikely even in the long term and certain to not arise in the next few years.”
- g. Internet Draft, Proposed Issues and Changes for IDNA - An Overview (IDNAbis Issues), February 23, 2007<sup>20</sup>

(Note: This is version 01, an update to the previously listed Internet Draft of the same name, version 00.)

Section 8.1, Design Criteria, says the following regarding tagged names:

- “3. Anyone entering a label into a DNS zone must properly validate that label -- i.e., be sure that the criteria for an A-label are met -- in order for Unicode version-independence to be possible. In particular:
- Any label that contains hyphens as its third and fourth characters MUST be IDNA-valid. This implies in particular that, (i) if the third and fourth characters are hyphens, the first and second ones MUST be "xn" until and unless this specification is updated to permit other prefixes and (ii) labels starting in "xn--" MUST be valid A-labels, as discussed in Section 3 above.”

Section 8.3, The Question of Prefix Changes, says:

“The conditions that would require a change in the IDNA "prefix" ("xn--" for the version of IDNA specified in [RFC3490]) have been a great concern to the community. A prefix change would clearly be necessary if the algorithms were modified in a manner that would create serious ambiguities during subsequent

transition in registrations. This section summarizes our conclusions about the conditions under which changes in prefix would be necessary.

#### “8.3.1. Conditions requiring a prefix change

“An IDN prefix change is needed if a given string would resolve or otherwise be interpreted differently depending on the version of the protocol or tables being used. Consequently, work to update IDNs would require a prefix change if, and only if, one of the following four conditions were met:

1. The conversion of a Punycode string to Unicode yields one string under IDNA2003 (RFC3490) and a different string under IDNA200x.
2. An input string that is valid under IDNA2003 and also valid under IDNA200x yields two different Punycode strings with the different versions of IDNA. This condition is believed to be essentially equivalent to the one above.

Note, however, that if the input string is valid under one version and not valid under the other, this condition does not apply. See the first item in Section 8.3.2, below.

3. A fundamental change is made to the semantics of the string that is inserted in the DNS, e.g., if a decision were made to try to include language or specific script information in that string, rather than having it be just a string of characters.
4. A sufficiently large number of characters is added to Unicode so that the Punycode mechanism for block offsets no longer has enough capacity to reference the higher-numbered planes and blocks. This condition is unlikely even in the long term and certain not to arise in the next few years.”

“Section 8.3.2, Conditions not requiring a prefix change, says:

“In particular, as a result of the principles described above, none of the following changes require a new prefix:

1. Prohibition of some characters as input to IDNA. This may make names that are now registered inaccessible, but does not require a prefix change.

2. Adjustments in Stringprep tables or IDNA actions, including normalization definitions, that do not affect characters that have already been invalid under IDNA2003.
3. Changes in the style of definitions of Stringprep or Nameprep that do not alter the actions performed by them.”

# APPENDIX G -- NIC, WHOIS & WWW RESERVED NAMES FOR REGISTRY OPERATIONS

Prepared by Timothy Denton

## 1. Background

The following three names are reserved for use in connection with the operation of the registry for the Registry TLD.

nic  
whois  
www

All 16 of the current gTLD registry agreements prohibit these from being used by any other gTLD registry at the second-level .aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel

Fourteen (14) out of 16 agreements specify that the Registry Operator may use them, but upon conclusion of the Registry Operator's designation as operator of the registry for the Registry TLD, they shall be transferred as specified by ICANN. These include the following 14 agreements: .aero, asia, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .pro, .tel and .travel. The successor rights clause does not appear in the cases of: .biz, .org.

<b>Names</b>	<b>Registries affected</b>	<b>Successor Rights clause not found in</b>	<b>Who may use the names</b>
Nic Whois www	.aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel	.biz, .org	Only the registries in question, no one else

GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

In the course of the work, the question arose whether to reserve *html*, *http* and *https* on reserve. That issue is dealt with in the report on ICANN and IANA reserved names. Because the names which this report addresses (NIC, Whois, www) are for registry operational uses and because there does not seem to be any identified registry operational need for html, http and https, it is not recommended that html, http and https be added to this category.

## 2. Role of the Reservation of these three names

The rationale for the reservation of these names for use by registry operators is based upon long standing and well established use of these strings by registry operators (both gTLD and ccTLDs) in connection with normal registry operations.

## 3. Recommendations

### Recommendations regarding Reservation of NIC, Whois and www for Registry Operations

Description of Current Reserved Name Requirement NIC, Whois, www			
Level	Type	More Work?	Recommendations
Top	ASCII	No	The following names must be reserved: nic, whois, www.
Top	IDN	No	Do not try to translate nic, whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist.
2 <sup>nd</sup>	ASCII	No	The following names must be reserved for use in connection with the operation of the registry for the Registry TLD: nic, whois, www. Registry Operator may use them, but upon conclusion of Registry Operator's designation as operator of the registry for the Registry TLD, they shall be transferred as specified by ICANN.
2 <sup>nd</sup>	IDN	No	Do not try to translate nic, whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist, except on a case by case basis as proposed by given registries.
3 <sup>rd</sup>	ASCII	No	For gTLDs with registrations as the third level, the following names must be reserved for use in connection with the operation of the registry for the Registry TLD: nic, whois, www. Registry Operator may use them, but upon

			conclusion of Registry Operator's designation as operator of the registry for the Registry TLD, they shall be transferred as specified by ICANN.
3 <sup>rd</sup>	IDN	No	For gTLDs with registrations as the third level, do not try to translate nic, whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist, except on a case by case basis as proposed by given registries.

#### 4. Consultation with Experts

Two kinds of question arose in connection with these names: first, why the difference in the reservation of names for dot biz and dot org, and second, the general question of principle as to whether these names should be reserved.

##### a) successor rights clause

The successor rights clause does not appear in the registry agreements of dot biz and dot org. Upon inquiry of Jeff Neuman, Senior Director, Law and Advanced Systems, of Neustar, operator of .biz, he replied that:

“To tell you the truth, we did not focus on this exhibit at all during the renegotiation and did not realize that this was any different than the other operators. Any deviation from the original 2001 agreement we signed was inadvertent and missed by both us and ICANN during the renegotiations.”

David Maher, Senior Vice President, Law and Policy, of the Public Interest Registry, wrote as follows:

“The answer appears to be that these 2d level names are in use. They were registered before there was a policy limiting their use. If the registrations were ever terminated, then they would become reserved.”

##### b) reservations of these names in principle

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

The official contact people within top-level and country code registries were consulted via email and in one case by telephone this past week. We heard from dot aero, dot org, dot name and dot travel.

David Maher of dot org responded: "Yes, the names should be kept reserved."

Marie Zitkova of dot aero responded as follows:

1) As a registry, do you wish to keep those names reserved?

Yes, these name are traditionally used by TLDs to designate specific functions key to the operation of registry and it makes sense for ICANN to maintain a certain standard across the board.

2) If they were not reserved, what actions would you take to protect your interests in those names?

I am not sure I understand the question. First, these names were reserved from day 1 so no such question ever came up and it cannot come up anymore because the names are in use.

Second, I certainly do not understand what is implied by "our interest" in those names. We are not talking about tradenames or trademarks. Surely, the reservation above was mandated not because of an interest of any individual sponsor or registry operator but because it makes sense for the entire system of TLDs to have some minimum level of predictability to locate elementary functions associated with the operation of the TLD.

Third, and that is answering the very hypothetical question what would happen before the launch of our TLD if these three names were not reserved by ICANN. We are a Sponsor of a sponsored TLDs, availability of names and eligibility criteria for the registration would be determined by the policies set by the Sponsor in consultation with the sponsored community and in the best interests of the aviation community, same process as we follow in all other cases, and the Registry Operator would implement those policies upon the request from the Sponsor.

Hakon Haugnes of dot name responded:

1) yes, they are in use and are expected to exist by the community.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

2) They are in use by the Registry so I guess that would be protection enough. It would be silly to have to defend them under UDRP, for example. We believe, though, that they belong to the Registry and not to the Company, of course.

I must admit I am not fully aware of the work of the WG, but what would be the purpose of not making them reserved?

Cherian Mathai of dot travel could only be reached by telephone, owing to a computer failure in his office. When asked whether he wanted those three names reserved, he responded "yes".

Eric Brown of Neulevel responded as follows:

"1. We believe that NIC and WHOIS should remain reserved. They are used to denote functionality to the .BIZ registry. For example, if one types in WHOIS.BIZ, they will be taken to our official WHOIS website for .BIZ domain names. In addition, with respect to NIC.BIZ, this is essential to keep reserved as well. This is because there are a number of people that do not know who a particular registry operator is and therefore have no way to get to the official registry site. NIC.TLD is important because it is a predictable place that one could (and should) always go when they know the TLD, but not the operator.

2. It is not that we believe we have some sort of intellectual property rights in the names so there are no actions we would take to protect it from an IP perspective. However, to not reserve these names (at least NIC and WHOIS), would cause confusion among consumers looking for the official WHOIS database of the TLD or looking for the official website of the registry (when they do not know the name)."

Cary Karp of dot museum responded as follows:

"...In my conceptual frame of reference, reservation places constraints on the circumstances under which a name may be registered. By definition, the reservation is terminated (or suspended, if you'd prefer) when that registration takes place. If such name should subsequently ever be removed from the DNS it could be placed back on the reserved list. In the hope that it properly answers your question, that is what I would intend to happen with the labels nic, whois, and www if they are ever removed from the .museum zone.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

2) If they were not reserved, what actions would you take to protect your interests in those names?

Karp: "If they had not been reserved we would have protected our interests in them by registering them in precisely the manner that we have."

Ray Fassett of dot jobs responded as follows:

1) As a registry, do you wish to keep those names reserved?

"Before I can answer this question, I must qualify with how I define a reserved name: A name that is prohibited to be allocated by the TLD operator to a third party of the contract.

I believe it is appropriate for the names www, nic, and whois to be prohibited from allocation by the TLD operator to a third party of the contract."

2) If they were not reserved, what actions would you take to protect your interests in those names?

"I believe an interest – or expectation - from the user community has evolved for these 3 names more so than an "interest" to us as the TLD operator in need of "protecting". Given the hypothetical nature of this question, the best I can answer would be an action felt to be in the best interests of the HR Community, consistent to the mission of .jobs."

It is likely that these names could be removed from the reserved list by negotiation between each registry and ICANN, if they thought this was to their respective advantages. Second, the fact that these names were not in contention suggests that the reservation of these names is not controversial.

To generalize from a few respondents, it appears that country codes are rather freer to follow less consistent policies. Michael Haberler of dot at wrote:

"what we did in the past is register "interesting" (which might be contentious if held by the wrong party) names like [www.at](http://www.at), internet.at etc on trustworthy registrants, like ourselves, or the ISP association. We do register others for our own purposes or likely fields of activity. But conceptually that's just a registration, not a reservation. We had the issue come up with registrars bitching about it and I just told them that we reserve the right to acquire names for our own purposes, and that's it, period."

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

Sabine Dolderer responded as follows:

1) does dot de have reserved names?

We have only some minor restrictions for domains which could not be registered but that are no real reservations. It is

- no domain name with less than 3 characters is allowed
- no domain name which is equal to an existing TLD is allowed (actually only com/net/org/edu/int) because of problems related to RFC1535
- no domains which are equal to local community carplate numbers are allowed. This is done because when the rule was created it was unclear if one would need a future structuring mechanism.

2) Does it reserve /nic, www/, and or /whois/?

No.

3) Does it give a reason for these reservations, if it has them?

- 2-character and existing TLDs has the reason because of problems with TLD. TLD as described in RFC 1535
- carplate numbers because of the potential structuring-issue – [The reasons are] no longer really valid but there are only viewed with 3-characters; most have 1- or 2-character abbreviations

Canada's Bernard Turcotte wrote back in relation to dot ca that these names are not reserved in the case of CIRA, but that, on reflection, he thought they ought to have been reserved.

A more systematic process of consultation with country code operators might enlighten us about their practices but would not be directly pertinent to whether the three names should be reserved at the generic TLD level.

### **c) Consultations with IDN experts**

As regards the IDN implications of these three names, both Cary Karp and Ram Mohan were consulted in a teleconference of March 1, 2007. The advice received was that these names were "integral designators" to be used "without translation". In other words, there was no need to reserve these strings in other languages. Ram Mohan suggested "Find the

Author: Chuck Gomes

# APPENDIX H -- GEOGRAPHIC & GEOPOLITICAL RESERVED NAMES

Prepared by Mike Palage, Avri Doria, Jon Nevett

## 1. Background

Geographic and geopolitical domain name reservations are a relatively new class of reservations that were first incorporated into the ICANN registry contracts in connection with the 2004 sTLD round. However, the genesis for this type of reservation can be specifically tracked back to ICANN Board resolution 01-92<sup>21</sup> involving issues surrounding the rollout of the .INFO gTLD. This topic has also received significant attention in other International fora, most notably the World Intellectual Property Organization's Second WIPO Internet Domain Name Process (hereinafter WIPO II Process).<sup>22</sup> As the WIPO II Process notes, "[t]his is a difficult area on which views are not only divided, but also ardently held."<sup>23</sup>

It is important to note at the outset that "geopolitical domain name reservations" is a term that has not been widely used within the broader geographical identifier discussion. In fact, the term is only used once in a parenthetical in the entire WIPO II Process final report.<sup>24</sup> Given the lack of any legal construct involving the term geopolitical domain names, it is most prudent to use the terminology contained in the WIPO II Process final report as a framework for discussion. Specifically, geographical identifiers should serve as an umbrella

---

<sup>21</sup> <http://www.icann.org/minutes/minutes-10sep01.htm>. It is also noteworthy that the passage of the resolution by the ICANN Board was far from unanimous (11 in favor, 7 in opposition).

<sup>22</sup> <http://www.wipo.int/amc/en/processes/process2/report/html/report.html>

<sup>23</sup> Paragraph 237, Second WIPO Internet Domain Process

<sup>24</sup> See Paragraph 55,

term that includes not only country names, but names of places within countries<sup>25</sup>, geographical indications<sup>26</sup>, and names of indigenous peoples<sup>27</sup>.

The first action by ICANN to seek protection for this class of names was in connection with ICANN Board Resolution 01-92. This action was taken by the ICANN Board in response to the 9 September 2001 Government Advisory Committee (GAC) communiqué<sup>28</sup> sent by Dr. Paul Twomey acting in his capacity as GAC Chair, which states in relevant part:

The GAC confirmed that this is an issue of considerable political importance and complexity that merits thorough study by qualified and competent experts. The issue also relates to the overall taxonomy of the DNS and its evolution concerning the expansion of the TLD space.

...

The GAC notes that the issue of geographical and geopolitical names is very complex and the subject of ongoing international discussion. Without prejudice to any future discussions, general policy or international rules in this area, and considering the very special nature of **.info**, and problems that have become apparent with the registration of such names in the sunrise period, the GAC agreed that interim *ad hoc* measures should be taken by ICANN and the Registries to prevent avoidable conflicts in **.info**. The GAC agreed that the use of names of countries and distinct economies as recognised in international fora as second level domains in the **.info** TLD should be at the discretion of the respective governments and public authorities.

---

<sup>25</sup> As the Second WIPO Internet Domain Process acknowledges “the list of names of places in the world that may have been registered as domain names is virtually limitless” See Paragraphs 256, Second WIPO Internet Domain Process.

<sup>26</sup> Geographical indications refer to “indications which identify a good as originating in the territory of a Member, or a region or locality in that territory, where a given quality, reputation or other characteristic of the good is essentially attributable to its geographical origin.” See Paragraph 217, Second WIPO Internet Domain Name Process. Examples of Geographical Indicators include Champaign, Napa Valley, Cognac etc.

<sup>27</sup> See Paragraphs 262 thru 263 of the WIPO II Process.

<sup>28</sup> See <http://gac.icann.org/web/communiques/gac10com.htm>

It is important to note that the GAC communiqué was limited to just the .INFO top-level domain (TLD) citing “the very special nature” of that TLD. Also noteworthy is the fact that none of the other six proof of concept TLDs had formerly launched.<sup>29</sup>

Notwithstanding the narrow construct of the GAC communiqué and the corresponding board action, the new registry contract language resulting from the 2004 sTLD round included several provisions dealing with geographic and geopolitical names which are summarized below.

**E.Geographic and Geopolitical Names.** All geographic and geopolitical names contained in the ISO 3166-1 list from time to time shall initially be reserved at both the second level and at all other levels within the TLD at which the Registry Operator provides for registrations. All names shall be reserved both in English and in all related official languages as may be directed by ICANN or the GAC.

NOTE: This is the exact provision contained with the .ASIA registry contract. The other 2004 sTLD registry contracts (.CAT, .JOBS, .MOBI, .TEL and .TRAVEL include the same language with the exception of “as may directed by ICANN or the GAC” which has been excluded in these contracts. There is no such corresponding provision in the .AERO, .BIZ, .COM, .COOP, .INFO, .MUSEUM, .NAME, .NET, .ORG or .PRO registry contracts.

In addition, Registry Operator shall reserve names of territories, distinct geographic locations, and other geographic and geopolitical names as ICANN may direct from time to time. Such names shall be reserved from registration during any sunrise period, and shall be registered in ICANN's name prior to start-up and open registration in the TLD. Registry Operator shall post and maintain an updated listing of all such names on its website, which list shall be subject to change at ICANN's direction. Upon determination by ICANN of appropriate standards and qualifications for registration following input from interested parties in the Internet community, such names may be approved for registration to the appropriate authoritative body.

NOTE: This is the exact provision contained with the .ASIA registry contract. The other 2004 sTLD registry contracts (.CAT, .JOBS, .MOBI, .TEL and

---

<sup>29</sup> Although other proof of concept registry strings had already been added to the root, i.e. .BIZ, no other proof of concept registries were allowing domain name registrants to register resolving names at the time of the GAC communiqué.

.TRAVEL include the same language but “geographic locations” is replaced by “economies”. There is no such corresponding provision in the .AERO, .BIZ, .COM, .COOP, .INFO, .MUSEUM, .NAME, .NET, .ORG or .PRO registry contracts

## 2. **Role for Geographic and Geopolitical Reservations**

Protection afforded to Geographic indicators is an evolving area of international law in which a one-size fits all approach is not currently viable. The proposed recommendations below are designed to ensure that registry operators comply with the national laws for which they are legally incorporated/organized.

## 3. **Recommendation of the Group**

### Top Level (ASCII and Unicode strings):

In order to approve the introduction of new gTLDs using geographic identifiers, ICANN shall require the solicitation of input from GAC members(s) and/or government(s) associated with the potential geographic string (ASCII and/or Unicode).

Additionally, Registries incorporated under the laws of those countries that have expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly (“Member States”), or have other related applicable national laws must take appropriate action to comply with those guidelines and those national laws. Registries incorporated under the laws of those countries that have not expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly (“Non-Member States”) must take appropriate action to comply with any related applicable national laws.

### Second Level (ASCII and Unicode strings):

Registries incorporated under the laws of those countries that have expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly (“Member States”) must take appropriate action to

Author: Chuck Gomes

GNSO Council Report 16 March 2007

This is a working document and has no official status.

promptly implement protections that are in line with these WIPO guidelines and are in accordance with the relevant national laws of the applicable Member State.

Third Level (ASCII and Unicode strings):

Registries that register names at the third level and are incorporated under the laws of those countries that have expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly (“Member States”) must take appropriate action to promptly implement protections that are in line with these WIPO guidelines and are in accordance with the relevant national laws of the applicable Member State.

If any of the above recommendations are not supported by the community, it is recommended that further consultation with WIPO, the ccNSO and the GAC be conducted as described in the following section, Consultation with Experts.

#### 4. **Consultation with Experts**

Because this topic has been discussed extensively in various international fora, the use of experts could prove beneficial. However, the scope of the expert involvement would likely be limited toward confirming the existing divided and ardently held views.<sup>30</sup> The reason that these experts are unlikely to assist in the advancement of any consensus position is rather articulately stated in Paragraph 287 of the WIPO II Process Final Report in which it states:

Both points lead us to conclude that we have reached the limits of what can be achieved legitimately through consultation processes, such as WIPO Internet Domain Name Processes or any similar ICANN processes. In other words, we agree with those commentators who are of the view that this particular question is one more appropriately dealt with by governments.

---

<sup>30</sup> Paragraph 237 WIPO II Process Final Report.

To date there are one-hundred and seventy-five WIPO Member States that have supported the protection of country names within the domain name system (DNS). Therefore, a representative from WIPO would be one potential expert to articulate the views held by these countries. However, the Delegations of Australia, Canada and the United States of America have opposed this protection.<sup>31</sup> Therefore a representative from one of these Delegations would potentially constitute a second expert. A possible third expert would be a representative from the International Trademark Association (INTA) that has a standing committee on geographic identifiers.

In addition to this consultation, the answers to the following questions would also be very beneficial to the working group.

#### **Question #1 to WIPO:**

In Francis Gurry's correspondence to ICANN dated 21 February 2003<sup>32</sup>, in Annex 2 Paragraph 7 (iv) states in relevant part that "the protection should be extended to all future registrations of domain names in generic top-level domains (gTLDs)" citing the Summary by the Chair of the SCT dated 15 November 2002.<sup>33</sup> This appears to be a narrowing of the scope of protection originally sought during the second Special Session of the SCT in May 2002, where the chair concluded that "the protection should be extended to all top-level domains, both gTLD and ccTLDs." However, in document WO/GA/30/2<sup>34</sup> prepared for the WIPO Generally Assembly and dated 7 August 2003, Paragraph 14 cites the original May 2002 report affording protection of country names in both gTLDs and ccTLDs.

---

<sup>31</sup> Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications, Ninth Session, Geneva, November 11 to 15, 2002. SCT/9/8 Date 15 November 2002.

<sup>32</sup> <http://www.icann.org/correspondence/gurry-letter-to-cerf-lynn-21feb03.htm>

<sup>33</sup> [http://www.wipo.int/edocs/mdocs/sct/en/sct\\_9/sct\\_9\\_8.pdf](http://www.wipo.int/edocs/mdocs/sct/en/sct_9/sct_9_8.pdf)

<sup>34</sup> [www.wipo.int/documents/en/document/govbody/wo\\_gb\\_ga/doc/wo\\_ga\\_30\\_2.doc](http://www.wipo.int/documents/en/document/govbody/wo_gb_ga/doc/wo_ga_30_2.doc)

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

Are WIPO Member States seeking protection for country names in just gTLDs as noted in Summary of the Chair dated 15 November 2002, or protection for country names in both gTLDs and ccTLDs as noted in the May 2002 and August 2003 documentation?

### **Question #2 to WIPO**

If WIPO Member States are only seeking protection for country names in gTLDs, can WIPO point to any interventions or documentation following the May 2002 report that lead to the narrowing of this protection to just gTLDs?

### **Question #3 to GAC:**

Paragraph 2.12 of the Draft GAC Principles and Guidelines on Public Policy Issues Regarding the Implementation of New gTLDs states in relevant part that “[e]ach government should have the right, without cost, to reserve or block its geographical name(s) in its' official language(s) in any new gTLD.”

The scope of this protection on its face appears to represent an expanse of the protection documented through the WIPO Member States in the Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications which calls for the following protection:

- (i) protection should be extended to the long and short names of countries, as provided by the United Nations Terminology Bulletin;
- (ii) the protection should be operative against the registration or use of a domain name which is identical or misleadingly similar to a country name, where the domain name holder has no right or legitimate interest in the name and the domain name is of a nature that is likely to mislead users into

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

believing that there is an association between the domain name holder and the constitutional authorities of the country in question;

(iii) each country name should be protected in the official language(s) of the country concerned and in the six official languages of the United Nations; and

(iv) the protection should be extended to all future registrations of domain names in generic top-level domains (gTLDs).

Can the GAC provide a basis for the broadened scope of protection they are seeking under Paragraph 2.12 of the draft GAC principles that call for an absolute right of denial/registration of a country's name while apparently abandoning the SCT recommendations that call for legal determination based on a number of factors.

**Question #4 to the GAC and the ccNSO:**

Paragraph 261 of the WIPO II Report cites eight ccTLD administrators that have adopted policies for “excluding the names of places in their countries from registration as domain names, at least under certain conditions.” Is the GAC or ccNSO aware of any ccTLD administrator that has provided protection for geographic indicators from another country, if so which ones?

**Question #5 to the GAC and the ccNSO:**

Is the GAC or ccNSO aware of any ccTLD administrator that has provided the protection sought by the GAC in Paragraph 2.12 of the draft GAC principles, if so which ones?

# APPENDIX I -- THIRD LEVEL RESERVED NAMES

Prepared by Greg Shatan and Dan Dougherty.

## 1. Background

### A. General Background

There are currently two TLDs that expressly reserve names at the third level, .pro and .name. In these two TLDs, domain names at the second level serve essentially as TLDs; the second level names are not registered to individual owners. Instead, they serve as quasi-domains where individual owners can register their individual domain name at the third level.

#### i. .Pro

The .pro TLD was proposed by RegistryPro as an unsponsored TLD restricted to registrations by persons and entities that provide professional services and are credentialed by governmental bodies, professional organizations and other appropriate entities. A key feature of the proposal, and one mentioned in the Board's selection process, is that the registration process for .pro provides a highly trustworthy framework for registrations by professionals.

The .pro TLD has second-level domains for specific professions, such as .med.pro for physicians. Members of the medical, legal, accounting and engineering professions, licensed in the United States, Canada, Germany or the United Kingdom, are eligible to register for third-level .Pro domains within the appropriate profession-specific second level domain (PS-SLD). Registrants can secure profession-specific third-level names such as [name].law.pro, [name].med.pro and [name].cpa.pro.

#### ii. .Name

The .name TLD was established by The Global Name Registry, Ltd. in 2002 as an unsponsored TLD where the second level represented the proper names of individuals (e.g., smith.name), including fictional characters for whom the registrant has rights. The third level would be the given name of a person (e.g., John.Smith.name) or fictional character (e.g., Harry.Potter.name), and could be registered by an individual or rightsholder.

### B. Types of Reservations, Restrictions and Prohibitions

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

i. Prohibited Third-Level Labels

Appendix L to the Registry Agreements for .Pro and .Name specify certain strings (or “labels”) that are not available for registration. Both .Pro and .Name prohibit the following labels at the 3<sup>rd</sup> level: dir, directory, email, http, mail, mx, mx[followed by a number from 0 to 100], ns, ns[followed by a number from 0 to 100], wap, www and www[followed by a number from 0 to 100]. In addition, each TLD prohibits certain additional labels. Specifically, .Pro prohibits av, ca, cca, cert, certificate, grpa, pro, registrypro, verify, and verification, while .Name prohibits genealogy.)

ii. ICANN and IANA Reserved Names.

Appendix K to both Registry Agreements includes a list of names that are reserved “at all other levels within the TLD at which Registry Operator makes registrations.” Thus, these names are reserved at the third level. The names listed are the “ICANN and IANA Reserved Names,” which are dealt with in the report of that name. These Reserved Names are:

ICANN:

- aso
- dnso
- icann
- internic
- pso

IANA-related names:

- |                |                |
|----------------|----------------|
| • afrinic      | • ietf         |
| • apnic        | • irtf         |
| • arin         | • istf         |
| • example      | • lacnic       |
| • gtld-servers | • latnic       |
| • iab          | • rfc-editor   |
| • iana         | • ripe         |
| • iana-servers | • root-servers |
| • iesg         |                |

iii. Patterns of names staying with the registry.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

Appendix X to the Registry Agreements specifies that “directory” and “www” are not available for registration at the third level and will be delegated to the registry, as follows:

a. .Pro

1. directory.<PS-SLD>.pro
2. www.<PS-SLD>.pro

b. .Name

1. Directory.<second-level name>.name
2. www.<second-level name>.name

We note that these two names are also among the “prohibited third-level labels” in Appendix L, discussed above in Section 1.B.i.

iv. Names Registered to Registry Operator

We note that Appendix X also lists certain names registered to the Registry Operator (and identified in the respective Appendices X for .name and .pro). These names are not dealt with here, since these are second level names and they are registered (or at least registerable) by the Registry Operator, and not reserved.

## 2. Role of Third Level Domain Name Reservation Requirement

Based on our discussions with experts, it appears that the role of the names specifically reserved at the third level is primarily to combat security concerns (e.g., a party registering www.med.pro could pose as the registrar for that domain). As a secondary matter, they may be needed overcome technical challenges presented by ‘double’ addresses (e.g., www.www.med.pro) and, to a lesser extent, consumer confusion. No documentation has been identified to date which provided the rationale for the reserved names.

## 3. Recommendations

We do not recommend any change in the treatment of “prohibited third level labels” and “patterns of names staying with the registry.” While recognizing the right of registries to reserve names for a variety of technical, security and/or business reasons, the registry operators should provide some documentation for the basis of these reservations. The ICANN and IANA reserved names at the third level should be harmonized with the recommendations regarding those names at the second level.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

If these or other registries reserving names at the third level are considering offering IDNs, the registry may wish to reserve IDN versions of the registry's reserved names, except where those name are abbreviations or acronyms.

#### **4. Consultation with Experts**

The list of restricted names for both registries is very similar (though the restrictions for .name do not include av, ca, cca, cert and certificate, among others). The decisions regarding these reserved names date back to 2001, and neither we nor the registries have been able to identify any documents that exist and which provide any context or detailing, for example, why: (i) these names were selected, (ii) the class of .name restrictions is more narrow than .pro; (iii) other names that were considered and rejected; etc.

However, in speaking with the registry experts it was learned that a common sense approach was taken to identify names that could cause security concerns and which should naturally be reserved (e.g., fraud concerns where a registrant poses as a registry through domain registrations such as www.law.pro). While security concerns outweighed technical limitations, there are scalability issues that helped identify names to be reserved at the third level. For example, where a very large number of users are added to a specific third level domain (e.g., [first name].smith.name). An example of this could be the email services offered by the .name registry which may cause it to partition off certain parts of its system to handle such larger levels (e.g., mx[1:100].smith.name and ns[1:100].smith.name). In short, the names selected for reservation were chosen through considered deliberation aimed at identifying names that may lend themselves to abuse and/or public confusion as well as functional needs of each registry.

As to IDNs, the opinion among the registries and the working group is that the approach adopted as to second level IDNs (e.g., if local equivalents are reserved) should likewise apply to the third level – particularly given that through certain mechanics of Registry Agreements some second level name reservations are applied to the third level (i.e., the names reserved pursuant to Appendix K of the agreements apply to both the second and third levels).

It is the working group's opinion that no expert consultation is required beyond what has already been obtained from the .pro and .name registry experts given that this category is very unique to the business model, and the reserved names are, on their face, sufficiently reasonable as to warrant acceptance without significant expert involvement.

Appendix L to the Registry Agreements for .Pro and .Name specify “labels” that are not available for registrations.  
(<http://www.icann.org/tlds/agreements/pro/registry-agmt-appl-30sep04.htm>)  
(<http://www.icann.org/tlds/agreements/name/registry-agmt-appl-8aug03.htm>)

- F. Appendix K to Registry Agreements: Reserved Names.

Appendix K to both Registry Agreements includes a list of “Names Reserved at All Levels”; these are the “ICANN and IANA Reserved Names.”  
(<http://www.icann.org/tlds/agreements/pro/registry-agmt-appk-21may04.htm>)  
(<http://www.icann.org/tlds/agreements/name/registry-agmt-appk-8aug03.htm>).

- G. Appendix X to Registry Agreement: Names Registered to Registry Operator.

Appendix X lists certain strings that are registered to the Registry Operator at the third level – specifically “www” and “directory.”

(<http://www.icann.org/tlds/agreements/pro/registry-agmt-appx-21may04.htm>)  
(<http://www.icann.org/tlds/agreements/name/registry-agmt-appx-8aug03.htm>).

## APPENDIX J -- OTHER SECOND-LEVEL RESERVED NAMES

Prepared C Greer, T Reznik, M Rodenbaugh

### A. gTLD Strings

#### 1. Background

Registry Agreements for .asia, .biz, .cat, .com, .info, .jobs, .mobi, .net, .org, .travel and .tel (the latter modified slightly) state that:

*“Registry Operator shall reserve, and not register any TLD strings appearing on the list of reserved TLD strings attached as Appendix 6 hereto or located at <http://data.iana.org/TLD/tlds-alpha-by-domain.txt> for initial (i.e., other than renewal) registration at the second level within the TLD<sup>35</sup>.”*

That particular language is not included in older TLD Agreements: .aero (2001), .coop (2001), .museum (2001), .name (2001) and .pro (2002) – those TLDs reserve the following names either as per Appendix 11 or Appendix K of their contracts in addition to two letter labels:

---

<sup>35</sup> *The listing shown at this URL is provided in the ‘Rainbow Document’ as circulated to the WG on 8<sup>th</sup> February, 2007.*

- biz
- com
- coop
- edu
- gov
- info
- int
- mil
- museum
- name
- net
- org
- pro

## 2. Role of the name reservation requirement

There is no documentary evidence regarding the origin of this reservation requirement but it would appear that this measure was put in place by ICANN in order to avoid consumer confusion in relation to TLD.TLD addresses.

As new TLDs came on board in 2005, the hyperlink to the IANA list was referenced so that there would not be a static list of TLDs, rather a dynamic list. Registries should consult this list on an ongoing basis.

## 3. Recommendations

**Table 4.10 Recommendations regarding gTLD strings**

Description of Current Reserved Name Requirement			
gTLD names at the 2 <sup>nd</sup> level			
Level	Type	More Work?	Recommendations
Top	ASCII	No	N/A
Top	IDN	Yes	More work is recommended. (See guidelines below.)
2 <sup>nd</sup>	ASCII	Yes	More work is recommended. (See guidelines below.)
2 <sup>nd</sup>	IDN	Yes	More work is recommended. (See guidelines below.)
3 <sup>rd</sup>	ASCII	Yes	Recommendations for the 2 <sup>nd</sup> level, if any, could likely be applied at the third level for gTLDs registering names at the 3 <sup>rd</sup> level.
3 <sup>rd</sup>	IDN	Yes	Recommendations for the 2 <sup>nd</sup> level, if any, could likely be applied at the third level for gTLDs registering names at the 3 <sup>rd</sup> level.

### Guidelines for Additional Work

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

Three alternative recommendations were considered by the subgroup:

[ALT1] The provision be retained in order to avoid consumer confusion.

[ALT2] The reservation requirement is overly restrictive and seems to create an unfair advantage for some existing registries over new registries. Thus, the reservation requirement should be removed.

[ALT3] The reservation requirement should be retained unless the two Registries in question come to agreement between themselves to release the names.

Section 4 (Consultation with Experts) summarizes the feedback received from about half of the existing gTLD registries. The opinions expressed are mixed so it might be helpful to solicit responses from the remaining gTLD registries.

It might also be helpful to attempt to collect data regarding ccTLD practices regarding use of gTLD strings at the second level.

Finally, there are at least three considerations regarding IDNs that need to be investigated: 1) should Unicode versions of existing ASCII strings be reserved in any scripts at the top level; 2) should ASCII and/or Unicode strings of future gTLDs be reserved; and 3) if it is decided that ASCII gTLD strings should be reserved at the second level, should corresponding Unicode strings be reserved in any scripts? Much of this work possibly should be done by the GNSO IDN working group or similar groups with IDN expertise.

#### **4. Consultation with experts**

The gTLD Registry Constituency was consulted as well as ICANN staff.

- ICANN staff (informal consultation) – favoured a removal of the reservation clause since it is likely to become unmanageable in the future with new TLDs coming on board.
- SITA (.aero) recommended removing the reservation requirement since the current system is favoring incumbents i.e. aero.com exists but com.aero (the airport code for Coleman airport in the US) is not available for registration
- PIR (.org) voted to retain the reservation requirement for future TLDs.
- Verisign (.com) believed that there should be no restrictions on unsponsored TLDs. As regards sponsored TLDs, a reserved list should be completely up to that sponsored TLDs, but should be in line with the mission of the TLD.
- GNR (.name) would rather that the reservation requirement be retained unless two Registries in question come to an agreement between themselves as regards the name release.
- NeuStar (.biz) supported a recommendation that the reservation requirement be removed from future TLD contracts.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

- dotAsia supported the view that relevant Registries could come to agreement between themselves to release the names, provided that such agreement not be unreasonably withheld.

The group also consulted the recently issued RSTEP Report on Internet Security and Stability Implications of the GNR proposal. A conclusion was reached that there were no technical issues as regards TLD.TLD combinations and the review team was aware of no significant impact on the security or stability of the Internet as a result (page 18).

## **5. Summary of Relevant Information Sources**

The Registry Agreements as posted on the ICANN web-site:

<http://www.icann.org/registries/agreements.htm>

RSTEP Report on GNR Proposal: <http://www.icann.org/registries/rsep/RSTEP-GNR-proposal-review-team-report.pdf>

## **B. Registry Specific Names**

### **1. Background**

Dot biz and dot info reserve a number of Registry-specific names as listed in Appendix 6 of their Agreements.

### **2. Role of the name reservation requirement**

The name reservations include Registry-related names (words and phrases associated with the day-to-day operations of a Registry) and reservations relating to the actual entity's name. The reservations came about during contract negotiations and are in place in order to protect the Registries and their successors and to avoid consumer confusion.

### **3. Recommendations**

Further consideration of this particular reservation requirement is advised. It does not appear that this issue clearly fits within the remit of the PRO WG and so future work is required by an alternative working group.

#### Guidelines for Further Work

The subgroup considered the following alternative recommendations:

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

[ALT1] Registries may propose such reservations during contract negotiations with the standard comment period to apply, allowing for input from all interests.

[ALT2] Registries should be allowed to reserve *and register* such names.

[ALT3] Referral to the Protecting Rights of Others (PRO) Working Group for further consideration in light of potential infringement of rights issues.

Other alternatives are likely possible and should be further investigated along with the above. For example, this type of reservation requirement could be handled strictly via the new gTLD application process with opportunity for public comments in that process.

Finally, if further work is done for this category of names, it would be helpful to obtain input from NeuStar regarding the .biz list of reserved names in this category.

#### **4. Consultation with experts**

The .info Registry (Afilias) was consulted and its statement is provided below.

*.info statement (S Hemphill):*

The list of names in Appendix 6 of the Afilias Registry Agreement is carried over from the original .INFO Agreement which was signed in 2001.

At the time, Afilias negotiated two lists of names that the Registry could register for its own use. One list contained names that ICANN wished to see transferred to any successor Registry Operator (these were names tied to specific use by the Operator of .info [e.g., registrars.info]), and the other list could be retained by Afilias in the event that a successor .INFO Registry Operator was named (these names were more specific to the business entity [e.g., afilias.info]). The fact that there are a number of misspellings included on the latter list was simply a matter of choice by the original Afilias negotiating team.

Afilias does not actually use many of these reserved names and has no immediate plans on releasing them for registration.

#### **5. Summary of Relevant Information Sources**

ip-rights.doc

## **C. Other Names Reserved at the Second Level (ie, those names not appearing in the Reserved Names Appendix of Registry contracts: non-ICANN names).**

### **1. Background**

These names differ from ICANN reserved names in that the names are actually intended to be allocated by the Registries. Therefore, the names fall outside the remit of this particular Working Group.

- .name reserves 'common names', 'community reservations', 'Registry common names' and 'post-fix reservations' as listed in Appendix K of its Agreement.
- .mobi reserves Premium Names as referenced in Appendix S of its Agreement and as listed at: [http://pc.mtld.mobi/documents/Premium\\_Name\\_List\\_16Jan07.pdf](http://pc.mtld.mobi/documents/Premium_Name_List_16Jan07.pdf)
- .coop reserves Non-ICANN names as referenced at and <http://www.coop/information.asp>
- travel and .jobs reserve Non-ICANN names as per Schedule S of their Agreements.

Allocation plans for these Registries are in some cases uncertain and have no timing requirements. At least one registry indicated it has no current plans to allocate these names, although it has recently come to our attention that that registry has begun to explore an allocation process. Thus, it is possible that these names could remain unallocated for extremely long periods of time and become *de facto* reserved names.

### **2. Role of the Name Reservation Requirement**

For the .name, .mobi, .coop, .travel and .job Registries, these non-ICANN reserved names directly benefit the communities that they represent and / or the reserved names are an integral part of the Registry's business model.

### **3. Recommendation**

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

It is recommended that more work be done on this subcategory of names. With regard to that work, the following recommendation was supported by several people in the working group and should be further considered in any follow-on work:

It was the group's observation that each gTLD's list of reserved names and its business model may be unique. There may not be any one-size-fits-all approach for all gTLDs. For new gTLDs, applicant's approach to this category of reserved names (if applicable) must continue to be set during contract process and must include an opportunity for public comment by all interested parties.

The following information must be included in new gTLD applications that involve names in this category:

5. A proposed list of reserved names from the registry, and a proposed procedure for opposing any names on such list, including a proposed administrator of such dispute resolution service (e.g., dotMobi's Premium Name Application Process for Trademark Holders which was administered by WIPO)
6. An overview as to why the various groups of names are being reserved and how this serves the community or forms part of the Registry's business model
7. An outer time limit, five years or less, as to how long the names will be reserved
8. A proposed procedure for releasing the names (e.g., an allocation method).

It is important to note that innovation should not be stifled and Registries should be allowed a degree of flexibility - provision should be allowed for Registry learning over time (e.g., as per the .name example). Therefore, the Registry Service Approval Process must be capable of handling such change requests or appropriate guidelines should be in place as regards notice given on any upcoming public comment period.

#### Minority Statement by Victoria McEvedy

I refer to my minority report in relation to Controversial Names and the comments of that Subgroup. For many of the same reasons I do not support any proposal that allows Registries to unilaterally deny applications at their discretion, without transparent and objective criteria, and without allowing for a proper external legal remedy by which the applicant can challenge the decision. Obviously there are concerns as to Freedom of Expression issues here. I support further work being undertaken on this issue.

#### Minority Statement by Marilyn Cade

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

This will be short. I think Greg/others identified an area that this group can make rapid progress on but which needs more work to determine how names are reserved, and then released by the registry.

I understand it may be a unique category but for now, addressing it will be most efficient by the present group who has some expertise.

#### Minority Statement from Caroline Greer

If Registries submit a list of reserved names for public comment during contract negotiations they should not also be *required* to provide for an opposition procedure administered by a third party. Such an opposition procedure may not be necessary or appropriate depending on the gTLD / names proposed and any opposition could be voiced during the public comment period. dotMobi's Premium Name Application Process for Trademark Holders was a unique process appropriate for that Registry (and developed after contract execution).

#### **4. Consultation with experts**

The following Registry representatives were contacted and asked to illustrate how the reservation of non-ICANN names served their community or formed an integral part of the Registry's business model.

.name – Simon Sheard  
.mobi – Caroline Greer  
.coop – Michael Palage  
.jobs – Ray Fassett  
.travel – Cherian Mathai

The representatives' statements are set out below:

##### .name statement (Simon Sheard):

The rationale for reserving names in the categories identified is to allow as many people as possible to have a domain name that is their name. When GNR originally applied for the contract to operate .name, it only applied to register third level products and thus, by definition, reserved all second level strings. In that way GNR could share common last names amongst many people who shared the same name but who were not necessarily from the same family.

When this did not take off as hoped, GNR applied to ICANN to amend the contract to allow for the sale of second level .names as well. However, in doing so, GNR

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

wanted to complement the third level products and not extinguish them nor the concept that many people could share the same (second level) domain if they shared the same last name. So GNR trawled various sources - ICANN community; national & international statistics etc - and came up with a list of about 2,900 surnames which they believe covers the majority of the common last names on the globe (excluding 1 and 2 character last names which were excluded from all/most agreements). These were then reserved on the second level to preserve the potential reach of .name.

The post-fix reservations relate to second level strings ending "-family" and it's various language equivalents. This was done to avoid potential confusion and ensure the availability of third level registrations.

.mobi statement (C Greer):

dotMobi makes a distinction between ICANN reserved names and its 'Premium Names' list. Premium Names are defined by dotMobi as 'commonly used words and phrases' and dotMobi has reserved approximately 5,000 such names.

DotMobi negotiated this product with ICANN and the objective of the Premium Name list is to (1) create a more level playing field in the allocation of these names (the high value names are not 'grabbed' by speculators at landrush) (2) increase the likelihood that these domain names will more promptly provide the mobile community with new features and services (RFP process) (3) preserve the stability and security of Registry operations (system is not put under pressure at landrush) . The list was created primarily using third party search criteria and was translated into a core set of languages.

dotMobi put in place a specific process, administered by WIPO, for trademark holders to apply to have their names removed from the Premium Name list in line with certain criteria. In agreement with ICANN, all remaining names will be allocated either via auction or a Request for Proposals process, the latter of which centers on content applications from the market. The successful RFP bidder in each case will enter into a contract with dotMobi to operate the second level domain in the interests of the sponsored community. dotMobi may also attach content obligations to auction names.

With auction names, revenue is used to help fund ongoing dotMobi initiatives for the web development and content provider communities.

.coop statement (M Palage):

DotCoop's reservation of community names was not specifically enumerated in its original contract with ICANN, but was undertaken by the DotCoop board in

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

consultation with the cooperative community under the authority delegated in the Sponsor's Charter. Originally, the Sponsor reserved a large number of names that related to many cooperative business sectors.

But it soon became clear that it would be difficult to define the appropriate "community" that should be allowed to register a particular sector name. Upon making this determination, the Sponsor decided to release the majority of names for general registration and only reserved those names that were connected with clearly defined organizations that would be able to help verify the appropriate registrant or to register the domain directly themselves. The currently reserved sector names are part of the .coop Community Name program that directly reflect the sector organizations that are part of the International Co-operative Alliance structure, see:

<http://www.ica.coop/ica/structure.html#sectoral>.

These names were reserved in the three primary languages of the ICA - English, French and Spanish.

In addition to these sector names, DotCoop also voluntarily reserved a list of country and geographic indicators in which there were strong ties to the cooperative community. To date various names have been registered including australia.coop, france.coop, newzealand.coop, unitedkingdom.coop, and usa.coop. In addition, uk.coop and nz.coop were registered in cooperation with the relevant ccTLD and government agencies.

Successful adoption and utilization of key domain names are the building blocks upon which the long term success/branding of any registry is based. Outside those domain names that are explicitly reserved from allocation by ICANN, DotCoop strongly believes it is important that each registry be provided the flexibility to make business decisions in connection with Registry/Sponsor reserved domain names, provided that any such processes are fair and equitable.

### *.jobs (Ray Fassett)*

.Jobs reserves all domain names at the second level to ensure fair and equitable treatment for all employers to acquire their legal or commonly known trade name at the point in time they desire to do so.

All second level domain names in .jobs are allocated on a first come, first serve basis at its discretion serving the best interests of the HR community and ICANN contractual obligations where applicable.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

An employer organization applies to acquire their legal or commonly known trade name. .jobs then validates that this is what the applicant is seeking to acquire before allowing the domain request to become active in the zone.

### .travel (Cherian Mathai)

The non-ICANN reserved names for .travel TLD can be broadly categorized into two:

1. Country and Place Names, and
2. Industry Names.

#### Country and Place Names

Following the recommendations of The Travel Partnership Corporation (TTPC), the sponsor of .travel, as well as contractual requirements with ICANN, the registry has reserved country names and certain place names under the following guidelines.

ISO 3166-1 Country Names are reserved pursuant to Schedule E of Appendix 6 of the .travel registry agreement. A list of place names such as city names and heritage sites was initially defined in 2005 for priority registration by the appropriate government body or government tourism bodies until December 2006, at which time the general priority was removed for all place names. A reduced list of place names continues to be subject to a 30-day "option" that gives the appropriate government entity a 30-day notice that a listed place name has been requested by another eligible entity. The government authority is permitted 30 days to register their name. If they do not take up their option the name is available for registration to any other eligible entity.

The travel community strongly feels that many place names are of particular value to the people of that area and their representative government should be given the first priority in registering that name.

#### Industry Names

The registry, following the recommendation of TTPC (the .travel sponsor), has reserved industry names such as adventure, cruise, hotels, airlines, restaurant, ticket etc., subject to development of policies at a later time. The travel community through TTPC feels that such industry names have value for the community as a whole and should not be registered by one particular travel service provider.

The .Travel registry has not yet released any of its reserved names and has no immediate plans to do so.

# APPENDIX K -- CONTROVERSIAL RESERVED NAMES

Prepared by Avri Doria, Marilyn Cade, Tim Ruiz, and Victoria McEvedy

## 1. BACKGROUND

The concept of a category of 'controversial names/disputed names' developed for the first time in discussion among the members of the PDP-Dec05 in their face to face meeting in Amsterdam. While there is not a specific reserved name category in any gTLD registry agreement that is called "controversial names", several ccTLD's registration policies prohibit 'controversial names at the second level' (or third level) in some manner.

### 1.1 Recommendations in the Current Report

The current draft recommendations state:

Term of Reference Two: 2.v. Strings should not be contrary to public policy principles {The GAC liaison is invited to provide information regarding when GAC public policy principles may be available and discussed with the GNSO council and working group members. }

### 1.2 Basis for Term of Reference 2.v. in the Current Report

The PDP-Dec05 draft final report <sup>5.5</sup> states as follows, in support of the recommendation:

*"20. There was detailed discussion about a general category of potential strings which may have public policy impacts of interest to national governments. In response to correspondence from the GNSO Council Chair, the Governmental Advisory Committee [20] have responded to a request to provide guidance on public policy issues. It is expected that these principles will be finalised at the ICANN meeting in March 2007. After those guidelines are formalised, the ICANN staff proposed implementation plan may be modified to take into account ways to address the public policy concerns of governments in relation to the introduction of new top level domains.*

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

21. *The Committee discussed proposed text to address the concerns of governments that was based on existing international law with respect to strings that may be contrary to public policy or accepted principles of morality or be of such a nature to deceive the public.*

22. *The Committee spent considerable time considering the public policy aspects of new top-level domains [21]. In particular, concerns about “public policy and morality” were raised. This phrasing is consistent with international laws including Article 3 (1) (f) of the 1988 European Union Trade Mark Directive 89/104/EEC and within Article 7 (1) (f) of the 1993 European Union Trade Mark Regulation 40/94. In addition, the phrasing “contrary to morality or public order and in particular of such a nature as to deceive the public” comes from Article 6quinques (B)(3) of the 1883 Paris Convention. The reference to the Paris Convention remains relevant to domain names even though, when it was drafted, domain names were completely unheard of.*

23. *The concept of “morality” is captured in Article 19 United Nations Convention on Human Rights (<http://www.unhcr.ch/udhr/lang/eng.htm>) says “...Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.” Article 29 continues by saying that “...In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society”.*

24. *The EU Trade Mark Office’s Examiner’s guidelines provides assistance on how to interpret morality and deceit. “...Contrary to morality or public order. Words or images which are offensive, such as swear words or racially derogatory images, or which are blasphemous are not acceptable. There is a dividing line between this and words which might be considered in poor taste. The latter do not offend against this provision.” The further element is deception of the public which is treated in the following way. “...Deceive the public. To deceive the public, is for instance as to the nature, quality or geographical origin. For example, a word may give rise to a real expectation of a particular locality which is untrue.” For more information, see Sections 8.7 and 8.8 at <http://oami.europa.eu/en/mark/marque/direc.htm>*

25. *The UK Trade Mark office provides similar guidance in its Examiner’s Guidance Manual. “Marks which offend fall broadly into three types: those with criminal connotations, those with religious connotations and explicit/taboo signs. Marks offending public policy are likely to offend accepted principles of morality, e.g. illegal*

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

*drug terminology, although the question of public policy may not arise against marks offending accepted principles of morality, for example, taboo swear words. If a mark is merely distasteful, an objection is unlikely to be justified, whereas if it would cause outrage or would be likely significantly to undermine religious, family or social values, then an objection will be appropriate. Offence may be caused on matters of race, sex, religious belief or general matters of taste and decency. Care should be taken when words have a religious significance and which may provoke greater offence than mere distaste, or even outrage, if used to parody a religion or its values. Where a sign has a very sacred status to members of a religion, mere use may be enough to cause outrage.” For more information, see <http://www.patent.gov.uk/tm/t-decisionmaking/t-law/t-law-manual.htm>)*

### **1.3 Controversial Names in ccTLDs**

- a) This report will address examples of the concept of controversial names where examples exist, largely in the country code TLDs.
- b) Although there is no specific prohibition in an RFC that governs the issue or topic of controversial names, some ccTLDs’ registration policies prohibit controversial names at the second level (or third level) in some manner although many do not. Examples of some of the more extreme policies are included below, but are by no means exhaustive. The sub group will undertake to quickly review a limited number of ccTLD policies including .us, .im, and .cn, and .se.
- c) There does not appear to be any such rule within any sponsored or unsponsored gTLD but review of relevant rules is not yet complete; the sub group will also email the gTLD Registry Constituency Chair to invite comments from all existing gTLD Registry representatives on current practice within their gTLD registry.
- d) “Controversy” has developed in the consideration of a few of the allocated gTLDs, but has generally been related to whether a string had support from a sponsoring community. One string applicant proposed a name that has been deemed to be very controversial largely with governments, and according to the review of the public forum lists, to some members of the community. .XXX TLD could also be discussed merely as an example of a string that has been found to be controversial and how the process followed by ICANN to address the questions and issues raised by various parties. If addressed by the WG, we

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

would propose to review the history of events around its approval and subsequent agreement negotiations..

e) Controversial Second Level Names – Example Practices/Rules of Various ccTLDs:

1. usTLD <sup>5.1</sup> - Policy Statement by usTLD Administrator

The usTLD Administrator will follow a policy to preserve and enhance the value of the .US Internet address to all users, including, in particular, state and local governments, libraries and K-12 schools. Given the importance of .US as a national public resource, certain guidelines must apply. Therefore, the usTLD Administrator will review, for possible deletion by the Registry, all registered second-level and locality domain names that contain, within the characters of the domain name registration, any of the seven words identified in *Federal Communications Commission v. Pacifica Foundation*, 438 U.S. 726, 98 S. Ct. 3026, 57 L.Ed.2d 1073 (1978), the “Seven Words”.

2. imTLD 5.2 - The following is taken verbatim from IM Rules of Registration and Use of Domain Names.

“5. Content restrictions on Domain Names and maintenance of the restricted word lists.

1 An application for a domain name may be rejected for one of the following reasons:

- It is included on the .im Black List;
- Is on the Reserved Domain List and is unavailable for registration;
- Upon review by the Designated Official if the domain name is deemed to be profane or otherwise undesirable it may be withdrawn and added to the Black List retrospectively.

.2 An application for a domain may be referred for approval if it includes words or terms which are in the list for referral. This includes words which are connected to regulated activities on the Isle of Man.

.3 The lists of undesirable words and words for referral are maintained by us in consultation with the Isle of Man Government and are not in the public domain.

.4 The lists are subject to change without notice.

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

.5 An application sent for referral does not mean that the application will be rejected or is likely to be rejected. It is however likely that additional information will be requested to support the application.

#### 11. Suspension of a .im Domain

11.2 The Designated Official may request suspension or withdrawal of a domain name should it consider for any reason the domain name is being used for an improper purpose to include anything illegal, considered defamatory or detrimental to the good name of the Isle of Man.”

### 3. cnTLD 5.3 - China Internet Domain Name Regulations

#### Chapter III Domain Name Registration

##### Article 25

In order to maintain the interests of the nation and the civil society, the Domain Name Registry may take necessary measures to protect certain words, and put it on record to MII before implementation.

##### Article 27

Any of the following contents shall not be included in any domain name registered and used by any organization or individual:

- 1) Those that are against the basic principles prescribed in the Constitution;
- 2) Those jeopardize national security, leak state secrets, intend to overturn the government, or disrupt of state integrity;
- 3) Those harm national honor and national interests;
- 4) Those instigate hostility or discrimination between different nationalities, or disrupt the national solidarity;
- 5) Those violate the state religion policies or propagate cult and feudal superstition;
- 6) Those spread rumors, disturb public order or disrupt social stability;

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

- 7) Those spread pornography, obscenity, gambling, violence, homicide, terror or instigate crimes;
- 8) Those insult, libel against others and infringe other people's legal rights and interests; or
- 9) Other contents prohibited in laws, rules and administrative regulations.

#### 4. .seTLD<sup>5.4</sup> - Regulations | Blocked/Reserved domains

There are a number of categories of domain names that are barred or reserved by .SE.

Some domain names are completely barred for registration while other are reserved for the rightful applicant. As an example, counties can register the reserved geographical names. Barred and reserved domains have been divided into the two categories.

Barred domain names:

- SE Blocked, Country codes
- SE Blocked, Example and test domains
- SE Blocked, Misleading
- SE Blocked, Second level domains
- SE Blocked, Sub-domains
- SE Blocked, Swedish law

Reserved domain names:

- SE Reserved, Countries
- SE Reserved, Geographical words
- SE Reserved, Numerical domains
- SE Reserved, The court

The following combinations are also barred:

All number combinations in the format xxxxxx-xxxx which constitutes or could in the future constitute social security number

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

The number series 900 000 - 909 000 with the format 90xxxx-x and 90x-xxxx respectively

90 000 for emergency calls

For technical reasons domain names beginning with two characters followed by two dashes are also barred.

Here you can download a text file with all barred and reserved domains. The data file is created once every 24 hours (at night):

[http://www.iis.se/external\\_pages/datafiles/barred\\_domains.txt](http://www.iis.se/external_pages/datafiles/barred_domains.txt)

### ROLE OF CONTROVERSIAL RESERVED NAMES

There is no apparent role for controversial names among the existing categories of names reserved at the second level within gTLDs. The role of controversial second level names within several ccTLDs varies and includes an array of concepts such as the protection of national interests, illegal activities, obscenity, and social disorder.

### 3. Recommendations

Definition of Controversial Names used in this report			
1. Qualifies as a TLD under the then prevailing String Criteria 2. Does not fall under any other Reserved Name category 3. Is disputed for reasons other than: i) It falls under any other Reserved Name category; ii) It infringes on the prior legal rights of others			
Level	Type	More Work?	Recommendations
Top	ASCII	Yes	1. Propose creating a category called Controversial Names for use at the top level only. A label that is applied for would be considered Controversial if during the Public Comment phase of the new gTLD application process the label becomes disputed by a formal notice of a consensus position from an ICANN Advisory Committee or ICANN Supporting Organization, and otherwise meets the definition of Controversial Names as defined above. 2. a. In the event of such dispute, applications for

2 <sup>nd</sup>	IDN	No	Processes, if any, to deal with controversial IDN names at the second level should be left to the discretion of the gTLD Registry Operator with the exception that Registry Operators must comply with applicable local laws and regulations.
3 <sup>rd</sup>	ASCII	No	Same as for the 2nd-level for any gTLDs for which registrations occur at the 3rd-level.
3 <sup>rd</sup>	IDN	No	Same as for the 2nd-level for any gTLDs for which registrations occur at the 3rd-level.

**Comments of Avri Doria (In consultation with Victoria McEvedy, Solicitor, International Dispute Resolution Practice Consultant.):**

This report is concerned to identify comprehensively the issues raised by the principles and to examine them.

**Trade Mark Laws and ccTLDs as models**

It should be noted that both Nation States' trade mark laws, which are territorially limited and ccTLDs are premised on the assumption that a Nation is monocultural with a unitary legal system and a generally accepted standard of morality and taste often with only one or two dominant religions. Issues arise from attempts to extrapolate standards globally in a multicultural context is clearly problematic. These analogies must be considered with this limit in mind.

Trade mark laws also give inadequate weight to Freedom of Expression concerns which are relevant in an internet context given that much of the use is non-

Author: Chuck Gomes  
 GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
 GNSO Council Report 16 March 2007

This is a working document and has no official status.

commercial. Consideration must also be given to the special considerations arising from the government sanction and exclusivity involved in trade marks which may not be applicable to the internet.

## **International Law**

. . . Arts 19 and 29 of the UN Convention on Human Rights . . . together subject Freedom of Expression to only such limitations as are determined by law. The ECHR provides similarly at Art. 10. Considerations arise as to the desirability of improving on such standards and questions as to the availability of other options.

Most nations have some restrictions on speech and inciting racial hatred or discrimination and crime tend to be included. It may be that common standards can be extracted after a review. Criticism of other religions is a tenant of Freedom of Expression in the West but prohibited in the Middle East. A full and proper study of the appropriateness of imposing the Eastern standards on the West should be considered.

## **Content v Strings**

Another issue that arises is the possibility that no action should be taken as to the strings on the basis that content is regulated by all nations so that for example, while .Nazi itself would not infringe French or German laws against glorification of the Nazi – the issue would be content related and depend on the content. See for example the Yahoo litigation.

## **The Veto**

The ability of any one nation to block an application requires serious consideration.

### **Comments of Marilyn Cade:**

While the GAC is developing public policy principles, these are presently not available in final version to the Working Group, or GNSO Council. It is therefore not possible to fully consider the GAC's principles, although earlier draft versions are being discussed. Indications are that there will be some guidance from the GAC regarding criteria. Ideally, in the future, ongoing discussion and dialogue about draft

GNSO Council Report 16 March 2007

This is a working document and has no official status.

principles will be undertaken in a 'multi stakeholder' discussion, before principles are finalized. Changes and improvements in sharing of information by the GNSO with the GAC should be considered as work in progress and undertaken during the GNSO improvements process. All such changes should accommodate the interests and perspectives of the GAC.

The GAC's advisory role to the ICANN processes is based on consensus of the GAC members. The Working Group should provide its best judgment, and provide for consultation and dialogue with the GAC, in conjunction with the GNSO Council, once the GAC principles are available for discussion. Ideally, the GAC will engage in dialogue with the GNSO Council, its Task Forces/Working Groups, and other ICANN expert bodies, before finalizing principles.

In my view, the establishment of the controversial/disputed names category is largely as a placeholder, where a name can be parked, and the disputed or controversial issues be addressed, in an established time frame. It is not my view that all strings that are proposed will be ultimately approved. Some will be denied for technical or political reasons, e.g. the name of a country proposed as a string by someone other than the country itself. While some believe that a TLD should be a matter of freedom of speech, I am not inclined to expect such lofty goals of a simple TLD. It is important to remember that second level registrations remain available to registrants, and the operating a registry is an obligation, not a right. The availability of second, third level registrations, and the ability to register for access to the Internet via ISPs for web pages and email addresses remains a core mechanism for users. Of today's 1 billion users, the vast majority use email addresses, web pages from ISPs, for their access and identity on the Internet.

**Comments of Tim Ruiz:**

The basis for my support of the straw recommendation is the desire that all applications for a new gTLD registry should be evaluated against transparent and predictable criteria, fully available to the applicants prior to the initiation of the process, and that it is impossible for ICANN to pre-determine all terms that may be morally offensive or of national, cultural or religious significance for all of the world's cultures and create predictable criteria for applicants.

It is my view that 2.v. of TOR two in the draft final report should be applied more as a warning to applicants, not as a criteria that ICANN can actually proactively apply when considering applications. The warning is that any string applied for may be contested as something contrary to public policy. If contested, the application will be

moved to a holding status as 'controversial' until the public policy claims can be further investigated.

The only exception might be the seven words banned by the US Federal Communication Commission. While I have not asked that this be added to the straw recommendation, it is my belief that the US Department of Commerce, who has ultimate approval of all additions to the root, would never allow a gTLD string that exactly matches one of the seven banned words into the root.

### Minority Statement by Victoria McEvedy

I wish to supplement the work of the Committee by adding these comments.

It is my view that any general Principle which seeks to prohibit any gTLD promoting hatred, racism, discrimination, crime or any abuse of religions or cultures is fundamentally flawed insofar as it fails to include any reference to Freedom of Expression.

GACs own Operating Principles, as amended at Mar del Plata, April 2005, provide at §6.3 that ICANN's decision making should take into account public policy objectives including, among other things:

- secure, reliable and affordable functioning of the Internet, including uninterrupted service and universal connectivity;
- the robust development of the Internet, in the interest of the public good, for government, private, educational, and commercial purposes, world wide;
- *transparency and non-discriminatory practices in ICANN's role in the allocation of Internet names and address;*
- effective competition at all appropriate levels of activity and conditions for fair competition, which will bring benefits to all categories of users including, greater choice, lower prices, and better services;
- fair information practices, including respect for personal privacy and issues of consumer concern; and
- *freedom of expression.*

GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

Given that one of GACs overall policy objectives is Freedom of Expression, it is critical that it be referred to in any statement the GAC may make on the new gTLDs. It is more significant than the concerns of Rights' claimants.

The internet is not solely concerned with commercial use and speech and it is critical that proper consideration be given to Freedom of Expression. This is a consumer concern and is why trade mark law is so often an inadequate analogy.<sup>36</sup>

It is now well established in international jurisprudence that Freedom of Expression should only be subject to limits prescribed by law. A classic example is the balance in Article 10 of the European Convention on Human Rights. E.g.:

“(1) Everyone has the right to freedom of expression. This right shall include freedom to hold opinions and to receive and impart information and ideas without interference by public authority and regardless of frontiers...(2) The exercise of these freedoms, since it carries with it duties and responsibilities, *may be subject to such formalities, conditions, restrictions or penalties as are prescribed by law and are necessary in a democratic society*, in the interests of national security, territorial integrity or public safety, for the prevention of disorder or crime, for the protection of health or morals, for the protection of the reputation or rights of others, for preventing the disclosure of information received in confidence, or for maintaining the authority and impartiality of the judiciary.”

Freedom of Expression is therefore predominant and subject only to those limits both prescribed by law *and* necessary in a democratic society for one of the enumerated purposes.

I propose that any GAC policy statement or Principles reflect a similar balance. The predominant concern should be Freedom of Expression, subject only to those limits supplied by law and in the interests of preventing the promotion of hatred, racism, discrimination etc. Most nations do have laws preventing this type of speech so this should not be problematic.

In relation to “abuse of specific religions or cultures,” unless that abuse would fall within one of the laws aforementioned, then presumably in the delicate balancing act between Freedom of Expression and limits prescribed, this conduct is deemed by a given society to fall within the right to Freedom of Expression.

---

<sup>36</sup> Not only does trade mark law contain many compromises in its complex defences which are not reflected in the Domain System, but entry on the register, for registered marks, was at the government's discretion and thus contained an element of state sanction –allowing it to impose a Victorian “taste and decency” approach.

Different societies have reached different answers to these difficult questions. Whose should prevail? The danger is that the nation with the most restrictive approach would drag the rest down to its standards.

Certainly in democratic traditions, it has never been acceptable to have secret closed committees, accountable to no-one, decide what can be said or published based on criteria known only to them and not subject to law or of law –this is censorship. This is the problem with the first stage of the “disputed application” approach as recommended. Arguably pre-determined criteria or restricted lists are more transparent.

ICANN should defer to the law but whose law? The choices are broadly Country of Origin or Countries of Destination. Destination is not feasible ---unless, if the proposed name would infringe a law in a nation state which objects to the application—the application could be granted with conditions restricting or preventing its use in the objecting state(s). I understand however that this may not be technically possible. It would however prevent one State imposing its laws on others. The technical issues should be investigated.

An alternative might be agreed rules for jurisdiction and choice of law. Experts should be consulted.

This applies similarly to names at the second level, and other levels, where it should not be left to the discretion of the Registrars.

#### **4. Recommendation for Experts**

Questions will be developed only if the RN-WG decides that consultation with experts is needed.

Experts may include relevant contacts at various ccTLD registries. It is recommended that experts on processes in International law be consulted on how similar issues regarding controversial terms are treated, e.g., the French government’s issues on the use of the word ‘Nazi’.

## APPENDIX L -- COMPARISON OF gTLD REGISTRY RESERVED NAMES, V.3

Prepared by Chuck Gomes for the Reserved Names Working Group, 29 Jan 2007 (additional information added by Patrick Jones, 27 Jan 2007)

The following information is intended to provide a comparison of the reserved name requirements contained in gTLD registry agreements as currently posted on ICANN's website at:

<http://www.icann.org/registries/agreements.htm>

As of 27 January 2007 there are a total of 16 agreements posted.

Notes:

It is hoped that there are minimal errors in this information but there was not time to have it verified by others so users of the information are encouraged to validate it on their own by checking each of the agreements directly.

Please be aware, as noted below, that the latest approved amendments regarding 2-character second-level domain reservations for the .name gTLD have not yet been posted so they are not included in this document.

A. Labels Reserved at All Levels. The following names shall be reserved at the second level and at all other levels within the TLD at which Registry Operator makes registrations:

ICANN-related names:

- Included in ALL 16 agreements except as noted below for 5 gTLDs: .aero, .asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel

aso

gnso 'dnso' for .aero, .coop, .museum, .name, .pro

icann

internic

ccnso 'ps0' for .aero, .coop, .museum, .name, .pro

IANA-related names:

- Included in ALL 16 agreements: .aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel

afrinic	ietf
apnic	irtf
arin	istf
example	lacnic
gtld-servers	latnic
iab	rfc-editor
iana	ripe
iana-servers	root-servers
iesg	

**B. Additional Second-Level Reservations.** In addition, the following names shall be reserved at the second level:

All single-character labels.

- Included in ALL 16 agreements: .aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel

All two-character labels shall be initially reserved.

Included in the following 15 agreements: .aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .net, .org, .pro, .tel and .travel

Author: Chuck Gomes  
GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

\* The posted agreement for .name does not include the latest amendment that modifies the reserved name requirement for two-character labels.

- Amendments have been approved for the .name gTLD that modify this reservation requirement, see the ICANN Board minutes at <http://www.icann.org/minutes/prelim-report-16jan07.htm>. The Board authorized staff to enter into negotiations with GNR to implement the registry service request that can be found at [http://www.icann.org/registries/rsep/GNR\\_Proposal.pdf](http://www.icann.org/registries/rsep/GNR_Proposal.pdf). Here is a quote from the proposed registry service document that summarizes the service: *"In pure technical terms, Global Name Registry proposes to simply add and reserve for third level registrations, all two-character strings according to the current rules in the .NAME registry., The strings will be added to the already existing shared third-level namespace on the .name gTLD available to people worldwide through ICANN Accredited Registrars, and made available for registration on the third level on a first-come, first-served basis. All two-character names will be shared and not released directly on the second level."* Here are two examples from the GNR proposal: *"e.g. Yin@Li.name or yin.wu.name."*

The reservation of a two-character label string shall be released to the extent that the Registry Operator reaches agreement with the government, country-code manager, or the ISO 3166 maintenance agency, whichever appropriate. The Registry Operator may also propose release of these reservations based on its implementation of measures to avoid confusion with the corresponding country codes.

- Included in the following 14 agreements: .aero, asia, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .pro, .tel and .travel  
- Not included in: .biz, .org

**C. Tagged Domain Names.** All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n").

- Included in ALL 16 agreements: .aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel

**D. Second-Level Reservations for Registry Operations.** The following names are reserved for use in connection with the operation of the registry for the Registry TLD.

- Included in ALL 16 agreements: .aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel

Registry Operator may use them, but upon conclusion of Registry Operator's designation as operator of the registry for the Registry TLD they shall be transferred as specified by ICANN:

Included in the following 14 agreements: .aero, asia, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .pro, .tel and .travel

Not included in: .biz, .org

whois

www

- Included in ALL 16 agreements: .aero, asia, .biz, .cat, com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel

**E.Geographic and Geopolitical Names.** All geographic and geopolitical names contained in the ISO 3166-1 list from time to time shall initially be reserved at both the second level and at all other levels within the TLD at which the Registry Operator provides for registrations. All names shall be reserved both in English and in all related official languages as may be directed by ICANN or the GAC.

- Included for: .asia

- Included for .cat, .jobs, .mobi, .tel and .travel with the following excluded: “as may be directed by ICANN or the GAC”

- Not included for: .aero, .biz, .com, .coop, .info, .museum, .name, .net, .org, .pro

In addition, Registry Operator shall reserve names of territories, distinct geographic locations, and other geographic and geopolitical names as ICANN may direct from time to time. Such names shall be reserved from registration during any sunrise period, and shall be registered in ICANN's name prior to start-up and open registration in the TLD. Registry Operator shall post and maintain an updated listing of all such names on its website, which list shall be subject to change at ICANN's direction. Upon determination by ICANN of appropriate standards and qualifications for registration following input from interested parties in the Internet community, such names may be approved for registration to the appropriate authoritative body.

- Included for: .asia

- Included for .cat, .jobs, .mobi, .tel and .travel but “geographic locations” is replaced by “economies”

- Not included for: .aero, .biz, .com, .coop, .info, .museum, .name, .net, .org, .pro

Language is included within the Registry Agreements listed below stating that “3.1 (d)(i)(A) Registry Operator shall reserve, and not register any TLD strings (i) appearing on the list of reserved TLD strings attached as Appendix 6 hereto or (ii) located at <http://data.iana.org/TLD/tlds-alpha-by-domain.txt> for initial (i.e., other than renewal) registration at the second level within the TLD.” [Note: 1) The listing shown at this URL as of 29 January 2007 is provided at the end of this document; 2) the .tel agreement refers to two URLs, the first one as listed here and a second one that lists all country code TLDs, which appear to be included in the list provided at the first URL.]

- Included for: .asia, .biz, .cat, .com, .info, .jobs, .mobi, .net, .org, .tel (modified slightly), and .travel

- Not included in: .aero, .coop, .museum, .name and .pro

### **Names reserved at the 3<sup>rd</sup> level**

Author: Chuck Gomes

GNSOPDPDec05 -- Introduction of new top level domains: Reserved Names Working Group  
GNSO Council Report 16 March 2007

This is a working document and has no official status.

All three-character labels shall be initially reserved by the Registry Operator. The reservation of a three-character label string shall be released to the Registry Operator in conjunction with the introduction of corresponding PS-SLDs and pursuant to the procedures outlined in Appendix K, Section 4.

**Included for .pro only**

Not included for: .aero, .asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .tel and .travel

**Other names reserved at the 2<sup>nd</sup> level**

.aero, .coop, .museum, .name and .pro also reserve the following:

- aero
- arpa
- biz
- com
- coop
- edu
- gov
- info
- int
- mil
- museum
- name
- net
- org
- pro

.biz also reserves the following:

**Part A: Names staying with the Registry in the event of reassignment**

.name also reserves the following:

In addition, the Registry will reserve a set of names (“Common Names”) that are shared by a very substantial number of people.

For a number of reasons, it is difficult to identify a specific number of names that should be reserved, or a specific percentage of the populations with names that should be reserved in any particular region or country. In some countries (such as China) reserving a very small number of names would protect a very large percentage of the population. In countries that have an extensive immigrant population or history of immigration (such as the United States), a much larger number of names is needed to cover the same portion of the population. At the same time, surnames popular in countries with very high Internet penetration are more likely to be already protected by existing third level registrations. In most cases, it will be most important to reserve names popular in developing countries. On the other hand, this will not always be the case: a name that is very popular in a small developing country may also be registered, and thus protected, as a result of a history of emigration from that country to developing nations (e.g., Vietnamese names in the U.S.).

For this reason, the GNR Registry will need to make judgments, based on research and input from the ICANN community and from appropriate national and regional governments, to identify appropriate names for reservation. There are many sources of information about popular surnames. In developed nations, census data is generally available for this purpose. In other countries, this information may be available only through universities or other institutions. There is also a wealth of information available on the Internet, of various degrees of credibility that the GNR Registry will consult as appropriate.

The following approaches will be used in parallel to identify appropriate names to be reserved at the second level for the operation of the registry for registrations of third level domain names and SLD Email Forwarding. While there is no perfect methodology, these approaches should produce, overall, an appropriate level of protection of popular surnames.

### **D.1 Community reservations**

The GNR Registry intends to get input from the ICANN community to learn which names may be important to reserve on the 2nd level. Governments may volunteer information on common names in their respective countries. This would be particularly useful for regions where extensive knowledge about Common Names is not currently readily available.

The Registry will evaluate names gathered from the Internet community, especially from government representatives participating in the Government Advisory Committee, and, after validation, may reserve common names on the 2nd level to help ensure that 3rd level registrations are available for such names.

The period for receiving input will be from August 18, 2003 to September 18, 2003, and during this period the Registry would collect submissions by email for review and reservation. Only strings that are names should be submitted, for the purpose of reserving them for registration on the third level at some time in the future. There will be an expiration date on this reservation, and if no third level is registered on a given 2nd level one year from the reservation date, the reservation will expire.

The Registry will publish its solicitation for input on the Registry website (<http://www.nic.name>), as well as ask ICANN to publish a link to the solicitation during the same timeframe.

## **D.2 Registry Common Name reservations**

The Registry will use names gathered from name statistics in a series of countries around the world to reserve names on the 2nd level. Names from these lists will be reserved on the 2nd level and made available only for 3rd level registrations.

The Registry will use statistics gathered for last names for the following countries/regions:

### **1. African Names**

(The GNR Registry will seek information on name distribution in a variety of African countries, with the intent of touching on the major language groups and cultures. Target countries will include, without limitation, Nigeria, Kenya, Ghana, Tanzania, Cote d'Ivoire, Ethiopia, Uganda, etc.)

### **2. Arabic Names**

(The GNR Registry will seek information on name distribution in a variety of Middle Eastern countries with the intent of touching on the major language groups and cultures.)

### **3. Belgium**

### **4. China**

### **5. Denmark**

### **6. Estonia**

### **7. Finland**

### **8. France**

### **9. Germany**

### **10. India**

### **11. Italy**

### **12. Japan**

### **13. Korea**

### **14. Malaysia**

### **15. Netherlands**

### **16. Norway**

### **17. Russia**

### **18. Singapore**

- 19. Spain
- 20. Sweden
- 21. Taiwan
- 22. United Kingdom
- 23. United States
- 24. Vietnam

### D.3 Post-fix Reservations

The Registry is reserving all 2nd level names ending in a particular set of strings. Such names are reserved on the second level by default, and only 3rd level registrations are allowed on such 2nd levels. The following post-fix strings are reserved:

Post-fix (English version)	Post-fix (Translated version)	Language
Family	-familie	Dutch
Family	-family	English
Family	-perhe	Finnish
Family	-famille	French
Family	-familie	German
Family	-parivaar	Hindi
Family	-keluarga	Indonesian
Family	-famiglia	Italian
Family	-angkan	Philippino
Family	-rodzina	Polish
Family	-familia	Portugués
Family	-familie	Scandinavian
Family	-familia	Spanish
Family	-mischpoche	Yiddish
Family	-umdeni	Zulu

As an example, the reservation of these post-fix strings means that all second level names ending in e.g. “-parivaar”, for example “patel-parivaar” are reserved on the second level for third level registrations only.

style='border-collapse:collapse;border:none;mso-border-alt:solid black .75pt;mso-yfti-tbllook:191;mso-padding-alt:0pt 5.4pt 0pt 5.4pt;mso-border-insideh:.75pt solid black;mso-border-insidev:.75pt solid black'>

A Label

ASCII-compatible

(ACE) form of an IDNA-valid string. See <http://www.ietf.org/internet-drafts/draft-klensin-idnabis-issues-01.txt>><http://www.ietf.org/internet-drafts/draft-klensin-idnabis-issues-01.txt>. An example is xn--1lq90i.

Character

A character may be a letter, digit, hyphen or symbol.

For the purposes of discussing

IDNs, a "character" can best be seen as the basic graphic unit of a writing system, which is a script plus a set of rules determining how it is used for representing a specific language.

However, domain labels do not convey any intrinsic information about the language with which they are intended to be associated, although they do reveal the script on which they are based. This language dependency can unfortunately not be eliminated by restricting the definition to script because in several cases (see examples below) languages that share the same script differ in the way they regard its individual elements. The term character can therefore not be defined independently of the context in which it is used.

In phonetically based writing systems, a character is typically a letter or represents a syllable, and in ideographic systems (or alternatively, pictographic or logographic systems) a character may represent a concept or word.

The following examples are

intended to illustrate that the definition of a character is at least two-fold, one being a linguistic base unit and the other is the associated code point.

U-label 酒 : Jiu; the Chinese word for 'alcoholic beverage'; Unicode code point is U+9152 (also referred to as: CJK UNIFIED IDEOGRAPH-9152); A-label is xn-jj4

U-label 北京 : the Chinese word for 'Beijing', Unicode code points are U+5300 U+4EAC; A-label is xn-1lq90i

U-label 東京 : Japanese word for 'Tokyo', the Unicode code points are U+6771 U+4EAC; A-label is xn-1lqs71d

U-label ايكوم; Farsi acronym for ICOM, Unicode code points are U+0627 U+06CC U+0643 U+0648 U+0645; A-label is xn-mgb0dgl27d.

Controversial  
Names

A name is designated as a controversial name if it qualifies as a TLD under the then prevailing String Criteria, does not fall under any other Reserved Name category and is disputed for reasons other than that it either falls under any other Reserved Name category or that it infringes on the prior legal rights of others.

Controversial  
Names - Dispute Resolution Panel

CN-DRP

Geographical  
Names

Geographical names refer to those names in the ISO 3166-1 list (e.g., Portugal, India, Brazil, China, Canada) & names of territories, distinct geographic locations (or economies), and other geographic names as ICANN may direct from time to time.

Geopolitical  
Names

The reserved name category titled 'Geographic and Geopolitical Names' is contained in a subset of existing ICANN registry agreements. Geopolitical names is a term that has not been widely used within the broader geographical identifier discussion. In fact, the term is only used once in a parenthetical in the entire WIPO II Process final report. See <http://www.wipo.int/amc/en/processes/process2/report/html/report.html> > <http://www.wipo.int/amc/en/processes/process2/report/html/report.html> Paragraph 55.

gTLD strings

gTLD strings refer to gTLDs (i.e., .com, .net, .org, .mobi) that are reserved from registration at the second level and third level where applicable as a contractual condition (e.g., .net, .travel, .org, .jobs, .mobi, .asia). Reservation is based upon the list

contained at href="<http://data.iana.org/TLD/tlds-alpha-by-domain.txt>"><http://data.iana.org/TLD/tlds-alpha-by-domain.txt>

Reserved  
Names

For the purpose of developing recommendations that are readily usable in the GNSO New gTLD PDP report and in response to direction received from the GNSO Council in Lisbon, the Reserved Name Working Group (RN-WG) focused attention in its final recommendations only on reserved name requirements that apply to all new gTLDs for which clear requirements could be defined. Depending on the specific reserved name category as well as the type (ASCII or IDN), the reserved name requirements recommended may apply in any one or more of the following levels as indicated:

1. At the top level regarding gTLD string restrictions
2. At the second-level as contractual conditions
3. At the third-level as contractual conditions for any new gTLDs that offer domain name registrations at the third-level.

Therefore, the final RN-WG reserved name recommendations fall into the following categories:

1. ICANN/IANA names
2. Single & two-character names, including the use of symbols
3. Tagged names
4. NIC, Whois and www
5. gTLD names at the second level (or third level if applicable).

In its work, the RN-WG also focused on the following categories of names:

Geographical and geopolitical  
names

Specific names reserved by particular gTLD registries at the second and third level

Controversial names.

In the case of the second category, the lists of registry specific names were unique to particular gTLD registries rather than to all gTLDs and thus did not fit the focus of the group. In the case of geographical/geopolitical names and controversial names, it was very difficult if not impossible to define clear reservation requirements that could be applied for all new gTLDs; at the same time, the work completed by the group seemed to be very applicable to the processes developed as part of the New gTLD PDP, so recommendations are included in this report for consideration as part of those processes.

#### Single & Two Character Labels

Prior to the release of IDNA, the characters available for inclusion in domain names consisted of a limited number of alphanumeric elements (a,...z; 0,..., 9; "-"), and policies could easily be based on the number of characters any label contained. There is no similar generally applicable way to compare the length of, for example, an ideographic and an alphabetic string, or even a sequence of characters taken from the basic Latin alphabet with a decorated version of the same sequence.

In Czech, <ch> is a single letter (or character -- the concepts do not differ in this regard) whereas in English it is two. In Danish, <æ> is the 27th letter of the alphabet. It is a single character and does not decompose to <a e>. Depending on who you ask and their linguistic background, there are either 12 or 13 characters in the English word <encyclopædia>. If written as <encyclopaedia>, all would agree on 13. Differentiation by considering semantic value does not help. In Turkish, there is a difference between a dotted <i> and a dotless <ı>. In English, there is no such distinction. Whether the dot is to be counted as a character in its own right or not will again depend on who you ask and what language they view the word as being written in.

#### Symbol

While the DNS supports all of the printable characters in the US-ASCII character table not all such characters are made available in domain names. Symbols, such as #, \$, &, !, \*, -, \_, +, =, are not available for registration in domain names because the top-level domain registries decided (before internationalization) to adopt the hostname rule for registration of

domain names. The hostname rule, defined in RFC 952 style='mso-footnote-id:ftn1' href="#\_ftn1" name="\_ftnref1" title="">[1] and updated in RFC 1123 style='mso-footnote-id:ftn2' href="#\_ftn2" name="\_ftnref2" title="">[2], specifies that only letters, digits and hyphens (a-z, 0-9, -) are valid characters in hostnames.

#### Tagged Names

##### All labels

with hyphens in both the third and fourth character positions (e.g., "bq-1k2n4h4b" or "xn-ndk061n")

##### U-Label

An IDNA-valid string of Unicode-coded characters; the representation of the Internationalised Domain Name (IDN) in Unicode. See href="http://www.ietf.org/internet-drafts/draft-klensin-idnabis-issues-01.txt">http://www.ietf.org/internet-drafts/draft-klensin-idnabis-issues-01.txt. An example is 北京, the U-Label for the Chinese word "Beijing".

**style='page-break-before:auto;mso-break-type:section-break'>**

#### name="\_Toc167705584">BACKGROUND

##### 1.

This Report is an additional input from the GNSO's Committee on the Introduction of New Top-Level Domains Reserved Names Working Group (RN-WG). The Report builds upon the 16 March 2007 Reserved Names Working Group Reportstyle='mso-footnote-id:ftn3' href="#\_ftn3" name="\_ftnref3" title="">[3]. There are four sections to this Report that map directly to the Statement of Work released by the RN-WG Chair on 10 April 2007style='mso-footnote-id:ftn4' href="#\_ftn4" name="\_ftnref4" title="">[4] for consideration by the GNSO Council at its 12 April 2007 meetingstyle='mso-footnote-id:ftn5' href="#\_ftn5" name="\_ftnref5" title="">[5]. This Report will be used as further input into the style='mso-bidi-font-style:normal'>new TLDs Final Report which is due to be released in early June 2007.

##### 2.

The first section of the Report sets out the procedural elements of the Working Group's remit and, in table form, provides the Group's full set of recommendations.

##### 3.

The second section discusses the RN-WG work.

##### 4.

The third

section of the report identifies areas that have been determined to be out of scope for the Working Group.

5.

The fourth

section includes recommendations for the GNSO Council to consider as new work for a later date.

6.

The fifth

section contains a full set of annexures and additional references which has informed the Working Group's deliberations.

**style='page-break-before:always'>**

**name="\_Toc167705585">SECTION  
ONE - PROCEDURAL BACKGROUND AND RECOMMENDATIONS TABLE**

1.

The work

discussed in this report is a continuation of the original work of the Reserved Names Working Group as found in the report<sup>[6]</sup> posted 19 March 2007 and from which the extended work program was devised. On 12 April 2007 the GNSO Council extended the RN-WG by 30 days.

Statement  
of Work for the additional 30-days

General Tasks

1.
  - Define reserved names per direction provided during meetings in Lisbon*
2.
  - Reorganize the RN-WG report so that recommendations are grouped in the following categories:*
    - a.
      - Reserved name recommendations ready for input into the New gTLD PDP report*
    - b.
      - Recommendations for possible use in the New gTLD evaluation process, not as reserved names*
        - i.
          - Geographical and geopolitical names*

style='mso-bidi-font-style:normal'>

ii.  
*Controversial  
names*

c.

*Categories of  
names deemed to be out of scope for the RN-WG*

style='mso-bidi-font-style:normal'>

i.  
*Three  
character names at the third level*

style='mso-bidi-font-style:normal'>

ii.  
*Registry  
specific names at the second level*

style='mso-bidi-font-style:normal'>

iii.  
*Other reserved  
names at the second level*

3.

*Review GAC  
Principles for New gTLDs*

4.

*Review IDN-WG  
Report*

5.

*Add the GAC  
Principles for New gTLDs to the RN-WG report and reference them in applicable  
name categories*

6.

*Request that  
the SSAC identify any possible security or stability issues with regard to  
RN-WG recommendations as well as suggestions as to how any such issues  
might be  
mitigated*

7.

*Create an  
annex as feasible (with no explanations) which is simply the full  
proposed list of reserved names listed alphanumerically*

8.

*Use format  
specifications to be provided by Liz Williams*

-

Tasks  
regarding Recommendations

1.

*ICANN/IANA  
reserved names*

a.

*Restate  
recommendations in the RN-WG report so that they can be readily  
transferred  
into the New gTLD PDP report*

style='mso-bidi-font-style:normal'>

i.

*Maintain  
status quo for now regarding ASCII names*

style='mso-bidi-font-style:normal'>

ii.

*Confirm that  
these names are already reserved at the third level for .name  
and .pro and edit  
the document accordingly*

style='mso-bidi-font-style:normal'>

iii.

*Reword  
recommendation for "example" at all levels for ASCII and IDN  
names*

1.

*Provide  
examples*

2.

*Incorporate  
any relevant comments from the IDN-WG report*

style='mso-bidi-font-style:normal'>

iv.

*Provide a  
brief rationale in support of the recommendations, referring to  
the role of the  
category as applicable*

b.

*Finalize  
guidelines for additional work*

2.

*Use of symbols  
in Reserved Names*

- a.  
*Restate  
recommendations in RN-WG report so that they can be readily  
transferred into  
the New gTLD PDP, including fine-tuning of language*

style='mso-bidi-font-style:normal'>

- i.  
*Provide  
examples as possible*

style='mso-bidi-font-style:normal'>

- ii.  
*Maintain  
status quo for now regarding ASCII names*

- b.  
*Provide a brief  
rationale in support of the recommendations, referring to the role of the  
category as applicable*

3.  
*Single &  
two-character reserved names*

- a.  
*Consult  
further with IDN experts regarding single and two-character IDN names  
including  
definition of the term 'character' as it relates to non-roman scripts*

- b.  
*Consult  
further with experts in the technical community regarding single letter  
ASCII  
names, single-number ASCII names and two-character ASCII names  
involving at  
least one number.*

- c.  
*Consult with  
the GAC as possible regarding single and two-character IDN names*

- d.  
*Restate  
recommendations in RN-WG report so that they can be readily  
transferred into  
the New gTLD PDP report*

style='mso-bidi-font-style:normal'>

- i.  
*Provide  
examples as possible for both the top and second levels, ASCII*

*and IDN, single  
and two-character*

style='mso-bidi-font-style:normal'>

ii.  
*Incorporate  
any relevant comments from the IDN-WG report*

e.  
*Provide a  
brief rationale in support of the recommendations, referring to the role of  
the  
category as applicable*

f.  
*Finalize  
guidelines for additional work for ASCII single character names at all  
levels*

g.  
*As necessary,  
finalize guidelines for additional work for IDN single and two-character  
names  
at all levels*

4.  
*Tagged names*

a.  
*Restate  
recommendations in RN-WG report so that they can be readily  
transferred into  
the New gTLD PDP report*

style='mso-bidi-font-style:normal'>

i.  
*To ensure  
clarity, change all occurrences of 'in the third and fourth  
character  
positions' to 'in both the third and fourth character positions'*

style='mso-bidi-font-style:normal'>

ii.  
*Move  
recommendation 2 for IDN gTLDs from ASCII, top level to IDN  
top level*

style='mso-bidi-font-style:normal'>

iii.  
*In  
recommendation 2 for IDN gTLDs, change wording  
to use the terms 'ASCII compatible encoding' and 'Unicode  
display form'*

style='mso-bidi-font-style:normal'>

- iv.  
*Provide examples, including an example of what new applicants for an IDN gTLD would have to provide*

style='mso-bidi-font-style:normal'>

- v.  
*Incorporate any relevant comments from the IDN-WG report*

- b.  
*Provide a brief rationale in support of the recommendations, referring to the role of the category as applicable*

5.  
*NIC, Whois and www*

- a.  
*Restate recommendations in RN-WG report so that they can be readily transferred into the New gTLD PDP report*

style='mso-bidi-font-style:normal'>

- i.  
*Provide examples*

style='mso-bidi-font-style:normal'>

- ii.  
*Incorporate any relevant comments from the IDN-WG report*

- b.  
*Provide a brief rationale in support of the recommendations, referring to the role of the category as applicable*

6.  
*Geographical & geopolitical names*

- a.  
*Review the GAC Principles for New gTLDs with regard to geographical and geopolitical names*

- b.  
*Consult with  
WIPO experts regarding geographical and geopolitical names and IGO  
names*
- c.  
*Consult with  
the GAC as possible*
- d.  
*Reference the  
treaty instead of the Guidelines and identify underlying laws if different  
than  
a treaty*
- e.  
*Consider  
restricting the second and third level recommendations to unsponsored  
gTLDs  
only*
- f.  
*Restate  
recommendations in RN-WG report for possible use in the New gTLD  
evaluation  
process, not as reserved names*

style='mso-bidi-font-style:normal'>

- i.  
*Describe  
process flow*

style='mso-bidi-font-style:normal'>

- ii.  
*Provide  
examples as possible*

style='mso-bidi-font-style:normal'>

- iii.  
*Incorporate  
any relevant comments from the IDN-WG report*

- g.  
*Provide a  
brief rationale in support of the recommendations, referring to the role of  
the  
category as applicable*
- h.  
*Edit other  
text of the individual subgroup report as applicable to conform with the  
fact*

*that geographical and geopolitical names will not be considered reserved names*

*i.*

*Finalize  
guidelines for additional work as necessary*

*7.*

*Third level  
names*

*a.*

*Replace  
recommendations with a statement about the direction by the Council  
that this  
category is not in the scope of the RN-WG*

*b.*

*Edit other  
text of the individual subgroup report as applicable with the statement  
regarding scope*

*8.*

*gTLD names at  
the 2<sup>nd</sup> (or 3<sup>rd</sup> level if applicable)*

*a.*

*Complete  
consultation with gTLD registries and incorporate final results in the RN-  
WG  
report*

*b.*

*Determine  
whether final recommendations can be made*

*c.*

*State  
recommendations in RN-WG report so that they can be readily  
transferred into  
the New gTLD PDP report*

*style='mso-bidi-font-style:normal'>*

*i.*

*Provide  
examples*

*style='mso-bidi-font-style:normal'>*

*ii.*

*Incorporate  
any relevant comments from the IDN-WG report*

*d.*

*Provide a*

*brief rationale in support of the recommendations, referring to the role of the category as applicable*

- e. *If additional work is needed, finalize guidelines for that work*

9. *Other names at the second level*

- a. *Replace recommendations with a statement about the direction by the Council that this category is not in the scope of the RN-WG*
- b. *Edit other text of the individual subgroup report as applicable with the statement regarding scope*

10. style='mso-bidi-font-style:normal'>Controversial names

- a. *Review the GAC Principles for New gTLDs with regard to controversial names*
- b. *Consult with the GAC as possible*
- c. *Consider the possibility of creating a disputed name list (not a reserved name list) that would be updated whenever controversial names are rejected and would be used for guideline purposes only*
- d. *Restate recommendations in RN-WG report for possible use in the New gTLD evaluation process, not as reserved names*

style='mso-bidi-font-style:normal'>

- i. *Describe process flow*

style='mso-bidi-font-style:normal'>

- ii.

*Provide  
examples as possible*

style='mso-bidi-font-style:normal'>

iii.  
*Incorporate  
any relevant comments from the IDN-WG report*

e.  
*Provide a  
brief rationale in support of the recommendations, referring to the role of  
the  
category as applicable*

f.  
*Edit other  
text of the individual subgroup report as applicable to conform with the  
fact  
that controversial names will not be considered reserved names*

g.  
*Finalize  
guidelines for additional work as necessary*

2.

In response to the above statement of work, the Working Group met weekly by teleconference from 11 April through 10 May. The calls were recorded and the MP3 versions of the calls are available on the GNSO website at <http://gns0.icann.org/calendar/#May>. The Working Group was chaired by Chuck Gomes and the full participation records can be found in Annex Nine.

3.

The Working Group set out, in its initial report, the categories (p8 of previous report) and the roles of reserved names (p10 of previous report). Those tables are repeated here for clarity.

**clear=all style='page-break-before:always;mso-break-type:section-break'>**

## **Summary of Existing Reserved Name Requirements**

style='width:662.4pt;border-collapse:collapse;border:none;mso-border-alt:solid windowtext .5pt;mso-yfti-tbllook:480;mso-padding-alt:0pt 5.4pt 0pt 5.4pt;mso-border-insideh:.5pt solid windowtext;mso-border-insidev:.5pt solid windowtext'>

### **Category of Names**

#### **TLD Level(s)**

#### **Reserved Names**

**Applicable gTLDs**

ICANN & IANA related

2<sup>nd</sup> (and 3<sup>rd</sup>  
if applicable)

ICANN: aso, gnso, icann, internic, ccNSO

IANA: afrinic, apnic, arin,  
example, gTLD-servers, iab, iana, iana-servers, iesg, ietf, irtf, istf,  
lacnic, latnic, rfc-editor, ripe, root-servers

All 16 gTLDs

Single Character

2<sup>nd</sup> level

All 36 alphanumeric ASCII  
characters (e.g., a.biz, b.aero)

All 16 gTLDs (some of these were  
registered prior to the requirement)

Two Character

2<sup>nd</sup> level

1296 combinations of ASCII letters  
and digits (e.g., xy.org, b2.info)

All 16 gTLDs (with some exceptions  
for certain gTLDs)

Tagged

2<sup>nd</sup> (and 3<sup>rd</sup>  
if applicable)

All labels with hyphens in the  
third and fourth character positions (e.g.,

"bq--1k2n4h4b" or

"xn--ndk061n")

All 16 gTLDs

NIC, Whois, www

2<sup>nd</sup> level

NIC, Whois, www (reserved for  
registry operations only)

All 16 gTLDs

**Geographic & Geopolitical**

2<sup>nd</sup> (and 3<sup>rd</sup>  
if applicable)

All geographic & geopolitical names in the ISO 3166-1 list (e.g., Portugal, India, Brazil, China, Canada) & names of territories, distinct geographic locations (or economies), and other geographic and geopolitical names as ICANN may direct from time to time

.asia, .cat, .jobs, .mobi, .tel  
& .travel

**Third Level**

3<sup>rd</sup> level

See Section 1.B of the subgroup report in Appendix H.

.pro and .name

**Other 2<sup>nd</sup> Level**

2<sup>nd</sup> level

See the section titled 'Other names reserved at the 2<sup>nd</sup> level' in Appendix I

Varying lists for .aero, .biz, .coop, .info, .museum, .name and .pro

**Controversial**

No current requirement

N/A

None

## **Roles of Reserved Names**

style='width:662.4pt;border-collapse:collapse;border:none;mso-border-alt:solid windowtext .5pt;mso-yfti-tbllook:480;mso-padding-alt:0pt 5.4pt 0pt 5.4pt;mso-border-insideh:.5pt solid windowtext;mso-border-insidev:.5pt solid windowtext'>

**Category of Names****Reserved Names****Role**

ICANN & IANA related

**ICANN:** aso, gnso, icann, internic, ccNSO

**IANA:**

afrinic, apnic, arin, example, gtld-servers, iab, iana, iana-servers, iesg, ietf, irtf, istf, lacnic, latnic, rfc-editor, ripe, root-servers

The role of the reserved names held by IANA and ICANN has been to maintain for those organizations the exclusive rights to the names of ICANN (icann), its bodies (aso, ccnso, pso, etc.) or essential related functions (internic) of the two organizations.

**Single Character**

All 36 alphanumeric ASCII characters (e.g., a.biz, b.aero)

It appears that the original purpose for reserving the single characters was driven by technical concerns.

**Two Character**

1296 combinations of ASCII letters and digits (e.g., xy.org, b2.info)

Two letter reservations appear to have been based on concerns about confusion with two letter country codes.

**Tagged**

All labels with hyphens in the third and fourth character positions (e.g.,

"bq--1k2n4h4b" or

"xn--ndk061n")

The role of the tagged name reservation requirement is to be able to provide a way to easily identify an IDN label in the DNS and to avoid confusion of non-IDN ASCII labels. Implicit in this role is the need to reserve tagged names for future use in case the ASCII IDN prefix is changed.

**NIC, Whois, www**

NIC, Whois, www (reserved for registry operations only)

The rationale for the reservation of these names for use by registry operators is based upon long standing and well established use of these strings by registry operators (both gTLD and ccTLDs) in connection with normal registry operations.

**Geographic & Geopolitical**

All geographic & geopolitical names in the ISO 3166-1 list (e.g., Portugal, India, Brazil, China, Canada) & names of territories,

distinct geographic locations (or economies), and other geographic and geopolitical names as ICANN may direct from time to time

Protection afforded to Geographic

indicators is an evolving area of international law in which a one-size fits all approach is not currently viable. The proposed recommendations in this report are designed to ensure that registry operators comply with the national laws for which they are legally incorporated/organized.

Third Level

See Section 1.B of the subgroup report in Appendix H.

The role of the names specifically reserved at the third level is primarily to combat security concerns (e.g., a party registering [www.med.pro](http://www.med.pro) could pose as the registrar for that domain). As a secondary matter, they may be needed to overcome technical challenges presented by 'double' addresses (e.g., [www.www.med.pro](http://www.www.med.pro)) and, to a lesser extent, consumer confusion.

Other 2<sup>nd</sup> Level

See the section titled 'Other names reserved at the 2<sup>nd</sup> level' in Appendix I.

1) reservation of gTLD strings at the second level was put in place by ICANN in order to avoid consumer confusion in relation to TLD.TLD addresses; 2) the reservation of registry-related names came about during contract negotiations and are in place in order to protect the Registries and their successors and to avoid consumer confusion; 3) for the .name, .mobi, .coop, .travel and .job Registries, certain non-ICANN reserved names directly benefit the communities that they represent and / or the reserved names are an integral part of the Registry's business model.

Controversial

N/A

There is no apparent role for controversial names among the existing categories of names reserved at the second level within gTLDs. The role of controversial second level names within several ccTLDs varies and includes an array of concepts such as the protection of national interests, illegal activities, obscenity, and social disorder.

4.

The input from the Working Group will now be included, where applicable, in the style='mso-bidi-font-style:normal'>Final Report on the *Introduction of New Top-Level Domains*.

## **name="\_Toc167705588">FULL RECOMMENDATION TABLE**

Detailed information for each of the recommendations in this table can be found in the applicable report annex shown in the last column.

style='width:708.5pt;border-collapse:collapse;border:none;mso-border-alt:solid windowtext .5pt;mso-yfti-tbllook:480;mso-padding-alt:0pt 5.4pt 0pt 5.4pt;mso-border-insideh:.5pt solid windowtext;mso-border-insidev:.5pt solid windowtext'>

### **Reserved Name Category**

#### **Domain Name Level(s)**

#### **Recommendation**

##### **Annex**

1

ICANN & IANA

All ASCII

Maintain the existing reservation requirement and extend it to the top level until further work is completed. Further work is recommended to send questions, receive and compile responses from organizations with related reserved names, and draft a report to the GNSO Council. Examples are icann.net, or admin.iana.

One

2

ICANN & IANA

Top level, IDN

For all but "example", reservations are not required for Unicode versions in various scripts, or ACE versions of such translations or transliterations if they exist.

All possible Unicode versions of the name "example" must be reserved

The New gTLD Committee should validate this recommendation with IDN experts.

One

3

ICANN & IANA

2<sup>nd</sup> & 3<sup>rd</sup> levels, IDN

For all but "example", reservations are not required for Unicode versions in various scripts, or ACE versions of such translations or transliterations if they exist.

Do not try to translate 'example' into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist, except on a case by case basis as proposed by given registries.

The New gTLD Committee should validate this recommendation with IDN experts.

One

4

Symbols

ALL

We recommend that current practice be maintained, so that no symbols other than the '-' [hyphen] be considered for use at any level, unless technology at some time permits the use of symbols. style='mso-footnote-id:ftn7' href="#\_ftn7" name="\_ftnref7" title="">>[7]

Two

5

Single and Two Character IDNs

IDNA-valid strings at all levels

Single and two-character U-labels

on the top level and second level of a domain name should not be restricted in general. At the top level, requested strings should be analyzed on a case by case basis in the new gTLD process depending on the script and language used in order to determine whether the string should be granted for allocation in the DNS. Single and two character labels at the second level and the third level if applicable should be available for registration, provided they are consistent with the IDN Guidelines. style='mso-footnote-id:ftn8' href="#\_ftn8" name="\_ftnref8" title="">>[8]

Examples of IDNs include .酒, 東京.com, تونس.icom.museum.

Two

6

Single Letters

Top Level

We recommend reservation of single letters at the top level based on technical questions raised. If sufficient research at a later date

demonstrates that the technical issues and concerns are addressed, the topic of releasing reservation status can be reconsidered.

Examples of names that would not be allowed include .a, .z.

Two

7

Single Letters and Digits

2<sup>nd</sup> Level

We recommend that single letters and digits be released at the second level in future gTLDs, and that those currently reserved in existing gTLDs should be released. This release should be contingent upon the use of appropriate allocation frameworks.

More work may be needed.

Examples include a.com, i.info.

Two

8

Single and Two Digits

Top Level

We recommend digits be reserved at the top level, in order to avoid potential confusion with IP addresses within software applications. Examples include .3, .99.

Two

9

Single Letter, Single Digit Combinations

Top Level

Applications may be considered for single letter, single digit combinations at the top level in accordance with the terms set forth in the new gTLD process. Examples include .3F, .A1, .u7.

Two

10

Two Letters

Top Level

We recommend that the current practice of allowing two letter names at the top level, only for ccTLDs, remain at this time. [\[9\]](#)

Examples include .AU, .DE, .UK.

Two

11

Any combination of Two Letters,  
Digits

2<sup>nd</sup> Level

Registries may propose release provided that measures to avoid confusion with any corresponding country codes are implemented. style='mso-footnote-id:ftn10' href="#\_ftn10" name="\_ftnref10" title="">[10] Examples include ba.aero, ub.cat, 53.com, 3M.com, e8.org.

Two

12

Tagged Names

Top Level ASCII

In

the absence of standardization activity and appropriate IANA registration, all labels with hyphens in both the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n") must be reserved in ASCII at the top level. style='mso-footnote-id:ftn11' href="#\_ftn11" name="\_ftnref11" title="">[11]

Three

13

N/A

Top Level IDN

For each IDN gTLD

proposed, applicant must provide both the "ASCII compatible encoding" ("A-label") and the "Unicode display form" ("U-label") style='mso-footnote-id:ftn12' href="#\_ftn12" name="\_ftnref12" title="">[12] For example:

- If the Chinese word for 'Beijing' is proposed as a new gTLD, the applicant would be required to provide the A-label (xn--1lq90i) and the U-label (北京).

If the Japanese word

for 'Tokyo' is proposed as a new gTLD, the applicant would be required to provide the A-label (xn--1lqs71d) and the U-label (東京).

Three

14

Tagged Names

2<sup>nd</sup> Level ASCII

The current reservation requirement be reworded to say, " style='mso-bidi-font-style:normal'>In the absence of standardization activity and *appropriate IANA registration*, all labels with hyphens in both the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n") must be reserved in ASCII at the second (2<sup>nd</sup>) level. style='mso-footnote-id:ftn13' href="#\_ftn13" name="\_ftnref13" title="">[13] - added words in style='mso-bidi-font-style:normal'>italics. (Note that names starting with "xn--" may only be used if the current ICANN IDN Guidelines are followed by a gTLD registry.)

Three

15

Tagged Names

3<sup>rd</sup> Level ASCII

All labels with hyphens in both the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n") must be reserved in ASCII at the third (3<sup>rd</sup> level) for gTLD registries that register names at the third level." style='mso-footnote-id:ftn14' href="#\_ftn14" name="\_ftnref14" title="">[14] - added words in style='mso-bidi-font-style:normal'>italics. (Note that names starting with "xn--" may only be used if the current ICANN IDN Guidelines are followed by a gTLD registry.)

Three

16

NIC/WHOIS/WWW

Top ASCII

The following names must be reserved: NIC, Whois, www.

Four

17

NIC/WHOIS/WWW

Top IDN

Do not try to translate NIC, Whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist.

Four

18

NIC/WHOIS/WWW

Second and Third\* ASCII

The following names must be reserved for use in connection with the operation of the registry for the Registry TLD: NIC, Whois, www. Registry Operator may use them, but upon conclusion of Registry Operator's designation as operator of the registry for the Registry TLD, they shall be transferred as specified by ICANN. (\*Third level only applies in cases where a registry offers registrations at the third level.)

Four

19

NIC/WHOIS/WWW

Second and Third\* IDN

Do not try to translate NIC, Whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist, except on a case by case basis as proposed by given registries. (\*Third level only applies in cases where a registry offers registrations at the third level.)

Four

20

Geographic and geopolitical

Top Level ASCII and IDN

There should be no geographical reserved names (i.e., no exclusionary list, no presumptive right of registration, no separate administrative procedure, etc.). The proposed challenge mechanisms currently being proposed in the draft new gTLD process would allow national or local governments to initiate a challenge, therefore no additional protection mechanisms are needed. Potential applicants for a new TLD need to represent that the use of the proposed string is not in violation of the national laws in which the applicant is incorporated.

However, new TLD applicants interested in applying for a TLD that incorporates a country, territory, or place name should be advised of the GAC principles, and the advisory role vested to it under the ICANN bylaws. Additionally, a summary overview of the obstacles encountered by previous applicants involving similar TLDs should be provided to allow an applicant to make an informed decision. Potential applicants should also be advised that the failure of the GAC, or an individual GAC member, to file a challenge during the TLD application process, does not constitute a waiver of the authority vested to the GAC under the ICANN bylaws.

Five

21

Geographic and geopolitical

All Levels ASCII and IDN

The term 'geopolitical names' should be avoided until such time that a useful definition can be adopted. The basis for this recommendation is founded on the potential ambiguity regarding the definition of the term, and the lack of any specific definition of it in the WIPO Second Report on Domain Names or GAC recommendations.

Five

22

Geographic and geopolitical

Second Level &amp; Third Level if applicable, ASCII &amp; IDN

The consensus view of the working group is given the lack of any established international law on the subject, conflicting legal opinions, and conflicting recommendations emerging from various governmental fora, the current geographical reservation provision contained in the sTLD contracts during the 2004 Round should be removed, and harmonized with the more recently executed .COM, .NET, .ORG, .BIZ and .INFO registry contracts. The only exception to this consensus recommendation is those registries incorporated/organized under countries that require additional protection for geographical identifiers. In this instance, the registry would have to incorporate appropriate mechanisms to comply with their national/local laws.

For those registries incorporated/organized under the laws of those countries that have expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly, it is strongly recommended (but not mandated) that these registries take appropriate action to promptly implement protections that are in line with these WIPO guidelines and are in accordance with the relevant national laws of the applicable Member State.

Five

23

gTLD Reserved Names

Second &amp;

Third Level ASCII and

IDN (when applicable)

Absent

justification for user confusion style='mso-footnote-id:ftn15' href="#"\_ftn15" name="\_ftnref15" title="">[15], the recommendation is that gTLD strings should no longer be reserved from registration for new gTLDs at the second or when applicable at the third level. Applicants for new gTLDs should take into consideration possible abusive or confusing uses of existing gTLD strings at the second level of their corresponding gTLD, based on the nature of their gTLD, when developing the startup process for their gTLD.

Six

24

Controversial Names

All Levels, ASCII & IDN

There should not be a new reserved names category for Controversial Names.

Seven

25

Controversial Names

Top Level, ASCII & IDN

There should be a list of disputed names created as a result of the dispute process to be created by the new gTLD process.

Seven

26

Controversial Names

Top Level, ASCII & IDN

In the event of the initiation of a CN-DRP process, applications for that label will be placed in a HOLD status that would allow for the dispute to be further examined. If the dispute is dismissed or otherwise resolved favorably, the applications will reenter the processing queue. The period of time allowed for dispute should be finite and should be relegated to the CN-DRP process. The external dispute process should be defined to be objective, neutral, and transparent.

The outcome of any dispute shall not result in the development of new categories of Reserved Names. style='mso-footnote-id:ftn16' href="#"\_ftn16" name="\_ftnref16" title="">[16]

Seven

27

Controversial Names

## Top Level, ASCII &amp; IDN

The new GTLD Controversial Names Dispute Resolution Panel should be established as a standing mechanism that is convened at the time a dispute is initiated. Preliminary elements of that process are provided in this report but further work is needed in this area.

Seven

28

## Controversial Names

## Top Level, ASCII &amp; IDN

Within the dispute process, disputes would be initiated by the ICANN Advisory Committees (e.g., ALAC or GAC) or supporting organizations (e.g., GNSO or ccNSO). As these organizations do not currently have formal processes for receiving, and deciding on such activities, these processes would need to be defined:

o

The Advisory Groups and the Supporting Organizations, using their own processes and consistent with their organizational structure, will need to define procedures for deciding on any requests for dispute initiation.

- o Any consensus or other formally supported position from an ICANN Advisory Committee or ICANN Supporting Organization must document the position of each member within that committee or organization (i.e., support, opposition, abstention) in compliance with both the spirit and letter of the ICANN bylaws regarding openness and transparency.

Seven

29

## Controversial Names

## Top Level, ASCII &amp; IDN

Further work is needed to develop predictable and transparent criteria that can be used by the Controversial Resolution Panel. These criteria must take into account the need to:

- § Protect freedom of expression
- § Affirm the fundamental human rights, in the dignity and worth of the human person

and the equal rights of men and women

Take into account sensitivities regarding terms with cultural and religious significance.

Seven

30

Controversial Names

Top Level, ASCII & IDN

In any dispute resolution process, or sequence of issue resolution processes, the Controversial name category should be the last category considered.

Seven

Annex Eight contains an alphabetical listing of all recommended reserved names as possible.

## name="\_Toc167705589">SECTION TWO - OVERVIEW OF RN-WG PROCESS

1.

This section provides a brief overview of the extended phase Statement of Work by name category: ICANN/IANA names; single and two character names (including symbols); tagged names; nic/whois/www; geographic and geopolitical names; gTLD names at the second and third level; and controversial names.

2.

The final subgroup reports are found, in full, in Annexes One through Seven. The Supporting Information section in each of the subgroup reports contains the following detailed information: background information; discussion of recommendations, rationale for the recommendations, description of consultations with experts and a summary of relevant information sources used.

3.

ICANN/IANA  
Names

- 3.1. The subgroup report for this category contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding ICANN and IANA reserved names.
- 3.2. The subgroup consisted of Mike Rodenbaugh (chair) and Edmon Chung.
- 3.3. The subgroup recommends that the existing reservations be maintained until further work to evaluate the reservation of these names is

completed.

3.4. There was no disagreement in the WG regarding the recommendations.

3.5. For detailed information, see Annex One.

4.

#### Single and Two Character Names (including symbols)

4.1. The subgroup report

for this category contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding single and two character labels.

4.2. The subgroup members included: Greg Shatan (chair); Neal Blair; Marilyn Cade; Alistair Dixon; Avri Doria; Patrick Jones; Jonathan Nevett; Mike Rodenbaugh; Victoria McEvedy (Resigned from RN-WG on 24 April 2004).

4.3. The original recommendations that formed the basis of this report were approved by the RN WG for inclusion in the 19 March 2007 RN-WG report. Following the ICANN meeting in Lisbon, Portugal, and throughout the 30-day extension period, the subgroup refined the recommendations and incorporated additional information. The recommendations represent the consensus of the full WG.

4.4. The minority statement below was submitted for the following subcategory: two letters at the top level.

4.4.1.

Author: Mike Rodenbaugh

4.4.2.

Statement: "I recommend that two letter ASCII gTLDs be allowed. A standardized approach should be used which ensures consultation with appropriate parties, including the ccNSO and ISO 3166 Maintenance Agency, and where security and stability issues are identified, SSAC. While there may be political reasons, there appears no strong policy reason to withhold every possible two-letter TLD from use, on the assumption that some of them may be desired by countries that may be created in the future. The GAC principle assumes there will be 'user confusion' if two letter codes are allowed other than for ccTLDs, but this is not substantiated -- and there are many ccTLDs that are visually very similar to other ccTLDs (including .ch and .cn which are two of the larger ccTLDs). In addition, this concern would diminish if countries were able to use their own name as a TLD, including in its IDN form, or in an IDN two letter ccTLD."

4.5. For detailed information, see Annex Two.

5.

#### Tagged Names

## 5.1.

The subgroup report for this category contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding tagged names.

## 5.2.

Chuck Gomes and Patrick Jones served as the subgroup for this report.

## 5.3.

The recommendations of this report were approved by the full RN-WG.

## 5.4.

There was no disagreement in the WG with the recommendations and hence no minority positions.

## 5.5. For detailed information, see Annex Three.

## 6.

NIC, Whois and  
www

## 6.1.

The subgroup report for this category contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding Names Reserved for Registry Operations, NIC, Whois and www.

## 6.2.

Tim Denton served as a one-person subgroup for this category with support from Chuck Gomes and ICANN staff in the preparation of the final subgroup report.

## 6.3.

The recommendations of this report were approved by the full RN-WG.

## 6.4.

There was no disagreement with the recommendations and hence no minority positions.

## 6.5. For detailed information, see Annex Four.

## 7. Geographic and Geopolitical Names

## 7.1. The subgroup

report for this category contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding Geographical and Geopolitical Names.

## 7.2. The Reserved Names

subgroup on Geographical and Geopolitical Names was composed of Alistair Dixon, Caroline

Greer, Michael Palage  
(chair), and Tim Ruiz.

- 7.3. The full RN-WG supported the recommendations in this report.
- 7.4. There was no disagreement with the recommendations and hence no minority positions.
- 7.5. For detailed information, see Annex Five.

## 8. gTLD Names at the Second and Third Levels

### 8.1.

The subgroup report for this category contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding gTLD reserved names at the second and third level.

### 8.2.

Ray Fassett  
(chair), Edmon Chung, and Patrick Jones served as the subgroup for this report.

- 8.3. The recommendations of this report were approved by the full RN-WG.

### 8.4.

There were no minority statements from the RN-WG members. Minority opinions from individuals from various GNSO constituencies who were not part of the RN-WG are included in Section 3 of the subgroup report in the section titled Consultation with Experts.

- 8.5. For detailed information, see Annex Six.

## 9. Controversial Names

- 9.1. The subgroup report for this category contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding Controversial Names.
- 9.2. The members of the subgroup were: Marilyn Cade; Avri Doria (chair); Victoria McEvedy; Michael Palage; and Tamara Reznik.
- 9.3. The RN-WG reached consensus on the recommendations.
- 9.4. There was no disagreement in the WG regarding the recommendations.
- 9.5. For detailed information, see Annex Six.

clear=all style='page-break-before:always;mso-break-type:section-break'>

## SECTION THREE - OUT OF SCOPE AREAS

1.

This section sets out the work that was determined to be out of scope for the Working Group.

2.

In its original work, the RN-WG focused on three categories of names that are reserved by certain gTLD registries but are not reserved name requirements for all gTLD registries [17]. These are third level reserved names; registry specific names reserved at the second level and other names reserved at the second level.

3.

The original RN-WG report (sent to the GNSO Council on 16 March 2007) contains subgroup reports that address these categories [18]. In sessions held during the ICANN meetings in Lisbon in March 2007, the GNSO Council concluded that the names in these categories were out of scope for the RN-WG. Therefore, no further work on these three categories of names was done by the RN-WG and no recommendations are included for them in this report.

4.

For information purposes, a brief overview of these two categories of names is provided below.

5.

Third-Level  
Reserved Names

style='mso-special-character:line-break'>

There are currently two gTLDs that expressly reserve names at the third level, .pro and .name. Appendix L to the registry agreements for .pro (<http://www.icann.org/tlds/agreements/pro/registry-agmt-appl-30sep04.htm>) and .name (<http://www.icann.org/tlds/agreements/name/registry-agmt-appl-8aug03.htm>) specify certain strings (or "labels") that are not available for registration. Both .pro and .name prohibit the following labels at the third-level: dir, directory, email, http, mail, mx, mx [followed by a number from 0 to 100], ns, ns [followed by a number from 0 to 100], wap, www and www [followed by a number from 0 to 100]. In addition, each TLD

prohibits certain additional labels.  
Specifically, .Pro prohibits av, ca, cca, cert, certificate, grpa, pro, RegistryPro, verify, and verification, while .Name prohibits genealogy.  
style='mso-special-character:line-break'>

The full subgroup report for this category of names can be found in Appendix H of the above referenced RN-WG Report.

## 6. Registry Specific Names Reserved at the Second-Level

The gTLD registry agreements for .biz and .org each contain a category of reserved names that are unique to these gTLDs. The List of Reserved TLD Strings in Appendix 6 of the .biz agreement (<http://www.icann.org/tlds/agreements/biz/appendix-06-08dec06.htm>) contains a category of names called Additional Reservations by Registry Operator. The Schedule of Reserved Names in Appendix 6 of the .info agreement (<http://www.icann.org/tlds/agreements/info/appendix-06-08dec06.htm>) contains a category of names called Registry and Registry Operator Reserved Names. The name reservations include Registry-related names (words and phrases associated with the day-to-day operations of a Registry) and reservations relating to the actual entity's name. The reservations came about during contract negotiations between ICANN and the respective registry.

The subgroup report for this category of names is contained in Part B of Appendix I of the above referenced first RN-WG Report.

7.

Other Names

Reserved at the Second-Level

These names differ from other reserved names in that the names are actually intended to be allocated by the Registries. For example, .coop reserves non-ICANN names as referenced in Attachment 13 of its agreement at <http://www.icann.org/tlds/agreements/coop/sponsorship-agmt-att13-28oct0...> .jobs reserves non-ICANN names per Schedule S of its agreement at <http://www.icann.org/tlds/agreements/jobs/appendix-S-05may05.htm> .mobi reserves Premium Names as referenced in Appendix S of its Agreement at [http://pc.mtld.mobi/documen](http://pc.mtld.mobi/documents/Premium_Name_List_16Jan07.pdf) and .name reserves 'common names', 'community reservations', 'registry common names' and 'post-fix reservations' as listed in Section D of Appendix K in its Agreement at <http://www.icann.org/tlds/agreements/name/registry-agmt-appk-8aug03.htm> . The .travel agreement reserves non-ICANN names per Schedule S of its agreement at <http://www.icann.org/tlds/agreements/travel/>.  
 style='mso-special-character:line-break'>

The subgroup report for this category of names is contained in Part C of Appendix I of the above referenced RN-WG Report.

style='page-break-before:always'>

## SECTION FOUR -- RECOMMENDATIONS FOR NEW WORK

1.

The RN-WG

recommends that the new work described in this section be undertaken at the direction of the GNSO Council. The work is organized according to reserved name category. Tasks that must be done before completion of the New gTLD Report is completed are shown in **bold** font.

2.

ICANN and IANA

## Names

### 2.1.

Proposed work tasks

#### 2.1.1.

**Validate the two IDN recommendations in this report (recommendations 2 & 3) with IDN experts**

#### 2.1.2.

Evaluate whether there is justification to continue reserving ICANN and IANA ASCII names at all levels as recommended in this report

### 2.2.

Guidelines for work

#### 2.2.1.

There are lots of IDN experts who could be consulted regarding work task 2.1.1 but it is recommended that the experts already used by the RN-WG be used because they already have a good frame of reference for the work: Tina Dam, Cary Karp, and Ram Mohan.

#### 2.2.2.

Regarding task 2.1.2, it is suggested that Mike Rodenbaugh, chair of the ICANN/IANA names subgroup and ICANN staff be consulted regarding ways to proceed.

### 3.

Single Letter Names at the Second and Third Level (recommendation 7)

#### 3.1.

Proposed work tasks<sup>19</sup>

##### 3.1.1.

**Determine whether an allocation method is needed before release of single letter names at the second level**

##### 3.1.2.

**If it is decided that an allocation method is needed, implement a process for developing an allocation method**

##### 3.1.3.

**Regardless of whether an allocation method is needed or not, coordinate with ICANN staff to modify contractual terms of registry agreements regarding reservation of single**

**letter names at the second and (if applicable) the third level.**

3.2.

Guidelines for work

3.2.1.

It may be helpful to consult with the ICANN General Counsel's office as a first step regarding task 3.1.1.

3.2.2.

The members of the Single-Character/Two-Character Name subgroup did considerable work on this topic and as such could serve as helpful resources in any additional work that is authorized.

4.

Geographic and

Geopolitical Names (recommendations 20 - 22)

4.1.

Proposed work

**task: It is recommended that the New gTLD Committee (Dec05 PDP) consider whether and how recommendations 20 to 22 can be incorporated into the selection process for the introduction of new gTLDs.**

4.2.

Guidelines for

work: The subgroup did not propose any specific guidelines but did provide extensive rationale for the recommendations; that rationale may prove useful in evaluating the recommendations for inclusion in the selection process.

5.

Controversial

Names (recommendations 23 -30)

5.1.

Proposed work

**task: It is recommended that the New gTLD Committee (Dec05 PDP) consider whether and how recommendations 23 to 30 can be incorporated into the selection process for the introduction of new gTLDs.**

5.2.

Guidelines for

work:

5.2.1.

Recommendations

25 - 28 provide specific ideas that can be developed further by the New gTLD Committee.

5.2.2.

Recommendation 29 provides the following guidelines for additional work:

## 5.2.2.1.

Further work is needed to develop predictable and transparent criteria that can be used by the Controversial Resolution Panel. These criteria must take into account the need to:

Protect  
freedom of expression

Affirm  
the fundamental human rights, in the dignity and worth of the human person and  
the equal rights of men and women

## 5.2.2.2.

Take into account sensitivities regarding terms with cultural and religious significance.

## 5.2.3.

Recommendation

30 suggests the following for consideration by the New gTLD Committee: In any dispute resolution process, or sequence of issue resolution processes, the Controversial name category should be the last category considered.

**style='page-break-before:always'>**

lacnic, latnic, rfc-editor, ripe, root-servers

### **EXECUTIVE SUMMARY**

1. This Report contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding ICANN and IANA reserved names.
2. The subgroup consists of Mike Rodenbaugh, BCUC, and Edmon Chung, RyC.
3. The subgroup recommends that the existing reservations be maintained, until further work to evaluate the reservation of these names is completed.
4. There was no disagreement in the subgroup regarding the below recommendations.

5.

The table below contains the recommendations for ICANN/IANA names.

style='width:446.4pt;border-collapse:collapse;border:none;mso-border-alt:solid windowtext .5pt;mso-yfti-tbllook:480;mso-padding-alt:0pt 5.4pt 0pt 5.4pt;mso-border-insideh:.5pt solid windowtext;mso-border-insidev:.5pt solid windowtext'>

**SoW**

**number**

(RN-WG 30-day extension SoW)

**Reserved**

**Name Category**

**Domain**

**Name Level(s)**

**Recommendation**

Recommendation task 1

ICANN & IANA

All ASCII

Maintain the existing reservation requirement and extend it to the top level until further work is completed. Further work is recommended to send questions, receive and compile responses from organizations with related reserved names, and draft a report to the GNSO Council. Examples are icann.net, or admin.iana.

style='mso-yfti-irow:2 !msorm;page-break-inside:avoid !msorm'>

Recommendation task 1

ICANN & IANA

Top level, IDN

For all but "example", reservations are not required for Unicode versions in various scripts, or ACE versions of such translations or transliterations if they exist.

All possible Unicode versions of the name "example" must be reserved

The New gTLD Committee should validate this recommendation with IDN experts.

Recommendation task 1

ICANN & IANA

2<sup>nd</sup> & 3<sup>rd</sup> levels, IDN

For all but "example", reservations are not required for Unicode versions in various scripts, or ACE versions of such translations or transliterations if they exist.

Do

not try to translate 'example' into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist, except on a case by case basis as proposed by given registries.

The New gTLD Committee should validate this recommendation with IDN experts.

#### Minority

##### Position from Mike Palage

(Originally

submitted as part of the original RN-WG Report dated, 16-March-2007.)

In

accordance with Article I, Section 2 subparagraph 8 of the ICANN bylaws it states that in performing its mission, the following core values should guide the decisions and actions of ICANN "[m]aking decisions by applying documented policies neutrally and objectively, with integrity and fairness." Unlike other reservations that are based upon long standing and well established principles, ICANN/IANA staff has sought to continue reservation of a compilation of strings in which they have been unable to provide any documentation regarding the legal authority for such reservation. For ICANN/IANA to continue to reserve these names while similarly situated parties, in this case sovereign national governments (country names), IGOs and nationally recognized trademark holders, are not provided equal protection appear to be a clear violation of the bylaw provision cited above. More detailed discussion regarding the legal concerns regarding these reservations has been documented on the working group's mailing list, see

title="<http://forum.icann.org/lists/gnso-rn-wg/msg00169.html>"><http://forum.icann.org/lists/gnso-rn-wg/msg00169.html>.

In

order for this or any other working group to make a determination based upon documented fact, the following inquiries should be explored:

- ICANN should make available to the group all written and historical references to the original basis of these reservations;
- ICANN should contact all organizations that have had their name reserved, and ask for documentation in connection with any actual confusion or security/stability concerns that have arisen in connection with the use of these strings in legacy gTLD (.com, .net and .org);

- ICANN should ask these organizations if they would prefer to have ICANN continue to reserve these names in existing and future TLDs, and the basis of this reservation request; and

- ICANN should undertake an analysis to determine any third parties that may have rights in the reserved strings (i.e. nationally registered trademarks, etc) and how this reservation potentially negatively impacts those rights."

***style='page-break-before:always'>***

## Supporting Information

### 1. Background

This report provides an overview and assesses the current status of the category of reserved names related to ICANN and IANA. As such, the reserved names are not available for registration by members of the public.

More specifically, the Registry Agreements negotiated by ICANN state that "the following names shall be reserved at the second level and at all other levels within the TLD at which Registry Operator makes registrations".

The two tables below present the set of reserved names for two organizations: ICANN and IANA. In the case of ICANN, there are five reserved names for each registry. In the case of the IANA, there are seventeen (17) for each registry.

**Table 1: ICANN-related names,  
in order of year of ICANN-Registry agreement**

***style='border-collapse:collapse;border:none;mso-border-alt:solid windowtext .5pt;mso-yfti-tbllook:480;mso-padding-alt:0pt 5.4pt 0pt 5.4pt;mso-border-insideh:.5pt solid windowtext;mso-border-insidev:.5pt solid windowtext'>***

### **Justification for ICANN**

#### **reserved names**

The

words reserved by ICANN are mostly acronyms that basically relate to the organization structures (bodies) and functions, as it has evolved, and the justification for reservation was deemed by the original RN-WG subgroup as "obvious." The current subgroup believes further work should be done to justify these reservations, and/or to consider their release.

The

"schedule of reserved names" was born with the new TLD registry agreements in early 2001. A consultation with ICANN officials resulted in the following: no one recalls any record of any public or private document that describes the rationale for having a scheduled names list, or that describes the reasons why particular strings were included (or excluded).

Some

members of the Working Group on Reserved Names believe that ICANN and IANA should not be able to reserve names corresponding to those entities, since all other entities must register names in order to keep them from public use.

A further point was made by

Patrick Jones of ICANN, in relation to ICANN- and IANA-reserved names.

"...

just to clarify that IANA/ICANN names are reserved, provided that if ICANN/IANA or the related entities whose names are on reserve wanted to use one of the names, those names could be registered by the requesting entity. For example, ICANN registered and paid for the registration costs to un-reserve ICANN.jobs. If ICANN wanted to use ICANN.info in the future, it should be able to un-reserve the name."

### **Justification for IANA's**

#### **reserved names**

There

has been little need in the past to justify decisions about some reserved names, some of which must date from the days of John Postel. A search by ICANN Staff has revealed only a few paragraphs here and there of justification.

The current subgroup believes further work should be done to justify these reservations, and/or to consider their release.

The IANA-reserved names relate to functions and institutions within the purview of IANA: subordinate name servers, IANA's regional nodes, the request for comment editor, and so forth.

The standard explanation offered to those seeking to register such names is basically given by IANA along the following lines.

General responses to other reserved domains:

Thank you for your enquiry.

Domain names reserved by the Internet Assigned Numbers Authority are not available for sale, registration or transfer. These have been reserved on policy grounds, and include single letter domains, domains with hyphens in the third and fourth positions, and other reserved words.

Should the policies regarding these rules change, they will be released from IANA's registration according to revised policy.

#### **A note on http, https, and html**

In the course of the work of the Working Group, the question of whether the following names should also be reserved has come up. They are:

*http, https and html.*

A review of the *Whois* sites showed that, as of March 5, http.org had been registered. All three names are currently registered in .com and there appear to be no issues with them:

https.com since 1999 (monetized)

http.com since 1995 (not currently resolving)

html.com since 1993 (hosting company)

## **2. Rationale for the recommendations**

The original WG report found no historical support for the reservations, stating that 'the justification for the reservation is ... obvious.' The further work recommended by the subgroup is designed to justify the reservation, or consider release of these names.

Process description

## **3. Expert Consultation**

Affected organizations with related names on the ICANN and IANA reserved name lists and other ICANN stakeholder groups should be consulted as follows.

The subgroup has requested ICANN Staff to send the following request to all such organizations, with responses requested by a specific date that allows reasonable time for responses:

As part of the input into its Policy Development Process regarding new gTLDs, the GNSO formed a Working Group to examine current name reservations in registry operator agreements and to recommend whether those reservations should be continued, modified or discontinued. The Registry Agreements negotiated by ICANN state that "the following names shall be reserved at the second level and at all other levels within the TLD at which Registry Operator makes registrations".

The Working Group has stated thus far: The role of the reserved names held by IANA and ICANN has been to maintain for those organizations the exclusive rights to the names of ICANN (icann), its bodies (aso, ccnso, pso, etc.) or essential related functions (internic) of the two organizations.

Do you believe that names on the attached table -- which correspond or relate to your organization -- should continue to be reserved, at all levels, in all current and future gTLDs?

If yes, please state the reasons why you believe such exclusive rights should be reserved in all gTLDs, and describe how you have used or may intend to use these domains in the 16 existing gTLDs, any existing ccTLDs, and in any other TLDs that may be added in the future.

If no, please state which name reservations need not continue, or if you believe the reservation should be modified (i.e., reservations only needed at top level) then please state this.

Please provide the name of the person completing this questionnaire, and any additional comments or questions that you or your organization may have for the WG. Your response is requested not later than 30 May 2007.

**DEFINITIONS**

*style='border-collapse:collapse;border:none;mso-yfti-tbllook:191;mso-padding-alt:0pt 5.4pt 0pt 5.4pt;mso-border-insideh:.75pt solid black;mso-border-insidev:.75pt solid black'>*

A-Label

ASCII-compatible (ACE) form of an IDNA-valid string.

See <http://www.ietf.org/internet-drafts/draft-klensin-idnabis-issues-01.txt>.

An example is xn--1lq90i.

Character

A

character may be a letter, digit, hyphen or symbol.

For the purposes of discussing IDNs, a "character" can best be seen as the basic graphic unit of a writing system, which is a script plus a set of rules determining how it is used for representing a specific language. However, domain labels do not convey any intrinsic information about the language with which they are intended to be associated, although they do reveal the script on which they are based. This language dependency can unfortunately not be eliminated by restricting the definition to script because in several cases (see examples below) languages that share the same script differ in the way they regard its individual elements. The term character can therefore not be defined independently of the context in which it is used.

In phonetically based

writing systems, a character is typically a letter or represents a syllable, and in ideographic systems (or alternatively, pictographic or logographic systems) a character may represent a concept or word.

The

following examples are intended to illustrate that the definition of a character is at least two-fold, one being a linguistic base unit and the other is the associated code point.

U-label 酒 : Jiu; the Chinese word for 'alcoholic beverage'; Unicode code point is U+9152 (also referred to as: CJK UNIFIED IDEOGRAPH-9152); A-label is xn-jj4

U-label 北京 : the Chinese word for 'Beijing', Unicode code points are U+5300 U+4EAC; A-label is xn-1lq90i

U-label 東京 : Japanese word for 'Tokyo', the Unicode code points are U+6771 U+4EAC; A-label is xn-1lqs71d

U-label ايكوم; Farsi acronym for ICOM, Unicode code points are U+0627 U+06CC U+0643 U+0648 U+0645; A-label is xn-mgb0dgl27d.

### Single and Two Character Labels

Prior to

the release of IDNA, the characters available for inclusion in domain names consisted of a limited number of alphanumeric elements (a, . . . , z; 0, . . . , 9; "-"), and policies could easily be based on the number of characters any label contained. There is no similar generally applicable way to compare the length of, for example, an ideographic and an alphabetic string, or even a sequence of characters taken from the basic Latin alphabet with a decorated version of the same sequence.

In Czech, <ch> is a

single letter (or character -- the concepts do not differ in this regard) whereas in English it is two. In Danish, <æ> is the 27th letter of the alphabet. It is a single character and does not decompose to <a e>.

Depending on who you ask and their linguistic background, there are either 12 or 13 characters in the English word <encyclopædia>. If written as <encyclopaedia>, all would agree on 13. Differentiation by considering semantic value does not help. In Turkish, there is a difference between a dotted <i> and a dotless <ı>. In English, there is no such distinction. Whether the dot is to be counted as a character in its own right or not will again depend on who you ask and what language they view the word as being written in.

### Symbols

While the DNS supports

all of the printable characters in the US-ASCII character table not all such characters are made available in domain names. Symbols, such as #, \$, &, !, \*, -, \_, +, =, are not available for registration in domain names because the top-level domain registries decided (before internationalization) to adopt the hostname rule for registration of domain names. The hostname rule, defined in RFC 952 and updated in RFC 1123, specifies that only letters, digits and hyphens (a-z, 0-9, -) are valid characters in hostnames.

### Tagged Names

All labels with hyphens in both the third and fourth character positions (e.g., "bq-1k2n4h4b" or "xn-ndk061n").

U-Label

An IDNA-valid string of Unicode-coded characters; the representation of the Internationalised Domain Name (IDN) in Unicode. See <http://www.ietf.org/internet-drafts/draft-klensin-idnabis-issues-01.txt>. An example is 北京, the U-Label for the Chinese word "Beijing".

*clear=all style='page-break-before:always'>*

## **EXECUTIVE SUMMARY**

1.

This Report contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding single and two character labels.

2.

The subgroup members included:

Greg Shatan (IPC - Subgroup Chair)

Neal Blair (BC)

Marilyn Cade (BC)

Alistair Dixon (BC)

Avri Doria (Nom Com appointee)

Patrick Jones (ICANN Staff)

Jonathan Nevett (Registrars)

Mike Rodenbaugh (BC)

Victoria McEvedy (NCUC) (Resigned from RN-WG on 24 April 2004)

3.

The original recommendations that formed the basis of this report were approved by the RN WG for inclusion in the 19 March 2007 RN-WG report. Following the ICANN meeting in Lisbon, Portugal, and throughout the 30-day extension period, the subgroup refined the recommendations and incorporated additional information. These recommendations represent the consensus of the subgroup.

4.

A minority

position has been inserted in the explanation for the following subcategory:  
two letters at the top level.

5.

The table below

contains the recommendations for single and two character labels (for letters,  
digits, symbols and IDNs).

style='width:419.4pt;border-collapse:collapse;border:none;mso-border-alt:solid windowtext .5pt;  
mso-yfti-tbllook:480;mso-padding-alt:0pt 5.4pt 0pt 5.4pt;mso-border-insideh:  
.5pt solid windowtext;mso-border-insidev:.5pt solid windowtext'>

**SoW number**

(RN-WG

30-day extension SoW)

**Reserved Name Category**

**Domain Name Level(s)**

**Recommendation**

Recommendation task 2

Symbols

ALL

We recommend that current practice be maintained, so that no  
symbols other than the '-' [hyphen] be considered for use at any level,  
unless technology at some time permits the use of symbols. style='mso-footnote-id:ftn20' href="#\_ftn20"  
name="\_ftnref20" title="">[20]

Recommendation task 3(a)

Single and Two Character

IDNs

IDNA-valid strings at all

levels

Single

and two-character U-labels on the top level and second level of a domain name  
should not be restricted in general. At the top level, requested strings  
should be analyzed on a case by case basis in the new gTLD process depending  
on the script and language used in order to determine whether the string  
should be granted for allocation in the DNS. Single and two character labels  
at the second level and the third level if applicable should be available for  
registration, provided they are consistent with the IDN Guidelines. style='mso-footnote-id:ftn21'  
href="#\_ftn21" name="\_ftnref21" title="">[21]

Examples of IDNs include .酒, 東京.com, تونس.icom.museum.

Recommendation task 3(b)

Single Letters

Top Level

We recommend reservation of single letters at the top level based on technical questions raised. If sufficient research at a later date demonstrates that the technical issues and concerns are addressed, the topic of releasing reservation status can be reconsidered.

Examples of names that would not be allowed include .a, .z.

Recommendation task 3(b)

Single Letters and Digits

2<sup>nd</sup> Level

We recommend that single letters and digits be released at the second level in future gTLDs, and that those currently reserved in existing gTLDs should be released. This release should be contingent upon the use of appropriate allocation frameworks. More work may be needed.

Examples include a.com, i.info.

Recommendation task 3(b)

Single and Two Digits

Top Level

We recommend digits be reserved at the top level, in order to avoid potential confusion with IP addresses within software applications. Examples include .3, .99.

Recommendation task 3(b)

Single Letter, Single Digit Combinations

Top Level

Applications may be considered for single letter, single digit combinations at the top level in accordance with the terms set forth in the new gTLD process. Examples include .3F, .A1, .u7.

Recommendation task 3

Two Letters

Top Level

We recommend that the current practice of allowing two letter names at the top level, only for ccTLDs, remain at this time. [\[22\]](#)

Examples include .AU, .DE, and .UK.

Recommendation task 3(b)

Any combination of  
Two Letters, Digits

2<sup>nd</sup> Level

Registries may propose release provided that measures to avoid confusion with any corresponding country codes are implemented. [\[23\]](#)

Examples include ba.aero, ub.cat, 53.com, 3M.com, e8.org.

-  
-

#### Minority Statement

-

Mike Rodenbaugh  
on two letters at the top level:

I recommend that two letter ASCII gTLDs be allowed. A standardized approach should be used which ensures consultation with appropriate parties, including the ccNSO and ISO 3166 Maintenance Agency, and where security and stability issues are identified, SSAC. While there may be political reasons, there appears no strong policy reason to withhold every possible two-letter TLD from use, on the assumption that some of them may be desired by countries that may be created in the future. The GAC principle assumes there will be 'user confusion' if two letter codes are allowed other than for ccTLDs, but this is not substantiated -- and there are many ccTLDs that are visually very similar to other ccTLDs (including .ch and .cn which are two of the larger ccTLDs). In addition, this concern would diminish if countries were able to use their own name as a TLD, including in its IDN form, or in an IDN two letter ccTLD.

*clear=all style='page-break-before:always'>*

## Supporting Information

### Background

Recommendations are provided for each of the following eight subcategories:

- Symbols
- Single and two-character IDNs
- Single letters at the top level
- Single letters and digits at the second level
- Digits at the top level
- Single letter, single digit combinations at the top level
- Two letters at the top level
- Any combination of two letters and digits at the second level

This report will examine the above subcategories, recognizing that the technical and policy issues may differ across each of the subcategories.

The purpose of this report is to examine whether there are any technical, policy or practical concerns about releasing these names. Domain names are defined in RFC 1034 (published in November 1987 and recognized as an Internet Standard, <ftp://ftp.rfc-editor.org/in-notes/rfc1034.txt>).

The initial treatment of using a 'reservation' developed with Jon Postel and involved both single and two character strings. Some discussion about reserved names can be traced back to specific RFCs, while the 'reservation category' has also evolved via gTLD registry agreements. The reserved names list was created during the proof-of-concept round of new gTLDs in 2001. The reserved names list was a topic of discussion during the ICANN Meeting in Melbourne, Australia in March 2001. An information page on the registry agreement appendices was first posted in February 2001 (<http://www.icann.org/melbourne/new-tld-agreements-topic.htm>). Subsequently, the category of Geographical and Geopolitical names was added to some of the Reserved Names appendices.

In all gTLD registry agreements as of 1 May 2007, single-character labels are reserved at the second-level and two-character labels are initially reserved.<sup>[24]</sup>

It appears that the original purpose for reserving the single characters was driven by technical concerns. Two letter reservations appear to have been based on concerns about confusion with two letter country codes.

The work of the Single and Dual Character Reserved Names Subgroup (now Single and Two Character Labels Subgroup) was originally included as Appendix E in the GNSO Reserved Names Working Group Report dated 19 March 2007, [href="http://gnso.icann.org/drafts/rn-wg-fr19mar07.pdf">http://gnso.icann.org/drafts/rn-wg-fr19mar07.pdf](http://gnso.icann.org/drafts/rn-wg-fr19mar07.pdf). This update incorporates inputs received during the ICANN meeting in Lisbon, Portugal, references the GAC Principles on New gTLDs, [href="http://gac.icann.org/web/home/gTLD\\_principles.pdf">http://gac.icann.org/web/home/gTLD\\_principles.pdf](http://gac.icann.org/web/home/gTLD_principles.pdf), the GNSO IDN Working Group Outcomes Report, [href="http://gnso.icann.org/drafts/idn-wg-fr-22mar07.htm">http://gnso.icann.org/drafts/idn-wg-fr-22mar07.htm](http://gnso.icann.org/drafts/idn-wg-fr-22mar07.htm), and inputs received during the 30 day extension of the Reserved Names Working Group.

### **RECOMMENDATION ONE: SYMBOLS**

We recommend that current practice be maintained, so that no symbols other than the '-' [hyphen] be considered for use at any level, unless technology at some time permits the use of symbols.

#### **Rationale**

The hostname convention defined in RFC 952[25] (later modified by RFC 1123) states that domain names must consist of the letters a-z; the numbers 0-9, and the hyphen-dash (-). "." has a special status: it is permitted by the DNS but used as a "separator" for labels. Only letters, digits and hyphens are permitted at present in the DNS, to the left of the TLD.

#### **Consultation with experts**

Discussions with technology experts indicate that there would not be support for making any changes to allow the release of symbols in one or two character domain names, at any level.

### **RECOMMENDATION TWO: SINGLE AND TWO CHARACTER IDNs**

Single and two-character U-labels on the top level and second level of a domain name should not be restricted in general. At the top level, requested strings should be analyzed on a case by case basis in the new gTLD process depending on the script and language used in order to determine whether the string should be available for allocation in the DNS. This is notwithstanding the rule that the ISO-3166 list will continue to be reserved and as such all two character ASCII strings (i.e., LDH-labels) will remain reserved at the top level and second level of a domain name, although registries may propose release of two character strings at the second level provided that measures to avoid confusion with any corresponding country codes are implemented. Single and two character labels at the second level should be available for registration, provided they are consistent with the IDN Guidelines.

## Rationale

In a resolution approved by the ICANN Board on 25 September 2000, the Board recognized "it is important that the Internet evolve to be more

accessible to those who do not use the ASCII character set" but stressed that "the internationalization of the Internet's domain name system must be accomplished through standards that are open, non-proprietary, and fully compatible with the Internet's existing end-to-end model and that preserve globally unique naming in a universally resolvable public name space."<sup>[26]</sup>

Once ICANN opens the process for new TLD applications, it is expected that many of those applications may be for IDNs. In some scripts, such as Chinese, Japanese and Korean, single and two characters frequently translate into words, concepts or phrases. Because of this, it is not advisable to maintain the existing reservation against single and two-character U-Label strings for IDNs. Applications should be reviewed on a script by script basis.

As examples, single and two character IDNs currently exist as second and third level domain names in both ccTLDs and gTLDs.

<sup>[26]</sup> <http://中国.icom.museum/> directs visitors to <http://china.icom.museum/>.

<sup>[27]</sup> <http://한국.icom.museum/> directs visitors to <http://www.icomkorea.org/board/index2.php>.

The GAC Communique released in Lisbon, Portugal acknowledged the joint GAC-ccNSO-GNSO IDN Working Group, and noted a draft issue paper on the selection of IDN ccTLDs associated with the ISO-3166 list. The GAC is continuing to work with the ccNSO on this issue, because in many languages and scripts country names cannot be abbreviated, and it may be difficult to assign internationalized versions of the ISO-3166 list. The GAC is continuing to develop guidance on IDN TLDs that will be incorporated into the new gTLD process.

While not specifically written for IDNs, the GAC Principles regarding New gTLDs released in Lisbon contain a number of recommendations relevant to single and two character IDNs:<sup>[27]</sup>

1.3 A gTLD is a top level domain which is not based on the ISO 3166 two-letter country code list. For the purposes and scope of this document, new gTLDs are defined as any gTLDs added to the Top Level Domain space after the date of the adoption of these principles by the GAC.

2.4 In the interests of consumer confidence and security, new gTLDs should not be confusingly similar to existing gTLDs. To avoid confusion with country-code Top Level Domains no two letter gTLDs should be introduced.

The GAC Principles do not address single and two character labels in IDNs.

The GNSO IDN Working Group (IDN WG) Report (<http://gnso.icann.org/drafts/idn-wg-fr-22mar07.htm>) provides some guidance on single and two character IDNs. The IDN WG found broad agreement in:

4.1.3,  
Language Community Input for Evaluation of New gTLD Strings

4.1.5,  
Limit Variant Confusion and Collision

4.1.6,  
Limit Confusingly Similar Strings

The IDN WG found support in:

4.2.9, Support for a country's rights to define/reserve IDN strings for the country name

4.2.22, Support for regarding "confusingly similar" as "visually confusingly similar" or "typographically confusingly similar"

4.2.23, Support for IDN considerations for extension of reserved names list, possibly by introducing the notion of "reserved concepts" (for example; the concept of "example" as expressed in other languages/scripts)

The IDN WG and GAC Principles recognize that there may be issues of user confusion related to the introduction of IDNs at the top level. ICANN should be concerned about the potential for user confusion in scripts that share similarities, such as confusion between single and two character labels in Cyrillic, Greek and Latin scripts, or confusion between Chinese, Japanese and Korean scripts that share characters, or Farsi and Arabic, etc.

Previous ICANN Board resolutions on IDNs also provide guidance to the Reserved Names Working Group on single and two character labels in IDNs. On 27 March 2003, the ICANN Board endorsed the IDN Implementation approach in the Guidelines for the Implementation of Internationalized Domain Names (<http://www.icann.org/minutes/minutes-27mar03.htm>).

On 18 February 2004, the Board adopted a resolution to permit VeriSign and Public Interest Registry to begin test bed registration of IDNs in the .COM, .NET and .ORG gTLDs.

On 8 December 2006, the ICANN Board issued a detailed resolution on IDNs (<http://www.icann.org/minutes/minutes-08dec06.htm>).

The Board requested "the ccNSO and the GAC, through a joint collaborative effort, in consultation as needed with the relevant technical community, to produce an issues paper relating to the selection of IDN ccTLDs associated with the ISO 3166-1 two-letter codes."

Additional examples of existing registrations of single and two character IDNs at the second level include:

[Examples provided by

William Tan at NeuStar, href="<http://forum.icann.org/lists/gnso-sl-wg/msg00019.html>"><http://forum.icann.org/lists/gnso-sl-wg/msg00019.html>.]

On 28 March 2007, during the

ICANN meeting in Lisbon, Portugal, the GAC-ccNSO-GNSO joint working group on IDNs held a workshop focusing on policy issues related to the introduction of IDNs at the top level (href="<http://www.icann.org/meetings/lisbon/agenda-idn-wg-28mar07.htm>"><http://www.icann.org/meetings/lisbon/agenda-idn-wg-28mar07.htm>).

A transcript from the workshop is available at href="<http://www.icann.org/meetings/lisbon/transcript-idn-wg-28mar07.htm>"><http://www.icann.org/meetings/lisbon/transcript-idn-wg-28mar07.htm>.

This session generated good discussion on issues related to implementation of IDNs, including single and two character labels in IDNs.

On 16 April 2007, the GAC

and GNSO had a telephone conference to discuss IDN issues within the context of the GAC Principles on New gTLDs.name="\_ftnref28" title="">[28]

As part of this discussion, GAC members were asked about single and two character IDNs. Cary Karp asked a question "about scripts where the concept of letter is irrelevant, such as two Chinese ideograms." Bill Dee, the EU representative on the GAC, stated "I think that is something we need to cover when we come with our IDN Principles, but we need to discuss it within the GAC first. So this is really useful that you have raised this. You have started a train of thought that we are going to have to pursue, obviously."

Based on the 16 April 2007 conference call, the GAC is likely to provide further guidance to ICANN on single and two character labels in IDNs as part of the GAC Principles on IDNs. The GAC may benefit from the consideration of single and two character labels by the Reserved Names Working Group.

### **Consultations with experts**

A number of consultations have occurred with IDN experts, linguistic experts, and members of the Subgroup, the full RN Working Group and with members of the GNSO IDN Working Group. The full RN Working Group had a conference call with [href="http://en.wikipedia.org/wiki/Cary\\_Karp">Cary Karp](http://en.wikipedia.org/wiki/Cary_Karp) and [href="http://en.wikipedia.org/wiki/Ram\\_Mohan">Ram Mohan](http://en.wikipedia.org/wiki/Ram_Mohan) on 1 March 2007. Several discussions occurred on IDN implications for Reserved Names during the ICANN meeting in Lisbon, Portugal. The GAC and GNSO discussed IDN issues as part of the discussion of the GAC Principles regarding New gTLDs on 16 April 2007.

Extensive consultation has occurred with Cary Karp and Tina Dam in the consideration of single and two character labels in IDNs.

### **Consultations on definition of character**

Consultations occurred with [href="http://www.evertype.com/misc/bio.html">Michael Everson](http://www.evertype.com/misc/bio.html), Tina Dam, Cary Karp, and Chuck Gomes. Cary Karp and Tina Dam provided extensive analysis of the draft definition and examples.

According to a 26 April 2006 email from Cary Karp, "Digits are also characters, but the status of what an Anglophone would regard as diacritical marks, is far less clear in other contexts where what is sometimes term[ed] 'decoration' is added to 'base' characters. Graphic symbols such as punctuation marks may also be termed characters, and the status of other graphic devices such as dingbats and smiley faces can also be argued."

## **RECOMMENDATION THREE: SINGLE LETTERS AT THE TOP LEVEL**

We recommend reservation of single letters at the top level, based on technical questions raised. If sufficient research at a later date demonstrates that the technical issues and concerns are addressed, the topic of releasing reservation status can be reconsidered. Examples of names that would not be allowed include .a, .z.

### **Rationale**

Single letter gTLDs have never been released by ICANN. In 2000, ICANN received an application for .i. This application was not approved (see <http://www.icann.org/tlds/i1/>).

RFC 1035 (see <http://www.ietf.org/rfc/rfc1035.txt>) states that domain names "must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphen. There are also some restrictions on the length. Labels must be 63 characters or less." "name=" \_ftnref29" title="">[29]  
RFC 1035 was updated by RFC 1123 (<ftp://ftp.rfc-editor.org/in-notes/pdf/rfc1123.txt.pdf>), so that domain names may start with either a letter or a digit.

There may be potential user confusion from mistaking certain single letters and digits (i.e., .l versus .1, .m versus .n, .q versus .g) due to visual similarity.

Some businesses own trademarks in single letters, such as Overstock, Nissan Motors, T-Mobile and Yahoo! [Examples are provided merely for illustration and discussion.] Such trademark owners may be interested in registering a corresponding gTLD.

According to research conducted by IANA, out of 9540 possible combinations of single-character LDH names at the second level (containing 26 letters, 10 numbers, but not symbols, across 265 TLDs), 1225 delegations of single-character LDH names exist in the zone. 63 TLDs have at least one single-character LDH delegation (see <http://forum.icann.org/lists/gnso-rn-wg/msg00039.html>).

During the discussions, consideration was given to releasing single letters at the top level. The Sub Group considered that that single letter and digit domains are widely in use at the second level in country codes and as IDNs, and initially thought it would be feasible to examine how to release and allocate single letter top level names. Members of the Sub Group were aware from RFC reviews and other sources that there could be technical concerns and potential 'resolution' issues regarding the use of single letter and digit domains at the second level in a single letter TLD (e.g., 1.a or a.a), and undertook outreach to two technical experts to learn more about the technical issues.

The release and allocation of single letters at the second level has been subject of some discussion during the PDP regarding contractual terms for TLD registries; this is addressed as a separate recommendation.

### **Consultation with experts**

In addition to reviewing relevant RFCs, an interactive consultation was held on 23 April 2007 by the Subgroup with two technical experts, Steve Bellovin (<http://www.cs.columbia.edu/~smb/>) and Mark McFadden (<http://www3.uwm.edu/sce/instructor.cfm?id=249>). Both experts discussed the concern with interaction with letters at both the top and the

second level as a problem. The transcript for that discussion can be found in the subgroup archive at (<http://forum.icann.org/lists/gnso-sl-wg/>).

RFC 1535 points out that there can be search order issues where an application attempts to resolve a domain name string.

On May 8, a follow up email was received from Steven Bellovin and is provided below, describing in more detail the technical issues associated with letters at the top level.

Sent: Tuesday, May 08, 2007 9:51 PM

"I read just the portions you cited.

Mostly ok, but...

1.5:

This is wrong:

However, due to technical concerns, we recommend that single character (LDH) names be reserved at the second level in any single letter TLD.

Single-letter TLDs are bad if there are single-letter second level names anywhere, and vice-versa. The problem is not restricted to direct descendants. For example, suppose that .a and .foo are TLDs. If I'm on host xyzy.foo and ask for 'a', do I get a -- the TLD? -- or a.foo? This is the problem described in RFC 1535. (Yes, it can happen with longer names; it was a real incident that inspired that RFC.)

The same concerns apply to this text:

*However, there may be technical concerns regarding the use of single letter and digit domains at the second level in a single letter TLD (e.g., 1.a or a.a). Allocation of single letters at both the top level and second level in combination may [will??] cause certain older DNS software applications to incorrectly resolve.*

and

If single letter TLDs are unreserved, single letters at the second level would need to be reserved in these domains.

and

*Single letters at the second level would need to be reserved in single letter TLDs until this problem has been eliminated."*

[email snipped. Relevant section provided under recommendation 5].

RFC 1535

23 April 2007 RN WG - Subgroup

Teleconference with Technical Experts

(<http://forum.icann.org/lists/gnso-sl-wg/msg00006.html>).

GAC Principle 1.4: referencing ICANN core values/bylaw:

"preserving operational stability, reliability, security and global interoperability of the Internet."

GAC Principle 2.6: "It is

important that the selection process for new gTLDs ensures the security, reliability, global interoperability and stability of the Domain Name System (DNS) and promotes competition, consumer choice, geographical and service provider diversity".

### **RECOMMENDATION FOUR: SINGLE LETTERS AND DIGITS AT THE SECOND LEVEL**

We recommend that single letters and digits be released at the second level in future gTLDs, and that those currently reserved in existing gTLDs should be released. This release should be contingent upon the development of an appropriate allocation framework.

#### **Rationale**

Currently, all 16 gTLD

registry agreements (.aero, .asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel) provide for the reservation of single-character names at the second level.

ICANN's gTLD registry agreements contain the following provision on single-character names. See Appendix 6

of the .TEL Registry Agreement, <http://www.icann.org/tlds/agreements/tel/appendix-6-07apr06.htm> ("the following names shall be reserved at the second-level: All single-character labels.").

Letters, numbers and the

hyphen symbol are allowed within second level names in both top level and country code TLDs. Single letters and

numbers also are allowed as IDNs -- as single-character Unicode renderings of ASCII compatible (ACE) forms of IDNA valid strings.

Before the current reserved

name policy was imposed in 1993, Jon Postel took steps to register all available single character letters and numbers at the second level, purportedly to reserve them for future extensibility of the Internet (see 20 May 1994 email from Jon Postel, <http://ops.ietf.org/lists/namedroppers/namedroppers.199x/msg01156.html>).

All but six (q.com, x.com, z.com, i.net, q.net, and x.org) of the possible 144 single letters or numbers at the second-level in .COM, .EDU, .NET and .ORG were registered and remain reserved by IANA. Those six registrations have been grandfathered, and several have been used for various purposes and/or transferred amongst different registrants.

Under current policy, these names would be placed on reserve if the registrations were allowed to expire.

Since the initial registration of single-letter names by IANA, IANA has uniformly turned down all offers by third parties to purchase the right to register these names, and has advised these parties that the names are reserved for infrastructure purposes to help ensure stable operation of the Internet.

An email of 27 May 2000 to the then DNSO-GA list provides further background on single-letter names (see <http://www.dnso.org/clubpublic/ga/Arc04/msg00442.html>).

According to research conducted by IANA, out of 9540 possible combinations of single-character ASCII names (containing 26 letters, 10 numbers, but not symbols, across 265 TLDs), 1225 delegations of single-character LDH names exist in the zone. 63 TLDs have at least one single-character LDH delegation (see <http://forum.icann.org/lists/gnso-rn-wg/msg00039.html>).

We understand that some businesses may own trademarks in single letters, such as Overstock, Nissan Motors, T-Mobile and Yahoo! [Examples have been provided merely for illustration and discussion.] These trademark owners, if they have not already registered their single-character trademarks as domain names, may be interested in doing so across a number of TLDs.

There may be potential user confusion from mistaking certain single letters and digits at the top level due to visual similarity (i.e., 1.com versus l.com, m.com versus n.com, q.com versus g.com).

Given that single letter and number second level domains are widely used in country codes and as IDNs, and six letters are used in the existing legacy generic top level domains at the second level, it seems feasible to examine how to release and allocate single letter and number second level names.

The release and allocation of single letters has been subject of some discussion during the PDP regarding contractual terms for TLD registries.

### **Consultation with experts**

Single letters and numbers are widely delegated at the second level, in 63 TLDs and as IDN (U-label) versions. Therefore, we presume there is no technical reason why remaining letters, at least, should remain reserved.

While it appears that single letters and digits at the second level can be released, further examination of allocation options is needed.

In relation to the special case of single letter second level names in single letter TLDs, consultation with technical experts identified the problem that RFC 1535 discusses as likely

to be experienced with combinations of single letters at the top and second level. (RFC1535 discusses security problems posed by some resolvers that attempt to resolve a partial name by processing a search list of partial domains to be added to portions of the specified host name until a DNS record is found.) .

#### RECOMMENDATION FIVE: DIGITS AT THE TOP LEVEL

We recommend continuation of the reserved status for digits at the top level, in order to avoid potential confusion with IP addresses, within software applications. Examples include .3, .99. Note: see later recommendation which proposes to continue to allow allocation of digits at the second and third levels, including single digits.

#### Rationale

Allocation of numbers at **both** the top level and second level in combination may cause DNS software applications to incorrectly deem a URL composed only of numbers as an IP address.

In addition to the DNS software issue, there are also legacy software applications that will interpret if certain numbers, such as "00", are omitted, and, if they are, insert numbers into a string, thus causing misdirection.

#### Consultation with experts

Single numbers have been denied in previous gTLD rounds. Discussions among the full RN WG have identified the concern about conflict with IP addresses, when numbers appear at both the second and top levels.

In addition to reviewing relevant RFCs, an interactive consultation was held on 23 April 2007 by the Subgroup with two technical experts, Steve Bellovin and Mark McFadden. Both experts discussed the concern with interaction with numbers at both the top and the second level as a problem. The transcript for that discussion can be found in the subgroup archive at (<http://forum.icann.org/lists/gnso-sl-wg/>).

On May 8 and 9, two emails were received from Steven Bellovin and relevant sections are provided below, describing in more detail the technical issues associated with digits.

Sent: Tuesday, May 08, 2007 9:51 PM

"I read just the portions you cited.

Mostly ok, but...

*Section*

*of email produced in 1.4 is not reproduced here. .*

1.6:

Numbers at the top and second level

\*will\* cause problems. Here's some text from RFC 3493 -- not an IETF standard, but I think it is a Posix standard, and it is present on all modern UNIX systems, i.e., it's not just legacy software.

If the nodename argument is not null, it can be a descriptive name or can be an address string. If the specified address family is AF\_INET, AF\_INET6, or AF\_UNSPEC, valid descriptive names include host names. If the specified address family is AF\_INET or AF\_UNSPEC, address strings using Internet standard dot notation as specified in inet\_addr() are valid.

This RFC doesn't define the behavior of inet\_addr(), but Solaris and Linux specify that it accepts ddd.ddd. I think (but haven't verified) that Posix requires that."

Sent: Wednesday, May 9, 2007

"I confirmed that UNIX standards \*require\* that ddd.ddd be interpreted as described; see <http://www.opengroup.org/onlinepubs/000095399/functions/getaddrinfo.html>

and

[http://www.opengroup.org/onlinepubs/000095399/functions/inet\\_addr.html](http://www.opengroup.org/onlinepubs/000095399/functions/inet_addr.html)

To be quite explicit: any program that uses IEEE standard 1003.1 \*will\* be confused by ddd.ddd." end of email.

References related to digits at the top level

RFC 1535

GAC Principle 1.4: referencing ICANN core values/bylaw: "preserving operational stability, reliability, security and global interoperability of the Internet."

GAC Principle 2.6: "It is important that the selection process for new gTLDs ensures the security, reliability, global interoperability and stability of the Domain Name System (DNS) and promotes competition, consumer choice, geographical and service provider diversity".

#### **RECOMMENDATION SIX: SINGLE LETTER, SINGLE DIGIT COMBINATIONS AT THE TOP LEVEL**

Applications

may be considered for two character names combining a single letter and single digit, in either order at

the top level in accordance with the terms set forth in the new gTLD process. Release of combinations of one letter and one digit at the top level can be allowed. Examples may be L0, or 2K.

#### **Rationale**

Combinations of numbers and letters exist at the second level, and there appears to be no technical prohibition to a single letter and a single number

combination at the top level.

There may be further considerations regarding how numbers and letters may be mistaken for each other by the user, due to visual similarity, such as '10', versus 'IO' (lower case 'l' and upper case 'O', where a user searching for a domain name, where numbers are allowed at the second level, and a user is searching for a 333.10, but types '333.10.

Numbers at the top level are not recommended - see recommendation five.)

### **Consultation with experts**

In addition to reviewing RFC 1535, an interactive consultation was held with Steve Bellovin and Mark McFadden. A transcript is available in the subgroup archive at (<http://forum.icann.org/lists/gnso-sl-wg/>). Except for user confusion in mistaking a letter for a number and then mistyping certain combinations, there does not appear to be a technical issue with a combination of number and letter at the top level.

### References

RFCs 952, 1123, 1535

Expert discussion with Steve Bellovin and Mark McFadden was held on 23 April 2007. They did not suggest that there are likely to be problems per se.

### **RECOMMENDATION SEVEN: TWO LETTERS AT THE TOP LEVEL**

We recommend

that the current practice of allowing two letter names at the top level, only for ccTLDs, remain at this time. The subgroup was encouraged by the ccNSO not to consider removing the restriction on two-letter names at the top level.

IANA has based its allocation of two-letter names at the top level on the ISO 3166 list. There is a risk of collisions between any interim allocations, and ISO 3166 assignments which may be desired in the future.

### Minority

Statement by Mike Rodenbaugh

I recommend that two letter ASCII gTLDs be allowed. A standardized approach should be used which

ensures consultation with appropriate parties, including the ccNSO and ISO 3166 Maintenance Agency, and where security and stability issues are identified, SSAC. While there may be political reasons, there appears no strong policy reason to withhold every possible two-letter TLD from use, on the assumption that some of them may be desired by countries that may be created in the future.

The GAC principle assumes there will be 'user confusion' if two letter codes are allowed other than for ccTLDs, but this is not substantiated -- and there are many ccTLDs that are visually very similar to other ccTLDs (including .ch and .cn which are two of the larger TLDs).

In addition, this concern would diminish if countries were able to use their own name as a TLD, including in its IDN form, or in an IDN two letter ccTLD.

## Rationale

To date, two-character TLDs have been released only as two letter ccTLDs. No combinations of letters and numbers, and no two-number strings have been allocated at the top level. The subgroup conducted expert outreach to examine any implications of release of such combination or two-digit TLDs.

An early RFC issued in October 1984 (RFC 920) defined country codes as the "The English two letter code (alpha-2) identifying a country according the ISO Standard for 'Codes for the Representation of Names of Countries'". This RFC was issued before ccTLDs had been established (see <ftp://ftp.rfc-editor.org/in-notes/rfc920.txt>, page 7).

RFC 1032, issued in November 1987, states that "countries that wish to be registered as top-level domains are required to name themselves after the two-letter country code listed in the international standard ISO-3166."

Two character/letter strings at the top level are now identified with the ISO 3166 list, which has a two letter code associated with all of the over 200 countries and recognized economies. Country code or ccTLDs correspond directly to the two character letters on the ISO 3166 list. The ISO 3166 Maintenance Agency governs the list of country codes. Further information on the ISO 3166 list is available at <http://www.iso.org/iso/en/prods-services/iso3166ma/index.html>. According to RFC 1591, "IANA is not in the business of deciding what is and is not a country" (<http://www.rfc-editor.org/rfc/rfc1591.txt>). "The selection of the ISO 3166 list as a basis for country code top-level domain names was made with the knowledge that ISO has a procedure for determining which entities should be and should not be on that list."

Further, RFC 1591 defines a country code as "a domain in the top level of the global domain name system assigned according to a two-letter code based on the ISO 3166-1 standard 'Codes for the Representation of Names of Countries and Their Subdivisions.'"

In the 2000 round, ICANN received an application for .GO. This string was not allocated on the ISO 3166 list to a country. This application was rejected.

The GAC Principles and Guidelines for the Delegation and Administration of Country-Code Top Level Domains (5 April 2005) contains a statement on ccTLDs:

## 4.1.2.

Every country or distinct economy with a government or public authority recognized in accordance with article 3.8 above should be able to ask for its appropriate country code to be represented as a ccTLD in the DNS and to designate the Registry for the ccTLD concerned.

A 27 February 2007 email from IANA Technical Liaison Kim Davies provides context to support the reservation of two-letter strings at the top level for use as future ccTLDs (see <http://forum.icann.org/lists/gnso-rn-wg/msg00163.html>).

A 4 March 2007 email from ccNSO Council Chair Chris Disspain states in part:

"gTLDs in ASCII - there is, if I understand it correctly, a current prohibition on issuing new gTLDs with 2 characters. I imagine the vast majority of the ccTLD community would be in favour of this prohibition being retained. Apart from anything else, reservation of 2 characters at the top level is the only way of ensuring that a new ccTLD code will be available for new territories."

There may be potential user confusion from mistyping combinations of letters and numbers (e.g., .c0 versus .co, .t0 versus .to, .1l versus .li, m0 versus .mo), with two-number strings (.00 versus .oo, .11 versus .ll, .l0 versus .lo), and with two-letter strings (ll versus li, .vy versus .yv, .pq vs. .pg).

The GAC Principles regarding New gTLDs, released on 28 March 2007, state:

## 1.3

A gTLD is a top level domain which is not based on the ISO 3166 two-letter country-code list.

## 2.4

In the interests of consumer confidence and security, new gTLDs should not be confusingly similar to existing TLDs. To avoid confusion with country-code Top Level Domains no two letter gTLDs should be introduced.

### Consultation with experts

Two letter strings at the top level have only been allowed for country codes as defined by the ISO 3166 list. Chris Disspain, Chair of the ccNSO, believes the vast majority of the ccTLD community would be in favour of this practice being retained. Kim Davies, IANA Technical Liaison believes the current practice should be continued, as a policy matter, due to potential need for some two-letter strings by future countries.

### **RECOMMENDATION EIGHT: ANY COMBINATION OF TWO LETTERS, DIGITS AT THE SECOND LEVEL**

We recommend that registries may propose release of two letter and/or digit

strings at the second level, provided that measures to avoid confusion with any corresponding country codes are implemented.

A standardized approach should be used which ensures consultation with appropriate parties, including the ccNSO and ISO-3166 Maintenance Agency, and where security and stability issues are identified, RSTEP.

The

existing gTLD registry agreements provide for a method of potential release of two-character LDH names at the second level. In addition, two character LDH strings at the second level may be released through the process for new registry services, which process involves analysis of any technical or security concerns and provides opportunity for public input. Technical issues related to the release of two-letter and/or number strings have been addressed by the RSTEP Report on GNR's proposed registry service. The GAC has previously noted the WIPO II Report statement that "If ISO 3166 alpha-2 country code elements are to be registered as domain names in the gTLDs, it is recommended that this be done in a manner that minimizes the potential for confusion with the ccTLDs."

### Rationale

In 2001, in considering a proposal from .AERO for the limited release of two-letter airline codes, a GAC Communique (<http://www.icann.org/committees/gac/communique-09sep01.htm>) noted that the WIPO II report addressed this category of names and recommended that "If ISO 3166 alpha-2 country code elements are to be registered as domain names in the gTLDs, it is recommended that this be done in a manner that minimizes the potential for confusion with the ccTLDs." This recommendation has been incorporated into the reserved names appendix of 14 of ICANN's current, gTLD registry agreements.

The WIPO II Report is available at

<http://www.wipo.int/amc/en/processes/process2/report/html/report.html> and included in this report under Section 5(k).

Fourteen out of sixteen of the present gTLD registry agreements (.aero, asia, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .pro, .tel and .travel) provide for the reservation of two-character names at the second level, via the following provision. (See, e.g., Appendix 6 of the .TEL Registry Agreement, <http://www.icann.org/tlds/agreements/tel/appendix-6-07apr06.htm>.)

Except to the extent that

ICANN otherwise expressly authorizes in writing, the Registry Operator shall reserve names formed with the following labels from initial (i.e. other than renewal) registration within the TLD: ... All two-character labels shall be initially reserved. The reservation of a two-character label string shall be released to the extent that the Registry Operator reaches agreement with the government and country-code manager, or the

ISO 3166 maintenance agency, whichever appropriate. The Registry Operator may also propose release of these reservations based on its implementation of measures to avoid confusion with the corresponding country codes.

Two of the sixteen present gTLD strings, .BIZ and .ORG registry agreements say only "Registry Operator shall reserve names formed with the following labels from initial (i.e. other than renewal) registration within the TLD: ... All two-character labels shall be initially reserved." See <http://www.icann.org/tlds/agreements/biz/appendix-06-08dec06.htm> and <http://www.icann.org/tlds/agreements/org/appendix-06-08dec06.htm>.

There may be potential user confusion between the combination of letters and numbers (e.g., c0.com versus co.com; t0.com versus to.com; 1l.com versus li.com, m0.com versus mo.com), with two-number strings (00.com versus oo.com, 11.com versus ll.com), and with two-letter strings (ll.com versus li.com, vy.com versus yv.com).

At the second level, two-character names have been registered, re-sold directly or via auction, and/or transferred by a wide variety of parties for many years. The GNR RSTEP report noted that there have been 18 UDRP cases involving two-character names at the second level.

Some businesses use two letter identifiers or two-character abbreviations, such as FT for Financial Times, GM for General Motors, DT for Deutsche Telecom, BT for British Telecom, HP for Hewlett-Packard, or have corporate names of characters and number, such as 3M. [Examples are provided merely for illustration and discussion.] These trademark owners, if they have not already registered their two-character trademarks as domain names, may be interested in doing so across a number of TLDs.

In the past, ICANN has approved the release of certain two-character names from the reserved names lists through one-on-one communication with the requesting registry operator. There are no public information sources on the release of these names, but in the past ICANN has agreed to the release of e8.org, a2.coop, nz.coop and uk.coop. NZ.coop and UK.coop were released with the approval of the UK and NZ government representatives and ccTLD managers. A2.coop and e8.org were released without objection from the ISO 3166-Maintenance Agency. On 25 May 2004, the ICANN Board approved the limited release of two-character airline codes in .AERO (<http://www.icann.org/minutes/resolutions-25may04.htm>).

On 16 January 2007, the ICANN Board approved the limited use of two-character names in .NAME (<http://www.icann.org/minutes/prelim-report-16jan07.htm>) (see summary of relevant information sources below for further information on the GNR proposal).

On 21 February 2007, Fundació puntCAT proposed release of three two-character names from the .CAT Sponsorship Agreement (UB.cat, UV.cat and UA.cat). Only

UA.cat corresponds to a country code TLD (Ukraine). ICANN approved this release on 7 March 2007, subject to certain conditions.

On

13 March 2007, EmployMedia proposed release of two-character names from the .JOBS Sponsorship Agreement. On 28 March 2007, ICANN approved this release, subject to certain conditions.

The

existing registry agreement provisions provide a mechanism for the release of two-character names at the second level, as set forth above. In addition, registries may submit a proposal for the release of two-character names through the process for new registry services (also known as the "Funnel"), which was approved as a GNSO Consensus Policy on 8 November 2005 (<http://www.icann.org/minutes/resolutions-08nov05.htm>) and implemented 25 July 2006 (<http://www.icann.org/announcements/rsep-advisory-25jul06.htm> and <http://www.icann.org/registries/rsep/rsep.html>).

### **Consultation with experts**

Second level strings with

two letters and/or digits have been widely used for a long time. Therefore we presume there is no technical reason why remaining strings should remain reserved. There may be other policy or political reasons to maintain the present reservation process, unless registries follow the previously given GAC advice and propose release of two-character names using methods to avoid confusion with any corresponding country codes.

In 2001 the GAC addressed

potential release of two-character names at the second level as part of its consideration of a request from .AERO for the limited release of two-letter airline codes. This issue has been addressed in 14 registry agreements as set forth above. Two-digit or letter-digit combinations, and two-letter combinations that are not likely to correspond to country codes, should be possible at the second level.

7. Correspondence from Kim Davies to Tim Denton, dated 7 January 2007:

"The single-letter/number domains in .com, .net, .org, .edu, .biz, .info, .name, .pro, .aero, .coop, and .museum are reserved by the IANA.

Accordingly, these names are not for "sale" or subject to transfer under established policy. A few of the single-letter names were registered before this reservation was made.

The IANA obtained the registration for most single-character names under .com in 1993 to implement a policy designed to enhance the extensibility of the domain-name space.

Since then, these names have been continuously under registration by the IANA. The IANA has received many inquiries from people seeking to register these names. As required by the existing policy, the IANA advises those inquiring that these names are already registered to the IANA and reserved for infrastructure purposes to help ensure stable operation of the Internet. The IANA has uniformly turned down all offers by third parties to purchase the right to register these names.

Four of the single-character names under .com were registered by other parties before the IANA entered its registration of these names. The registrations of these names have been (and are) grandfathered for the time being. Recently some of these registrations have been transferred from one third party to another. Those transfers are consistent with the grandfathering policy.

Having assumed the responsibility for operating the IANA, and for overall technical management of the Internet, ICANN is following the same policies for the operation of the IANA as were followed by Dr. Postel and his colleagues at the Information Sciences Institute. ICANN's charter and bylaws, together with its obligations under its various agreements with the United States Government, establish consensus-based procedures for modification of existing policies, fostering participation by affected parties. Until the policy is changed by the established procedures, ICANN is required to continue its registration of the single-letter .com domain names for the benefit of the Internet community."

There is also an Information page at <http://res-dom.iana.org/>.

#### 8. Email correspondence from Kim Davies, IANA

Technical Liaison, to Patrick Jones, posted on RN WG list 27 February 2007:

[href="http://forum.icann.org/lists/gnso-rn-wg/msg00163.html">http://forum.icann.org/lists/gnso-rn-wg/msg00163.html](http://forum.icann.org/lists/gnso-rn-wg/msg00163.html).

RFC 1591, sect 2 reads:

"In the Domain Name System (DNS) naming of computers there is a hierarchy of names. The root of system is unnamed. There are a set of what are called "top-level domain names" (TLDs). These are the generic TLDs (EDU, COM, NET, ORG, GOV, MIL, and INT), and the two letter country codes from ISO-3166."

As

any possible two-letter combination is eligible to be allocated or reserved in the ISO 3166-1 alpha-2 standard in the future, the working group is strongly encouraged not to consider using these possibilities for other applications. There is a risk of collisions between such allocations, and future ISO-3166 assignments, and in such cases would mean ICANN is unable to grant a ccTLD to a valid country.

IANA

has, since the introduction of the DNS, relied upon the determinations within the ISO-3166 standard to identify what constitutes a country, and what is the appropriate two-letter code for that country. This shields the organisation from making value judgments that would be very political, and instead lets and independent third party decide (the ISO 3166 Maintenance Agency, which is guided by the United Nations Statistics Office). On this matter, RFC 1591 is clear:

"The IANA is not in the business of deciding what is and what is not a country."

The

selection of the ISO 3166 list as a basis for country code top-level domain names was made with the knowledge that ISO has a procedure for determining which entities should be and should not be on that list."

The

ISO-3166 standard is not static, and evolves with changes to countries and their territories. Most importantly, new codes are added for new regions and countries. Just this year "AX", "ME" and "RS" have been new additions. One can assume there will be more changes in the future that we can not predict.

If a conflict is introduced between a newly created ccTLD code, and an allocated gTLD, IANA's neutrality would be compromised. It would either need to deprive a country of a country-code top-level domain, or it would need to stop adhering to the ISO 3166 standard which would be problematic. It would represent a key divergence from

one  
of the most central tenets of ccTLD policy.

9. Email from Chris Disspain to Patrick  
Jones, dated March 4, 2007:

I  
am copying this to the ccNSO members and council lists. Those who wish to  
comment, will you please send your comments to Gabi ([gabriella.schittek@icann.org](mailto:gabriella.schittek@icann.org))  
who will collate them and forward to Patrick.

I  
am unclear as to whether the draft report is intended to deal only with  
reserved names/characters in ASCII and so I'd like to make the following  
general points in respect to reserved names/characters at the top level. I  
believe this issue splits into 2 categories:

gTLDs  
in ASCII - there is, if I understand it correctly, a current prohibition on issuing  
new gTLDs with 2 characters. I imagine the vast majority of the ccTLD community  
would be in favour of this prohibition being retained. Apart from anything  
else, reservation of 2 characters at the top level is the only way of ensuring  
that a new ccTLD code will be available for new territories.

IDNs  
- here is where the problems start. I won't go into details here of the myriad  
challenges of .idn but the issue of reserved names serves to illustrate my  
serious concerns about the GNSO's decision to couple new gTLD policy with IDN  
policy. What is a relatively simple issue for new ASCII gTLDs (see paragraph  
above) becomes a minefield in respect to .idn. This is because there are  
currently no rules and no precedents.

So,  
for example, we could say that all 2 character names at the top level are  
reserved for ccTLD registrations in both ASCII and IDN characters but that  
assumes that new .idn ccTLDs will be limited to 2 characters and that is an  
assumption which cannot be made at this stage. It might end up being the case  
but we can't assume it now.

Further,  
the ccTLD community cannot sensibly create ccTLD .idn policy on an issue by  
issue basis. Reserved names is but one issue of many and whilst we can sensibly  
comment on it in regard to ASCII names we cannot in regard to IDNs.

If  
the report on single and dual characters is intended to cover only ASCII (and  
if that is the case then it needs to say so clearly) then I imagine that you  
will be able to get input from the cc community within a reasonable time. However,  
if it is also intended to cover IDNs the ccNSO will, I suspect, be unable to  
respond at this stage and the matter will need to be placed in the 'further  
time and research' category that you have outlined below.

Finally,

I believe that this situation is not isolated and my response above is likely to arise time and time again with respect to IDNs where there are cc and g crossover issues.

10. GAC Principles and Guidelines for the Delegation and Administration of Country-Code Top Level Domains (5 April 2005)

4.1.2. Every country or distinct economy with a government or public authority recognized in accordance with article 3.8 above should be able to ask for its appropriate country code to be represented as a ccTLD in the DNS and to designate the Registry for the ccTLD concerned.

11. WIPO II Report (Second WIPO Internet Domain Name Process, published 3 September 2001),  
<http://www.wipo.int/amc/en/processes/process2/report/html/report.html>><http://www.wipo.int/amc/en/proces>

19. The ccTLDs are those top-level domains which bear two letter codes essentially derived from the International Organization for Standardization's (ISO) Standard 3166.

**ISO 3166 Country Code Elements**

254. The origin of the codes reflecting country top-level domains is the International Organization for Standardization (ISO). ISO, which was established in 1947 as a non-governmental organization, is a worldwide federation of national standards bodies from 137 countries. Its mission is to promote the development of standardization and related activities in the world with a view to facilitating the international exchange of goods and services, and to developing cooperation in the spheres of intellectual, scientific, technological and economic activity. [244] One of ISO's most famous standards is Part 1 of ISO 3166 concerning codes for the representation of names of countries and their subdivisions. Part 1 of ISO 3166 contains two letter country codes (alpha-2 codes; for example, au for Australia) and three letter country codes (alpha-3 codes, for example, aus for Australia). It is on the basis of the alpha-2 codes that the country code top-level domains (ccTLDs) were created by the Internet Authority for Assigned Names and Numbers (IANA) during the late eighties and early nineties. [245] Since the creation of the ccTLDs, registrations in the country domains have flourished, as the use of the Internet has spread throughout the world. It is expected that the importance of the ccTLDs will continue to grow in the future.

255. A phenomenon concerning ccTLDs that merits attention is the registration at the second level in the gTLDs of the country code elements (for example, *uk.com*). Often these domain names are registered by persons or entities in order to make them available to the public for the registration of names at the third level (for example, *company.uk.com*). [246] The implications of such practices are discussed below.

**ISO 3166 Country Code Elements**

268. The Interim Report recommended the exclusion of the ISO 3166 alpha-2 country code elements from registration as domain names in the new gTLDs, in the absence of an agreement to the contrary from the relevant competent authorities. Furthermore, the Interim Report recommended that persons or entities who have registered such codes at the second level in the existing gTLDs and who accept registrations of names under them should take measures to render the UDRP applicable to such lower level registrations.

269. Several commentators favored the exclusion mechanism proposed in the Interim Report for the ISO 3166 alpha-2 country code elements, [278] while others opposed it. [279] Some of the entities offering the possibility of registrations under the codes in the existing gTLDs have expressed a willingness to adopt the UDRP or a similar procedure, as recommended in the Interim Report.[280] Few administrators of ccTLDs submitted comments on the Interim Report's recommendations in this area. Trademark owners have expressed concerns that the exclusion mechanism proposed in the Interim Report would prevent the legitimate registration of two-letter trademarks or acronyms of trademarks. [281]

#### ***ISO 3166 Alpha-2 Country Code Elements***

290. The Interim Report formulated two recommendations in relation to ISO 3166 country code elements. First, it proposed that these codes be excluded from registration in the new gTLDs, unless the relevant authorities grant permission for their registration. Secondly, it recommended that persons or entities who have registered such codes at the second level in the existing gTLDs and who accept registrations of names under them take measures to ensure that the UDRP applies to such lower level registrations.

291. In connection with the first recommendation, we note that the current version of Appendix K to the Registry Agreements between ICANN and the sponsors and operators of the new gTLDs states that [a]ll two-character labels shall be initially reserved. The reservation of a two-character label string shall be released to the extent that the Registry Operator reaches agreement with the government and country-code manager, or the ISO 3166 maintenance agency, whichever appropriate. The Registry Operator may also propose release of these reservations based on its implementation of measures to avoid confusion with the corresponding country codes. [292]

*Exclusions for ISO 3166 Country Code Elements.* A number of factors, highlighted in the comments and reactions received on the Interim Report, have lead us to re-consider our recommendation that the ISO 3166 alpha-2 country code elements should be excluded from registration as domain names in the gTLDs. These factors are as follows:

- (i) While, on the Internet, the ISO 3166 codes have been associated in particular with country code top-level domains, in the physical world they find broad application and use throughout a wide variety of industries. This is consistent with the

nature and purpose of the standard, which itself states that [it] provides *universally applicable* coded representations of names of countries and that [it] is intended for use *in any application* requiring the expression of current country names in coded form. (*Emphasis added*)[293]

We observe that some of the industries which traditionally have used the ISO 3166 codes to structure themselves in the physical world are migrating some aspects of their operations to the online world, and that this trend may intensify in the future. As they move to the Internet, these industries may wish to rely on the same codes to replicate their structures in the networked environment, including the DNS. Excluding the registration of the ISO 3166 codes as domain names may, under certain circumstances, unfairly hamper those industries in their on-line activities, by establishing an overly exclusive linkage between the codes in question and the country domains.

(ii) Certain ISO 3166 country codes correspond to the acronyms of other identifiers, in particular trademarks. Excluding the codes from registration in the DNS would prevent such other identifiers from being registered as domain names without seeming justification.

292. In light of the above considerations, we no longer subscribe to the view that the ISO 3166 country code elements should be excluded from registration in the new gTLDs under all circumstances. Nonetheless, we remain concerned that, depending on the manner in which these codes are registered and used in the DNS, confusion may be created with the ccTLDs. That being the case, we believe that the proper focus should be on the avoidance of confusion with regard to those codes, rather than on an absolute prohibition of their registration and use.

293. If ISO 3166 alpha-2 country code elements are to be registered as domain names in the gTLDs, it is recommended that this be done in a manner that minimizes the potential for confusion with the ccTLDs.

## **ANNEX THREE -- TAGGED NAMES SUB GROUP REPORT**

### **GNSO new TLDs Committee**

### **Reserved Names Working Group**

### **Sub-Group Report - Tagged Names**

## **DEFINITION**

Tagged Names	All labels with hyphens in both the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")
--------------	--

## EXECUTIVE SUMMARY

1. This Report contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding tagged names.
2. Chuck Gomes and Patrick Jones served as the subgroup for this report.
3. The recommendations of this report were approved by the full RN-WG.
4. There was no disagreement with the recommendations and hence no minority positions.
5. The table below contains the recommendations for ASCII tagged names as well as one recommendation with regard to application requirements for IDN gTLDs. Note that the concept of tagged names is not applicable because only ASCII names are allowed in the DNS.

SoW number (RN-WG 30-day extension SoW)	Reserved Name Category	Domain Name Level(s)	Recommendation
Recommendation task 4	Tagged Names	Top Level ASCII	In the absence of standardization activity and appropriate IANA registration, all labels with hyphens in both the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n") must be reserved in ASCII at the top level.[30]
Recommendation task 4	N/A	Top Level IDN	For each IDN gTLD proposed, applicant must provide both the "ASCII compatible encoding" ("A-label") and the "Unicode display form" ("U-label") [31] For example: <ul style="list-style-type: none"> <li>• If the Chinese word for 'Beijing' is proposed as a new gTLD, the applicant would be required to provide the A-label (xn--1lq90i) and the U-label (北京).</li> <li>• If the Japanese word for 'Tokyo' is proposed as a new gTLD, the applicant would be required to provide the A-label (xn--1lqs71d) and the U-label (東京).</li> </ul>

SoW number (RN-WG 30-day extension SoW)	Reserved Name Category	Domain Name Level(s)	Recommendation
Recommendation task 4	Tagged Names	2 <sup>nd</sup> Level ASCII	The current reservation requirement be reworded to say, " <i>In the absence of standardization activity and appropriate IANA registration, all labels with hyphens in both the third and fourth character positions (e.g., "bq-1k2n4h4b" or "xn--ndk061n") must be reserved in ASCII at the second (2<sup>nd</sup>) level.</i> [32] - added words in italics. (Note that names starting with "xn--" may only be used if the current ICANN IDN Guidelines are followed by a gTLD registry.)
Recommendation task 4	Tagged Names	3 <sup>rd</sup> Level ASCII	All labels with hyphens in both the third and fourth character positions (e.g., "bq-1k2n4h4b" or "xn--ndk061n") must be reserved in ASCII at the third (3 <sup>rd</sup> level) for gTLD registries that register names at the third level." <i>[33] - added words in italics. (Note that names starting with "xn--" may only be used if the current ICANN IDN Guidelines are followed by a gTLD registry.)</i>

## Supporting Information

### 1. Background

All existing ICANN registry agreements as of 25 April 2007 contain the requirement for gTLD registries to reserve all labels with hyphens in the third and fourth positions (e.g., "xn--ndk061n"). This requirement comes directly from the approved technical standards for Internationalized Domain Names (IDNs) (found on the ICANN website at <http://www.icann.org/topics/idn/implementation-guidelines.htm>). Note that this reservation requirement does not specify any domain name level, so it is assumed that it applies to all levels of names registered by a given gTLD registry.

Only ASCII characters are permitted in the Domain Name System (DNS) thereby limiting characters to the letters a-z, the numbers 0-9 and the hyphen-dash (-), the last of which cannot be the first or last character of a domain name. Consequently, to be able to allow representation of domain names in non-ASCII characters, standards were developed in the Internet Engineering Task Force (IETF) that map international scripts to strings of ASCII characters. Those standards require that all ASCII representations of IDNs begin with a 4-character prefix with hyphens in the third and fourth positions.

The current prefix is "xn--". To avoid confusion of IDNs with ASCII names having the same prefix, it is necessary to reserve the "xn--" prefix. Prior to the finalization of the IDN standards, other prefixes were used,

the most recent of which was "bq--". At that time, speculators started registering ASCII names with the "bq--" prefix. To avoid this possibility with future prefixes, it was decided to reserve all prefixes of this form.

It is also important to note that the current prefix might need to be changed in the future. If that happens, confusion will be avoided by the fact that all labels with hyphens in the third and fourth positions are reserved.

For further information regarding IDNs, please refer to the ICANN Internationalized Domain Names (IDN) information area: <http://www.icann.org/topics/idn/>.

## 2. Rationale for the recommendations

The role of the tagged name reservation requirement is to be able to provide a way to easily identify an IDN label in the DNS and to avoid confusion of non-IDN ASCII labels. Implicit in this role is the need to reserve tagged names for future use in case the ASCII IDN prefix is changed.

The rationale for the recommendations of tagged ASCII names then is to avoid user confusion that

The reason for recommending that applicants for IDN gTLDs be required to provide both the A-label]

## 3. Consultation with experts

The Tagged Name Subgroup relied on the advice of Ram Mohan (Chair of the GNSO IDN Working Group, Member of the ICANN President's IDN Committee, and Member of the ICANN IDN Guidelines Working Group), Cary Karp (Member of the GNSO IDN Working Group, Member of the ICANN President's IDN Committee, and Member of the ICANN IDN Guidelines Working Group) and Tina Dam (ICANN IDN Program Director) as experts and did not believe that additional expert consultation was needed for the topic of tagged name reservations. On 1 March 2007 a full WG consultation with Ram, Cary and Tina was held to assist in the finalization of reports for other reserved name categories with regard to IDNs.

The following questions were asked of Ram and Tina:

Would it be possible to only reserve a subset of the tagged names of the form character-character-dash-dash instead of all 1296 variations?

If so, how big a subset would be needed?

Would we need feedback from the technical community in this regard?

If so, who do you think we should contact in that regard?

Here is Ram's response:

"The IETF has defined "xn--" for IDNA, as you know. It is safe to say that questions of defining a subset of the available CCHH range should definitely be run by the IAB, with a note sent to the IAB Chair (Leslie).

"To your question regarding how big a subset would be "needed", the fact is that all CCHH names are restricted so that we don't have charlatans who sell unwitting customers some other CCHH name(s) that will absolutely not work with the existing technical protocols for resolving IDN names worldwide. Therefore, my sense is that it is much safer to restrict all CCHH combinations than to allow just a few, because the end-user is just not going to be able to tell the difference between a legitimate IDN name and an illegitimate one."

Here is Tina's response:

". . I agree with Ram. There is no reason currently to believe that the xn prefix will change but I still think it might be a good pre-caution to keep all labels with "--" in third and fourth place reserved.

One additional comment. The reservation of these kinds of labels must include a process for allowing such reserved labels to be registered (at the time where internationalized top level labels are available for registration) and possible some reference to the Unicode version of that label (following the IDNA protocol) is reserved as well. The latter is to make sure that both the stored and displayed names are reserved together. More specific and clear terminology for the stored/displayed label will come for the protocol revision work. As soon as this is available I will send you another note for potential inclusion in the RN-WG work."

Numerous exchanges occurred involving Tina and Ram to clarify Tina's suggestion regarding Unicode versions of labels. Rather than pasting all of the email (the full mail archive is found at <http://forum.icann.org/lists/gnso-idn-wg/>), we report that the basic suggestion is that, for any IDN gTLDs that are proposed, the applicant should be required to provide the "ASCII compatible (ACE) form of an IDNA valid string" representations along with the corresponding Unicode representation to ensure that there is a one-to-one mapping between the "ASCII compatible (ACE) form of an IDNA valid string" and Unicode representations.

Tina also reported that clearer terminology will come from the protocol revision group and suggests that all IDN related WGs incorporate this terminology. It is expected that the protocol revision, soon to be released, will likely recommend against the use of the term "punycode string" and instead recommend the use of "ASCII compatible (ACE) form of an IDNA valid string". She went on to clarify that "an IDNA valid string is a string that fulfills the requirements of the IDNA protocol" and noted that "the protocol document goes into further details of what this means". She suggested using the following term: "ASCII compatible (ACE) form of an IDNA protocol valid string". Finally, she stated that under the revised protocol, "Every ACE label will begin with the IDNA ACE prefix, 'xn--'."

#### 4. Summary of Relevant Information Sources

##### a. ICANN Registry Agreement Requirements

All 16 existing gTLD registry agreements posted on ICANN's website as of 2 February 2007 (.aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel) contain the following requirement<sup>[34]</sup>

Except to the extent that ICANN otherwise expressly authorizes in writing, the Registry Operator shall reserve names formed with the following labels from initial (i.e. other than renewal) registration within the TLD:

**C. Tagged Domain Names.** All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n").

**ICANN also has ccTLD Sponsorship Agreements and MOUs in place with 12 ccTLD managers.<sup>[35]</sup> Each of those agreements contains the following requirement on tagged names:**

4. Tagged Domain Names. In addition, domain names in the Delegated ccTLD (excluding sub-domain names under domains registered to third parties) having labels with hyphens in the third and fourth character positions (e.g., "rq--1k2n4h4b") are reserved from initial (i.e. other than renewal) registration, except as authorized by ICANN policy or by written exception from ICANN.<sup>[36]</sup>

- b. RFC 3490 (found at <http://www.faqs.org/rfcs/rfc3490.html>), Internationalizing Domain Names in Applications (IDNA)[37]

- c. RFC 3492, Punycode: A Bootstring encoding of Unicode for Internationalized Domain Names in Applications (IDNA), March 2003[38]

The Introduction of this RFC says the following:

"[IDNA] describes an architecture for supporting internationalized domain names. Labels containing non-ASCII characters can be represented by ACE labels, which begin with a special ACE prefix and contain only ASCII characters. The remainder of the label after the prefix is a Punycode encoding of a Unicode string satisfying certain constraints. For the details of the prefix and constraints, see [IDNA] and [NAMEPREP]."

- d. GNSO Preliminary Issues Report Policy Issues relating to IDN at the top-level, 28 May 2006[39]

An introduction of PUNYCODE is provided in this document:

"Punycode is a bootstring encoding that will convert the local characters in a domain name into the limited character set that is supported by the DNS. The encoding is applied to each component of a domain name and a prefix 'xn--' is added to the translated Punycode string. For example, the first component of the domain name rødgrødmedfløde.dk becomes 'xn--rdgrdmedfide-vjbdg', and the domain will be represented as xn--rdgrdmedfide-vjbdg.dk. This kind of encoding would apply for top-level labels with characters from non-Latin scripts."

- e. Informational RFC 4690, Review and Recommendations for Internationalized Domain Names (IDNs), September 2006[40]

The following excerpt relates to the possibility of the need to change the Punycode prefix:

"It is worth noting that sufficiently extreme changes to IDNA would require a new Punycode prefix, probably with long-term support for both the old prefix and the new one in both registration arrangements and applications. An alternative, which is almost certainly impractical, would be some sort of "flag day", i.e., a date on which the old rules are simultaneously abandoned by everyone and the new ones adopted. However, preliminary analysis indicates that few, if any, of the changes recommended for consideration elsewhere in this document would require this type of version change. For example, suppose additional restrictions, such as those implied above, are imposed on what can be registered. Those restrictions might require policy decisions about how labels are to be disposed of if they conformed to the earlier rules but not to the new ones. But they would not inherently require changes in the protocol or prefix."

- f. Internet Draft, Proposed Issues and Changes for IDNA - An Overview, October 16, 2006[41]

Section 5, The Question of Prefix Changes, says the following:

"The conditions that would require a change in the IDNA "prefix" ("xn--" for the version

## ANNEX FOUR -- NIC/WHOIS/WWW SUB GROUP REPORT

### GNSO new TLDs Committee

### Reserved Names Working Group

### Sub-Group Report - NIC, Whois, www

## DEFINITION

NIC, Whois & www

Names reserved for registry operations at the second-level

## EXECUTIVE SUMMARY

1. This Report contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding Names Reserved for Registry Operations, NIC, Whois and www.
2. Tim Denton served as a one-person subgroup for this category with support from Chuck Gomes and ICANN staff in the preparation of the final subgroup report.
3. The recommendations of this report were approved by the full RN-WG.
4. There was no disagreement with the recommendations and hence no minority positions.
5. The table below contains the recommendations for Names Reserved for Registry Operations, NIC, Whois and www.

SoW number (RN-WG 30-day extension SoW)	Reserved Name Category	Domain Name Level(s)	Recommendation
Recommendation task 5	NIC, Whois, www	Top level, ASCII	The following names must be reserved: NIC, Whois, www.
Recommendation task 5	NIC, Whois, www	Top level, IDN	Do not try to translate NIC, Whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist.

<b>SoW number</b> (RN-WG 30-day extension SoW)	<b>Reserved Name Category</b>	<b>Domain Name Level(s)</b>	<b>Recommendation</b>
Recommendation task 5	NIC, Whois, www	2 <sup>nd</sup> level, ASCII	The following names must be reserved for use in connection with the operation of the registry for the Registry TLD: NIC, Whois, www. Registry Operator may use them, but upon conclusion of Registry Operator's designation as operator of the registry for the Registry TLD, they shall be transferred as specified by ICANN.
Recommendation task 5	NIC, Whois, www	2 <sup>nd</sup> level, IDN	Do not try to translate NIC, Whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist, except on a case by case basis as proposed by given registries.
Recommendation task 5	NIC, Whois, www	3 <sup>rd</sup> level, ASCII	For gTLDs with registrations as the third level, the following names must be reserved for use in connection with the operation of the registry for the Registry TLD: NIC, Whois, www. Registry Operator may use them, but upon conclusion of Registry Operator's designation as operator of the registry for the Registry TLD, they shall be transferred as specified by ICANN.
Recommendation task 5	NIC, Whois, www	3 <sup>rd</sup> level, IDN	For gTLDs with registrations at the third level, do not try to translate NIC, Whois and www into Unicode versions for various scripts or to reserve any ACE versions of such translations or transliterations if they exist, except on a case by case basis as proposed by given registries.

## Supporting Information

### 1. Background

In all gTLD registry agreements as of 25 April 2007, the following three names are reserved for use in connection with the operation of the registry for the Registry TLD.

NIC

Whois

www

All 16 of the current gTLD registry agreements prohibit these from being used by any other gTLD registry at the second-level: .aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel.

Fourteen (14) out of 16 agreements have a successor rights clause that specifies that the Registry Operator may use them, but upon conclusion of the Registry Operator's designation as operator of the registry for the Registry TLD, they shall be transferred as specified by ICANN. These include the following 14 agreements: .aero, asia, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .pro, .tel and .travel. The successor rights clause does not appear in the cases of: .biz, .org.

Names	Registries affected	Successor Rights clause not found in	Who may use the names
NIC Whois www	.aero, asia, .biz, .cat, .com, .coop, .info, .jobs, .mobi, .museum, .name, .net, .org, .pro, .tel and .travel	.biz, .org	Only the registries in question, no one else

In the course of the work, the question arose whether to reserve `html`, `http` and `https`. That issue is dealt with in the report on ICANN and IANA reserved names. Because the names which this report addresses (NIC, Whois, www) are for registry operational uses and because there does not seem to be any identified registry operational need for `html`, `http` and `https`, it is not recommended that `html`, `http` and `https` be added to this category.

## 2. Rationale for the recommendations

The rationale for the reservation of these ASCII names below the top level for use by registry operators is based upon long standing and well established use of these strings by registry operators (both gTLDs and ccTLDs) in connection with normal registry operations.

At the top level, use of NIC, Whois or www could possibly cause user confusion with regard to uses of the same names below the top-level by certain registry operators. In the case of Whois at the top level, if there ever was a centralized or universal Whois service, the use of a 'Whois' top level domain would seem to be a natural TLD for that use. In the case of www at the top level, there could possibly be confusion at the application level with regard to URLs that often include www.

Regarding the IDN implications of these three names, there are two primary reasons why no general reservation requirement is recommended: 1) these names are "integral designators" in Internet usage and as such were never intended to be used with translation; 2) in many scripts, it is difficult or impossible to translate or transliterate acronyms or unique strings. In cases where it is possible to find translated or transliterated versions of NIC, Whois or www, the applicable registry operators could reserve such IDN names on a case-by-case basis.

## 3. Consultation with experts

Three kinds of questions arose in connection with these names: 1) Why is there a difference in the reservation of names for .biz and .org (successor rights clause)? 2) Based on general principle, should these

names be reserved? 3) Should IDN versions of the names be reserved? Each of these questions is discussed in the subsections below.

### 3.1 Successor rights clause

The successor rights clause does not appear in the registry agreements of .biz and .org. Upon inquiry of Jeff Neuman, Senior Director, Law and Advanced Systems, of NeuStar, operator of .biz, he replied:

"To tell you the truth, we did not focus on this exhibit at all during the renegotiation and did not realize that this was any different than the other operators. Any deviation from the original 2001 agreement we signed was inadvertent and missed by both us and ICANN during the renegotiations."

David Maher, Senior Vice President, Law and Policy, of the Public Interest Registry, wrote as follows:

"The answer appears to be that these second level names are in use. They were registered before there was a policy limiting their use. If the registrations were ever terminated, then they would become reserved."

### 3.2 Reservations of these names in principle

The official contact people within top-level and country code registries were consulted via email and in one case by telephone. Responses were received from representatives of .aero, .org, .name, .travel, .biz, .museum and .jobs.

David Maher of .org responded: "Yes, the names should be kept reserved."

Marie Zitkova of .aero responded as follows:

1) As a registry, do you wish to keep those names reserved?

"Yes, these names are traditionally used by TLDs to designate specific functions key to the operation of registry and it makes sense for ICANN to maintain a certain standard across the board."

2) If they were not reserved, what actions would you take to protect your interests in those names?

"I am not sure I understand the question. First, these names were reserved from day 1 so no such question ever came up and it cannot come up anymore because the names are in use.

"Second, I certainly do not understand what is implied by 'our interest' in those names. We are not talking about trade names or trademarks. Surely, the reservation above was mandated not because of an interest of any individual sponsor or registry operator but because it makes sense for the entire system of TLDs to have some minimum level of predictability to locate elementary functions associated with the operation of the TLD.

"Third, and that is answering the very hypothetical question what would happen before the launch of our TLD if these three names were not reserved by ICANN. We are a Sponsor of a sponsored TLD, availability of names and eligibility criteria for the registration would be determined by the policies set by the Sponsor in consultation with the sponsored community and in the best interests of the aviation community, same process as we follow in all other cases, and the Registry Operator would implement those policies upon the request from the Sponsor."

Hakon Haugnes of .name responded:

"1) Yes, they are in use and are expected to exist by the community.

2) They are in use by the Registry so I guess that would be protection enough. It would be silly to have to defend them under UDRP, for example. We believe, though, that they belong to the Registry and not to the Company, of course.

"I must admit I am not fully aware of the work of the WG, but what would be the purpose of not making them reserved?"

Cherian Mathai of .travel was reached by telephone. When asked whether he wanted those three names reserved, he responded "yes".

Eric Brown of .biz responded as follows:

"1. We believe that NIC and WHOIS should remain reserved. They are used to denote functionality to the .BIZ registry. For example, if one types in WHOIS.BIZ, they will be taken to our official WHOIS website for .BIZ domain names. In addition, with respect to NIC.BIZ, this is essential to keep reserved as well. This is because there are a number of people that do not know who a particular registry operator is and therefore have no way to get to the official registry site. NIC.TLD is important because it is a predictable place that one could (and should) always go when they know the TLD, but not the operator.

"2. It is not that we believe we have some sort of intellectual property rights in the names so there are no actions we would take to protect it from an IP perspective. However, to not reserve these names (at least NIC and WHOIS), would cause confusion among consumers looking for the official WHOIS database of the TLD or looking for the official website of the registry (when they do not know the name)."

Cary Karp of .museum responded as follows:

1) As a registry, do you wish to keep those names reserved?

". . . in my conceptual frame of reference, reservation places constraints on the circumstances under which a name may be registered. By definition, the reservation is terminated (or suspended, if you'd prefer) when that registration takes place. If such name should subsequently ever be removed from the DNS it could be placed back on the reserved list. In the hope that it properly answers your question, that is what I would intend to happen with the labels NIC, Whois, and www if they are ever removed from the .museum zone."

2) If they were not reserved, what actions would you take to protect your interests in those names?

"If they had not been reserved we would have protected our interests in them by registering them in precisely the manner that we have."

Ray Fassett of .jobs responded as follows:

1) As a registry, do you wish to keep those names reserved?

"Before I can answer this question, I must qualify how I define a reserved name: A name that is prohibited to be allocated by the TLD operator to a third party of the contract.

"I believe it is appropriate for the names *www*, *NIC*, and *Whois* to be prohibited from allocation by the TLD operator to a third party of the contract."

2) If they were not reserved, what actions would you take to protect your interests in those names?

"I believe an interest - or expectation - from the user community has evolved for these 3 names more so than an 'interest' to us as the TLD operator in need of 'protecting'. Given the hypothetical nature of this question, the best I can answer would be an action felt to be in the best interests of the HR Community, consistent to the mission of *.jobs*."

It is likely that these names could be removed from the reserved list by negotiation between each registry and ICANN, if they thought this was to their respective advantages. Second, the fact that these names were not in contention suggests that the reservation of these names is not controversial.

To generalize from a few respondents, it appears that country codes are rather freer to follow less consistent policies. Michael Haberler of *.at* wrote:

"What we did in the past is register 'interesting' (which might be contentious if held by the wrong party) names like *www.at*, *internet.at* etc. on trustworthy registrants, like ourselves, or the ISP association. We do register others for our own purposes or likely fields of activity. But conceptually that's just a registration, not a reservation. We had the issue come up with registrars bitching about it and I just told them that we reserve the right to acquire names for our own purposes, and that's it, period."

Sabine Dolderer (representing *.de* at the time) responded as follows:

1) Does *.de* have reserved names?

"We have only some minor restrictions for domains which could not be registered but that are no real reservations. They are:

- No domain name with less than 3 characters is allowed
- No domain name which is equal to an existing TLD is allowed (actually only *com/net/org/edu/int*) because of problems related to RFC1535
- No domains which are equal to local community car plate numbers are allowed. This is done because when the rule was created it was unclear if one would need a future structuring mechanism."

2) Does it reserve */NIC*, *www/*, and or */Whois/*?

"No."

3) Does it give a reason for these reservations, if it has them?

"The reason for reserving 2-character and existing TLDs is because of problems with TLD.TLD as described in RFC 1535. Car plate numbers were reserved because of the potential structuring issue. The reasons are no longer really valid but most have 1- or 2-character abbreviations."

Canada's Bernard Turcotte wrote back in relation to *.ca* that these names are not reserved in the case of CIRA, but that, on reflection, he thought they ought to have been reserved.

A more systematic process of consultation with country code operators might enlighten us about their practices but would not be directly pertinent to whether the three names should be reserved at the generic TLD level.

### 3.3 Consultations with IDN experts

Regarding the IDN implications of these three names, both Cary Karp and Ram Mohan were consulted in a teleconference call held on March 1, 2007. The advice received was that these names were "integral designators" to be used "without translation". In other words, there was no need to reserve these strings in other languages. Ram Mohan suggested "Find the equivalent and reserve them at that time" and added "Don't try to translate them", referring to the acronyms and/or abbreviations."

## 4. Summary of Relevant Information Sources

The primary source of information for this category of reserved names is the set of ICANN-registry agreements, found at <http://www.icann.org/registries/agreements.htm> In particular refer to the Schedule of Reserved Names appendix for each agreement (Appendix 6 in most cases).

There do not appear to be any documented rationales or explanations.

## ANNEX FIVE -- GEOGRAPHICAL AND GEOPOLITICAL NAMES SUB GROUP REPORT

### GNSO new TLDs Committee

### Reserved Names Working Group

### Sub-Group Report

### Geographic and Geopolitical Names

10 May 2007

## DEFINITIONS

Geographical Names	Geographical names refer to those names in the ISO 3166-1 list (e.g., Portugal, India, Bra: China, Canada) & names of territories, distinct geographic locations (or economies), and other geographic names as ICANN may direct from time to time.
Geopolitical Names	The reserved name category titled 'Geographic and Geopolitical Names' is contained in a subset of existing ICANN registry agreements. Geopolitical names is a term that has not been widely used within the broader geographical identifier discussion. In fact, the term is only used once in a parenthetical in the entire WIPO II Process final report. See <a href="http://www.wipo.int/amc/en/processes/process2/report/html/report.html">http://www.wipo.int/amc/en/processes/process2/report/html/report.html</a> Paragraph 55.

## EXECUTIVE SUMMARY

1. This Report contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding Geographical and Geopolitical Names
2. The Reserved Names Working Group on Geographical and Geopolitical Names was composed of Alistair Dixon, Caroline Greer, Michael Palage, and Tim Ruiz.

3. The Working Group on Geographical and Geopolitical Names reached unanimous agreement on the recommendations in this report.
4. There was no disagreement with the recommendations and hence no minority positions.
5. The table below contains the consensus recommendations for Geographic and Geopolitical Reserved Names.

<b>SoW number</b> (RN-WG 30-day extension SoW)	<b>Reserved Name Category</b>	<b>Domain Name Level(s)</b>	<b>Recommendation</b>
Recommendation task 6	Geographical	Top Level (ASCII and IDN)	<p>There should be no geographical reserve names (i.e., no exclusionary list, no presumptive right of registration, no separate administrative procedure, etc.). The proposed challenge mechanisms currently being proposed in the draft new gTLD process would allow national or loc governments to initiate a challenge, therefore no additional protection mechanisms are needed. Potential applicants for a new TLD need to represent that the use of the proposed string is not a violation of the national laws in which the applicant is incorporated.</p> <p>However, new TLD applicants interested in applying for a TLD that incorporates a country, territory, or place name should be advised of the GAC principles, and the advisory role vested in it under the ICANN bylaws. Additionally, a summary overview of the obstacles encountered by previous applicants involving similar TLDs should be provided to allow an applicant to make an informed decision. Potential applicants should also be advised that the failure of the GAC, or an individual GAC member, to file a challenge during the TLD application process, does not constitute a waiver of the authority vested in the GAC under the ICANN bylaws.</p>

SoW number (RN-WG 30-day extension SoW)	Reserved Name Category	Domain Name Level(s)	Recommendation
Recommendation task 6	Geopolitical	All Levels (ASCII and IDN)	The term 'geopolitical names' should be avoided until such time that a useful definition can be adopted. The basis for this recommendation is founded on the potential ambiguity regarding the definition of the term, and the lack of any specific definition of it in the WIPO Second Report on Domain Names or GAC recommendations.
Recommendation task 6	Geographical	Second Level & Third Level if applicable	<p>The consensus view of the working group given the lack of any established international law on the subject, conflicting legal opinions, and conflicting recommendations emerging from various governmental fora, the current geographical reservation provision contained in the sTLD contracts during the 2004 Round should be removed, and harmonized with the more recently executed .COM, .NET, .ORG, .B and .INFO registry contracts. The only exception to this consensus recommendation is those registries incorporated/organized under countries that require additional protection for geographical identifiers. In this instance, a registry would have to incorporate appropriate mechanisms to comply with their national/local laws.</p> <p>For those registries incorporated/organized under the laws of those countries that have expressly supported the guidelines of the WIPO Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications as adopted by the WIPO General Assembly, it is strongly recommended (but not mandated) that these registries take appropriate action to promptly implement protections that are in line with these WIPO guidelines and are in accordance with the relevant national law of the applicable Member State.</p>

### Supporting Information

## 1. Background

Geographic and geopolitical domain name reservations are a relatively new class of reservations that were first incorporated into the ICANN registry contracts in connection with the 2004 sTLD round. However, the genesis for this type of reservation can be specifically tracked back to ICANN Board resolution 01-92[43] involving issues surrounding the rollout of the .INFO gTLD. This topic has also received significant attention in other International fora, most notably the World Intellectual Property Organization's Second WIPO Internet Domain Name Process (hereinafter WIPO II Process).[44] As the WIPO II Process accurately notes, "[t]his is a difficult area on which views are not only divided, but also ardently held." [45]

It is important to note at the outset that "geopolitical" domain name reservations is a term that has not been widely used within the broader geographical identifier discussion. In fact, the term is only used once in a parenthetical in the entire WIPO II Process final report.[46] Given the lack of any legal construct involving the term geopolitical domain names, it is most prudent to use the terminology contained in the WIPO II Process final report as a framework for discussion. Specifically, geographical identifiers should serve as an umbrella term that includes not only country names, but names of places within countries[47], geographical indications[48], and names of indigenous peoples[49].

The first action by ICANN to affirmatively seek protection for this class of names was in connection with ICANN Board Resolution 01-92. This action was taken by the ICANN Board in response to the 9 September 2001 Government Advisory Committee (GAC) communiqué[50] sent by Dr. Paul Twomey acting in his capacity as GAC Chair which states in relevant part:

**A.** The GAC confirmed that this is an issue of considerable political importance and complexity that merits thorough study by qualified and competent experts. The issue also relates to the overall taxonomy of the DNS and its evolution concerning the expansion of the TLD space.

**B.** ...

**C.** The GAC notes that the issue of geographical and geopolitical names is very complex and the subject of ongoing international discussion. Without prejudice to any future discussions, general policy or international rules in this area, and considering the very special nature of *.info*, and problems that have become apparent with the registration of such names in the sunrise period, the GAC agreed that interim *ad hoc* measures should be taken by ICANN and the Registries to prevent avoidable conflicts in *.info*. The GAC agreed that the use of names of countries and distinct economies as recognized in international fora as second level domains in the *.info* TLD should be at the discretion of the respective governments and public authorities.

It is important to note that GAC communiqué was limited to just the .INFO top-level domain (TLD) citing "the very special nature" of that TLD. Also noteworthy is the fact that none of the other six proof of concept TLDs had formerly launched.[51]

Notwithstanding the narrow construct of the GAC communiqué and the corresponding board action, the new registry contract language resulting from the 2004 sTLD round included several provisions dealing with geographic and geopolitical names which are summarized below.

**E. Geographic and Geopolitical Names.** All geographic and geopolitical names contained in the ISO 3166-1 list from time to time shall initially be reserved at both the second level and at all other levels within the TLD at which the Registry Operator provides for registrations. All names shall be reserved both in English and in all related official languages as may be directed by ICANN or the GAC.

**NOTE: This is the exact provision contained with the .ASIA registry contract. The other 2004 sTLD registry contracts (.CAT, .JOBS, .MOBI, .TEL and .TRAVEL include**

**the same language with the exception of "as may directed by ICANN or the GAC" which has been excluded in these contracts. There is no such corresponding provision in the .AERO, .BIZ, .COM, .COOP, .INFO, .MUSEUM, .NAME, .NET, .ORG or .PRO registry contracts.**

In addition, Registry Operator shall reserve names of territories, distinct geographic locations, and other geographic and geopolitical names as ICANN may direct from time to time. Such names shall be reserved from registration during any sunrise period, and shall be registered in ICANN's name prior to start-up and open registration in the TLD. Registry Operator shall post and maintain an updated listing of all such names on its website, which list shall be subject to change at ICANN's direction. Upon determination by ICANN of appropriate standards and qualifications for registration following input from interested parties in the Internet community, such names may be approved for registration to the appropriate authoritative body.

**NOTE: This is the exact provision contained with the .ASIA registry contract. The other 2004 sTLD registry contracts (.CAT, .JOBS, .MOBI, .TEL and .TRAVEL include the same language but "geographic locations" is replaced by "economies". There is no such corresponding provision in the .AERO, .BIZ, .COM, .COOP, .INFO, .MUSEUM, .NAME, .NET, .ORG or .PRO registry contracts**

## 2. Rationale for the recommendations

As noted above in the WIPO II report, "[t]his is a difficult area in which views are not only divided, but also ardently held."<sup>[52]</sup> Therefore, this subgroup undertook a very cautious approach to ensure that "there is a solid and clear basis in existing international law which can be applied so as to prevent erosion of the integrity of geographical indicators and enhance the creditability of the DNS."<sup>[53]</sup>

The work of this subgroup began with a review of this subgroup's previous work and the final GAC Principles Regarding New gTLDs, specifically Paragraph 2.7 that states in relevant part:

Applicant registries for new gTLDs should pledge to:

A) Adopt, before the new gTLD is introduced, appropriate procedures for blocking, at no cost and upon demand of governments, public authorities or IGOs, names with national or geographic significance at the second level of any new TLDs.

B) Ensure procedures to allow governments, public authorities or IGOs to challenge abuses of names with national or geographic significance at the second level of any new gTLD.

In reviewing this GAC principle, the subgroup was concerned about the apparent "rights in gross" that the principle seems to imply in connection with geographic identifiers. This concern was based on several factors. First, the GAC provided no legal basis for their claim. Second, per se rights in gross regarding geographical identifiers were specifically considered in the WIPO II report, but not adopted.<sup>[54]</sup> Third, the GAC principle on its face appears to be inconsistent with the recommendations of the WIPO General Assembly that conducted a multi-year and detailed international consultation on this exact topic. Finally, some of the legal decisions involving geographical identifiers and domain names appear to support the statements in the WIPO II report that concluded that "we have reached the limits of what can be **achieved legitimately** through consultation processes, such as the WIPO Internet Domain Name Processes or any similar ICANN processes." (emphasis added).<sup>[55]</sup>

### Lack of International Legal Authority Cited in the GAC Principles:

In response to the lack of authority cited in the GAC Principles, the subgroup submitted through ICANN staff a list of questions (see Section 3 below) seeking to understand the international legal authority upon which

the GAC Principles were based. While we recognize that the short turn around would likely limit any in-depth response to our inquiries, upon the finalization of this report, no responses had been received.

In the absence of any response from the GAC, the subgroup revisited the comprehensive work of the WIPO on this subject matter, with particular attention focused on the legal treaties that member states have entered into. There are four treaties that provide "a well established framework for the prohibition of the misuse of geographical identifiers at the international, regional and national levels."<sup>[56]</sup> These treaties are the Paris Convention for the Protection of Industrial Property (Paris Convention), to which 162 States are party; the Madrid Agreement for the Repression of False or Deceptive Indications of Source on Goods (the Madrid (indications of Source) Agreement), to which 33 States are party; the Lisbon Agreement for the Protection of Appellations of Origin (the Lisbon Agreement), to which 20 States are party; and the Agreement on Trade-Related Aspects of Intellectual Property Rights (the TRIPS Agreement), which has 142 Contracting Parties.<sup>[57]</sup>

This international framework of protection for geographical identifiers consists of two elements: (i) a prohibition of the false descriptions of the geographic source of goods; and (ii) a more extensive set of rules prohibiting the misuse of one class of geographic source indicators, known as geographic indicators."<sup>[58]</sup>

The first element that prohibits the use of false indications of geographical source **on goods** is established in three treaties: the Paris Convention; the Madrid Agreement, and the TRIPS Agreement.<sup>[59]</sup> However, the scope of this protection is primarily limited to goods, and does not extend to services. The WIPO II Report expands upon other potential considerations limiting the extension of these treaties to cover the false use of geographical identifiers in the DNS.<sup>[60]</sup>

With regard to the second element relating to a more extensive set of rules prohibiting the misuse of geographical indications, one needs to refer to Article 22.1 of the TRIPS Agreement that prohibits:

(a) The use of any means in the designation or presentation of a good that indicates or suggests that the good in question originates in a geographical area other than the true place of origin in a manner which misleads the public as to the geographical origin of the good;

(b) Any use which constitutes an act of unfair competition within the meaning of Article 10*bis* of the Paris Convention (1967).

"The essential difference between the rules relating to geographical indications and those relating to false indications of geographical source is that the former place emphasis on a certain quality attached to a limited class of geographical terms, rather than establishing a rule of market behaviors which may be violated through the false use of any geographical term."<sup>[61]</sup>

In reviewing the WIPO II report and these treaties, the subgroup could find no legal basis for the recommendations included in the GAC Principles regarding New TLDs.

#### The Non-Existence of Per Se Rights in Gross with regard to Geographical Indicators:

The proposed GAC Principles call for the new gTLDs to provide for "blocking, at no cost and upon demand of governments, public authorities or IGOs, names with national or geographic significance at the second level of any new TLDs." This could be interpreted to imply a unilateral claim by governments for rights in gross to an undefined universe of names that they themselves are entitled to establish. Such a claim would be unusual and extraordinary because the WIPO II report specifically analyzed the preference and protection for geographical terms per se, and elected not to recognize such claims. Providing any party rights in gross in connection with a specific designation would be inconsistent with fundamental tenets of international trademark law.<sup>[62]</sup>

*GAC Principles Appear on their Face to be Inconsistent with the WIPO General Assembly*

*Recommendations:*

While respecting the authority of the GAC under the ICANN bylaws to provide advice, the subgroup struggled to reconcile the GAC advice with the output of the WIPO multi-lateral consultative processes. Specifically, the GAC provided no underlying legal analysis to support their expansive claim of rights in gross to a yet undefined list of names of national or geographic significance. This was in contrast to the WIPO processes that described in great detail the underlying legal analysis surrounding the issue, and included an extensive record of written submissions of numerous Member States. It is also important to note that the final recommendations of the WIPO General Assembly called for an administrative process to balance a series of factors prior to making a determination if such use was inappropriate, not a per se claim for rights in gross as claimed in the GAC principles.

Balancing these factors, the subgroup elected to recommend the use of the WIPO General Assembly guidelines, for those registries incorporated under the laws of those Member States that voted in favour of these guidelines.

*Conflicting Legal Decisions:*

The lack of a uniform body of international law on this subject can be easily ascertained by a brief review of a number of legal decisions from various national courts that have dealt with this issue. For example, in litigation involving the domain name solingen.info, a German Federal High Court ruled in favour of the city of Solingen. However, in its ruling the court noted the unique nature of .info and distinguished it from other TLDs such as .com, .biz and .pro. This is an important distinction that was also noted in the original GAC 2001 Communiqué that provided the initial foundation for the discussion.

This ruling is in contrast to a recent decision involving French city of Lavallois Perret that filed suit against 1&1 Internet over the domain name lavallois.tv. In this case the Tribunal de grande instance de Nanterre Ordonnance de référé 30 janvier 2007 Commune de Lavallois Perret / Loïc L., 1 & 1 Internet, ruled against the city of Lavallois Perret and they were ordered to pay 1,000 euros and the costs of the action to 1&1.

In response to these types of legal proceedings, domain name registrants have begun to proactively seek redress through the court system. For example, in response to claims by the city of Paris, the domain name owners of paris.com and paris.tv are now suing the city of Paris in the U.S. Federal Court in New York and Virginia respectively.

Another reason for ICANN to carefully consider imposing via contract any consensus policies not based on sound legal principles, is because of the potential litigation risk that it might be exposing registration authorities to, as was the case in the 1&1 litigation. This concern is even more valid as ICANN has been systematically removing from registry contracts the provision that provided registries indemnification from ICANN in connection with consensus policies that they implement.

*Conclusion*

Protection afforded to Geographic indicators is an evolving area of international law in which a one-size fits all approach is not currently viable. The proposed recommendations of this subgroup are designed to ensure that registry operators comply with the national laws under which they are legally incorporated/organized.

3. Expert Consultation

Listed below are the questions that the group asked ICANN staff to submit to WIPO, the GAC and the ccNSO in connection with its work. If and when responses to the questions are received, it is recommended that the New gTLD Committee or the GNSO Council review and consider them in their deliberations.

As of 10 may 2007, no responses were received.

Question #1 to WIPO:

In Francis Gurry's correspondence to ICANN dated 21 February 2003, in Annex 2 Paragraph 7 (iv) states in relevant part that "the protection should be extended to all future registrations of domain names in generic top-level domains (gTLDs)" citing the Summary by the Chair of the SCT dated 15 November 2002. This appears to be a narrowing of the scope of protection originally sought during the second Special Session of the SCT in May 2002, where the chair concluded that "the protection should be extended to all top-level domains, both gTLD and ccTLDs." However, in document WO/GA/30/2, prepared for the WIPO Generally Assembly and dated 7 August 2003, Paragraph 14 cites the original May 2002 report affording protection of country names in both gTLDs and ccTLDs.

Are WIPO Member States seeking protection for country names in just gTLDs as noted in Summary of the Chair dated 15 November 2002, or protection for country names in both gTLDs and ccTLDs as noted in the May 2002 and August 2003 documentation?

## Question #2 to WIPO

If WIPO Member States are only seeking protection for country names in gTLDs, can WIPO point to any interventions or documentation following the May 2002 report that lead to the narrowing of this protection to just gTLDs?

Question #3 to GAC:

Paragraph 2.7 of the GAC Principles regarding New TLDs states:

Applicant registries for new gTLDs should pledge to:

A) Adopt, before the new gTLD is introduced, appropriate procedures for blocking, at no cost and upon demand of governments, public authorities or IGOs, names with national or geographic significance at the second level of any new TLDs.

B) Ensure procedures to allow governments, public authorities or IGOs to challenge abuses of names with national or geographic significance at the second level of any new gTLD.

The scope of this protection on its face appears to represent an expansion of the protection documented through the WIPO Member States in the Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications which calls for the following protection:

- (i) Protection should be extended to the long and short names of countries, as provided by the United Nations Terminology Bulletin;
- (ii) the protection should be operative against the registration or use of a domain name which is identical or misleadingly similar to a country name, where the domain name holder has no right or legitimate interest in the name and the domain name is of a nature that is likely to mislead users into believing that there is an association between the domain name holder and the constitutional authorities of the country in question;
- (iii) Each country name should be protected in the official language(s) of the country concerned and in the six official languages of the United Nations; and
- (iv) The protection should be extended to all future registrations of domain names in generic top-level domains (gTLDs).

Can the GAC provide any basis for the broadened scope of protection they are seeking under Paragraph 2.7 of the GAC Principles regarding New TLDs that call for an absolute right of blocking a country's name while apparently abandoning the SCT recommendations that call for legal determination based on a number of factors.

Question #4 to the GAC:

Can the GAC please attempt to reconcile these two different standards. Specifically, the GAC Principles regarding New gTLDs provide the government with "rights in gross" where as the WIPO General Assembly provides a balancing test including several factors for resolving potential challenges.

Question #5 to the GAC:

Coupled with the fact that this specific principle suggests just a "pledge" (not a mandated requirement) on behalf of new gTLD applicants, would the GAC be in support of mandating that registry operators comply with the national laws under which they are incorporated, similar to that of a ccTLD operator?

Question #6 to the GAC and the ccNSO:

Paragraph 261 of the WIPO II Report cites eight ccTLD administrators that have adopted policies for "excluding the names of places in their countries from registration as domain names, at least under certain conditions." Is the GAC or ccNSO aware of a ccTLD administrator that has provided protection for geographic indicators from another county, if so which ones?

Question #7 to the GAC and the ccNSO:

Is the GAC or ccNSO aware of any ccTLD administrator that has provided the protection sought by the GAC in Paragraph 2.7 of the GAC Principles regarding New gTLDs and if so which ones?

## **ANNEX SIX -- Sub-Group Report - gTLD Strings**

**GNSO new TLDs Committee**

**Reserved Names Working Group**

### **Sub-Group Report - gTLD Strings**

**10 May 2007**

#### **DEFINITION**

gTLD Strings	gTLD strings refer to gTLDs (i.e. .com, .net .org, .mobi) that are reserved from registration at the second level and third level where applicable as a contractual condition (e.g., net.travel, org.jobs, mobi.asia). Reservation is based upon the list contained at <a href="http://data.iana.org/TLD/tlds-alpha-by-domain.txt">http://data.iana.org/TLD/tlds-alpha-by-domain.txt</a>
--------------	--

#### **EXECUTIVE SUMMARY**

1. This Report contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding gTLD reserved names at the second and third level.
2. Ray Fassett, Edmon Chung, and Patrick Jones served as the subgroup for this report.
3. The recommendations of this report were approved by all three of the subgroup members.
4. There were no minority statements from the subgroup members. Minority opinions from individuals from various GNSO constituencies who were not part of the RN-WG are included in Section 3 of this report (Consultation with Experts).
5. The table below contains the recommendation for gTLD reserved names.

SoW number (RN-WG 30-day extension SoW)	Reserved Name Category	Domain Name Level(s)	Recommendation
Recommendation task 8	gTLD Reserved Names	Second & Third Level, IDN (when applicable)	Absent justification for user confusion[63], the recommendation is that gTLD strings should not be reserved from registration for new gTLDs at the second level when applicable at the third level. Applicants for new gTLDs should take into consideration possible abusive uses of existing gTLD strings at the second level of the corresponding gTLD, based on the nature of the gTLD when developing the startup process for their gTLD.

### Supporting Information

#### 1. Background

Language INCLUDED within the main body Registry Agreements for .asia, .biz, .cat, .com, .info, .jobs, .mobi, .net, .org, .travel and .tel (the later modified slightly) states that:

*"Registry Operator shall reserve, and not register any TLD strings appearing on the list of reserved TLD strings attached as Appendix 6 hereto or located at <http://data.iana.org/TLD/tlds-alpha-by-domain.txt> for initial (i.e., other than renewal) registration at the second level within the TLD."*

That particular language is NOT INCLUDED in older TLD Agreements: .aero (2001), .coop (2001), .museum (2001), .name (2001) and .pro (2002) - those TLDs reserve the following names either as per Appendix 11 or Appendix K of their contracts in addition to two letter labels:

- aero
- arpa
- biz
- com
- coop
- edu
- gov
- info
- int
- mil
- museum
- name
- net
- org

pro

## 2. Rationale for the recommendations

Guiding Principle 1: TLD1.TLD2 (e.g., com.travel) has recently been identified as not being a risk to the security and stability of the DNS by an expert technical panel (<http://www.icann.org/registries/rsep/RSTEP-GNR-proposal-review-team-report.pdf>)

Guiding Principle 2: Evidence has not been presented to justify that user confusion would exist as a result of TLD1.TLD2 with the addition of new gTLDs.

Guiding Principle 3: There is market evidence to indicate that TLD1.TLD2 has not resulted in user confusion.

Consultation with ICANN staff identified that this measure was originally put in place by ICANN in order to avoid consumer confusion in relation to 'double' TLD addresses (i.e., TLD1.TLD2 such as com.travel and travel.jobs). For existing gTLDs, reservation of gTLD strings is a contractual condition imposed upon the TLD operator, not a result of ICANN policy development.

As new gTLDs came on board as of 2005, the hyperlink to the IANA list was referenced in the gTLD contract so that there would not be a static list of gTLDs, rather a dynamic list. For contractual compliance, existing registries need to consult this list on an ongoing basis. The goal of the GNSO Dec05 PDP (Introduction of New gTLDs) is to develop an objective process to allow many new gTLDs to exist on the Internet that would have the effect of expanding the IANA list contained at <http://data.iana.org/TLD/tlds-alpha-by-domain.txt>.

The primary reasons for the sub-group recommendation are 1) TLD1.TLD2 has recently been identified as not being a risk to the security and stability of the DNS and 2) The potential risk of user confusion for new gTLDs has been balanced against a) the fact that thousands of combinations have existed for an extended period of time for TLD1.TLD2 (e.g. [www.net.com](http://www.net.com), [www.edu.org](http://www.edu.org), [www.jobs.com](http://www.jobs.com), [www.travel.ca](http://www.travel.ca)) without any documented side effects of user confusion to corresponding gTLD strings and b) the anticipation of many new gTLDs to the root zone (and the timing of new gTLDs to the root zone) poses a scalability issue for the management of this reserved names category. As a result, the basis for a given gTLD reservation in a given gTLD string contained at <http://data.iana.org/TLD/tlds-alpha-by-domain.txt> could become confusing for just about anyone to understand the origin of. Scalability of the gTLD reserved names category comes into question under the assumption that an objective process is in place to admit many new gTLD strings at varying points in time in the coming years ahead.

## 3. Consultation with experts

The sub-group did not feel the need to seek additional technical expert advice for the reason ICANN's RSTEP recently provided its expert opinion that TLD1.TLD2 was not a risk to the security and stability of the DNS as follows:

*"<TLD>.<TLD> combinations are already extremely common, including combinations that seem far more likely to cause problems than two-character SLDs within .name, such as net.uk or de.com. **The review team is not aware of any reports of problems attributed to existing <TLD>.<TLD> combinations**" (emphasis added).*

The gTLD Reserved Name sub-group relied upon additional advice provided by members of ICANN's GNSO constituencies. The primary issue at hand for investigation by the sub-group pertained to the potential risk to user confusion as a result of removing gTLD strings as a reserved names category for future, new TLDs. It is always difficult to gauge potential future risk absent empirical evidence. The sub-group recommendation takes into account that the primary goals of the Dec05 PDP will be achieved, which is a process to introduce many new gTLDs in a manner that is objective and can scale with least amount of subjectivity.

The sub-group took appreciation to the fact that conflicting opinion was in fact the result of the initial work of the gTLD reserved names category (i.e., there was not a clear - or majority view - to the issue of user confusion but instead conflicting views). For this reason, the sub-group - during its extended work - chose the initial approach of challenging the view that user confusion would NOT become the result.

Substantive feedback from GNSO constituency members indicated that the burden of potential user confusion should instead be placed upon those that wish to maintain the status quo of gTLD strings as reserved names. Reasons for this included unfair protectionism for existing gTLD operators, scalability concerns, and unfounded claims for potential user confusion where such have not been shown to exist today. Further investigation by the sub-group of Registry Constituency members found that not all members of the Registry Constituency shared the view of potential user confusion.

In all, members of the Registry, Registrar, and Business Constituency responded to the sub-group's request for feedback. The concern for potential user confusion was voiced the strongest by members of the Registry Constituency - but not an opinion shared by all Registry Constituency members. Also, there was not consistency of opinion based upon whether the Registry Constituency member is sponsored or unsponsored. For example, some sponsored gTLDs felt there would not be a likelihood of user confusion as result of removing gTLD strings as reserved names for future gTLDs while other sponsored gTLDs had the opposite opinion. Likewise, unsponsored gTLDs offered opposite opinions to the issue of potential user confusion.

Feedback from individual members of the Registrar Constituency and Business Constituency supported the notion that there would not be a likelihood of user confusion as the result of TLD1.TLD2 for new gTLDs. Feedback was not received from the IP Constituency, ISP Constituency, and Non Commercial Users Constituency. The subgroup assumed that this indicates the issue is not of material impact to the respective constituency members, including the issue of potential user confusion as a result of removing gTLD strings as reserved names for new gTLDs.

The sub-group examined the GAC Principles regarding New gTLDs ([http://gac.icann.org/web/home/gTLD\\_principles.pdf](http://gac.icann.org/web/home/gTLD_principles.pdf)) and determined that this recommendation did not go against these principles.

The sub-group examined the fact that technical expert opinion recently, and for the first time, cited that TLD1.TLD2 did not pose a threat to the security and stability of the DNS and therefore questioned whether ICANN should be imposing such a reserved names category upon new TLD operators. In this light, the sub-group did take into account ICANN's Core Value 3:

*To the extent feasible and appropriate, delegating coordination functions to or recognizing the polic*

A common thread of all input received by the sub-group is that gTLD strings can be unreserved without known adverse effect to the security and stability of the DNS. A minority opinion surfaced that any such release of gTLD strings in a new gTLD should be upon some 'condition' for the primary reason of avoiding potential user confusion. The minority opinion was unable to justify that user confusion would exist to substantiate the need for conditional release.

The sub-group members reasoned that those in favor of conditional release would have time to document their justification for potential user confusion in the coming months, such as through various public comment periods inclusive with the Dec05 PDP. In consideration of this, the sub-group has noticeably prefaced its recommendation with: "Absent justification for user confusion..."

The sub-group examined the findings of the GNSO Internationalized Domain Names Working Group (<http://gns0.icann.org/drafts/idn-wg-fr-22mar07.htm>), notably 4.1.5 (Limit Variant Confusion and Collision) and 4.1.6 (Limit Confusingly Similar Strings). The sub-group reasoned that SLD.TLD, where SLD is a

different script than TLD, can already exist in a manner that is ICANN compliant (<http://www.icann.org/topics/idn/>).

Comments the sub-group interpreted as in favor of the recommendation are contained below. (Comments in support of the minority opinion to maintain the status quo to reserve gTLD strings for new gTLDs follow after.)

Marie Zitkova, SITA, .aero registry operator:

*Strictly speaking, the current "system" is favoring incumbents, i.e.,*

*aero.com exists but we are not allowed to register com.aero no matter how much the Coleman airport in the US using this airport code may need it.*

*Also it in no way addresses the same situation in ccTLDs, i.e., coop.cc is perfectly acceptable to ICANN although if we are talking consumer confusion, that is much more likely.*

*b) could be confusing if specific rules are not set. I assume that most registries will not know who will register the released name and cannot guarantee how such names would be used once registered so making a registry-registry agreement does not seem to make much sense. If specific rules are set (such as in case of two char names - to implement measure which prevents confusion), this would create additional eligibility requirement and de facto new eligibility policy for some names set for all TLDs. While this is possible, I am not sure about feasibility for all TLDs.*

Pat Kane, VeriSign, com/net registry operator:

*I think that there is a difference in this space for us as to whether we are sponsored or unsponsored gTLDs.*

*From a practical perspective, the com and net registries will likely have the names we are talking about for the future already registered, even if new IDN gTLDs are introduced. So from a consistency approach I believe that there should be no restrictions on unsponsored TLDs. Whereas sponsored TLDs support a specific community or sponsoring organization, a reserved list should be completely up to that sponsored TLD, but should be in line with the mission of the TLD. Some of the categories they may choose may be ISO lists of country codes if they have a geography foundation, SIC codes if they have an industry categorization component, or whatever.*

Keith Drazek, NeuStar, .biz registry operator:

*NeuStar supports recommendation (a) that the reservation requirement be removed from future TLD contracts, and (b) that existing registries are able to release in agreement with each other. Please let me know if you have any other questions.*

Ray Fassett, Employ Media, .jobs registry operator[64]:

*.jobs is not opposed to removing the reservation requirement for two reasons:*

- 1. No technical security or stability issue has been identified for the reservation requirement.*
- 2. The fact that some of the more recent TLD strings have long been released as second level domains in prior released gTLDs. In effect it is different rules for different circumstances that a general user population is not going to understand the origin of.*

Tim Ruiz, Go Daddy registrar:

*I would suggest that this reserved name requirement be dropped for all new gTLDs, and that existing gTLDs be allowed to request these strings to be unreserved and that ICANN would not unreasonably deny such requests.*

*Peter Stevenson, Fabulous.com registrar:*

*I agree with Tim and believe that the reserving of gTLD strings from registration at a second level should be dropped for all new gTLDs.*

*All new gTLDs should be treated the same as each other.*

*I do not believe or know of any adverse affects that would occur from this being dropped.*

Ross Radar, Tucows registrar:

*I don't believe that we need policy in this area at this time. The number of reservations and the size of the "problem" are both small enough that continuing to pursue this in an ad hoc manner between ICANN staff and the registry in question seems appropriate. Until it can be demonstrated that there are security or stability issues, I believe ICANN's policy community should continue to focus its efforts in areas where there is clear harm as a higher priority.*

Mike Rodenbaugh, member of Business Constituency:

*I very much doubt users would be confused to thinking, for example, that jobs.travel must be affiliated with the .jobs registry or that org.jobs must be affiliated with the .org registry. I also think it is an unfair advantage for existing TLD registries to reserve their name at the second level in every new TLD, while new gTLD operators can have no such protection in existing TLDs. Indeed that is the case now with all the 'newer' TLD strings registered in com, net and org. In the world of 1000 TLDs that everyone envisions, this reservation requirement makes no sense and it has not been justified in any way by anyone to date. I think therefore that the WG should recommend it be eliminated, and existing domains reserved on this basis should be released.*

*If this is not the majority opinion, then I would like to make this a minority statement.*

Alistair Dixon, Member of Business Constituency:

*I have similar concerns to Mike: a requirement for permission from the relevant gTLD registry for release of a gTLD string seems to me as much a device to restrict competition as to unreserve names. As was pointed out on the call, gTLD strings are present in many cc domains, e.g., .com.au, .net.nz, .mil.nz, .org.uk, etc. There is certainly no evidence of user confusion with these strings and why there would be with jobs.travel or mobi.net is unclear to me. The RSTEP report seems to confirm this. I would therefore agree with Mike's proposed recommendation that existing names reserved on this basis be released.*

John Berryhill (in part):

*If there is an issue relating to how the strings are used, that is probably outside of the scope of domain name policy per se.*

#### **MINORITY OPINIONS:**

David Maher, PIR, .org registry operator:

*PIR votes to preserve the reserved names provisions (with some conditions for release) as they exist for .ORG, and to maintain a similar reserved names provision for new gTLDs.*

Caroline Greer, mTLD, .mobi registry operator:

*DotMobi agrees with the pre recommendation-i.e., lifting of the requirement if agreement is reached between the relevant Registries and subsequent notification to ICANN.*

Cherian Mathai, Tralliance, .travel registry operator:

*.travel supports the second proposition - to preserve the reservation of gTLD strings for new TLDs.*

*We believe it should continue because otherwise*

*(a) it can lead to confusion as to what a TLD is, and*

*(b) for a sponsored TLD, the name string belongs to a particular community and if it is not reserved it could lead to usage of that string by extraneous elements in a way detrimental to community's TLD.*

*A case in point would be the .travel string promoted by new.net that took the .travel domain name at the third level and started marketing .travel.*

*It took us more than three years and counting at an enormous cost to educate the travel community that new.net's .travel is not a TLD. This is what we referred to as the confusion with regard to what a TLD is. We had to keep on harping the theme that we are the ICANN approved TLD and the other is a third level domain name, even though with the use of the freely downloadable software they were able to confuse the market place and mask itself as a TLD. As the only TLD who had been a victim of new.net we feel that this reservation has a lot of merit.*

*If such an entity can do an end-run on a bonafide TLD at the third-level, imagine what it would be like if the name is available at the second-level in all future TLDs. We do not know whether this is a security and stability issue according to SSAC. But as seen in the case of new.net and also possibly in the future it would lead to confusion and mis-appropriation of domain names under false pretenses. This would make a mockery of the ICANN TLD award process.*

*We are not sure ... that if the reservation of existing TLDs is released, the current and future TLD operators are bound by the name eligibility policies of an existing sponsored TLD. We do not believe that travel.mobi or travel.tel or a future travel.bank will be bound by the name eligibility policies of the global travel community conceived and developed through the .travel sponsor, The Travel Partnership Corporation.*

*True, there is no protection for future TLD strings in existing TLDs. But it is better to limit the damage that could be caused by upstart elements creating confusion and chaos in the domain name marketplace rather than provide them with an "open season".*

Simon Heard, Global Name Registry, .name registry operator:

*.name's supports preserving current practice with certain conditions for release.*

Philip Colebrook, Telnic, .tel registry operator

*Support reservation of gTLD strings with release under certain circumstances.*

Edmon Chung, dotASIA, .asia registry operator:

*I do not quite understand the point about restriction of competition. This particular whole process for creating new gTLDs creates competition for registries, which I do not find any problem with. I personally do think that it is a sensible idea to caution new gTLDs on the release of names that correspond to other TLDs. That is no different than cautioning new gTLDs on releasing names that have some form of registered prior right that may or may not be confusing given a particular TLD.*

*What I am suggesting I think makes sense in a way that would caution new TLD operators that it is important to take into consideration the other TLDs when you allocate these names. As mentioned, the idea is that consent be sought from existing registry operator for which must not be unreasonably withheld. For example, it is unreasonable to withhold such consent due to anti-competition reason.*

*So I don't quite understand the issue with restricting competition.*

*The other part about managing the process, well even at the 1000 gTLDs level, I do not think it will be overly burdensome if these names required such a consideration. Again, back to the point that giving some consideration and not prevention is important in my mind.*

*Furthermore, before we get to that volume, I am sure many other policies have to be revised as well... and this would not be on top of the list I feel.*

Marcus Faure, CORE registrar:

*While I can see that damage has already been done, this should not mean we deliberately increase the level of damage. The cc.com business relies on confusing users and leaves them in the hands of a commercial institution with no oversight; hence I see this as counterproductive to the development of the DNS. I therefore suggest to stay with the current restrictions and moreover ask to have the effect of cc.com registrations on us investigated.*

*I do not have a problem with a company using tld.com for their own website. I do have a problem with a "registrar" offering 3rd level registrations under tld.com, especially if they tell you that this is the way the internet is structured, and the reason it is structured like that is because they have a good deal with [insert name of big icann registrar].*

*This may not be within our scope, but if I were king I'd rule this out.*

#### 4. Summary of Relevant Information Sources

##### h. ICANN Registry Agreement Requirements

Language INCLUDED within the main body Registry Agreements for .asia, .biz, .cat, .com, .info, .jobs, .mobi, .net, .org, .travel and .tel (the latter modified slightly) states that:

*"Registry Operator shall reserve, and not register any TLD strings appearing on the list of reserved TLD strings attached as Appendix 6 hereto or located at <http://data.iana.org/TLD/tlds-alpha-by-domain.txt> for initial (i.e., other than renewal) registration at the second level within the TLD."*

That particular language is NOT INCLUDED in older TLD Agreements: .aero (2001), .coop (2001), .museum (2001), .name (2001) and .pro (2002) - those TLDs reserve the following names either as per Appendix 11 or Appendix K of their contracts in addition to two letter labels:

- aero
- arpa
- biz
- com
- coop
- edu
- gov
- info
- int
- mil

- museum
  - name
  - net
  - org
  - pro

**Report on Internet Security and Stability Implications  
of the Global Name Registry, LTD**

**Proposal for the Limited Release of Initially Reserved**

**Two-Character Names**

**December 4, 2006**

**Excerpt below. Full report at:** <http://www.icann.org/registries/rsep/RSTEP-GNR-proposal-review-team-report.pdf>

**3 Analysis of Security and Stability Issues**

In order to assess the potential security and stability impact of introducing two-character SLDs into .name, the review team began by considering the current practices regarding two-character SLDs within various TLDs, as well as the presence of <TLD>.<TLD> combinations. The review team noted that there are a significant number of TLDs that allow the registration of TLDs as SLDs. A systematic walk through the DNS shows the following numbers:

Number of TLDs registered in the root zone 265

Possible <TLD>.<TLD> combinations 70225

<TLD>.<TLD> combinations with NS or A

Records 11592

In addition to considering the frequency of two-character SLDs and

<TLD>.<TLD> combinations, the team reviewed known problems with <TLD>.<TLD> combinations. A recent overview of known problems with the DNS was presented at the RIPE53 meeting by Duane Wessels of The Measurement Factory/CAIDA. It recited a list of 32 known problems with the DNS, categorized as follows:

Protocol Issues 9

Implementation Issues 8

Operational Issues 10

Registry/Registrar Issues 5

Of the eight implementation issues, two were related to a combination of the presence of <TLD>.<TLD> domains and bad software behavior. The most significant of these problems is described in RFC 1535 and is discussed in detail in Section 3.1.1 below. The review team also conducted an exhaustive investigation of the potential security- and stability-related effects in each of the potential problem areas.

In addition, the review team conducted two kinds of analysis on the data collected from the behavior of actual DNS servers. First, we reviewed name server data from one of the .uk name servers.

Second, we conducted an experiment in an attempt to produce the problems theoretically caused by <TLD>.<TLD> combinations.

We also considered special characteristics of the .name domain.

Taking these factors into consideration, the review team concludes that:

(1) Name server and experimental data reveal that inadvertent queries for <TLD>.<TLD> domains are fairly uncommon. More often than not, these queries seem to be the result of user error or temporary failures as opposed to software errors.

(2) <TLD>.<TLD> combinations are already extremely common, including combinations that seem far more likely to cause problems than two-character SLDs within .name, such as net.uk or de.com. The review team is not aware of any reports of problems attributed to existing <TLD>.<TLD> combinations.

(3) On balance, and taking into account theoretical security and stability effects as a result of the introduction of two-character

SLDs within .name, these SLDs are unlikely to have any meaningful net increase in the level of these security or stability issues.

**ANNEX SEVEN -- CONTROVERSIAL NAMES SUB GROUP REPORT**

**GNSO new TLDs Committee**

**Reserved Names Working Group**

**Sub-Group Report**

**Controversial Names**

**10 May 2007**

**DEFINITIONS**

Controversial Names	A name is designated as a controversial name if it qualifies as a gTLD under the then prevailing String Criteria, does not fall under any other Reserved Name category and is disputed for reasons other than that it either falls under any other Reserved Name category or that infringes on the prior legal rights of others.
---------------------	--

CN-DRP	Controversial Names - Dispute Resolution Panel
--------	--

## EXECUTIVE SUMMARY

1. This Report contains the recommendations and supporting information from the GNSO Reserved Names Working Group (RN-WG) regarding Controversial Names.
2. The members of the group are:
  - I Marilyn Cade
  - I Avri Doria (chair)
  - I Victoria McEvedy
  - I Michael Palage
  - I Tamara Reznik
3. The subgroup reached full consensus on the recommendations below.
4. *There was no disagreement in the subgroup regarding the recommendations below.*
5. The table below contains the recommendations for Controversial names.

SoW number (RN-WG 30-day extension SoW)	Reserved Name Category	Domain Name Level(s)	Recommendation
Recommendation task 10	Controversial Names	All Levels, ASCII & IDN	There should not be a new reserved names category for Controversial Names.
Recommendation task 10	Controversial Names	Top Level, ASCII & IDN	There should be a list of disputed names created as a result of the dispute process to be created by the new gTLD process.

SoW number (RN-WG 30-day extension SoW)	Reserved Name Category	Domain Name Level(s)	Recommendation
Recommendation task 10	Controversial Names	Top Level, ASCII & IDN	In the event of the initiation of a CN-DRP process, applications for that label will be placed in a HOLD status that would allow for the dispute to be further examined. If the dispute is dismissed or otherwise resolved favorably, the applications will reenter the processing queue. The period of time allowed for dispute should be finite and should be relegated to the CN-DRP process. The external dispute process should be defined to be objective, neutral, and transparent. The outcome of any dispute shall not result in the development of new categories of Reserved Names.[65]
Recommendation task 10	Controversial Names	Top Level, ASCII & IDN	The new GTLD Controversial Names Dispute Resolution Panel should be established as a standing mechanism that is convened at the time a dispute is initiated. Preliminary elements of that process are provided in this report but further work is needed in this area.

SoW number (RN-WG 30-day extension SoW)	Reserved Name Category	Domain Name Level(s)	Recommendation
Recommendation task 10	Controversial Names	Top Level, ASCII & IDN	<p>Within the dispute process, disputes would be initiated by the ICANN Advisory Committees (e.g., ALAC or GAC) or supporting organizations (e.g., GNSO or ccNSO). As these organizations do not currently have formal processes for receiving, and deciding on such activities, these processes would need to be defined:</p> <ul style="list-style-type: none"> <li>I The Advisory Groups and the Supporting Organizations, using their own processes and consistent with their organizational structure, will need to define procedures for deciding on any requests for dispute initiation.</li> <li>I Any consensus or other formally supported position from an ICANN Advisory Committee or ICANN Supporting Organization must document the position of each member within that committee or organization (i.e., support, opposition, abstention) in compliance with both the spirit and letter of the ICANN bylaws regarding openness and transparency.</li> </ul>

SoW number (RN-WG 30-day extension SoW)	Reserved Name Category	Domain Name Level(s)	Recommendation
Recommendation task 10	Controversial Names	Top Level, ASCII & IDN	Further work is needed to develop predictable and transparent criteria that can be used by the Controversial Resolution Panel. These criteria must take into account the need to: <ul style="list-style-type: none"> <li>I Protect freedom of expression</li> <li>I Affirm the fundamental human rights, in the dignity and worth of the human person and the equal rights of men and women</li> <li>I Take into account sensitivities regarding terms with cultural and religious significance.</li> </ul>
Recommendation task 10	Controversial Names	Top Level, ASCII & IDN	In any dispute resolution process, or sequence of issue resolution processes, the Controversial name category should be the last category considered.

## Supporting Information

### 1. Background

The work items for the subgroup contained the following elements:

- a. *Review the GAC Principles regarding New gTLDs with regard to controversial names*
- b. *Consult with the GAC as possible*
- c. *Consider the possibility of creating a disputed name list (not a reserved name list) that would be updated whenever controversial names are rejected and would be used for guideline purposes only*
- d. *Restate recommendations in the original RN-WG report for possible use in the New gTLD evaluation process, not as reserved names*
- e. *Describe process flow*

### 2. Rationale for the recommendations

The following reflects the work that was done on each of the work items listed in the SOW.

- a. The GAC principles were reviewed.

One that was discussed in particular and that created some concern:

*If individual GAC members or other governments express formal concerns about any issues related to the new gTLDs, the ICANN board should fully consider those concerns and clearly explain how it will address them.*

Some of the subgroup members indicated a concern that the GAC principle points to an issue with the original position that was supported by the RN WG. Specifically in recommendation number 1 from the RN WG report of 19 March 2007:

*A label that is applied for would be considered Controversial if during the Public Comment phase of the new gTLD application process the label becomes disputed by a formal notice of a consensus position from an ICANN Advisory Committee or ICANN Supporting Organization, and otherwise meets the definition of Controversial Names as defined above.*

This previous recommendation indicated that the dispute process would only be activated by a consensus position of an Advisory Committee such as the GAC, whereas the GAC principle indicates that the concern of an individual government be considered by the ICANN board before making a decision on a new gTLD. In the discussion, several considerations came to light:

- The GAC principle does not specifically relate to the new gTLD dispute process under review but to the consideration given by the ICANN Board to issues raised by an individual government. In some respects, this is a restatement of the common respect that the ICANN board should give to any appeal it receives. It is also an extension of the ICANN Board's obligation under its bylaws to consider the advice and concerns of the GAC.
- While the GAC principle may not directly relate to the dispute process being defined by the new gTLD PDP process as it addresses board behavior, one of the guiding scalability principles of that PDP process is that, to the maximum extent possible, the process should provide a predictable and transparent method for approving new gTLDs that does not rely on the Board having to handle each and every dispute.
- On the other hand, the same scalability principle requires that the disputes be filtered before reaching the dispute process. A concern has been expressed by some members of the subgroup that it is very likely that a great number of candidate gTLDs might be controversial in the view of some individuals, groups or individual countries. It is for this reason that the original RN working group recommended that the threshold for a dispute be set at the consensus level for an ICANN advisory committee or supporting organization.
- There was, however, some concern raised that it may not be appropriate for a GNSO process to set the internal criteria for a decision made by the GAC or another Advisory group. It was acknowledged that it may be advisable to modify the original RN working groups recommendation to read:
  - o *A label that is applied for would be considered Controversial if during the Public Comment phase of the new gTLD application process the label becomes disputed by a formal notice of a consensus or other formally supported decision process position from an ICANN Advisory Committee or ICANN Supporting Organization, and otherwise meets the definition of Controversial Names as defined above.*
- It was discussed that in the event the proposal being recommended in this report is accepted, each of the Advisory Committees and Supporting Organizations would need to develop a process, appropriate to its organizational constraints, to allow it to initiate disputes.

- As part of the discussion over who could initiate a dispute, several other concerns were raised with how organizations external to ICANN could raise disputes concerning controversial names.
- Again, applying the principles of scalability there was some concern expressed that the dispute process could not be open to any and all who might dispute a candidate gTLD.
- Recognizing that the constituency and advisory groups of ICANN are, in principle, responsible for representing all of the stakeholders involved in the allocation and use of TLDs, it was considered by some in the subgroup sufficient that all of the supporting organizations, composed of the constituencies and other stakeholders, and advisory groups be empowered to initiate dispute actions on potentially controversial TLDs. One value of using the Advisory Groups and Supporting Organizations for such purpose was that these groups were optimally placed to understand both the concerns of the participating stakeholders and the processes of ICANN.
- There was a concern expressed that perhaps all stakeholders were not adequately represented by the current ICANN structures and that in this case these individuals and other stakeholders would not have adequate access to the dispute process. This issue, however, was larger than the scope of the subgroup and it is already the subject of other remedial processes within ICANN.
- There was also an option expressed in the subgroup for allowing any organizational entity with standing to initiate a dispute using the CN-DRP process. Under this formulation, the definition of 'standing' would require further work.
- There was also an option expressed for allowing any individual or organization to initiate a dispute. In order to support process scalability, a fee could be charged for initiating a dispute. A concern raised about this option concerned the financial barrier to disputes this might create. One possibility mentioned (in private conversations) was that this option could be combined with the option that allowed ICANN Advisory Committees to also initiate disputes.

#### b. Consult with the GAC

It was considered by the subgroup that the general consultation held with the GAC on 16 April 2007, was adequate to the subgroup's needs. The subgroup does, however, look forward to discussing any of the recommendations made in this report with the Advisory Committees or their members.

#### c. Consider the possibility of creating a disputed name list

The subgroup supported the idea that a disputed name list would be created as a result of the dispute process. This was not, however, to be considered a reserved name list, and the names on the list could still be approved in future allocations. For discussion purposes<sup>[66]</sup>:

- The gTLD .god (or even .g-d) might be disputed as controversial
- The CN-DRP might agree with the case for controversy brought forward and might decide to refuse the application and to put the name on the disputed name list.
- During a separate application round another application, perhaps even including the previous applicants, might apply with the backing of the World Council of Religions and many of the

world's religions. In such a case, the CN-DRP might recommend removing the name from the disputed name list and assigning it to the applications.

d. Restate recommendations in RN-WG report for possible use in the New gTLD evaluation process, not as reserved names

This report includes a restatement of the proposal for creation of a CN-DRP dispute evaluation process and the creation of a disputed name list.

e. Describe process flow

The purpose is to consider and to propose procedural options and concepts that could be used as a basis for the development of a standing panel to handle objections on the basis of 'controversial names' for binding dispute resolution.

The ICANN RSTEP process was used as a model for this proposal.

Some of the recommended elements of a proposed Controversial Names - Dispute Resolution Panel (CN-DRP) include:

1. Establish a 'standing group' with identified 'experts' and a procedure for the selection of such experts. This could be by selection of existing service providing organizations such as WIPO, CPR, NAF or others. Alternatively a group could be appointed by public tender based on recognized qualifications.
2. Identify a senior individual, e.g., a retired judge, to act as chair, but establish two or more, vice-chairs with expertise in other areas who are well respected, and senior members with different kinds of expertise.
3. Use the Chair and vice chairs as a standing committee of 3-4 people, whose task it is to help to identify 'neutral experts' to act as panelists. Chair and vice-chairs, in particular, must not have current relationships with ICANN and should be highly respected and credible individuals. The concern here is to avoid any perception that the dispute process may not be independent and to avoid even the perception that insiders can be influenced and decisions politicized.
4. For Panelists as well, great care should be taken to ensure neutrality, and avoid conflicts of interests or the perception of a conflict of interest. An initial list of participants in 'panels' can be pre-qualified to act, on an invited basis, when a name is disputed as controversial. The role of the chair would function much like the chair of the RSTEP. The chair could appoint knowledgeable experts from areas, such as culture, to advise the 'panel' on language, or cultural, or technical issues with a particular controversial string.
5. An initial list of panelists could be developed, with the understanding that additions will be possible, depending on the categories of names that are referred to the CN-DRP.
6. Each dispute shall be determined and accompanied by a decision with reasoned grounds. The report of the decision will be published, as part of the routine publication of the application.
7. Further work needs to be done on drafting, with the help of expert advice, a set of procedural rules to govern the decision process of the CN-DRP. It is important going forward to avoid lists of examples, categories or any other attempt to list and predict in

advance what is controversial as this will inevitably become entrenched. Avoiding such entrenchment and pre-determined lists is key to the recommendation in the first report of the Reserved Names WG.

8. The CN-DRP's decisions are binding. One issue under discussion was whether further work is needed to develop an appeals process.
9. The CN-DRG will have access to legal counsel external to ICANN that it may consult for questions of national law, etc.
10. Where the CN-DRP review team or the ICANN staff identify that a name brought to the CN-DRP might also have other stability or stability concerns, all other comment period challenges and reserved name evaluations must occur prior to evaluation by the CN\_DRP.

#### 11. Funding

- i. Reimbursement: Create a compensation framework that would pay a retainer to the chair and vice chairs to be available on a 'standing basis'. Develop a compensation fee schedule, to be developed by the Chair, working with ICANN staff and administered by the chair/staff manager, with a flat amount for an estimated number of hours devoted to the consideration, documentation, etc. by the Panel members.

- ii. Initially, since there is no experience in what the fees might be, task the chair and vice chairs, supported by ICANN operational staff, to develop an 'interim budget' and fee schedule.

- iii. Applicants should expect that the cost of ICANN fees will include the cost of convening the Panel.

- iv. Consistent with the overall fee structure established for new gTLDs, the fees established should include a cost recovery element that supports the additional costs that ICANN incurs.

#### 12. Further work for creation of the CN-DRP includes, but is not limited to:

- i. Development of criteria for the background of the chair, vice chairs and panelists

- ii. Further development of what might constitute transparent and predictable criteria/guidance to the panels

- iii. Whether it is possible to have a 'quick look' by the chair/vice chairs to determine whether to accept a referral or not, and what appeal of that would be available, if any

- iv. Under consideration of how to recoup the fees for providing the dispute procedure, discussion of who should fund the procedure should include whether the applicant pays or whether the costs are shared by the entity filing the dispute, etc.

- v. Further work is needed in scoping and scaling the anticipated number(s) of possibly controversial applications and what time frame should be established to give a panel an assignment, research/discuss/reach a decision,

and whether and what documentation would be expected from the applicant and the entity that files the dispute.

3. Summary of Relevant Information Sources

- Previous discussion and work related to controversial names done by the New gTLD Task force can be found in the current version of the GNSO new TLDs Committee Draft Final Report at:

<http://gns0.icann.org/drafts/pdp-dec05-draft-fr.htm>

- The GAC Principles regarding New gTLDs can be found at:

<http://gac.icann.org/web/communiqués/gac27com.pdf>

- The original Controversial Names Subgroup report contains much additional information that was not duplicated in this report. It is in Appendix J of the original RN-WG report at:

<http://gns0.icann.org/drafts/rn-wg-fr19mar07.pdf>

**ANNEX EIGHT -- Alphabetical Listing of Recommended Reserved Names**

The tables below are intended to be brief summaries of all names that the RN-WG recommends be reserved, ordered alphabetically by name where possible in the first table and alphabetical by category in the second table. These tables are provided for convenience only; please refer to the recommendations provided in Section One for complete reservations recommended. The names listed are not case-sensitive.

Single Letter, Single Digit Combinations	No	No	No	N/A	N/A	N/A
Single Characters	Yes	No	No	No***	No	No
Symbols	Yes <sup>#</sup>	Yes <sup>#</sup>	Yes <sup>#</sup>	N/A	N/A	N/A
Tagged	Yes	Yes	Yes	N/A	N/A	N/A
Two Digits	Yes	No	No	N/A	N/A	N/A
Two IDN Characters	N/A	N/A	N/A	No***	No	No
Two Letters	Yes <sup>##</sup>	No	No	N/A	N/A	N/A

\* Except for Unicode versions of 'example'.

\*\* For use by registries only.

\*\*\* At the top level, requested strings should be analyzed on a case by case basis in the new gTLD process depending on the script and language used in order to determine whether the string should be granted for allocation in the DNS.

# Except for the use of the hyphen (-) where allowed.

## For ccTLD use only.

[5] Agenda posted at <http://gnso.icann.org/meetings/agenda-12apr07.shtml>

[6] Posted at <http://gnso.icann.org/drafts/rn-wg-fr19mar07.pdf>

[7] The following RFCs require that domain names must begin with a letter or a digit so the use of the hyphen as a top level domain or the use of names beginning or ending with a hyphen at any level is not allowed: RFC 952, <ftp://ftp.rfc-editor.org/in-notes/pdf/rfc952.txt.pdf>. This RFC was later modified by RFC 1123, <ftp://ftp.rfc-editor.org/in-notes/pdf/rfc1123.txt.pdf>.

[8] This is notwithstanding two letter TLDs will be allowed only as ccTLDs, when added to the ISO-3166 list, and as such all two letter ASCII strings will remain reserved at the top level and second level of a domain name, although registries may propose release of two letter LDH strings at the second level provided that measures to avoid confusion with any corresponding country codes are implemented.

[9] The subgroup was encouraged by the ccNSO not to consider removing the restriction on two-letter names at the top level. IANA has based its allocation of two-letter names at the top level on the ISO 3166 list. There is a risk of collisions between any interim allocations, and ISO 3166 assignments which may be desired in the future.

[10] The existing gTLD registry agreements provide for a method of potential release of two-character LDH names at the second level. In addition, two character LDH strings at the second level may be released through the process for new registry services, which process involves analysis of any technical or security concerns and provides opportunity for public input. Technical issues related to the release of two-letter and/or number strings have been addressed by the RSTEP Report on GNR's proposed registry service. The GAC has previously noted the WIPO II Report statement that "If ISO 3166 alpha-2 country code elements are to be registered as domain names in the gTLDs, it is recommended that this be done in a manner that minimises the potential for confusion with the ccTLDs."

[11] Considering that the current requirement in all 16 registry agreement reserves "All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")", this requirement reserves any names having any of a combination of 1296 different prefixes (36x36).

[12] Internet Draft IDNAbis Issues: <http://www.ietf.org/internet-drafts/draft-klensin-idnabis-issues-01.txt>(J. Klensin), Section 3.1.1.1

[13] Considering that the current requirement in all 16 registry agreement reserves "All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")", this requirement reserves any names having any of a combination of 1296 different prefixes (36x36).

[14] Considering that the current requirement in all 16 registry agreement reserves "All labels with hyphens in the third and fourth character positions (e.g., "bq--1k2n4h4b" or "xn--ndk061n")", this requirement reserves any names having any of a combination of 1296 different prefixes (36x36).

[15] With its recommendation, the sub-group takes into consideration that justification for potential user confusion (i.e., the minority view) as a result of removing the contractual condition to reserve gTLD strings for new TLDs may surface during one or more public comment periods.

[16] Note that this recommendation is a continuation of the recommendation in the original RN-WG report, modified to synchronize with the additional work done in the 30-day extension period.

[17] The full list of registry agreements is found at <http://www.icann.org/registries/agreements.htm>.

[18] Posted at <http://gnso.icann.org/drafts/rn-wg-fr19mar07.pdf>.

[19] Note that these work tasks are only a prerequisite for the Introduction of New gTLDs if the requirement to reserve single letter names is not included in new gTLD registry agreements.

[20] The following RFCs require that domain names must begin with a letter or a digit so the use of the hyphen as a top level domain or the use of names beginning or ending with a hyphen at any level is not allowed: RFC 952, <ftp://ftp.rfc-editor.org/in-notes/pdf/rfc952.txt.pdf>. This RFC was later modified by RFC 1123, <ftp://ftp.rfc-editor.org/in-notes/pdf/rfc1123.txt.pdf>.

[21] This is notwithstanding two letter TLDs will be allowed only as ccTLDs, when added to the ISO-3166 list, and as such all two letter ASCII strings will remain reserved at the top level and second level of a domain name, although registries may propose release of two letter LDH strings at the second level provided that measures to avoid confusion with any corresponding country codes are implemented.

[22] The subgroup was encouraged by the ccNSO not to consider removing the restriction on two-letter names at the top level. IANA has based its allocation of two-letter names at the top level on the ISO 3166 list. There is a risk of collisions between any interim allocations, and ISO 3166 assignments which may be desired in the future.

[23] The existing gTLD registry agreements provide for a method of potential release of two-character LDH names at the second level. In addition, two character LDH strings at the second level may be released through the process for new registry services, which process involves analysis of any technical or security concerns and provides opportunity for public input. Technical issues related to the release of two-letter and/or number strings have been addressed by the RSTEP Report on GNR's proposed registry service. The GAC has previously noted the WIPO II Report statement that "If ISO 3166 alpha-2 country code elements are to be registered as domain names in the gTLDs, it is recommended that this be done in a manner that minimises the potential for confusion with the ccTLDs."

[24] The gTLD registry agreements provide a mechanism for release of two-character labels at the second level. "The reservation of a two-character label string shall be released to the extent that the Registry Operator reaches agreement with the government, country-code manager, or the ISO 3166 maintenance agency, whichever appropriate. The Registry Operator may also propose release of these reservations based on its implementation of measures to avoid confusion with the corresponding country codes." See Appendix 6, .ASIA Registry Agreement, <http://www.icann.org/tlds/agreements/asia/appendix-6-06dec06.htm>.

[25] RFC 952, <ftp://ftp.rfc-editor.org/in-notes/pdf/rfc952.txt.pdf>. This RFC was later modified by RFC 1123, <ftp://ftp.rfc-editor.org/in-notes/pdf/rfc1123.txt.pdf>.

[45] Paragraph 237, Second WIPO Internet Domain Process II

[46] See Paragraph 55,

[47] As the Second WIPO Internet Domain Process acknowledges "the list of names of places in the world that may have been registered as domain names is virtually limitless" See Paragraphs 256, Second WIPO Internet Domain Process.

[48] Geographical indications refer to "indications which identify a good as originating in the territory of a Member, or a region or locality in that territory, where a given quality, reputation or other characteristic of the good is essentially attributable to its geographical origin." See Paragraph 217, Second WIPO Internet Domain Name Process. Examples of Geographical Indicators include Champaign, Napa Valley, Cognac

[49] See Paragraphs 262 thru 263 of the WIPO II Process.

[50] See <http://gac.icann.org/web/communiqués/gac10com.htm>

[51] Although other proof of concept registry strings had already been added to the root, i.e. .BIZ, no other proof of concept registry were allowing domain name registrants to register resolving names at the time of the GAC communiqué.

[52] Paragraph 237, Second WIPO Internet Domain Process II

[53] Paragraph 238, Second WIPO Internet Domain Process II

[54] Paragraphs 246 thru 248, Second WIPO Internet Domain Process II

[55] Paragraph 287, Second WIPO Internet Domain Process II

[56] Paragraphs 206, Second WIPO Internet Domain Process II.

[57] Paragraph 207, Second WIPO Internet Domain Process II.

[58] Paragraph 210, Second WIPO Internet Domain Process II.

[59] Paragraph 211, Second WIPO Internet Domain Process II.

[60] Paragraph 213, Second WIPO Internet Domain Process II.

[61] Paragraph 219, Second WIPO Internet Domain Process II.

[62] See *J. Crew International, Inc. v. crew.com*, a WIPO UDRP decision that discusses both in a majority and minority opinion the limitations involving trademark principles and rights in [gross.http://www.wipo.int/amc/en/domains/decisions/html/2000/d2000-0054.html](http://www.wipo.int/amc/en/domains/decisions/html/2000/d2000-0054.html)

[63]With its recommendation, the sub-group takes into consideration that justification for potential user confusion (i.e., the minority view) as a result of removing the contractual condition to reserve gTLD strings for new TLDs may surface during one or more public comment periods.

[64]Ray Fassett served as the Chair of this sub-group.

[65]Note that this recommendation is a continuation of the recommendation in the original RN-WG report, modified to synchronize with the additional work done in the 30-day extension period.

[66] Although the SOW asked for specific examples, there was an opinion expressed within the group that in the case of allegedly controversial names, citing examples or even categories of examples, was potentially dangerous as even the mention of an example created a future presumption of controversy.

<b>ANNEX FOUR – NEW TLDS PROPOSED RECOMMENDATIONS &amp; IMPLEMENTATION GUIDELINES.....</b>	<b>106</b>

## 1. SUMMARY

1. This is the Final Report of the Protecting the Rights of Others (PRO-WG) Working Group. The PRO-WG was formed as a sub-group of the GNSO's Committee for the Introduction of New Top-Level Domains to consider issues that related to the registration of names at the second level in new TLD registries. The GNSO Council considered the request to form a Working Group at its 1 February 2007 meeting<sup>1</sup> and ratified the Statement of Work at its 15 March 2007 meeting<sup>2</sup>, the minutes of which are posted on the GNSO's website<sup>3</sup>.
2. There are six substantive sections to this Report that map directly to the Statement of Work in addition to the Annexes which contain background information<sup>4</sup>. This Report will be used as further input into the new TLDs Final Report which is due to be released in early June 2007.
3. The Statement of Work included the background and rationale for the work<sup>5</sup>. "There is a new gTLD committee of the GNSO that is developing policy recommendations with respect to the introduction of new gTLDs. In addition to policy recommendations, the committee is also considering guidelines that may assist the ICANN staff in preparing an application process, and also creating a framework agreement for registry operators. The current registrar accreditation agreement requires that Registered Name Holders represent that, to the best of the Registered Name Holder's knowledge and belief,

---

<sup>1</sup> Agenda posted at <http://gnso.icann.org/meetings/agenda-01feb07.shtml>

<sup>2</sup> Agenda posted at <http://gnso.icann.org/meetings/agenda-15mar07.shtml>

<sup>3</sup> Minutes posted at <http://gnso.icann.org/meetings/minutes-gnso-15mar07.shtml>

<sup>4</sup> On 15 March 2007 two decisions were made which are recorded in the minutes. Decision 2: The GNSO Council approved the [revised charter for the working group on "Protecting the rights of others"](#) and Decision 3: The Council extended the timeline for the working group on the Protection of the Rights of Others from the end of April to May 17, in order for the report to be considered at the GNSO Council meeting on 24 May 2007. This deadline was not met as the group needed more time to agree on the substantive recommendations.

<sup>5</sup> A full set of the proposed recommendations and implementation guidelines (as at 30 May 2007) are found in Annex Four. These provide the context for this work.

neither the registration of the Registered Name, nor the manner in which it is directly or indirectly used, infringes the legal rights of any third party. ICANN also has a Consensus Policy called the Uniform Dispute Resolution Policy (UDRP) that is intended for resolving disputes between the registrant and any third party over the registration and use of an Internet domain name. In past new gTLD rounds, applicants for new gTLDs have been required to implement measures that discourage registration of domain names that infringe intellectual property rights; reserve specific names to prevent inappropriate name registrations; minimize abusive registrations; comply with applicable trademark and anti-cyber squatting legislation; and provide protections (other than exceptions that may be applicable during the start-up period) for famous name and trademark owners. There have been a range of approaches used which vary in terms of both cost to registrants and third parties affected by registration, and effectiveness. As part of the new gTLD committee's deliberations, there has been some discussion about what additional protections beyond the current terms in the registration agreement and existing dispute resolution mechanisms should be in place to protect the legal rights of others during the domain name registration process, particularly during the initial start up of a new gTLD where there is contention for what Registrants perceive as the "best" names."

4. The Statement of Work then described the purpose of the work. "The purpose of the working group is to: (1) Document the additional protections implemented by existing gTLD operators beyond the current terms in the registration agreement and existing dispute resolution mechanisms to protect the legal rights of others during the domain name registration process, particularly during the initial start up of a new gTLD where there is contention for what Registrants perceive as the "best" names. The documentation should identify the problems that the protections were intended to solve. The working group should establish definitions of terms used in this document to ensure a

common understanding amongst members of the working group. These definitions would only be in the context of the document, and without prejudice to the meaning of these terms in other legal contexts. In addition, the work will “(2) Determine whether to recommend to Council a best practices approach to providing any additional protections beyond the current registration agreement and UDRP policy for the legal rights of others during the domain name registration process, particularly during the initial start up of a new gTLD where there is contention for what Registrants perceive as the "best" names. A best practices document could be incorporated into the material for the application process for new gTLD applicants. The GNSO could elect in future to use the policy development process (PDP) to create a Consensus Policy in this area”.

5. The work was conducted using teleconferences and one face-to-face meeting that coincided with ICANN’s March 2007 meeting in Lisbon. The Working Group had a relatively diverse membership but patchy and inconsistent representation from some constituencies and none from the Internet Service Providers Constituency. The full set of participation data is found in Annex Two. In addition, MP3 recordings of the meetings can be found here <http://gns0.icann.org/calendar/#may>.
6. The GNSO PRO WG did not conclude its work on the Terms of Reference as specified by the GNSO Council. This report also provides a written summary of areas in which broad agreement and support were not reached and for which the PRO WG believes additional time is necessary. The WG discussed various approaches to providing additional protections beyond the current registration agreement and UDRP policy for the legal rights of others during the domain name registration process for new TLDs, but was unable to reach consensus on whether to recommend a "best practices" approach to providing such protections. The group was unable to agree on a common approach because of a wide variety of registry services business models and

the diverse objectives of the working group participants. In addition, WG members who opposed recommending “best practice” guidelines stated a concern that, if “best practices” were developed and incorporated into the new TLDs implementation plan, there could be negative implications for new registry operators that chose not to implement them.

7. The WG was able to develop a list of draft principles that various WG members believe should be considered as policy statements for TLD operators to implement, but has yet to fully engage in discussion of that list of draft principles.

## 2. DEFINITIONS

The table below sets out the definitions for some key terms which were developed by the Working Group.

Abusive Registration	Abusive Registration means a Domain Name which either: i . was registered or otherwise acquired in a manner which, at the time when the registration or acquisition took place, took unfair advantage of or was unfairly detrimental to another's Legal Rights; OR ii. has been used in a manner which took unfair advantage of or was unfairly detrimental to another's Legal Rights.
Authentication Agent	An Authentication Agent is the person or entity authorized by a new TLD registry to authenticate the Legal Rights claimed by a domain name applicant or to authenticate the identity of a domain name applicant.
Authentication of Legal Rights	Authentication of Legal Rights is the process performed by the Authentication Agent to confirm that the claimed Legal Rights are prima facie authentic based on documentary evidence and of a nature and class accepted by the TLD registry for its Rights Protection Mechanisms. Authentication of the Legal Rights has no bearing on their validity which is a matter for courts of competent jurisdiction.
Authentication of Applicant	Authentication of Applicant is a service conducted by the Authentication Agent to confirm the identity of the domain name applicant claiming a Legal Right in a Rights Protection Mechanism
Charter Eligibility Dispute Resolution Policy (CEDRP)	The CEDRP followed by certain TLDs (such as .aero, .biz, .coop, .museum, .name, .pro, and .travel), provides a mechanism for challenging a domain name registration on the grounds that the registrant does not meet the eligibility requirements set forth in the TLD charter. Any person or entity may bring such a challenge under the CEDRP.
Defensive Registrations	Defensive Registrations are domain name registrations by holders of Legal Rights primarily for the purpose of preventing third parties from registering strings that include names identical to or similar to their Legal Rights.
First Come First Served (FCFS)	FCFS is an allocation policy adopted by a TLD registry where a domain name registration is awarded to the first registrant that successfully submits a valid registration request for the requested string to the registry through its registrar.

IP Claim Service	An IP Claim Service is a service that permits a registrant to submit an Intellectual Property Claim (“IP Claim”), based on asserted Legal Rights. (NeuLevel, which used an IP Claim process for the .biz TLD, restricted the bases for IP Claims to registered or common-law trademarks.) Filing of an IP Claim does not automatically entitle the holder of that claim to registration of the domain name corresponding to the IP Claim; rather, the filing ensures that any potential applicant for a domain name registration corresponding to the IP Claim would be (1) notified of the IP Claim and (2) have to affirmatively agree to proceed with its application after such notification. The holder of an IP Claim may challenge any potential applicant through the Start-up Trademark Opposition Process (“STOP”).
Land Rush	Land Rush is the commencement of the “go live” period of a new TLD launch where the registry begins accepting live domain registrations from registrants through registrars.
Legal Rights	Legal Rights are rights of a nature and class recognized by a TLD as, subject to Authentication, entitling owners to participate in a Rights Protection Mechanism. Legal Rights have included registered national and regional unitary marks and, in so far as recognized by the law of the nation state where they are held, unregistered trademarks, trade names, business identifiers, company names, geographical names and designations of origin and distinctive titles of protected literary and artistic works.
Name String Notification	A Name-String Notification is a paid subscription function where the owner of a Legal Right can be notified by a registry of an application to register a new domain name which includes the monitored name-string.
<i>Protecting the commons<sup>6</sup></i>	<i>Language itself is not property and as such belongs to the commons available for free and unencumbered use by all people. While many legal entities are placing trademarks on common natural words when used in specific commercial contexts, these trademarks may not affect the rights of individuals to use these words or to register them as domain names. Within ICANN this can be taken to mean that these names are to remain available for registration according to the regular procedures, for example, first come first served or as determined by the registry, as long as the registrant is not in violation of provisions of the UDRP.</i>

<sup>6</sup> This definition, provided by Nominating Committee Representative Avri Doria, was not agreed upon by the Working Group but was used to illustrate differing points of view.

Final Report PRO WG

Rights Protection Mechanisms	<p>RPM</p> <p>Rights Protection Mechanisms are processes or mechanisms adopted and implemented by TLD registries for the purpose of protecting Legal Rights by discouraging or preventing registration of domain names that violate or abuse a participant's Legal Rights. Rights Protection Mechanisms are in addition to the protection afforded through the UDRP and Registration Agreement.</p>
<i>Rights of Others</i> <sup>7</sup>	<p><i>Rights of Others are the rights of the public to use descriptive and generic words, including where permitted by the law of the nation state where they reside, to use words which may be subject to Legal Rights in particular classes of the Nice Classification System—outside those classes. In relation to unregistered Legal Rights, they include the right to use words that are not subject to protection in their nation state or where no goodwill or reputation arises in their nation state in relation to such a word. They include the right to make fair and legitimate use of words in which others may claim Legal Rights.</i></p>
Start-Up Trademark Opposition Policy (STOP)	<p>Start-Up Trademark Opposition Policy is a policy available only to an IP Claimant who properly claimed Legal Rights through the IP Claim Service. STOP is a unique dispute resolution process, similar to the UDRP, and put in place for dealing with disputes between IP Claimants and potential registrants. An IP Claimant shall prevail over the potential registrant in a STOP proceeding where it demonstrates that a TLD was either (1) registered in bad faith or (2) used in bad faith,</p>
Sunrise Process	<p>A process in which owners of Legal Rights have the opportunity to register domain names before the Landrush process open to the public. Registries that used a Sunrise Process identified the Legal Rights on which a Sunrise Process registration could be based.</p>
Uniform Domain-Name Dispute Resolution Policy (UDRP)	<p>ICANN-accredited registrars in all gTLDs have adopted UDRP. Under the UDRP, dispute proceedings arising from alleged abusive registrations of domain names (for example, cyber squatting) may be initiated by a holder of trademark rights. The UDRP is a policy between a registrar and its customer and is included in registration agreements for all ICANN-accredited registrars.</p>

<sup>7</sup> This definition, provided by the NCUC, was not approved by the Working Group but is provided here as a reflection of the discussion.

## Final Report PRO WG

The tables illustrate the kinds of mechanisms which are used in a variety of registries – sponsored, generic and country code – to further explain the context for the work. See below for charts that set out the current proposals for the introduction of new top-level domains from the GNSO Committee.

### **TLD Eligibility and Name Selection**

TLD Eligibility Requirements	TLD-Specific Eligibility Identification Number	Name Selection Requirements	Eligibility Challenge Mechanism
.aero	.aero	.museum	.aero
.cat	.museum	.travel	.museum
.coop	.travel		.name
.eu			
.museum			
.pro			
.travel

### 3. RECOMMENDATION SUMMARY

		Supported by (see table below)
1	That there is no universal rights protection mechanism (RPM).	VMcE, TR, KR, JN, AD, KWS, EC
2	That each new gTLD should adopt and implement a dispute mechanism under which a third party could challenge another's use of that gTLD's RPM that results in obtaining a domain name registration.	VMcE, KR, PGO, KWS, EC, MR
3	That the Legal Rights on which a party bases its participation and seeks to protect in a RPM should be subject to actual authentication, at least if the authenticity of such rights is challenged.	VMcE, KR, JN, PGO, KWS, EC, MR
4	That if a new gTLD elects to use a Sunrise Process as its RPM, it should restrict eligible Legal Rights in such a manner as to discourage abusive registration.	VMcE, TR, KR, JN, PGO, AD, KWS,
5	That regardless of other authentication of Legal Rights, all new gTLDs should institute measures to deter abuse of the RPMs and clearly false submissions. These measures could be automated or conducted on an ad hoc basis to focus on RPM submissions that are nonsensical or likely to be false (e.g., registration number is 12345, date is 00/00/00, name is John Doe).	VMcE, TR, KR, JN, PGO, AD, KWS, MR
6	That all Legal Rights to be protected in an RPM must be capable of being authenticated.	VMcE, TR, KR, JN, PGO, AD, KWS, EC, MR

TR	Tim Ruiz	Registrar
VMcE	Victoria McEvedy	NCUC

## 4. DISCUSSION

1. The introduction of new top-level domains (TLDs) in 2000 (.aero, .biz, .coop, .museum, .name and .pro) included the introduction of several rights protection mechanisms which aimed to protect trademark and other rights from third party domain name registrations that may have violated those rights. These methods varied as did their complexity and ultimate success.<sup>8</sup>
2. In 2007, as ICANN considers the introduction of additional TLDs, the rights protection mechanisms used in the past are instructive but raise questions concerning the necessity and adequacy of such mechanisms. The PRO-WG was chartered to provide a report to the GNSO Committee on the Introduction of New Top-Level Domains with a view to assessing further steps to take, including the possible need for the creation of a Policy Development Process (PDP) on rights protection mechanisms beyond the protections embodied in the current Registration Agreement and the Uniform Domain Name Dispute Resolution Policy.
3. The GNSO Council provided the PRO-WG with the following Statement of Work:

(1) Document the additional protections implemented by existing gTLD operators beyond the current terms in the registration agreement and existing dispute resolution mechanisms to the protect the legal rights of others during the domain name registration process, particularly during the initial start up of a new gTLD where there is contention for what Registrants perceive as the "best" names. The documentation should identify the problems that the protections were intended to solve. The working group should establish definitions of terms used in this document to ensure a common understanding amongst members of the working

---

<sup>8</sup> See Evaluation of the New gTLDs: Policy and Legal Issues, by Summit Strategies International, <http://www.icann.org/tlds/new-gtld-eval-31aug04.pdf>.; Registry Proof of Concept Reports, <http://www.icann.org/registries/poc/>.

group. These definitions would only be in the context of the document, and without prejudice to the meaning of these terms in other legal contexts.

(2) Determine whether to recommend to Council a best practices approach to providing any additional protections beyond the current registration agreement and UDRP policy for the legal rights of others during the domain name registration process, particularly during the initial start up of a new gTLD where there is contention for what Registrants perceive as the "best" names. A best practices document could be incorporated into the material for the application process for new gTLD applicants. The GNSO could elect in future to use the policy development process (PDP) to create a Consensus Policy in this area.

4. To determine the answers to the questions posed in the Statement of Work, the Working Group used several different work methods. The first was an analysis of existing registry operations. Those summaries are found in full in Annex One, the majority of which were completed by WG members. In addition, some ccTLD registries were included in the summaries to see whether there were additional lessons to be learnt from the ccTLD environment. The Working Group also developed a questionnaire which posed a range of questions that were developed by the Working Group during a teleconference and refined through the mailing list. The questionnaire was distributed in both Word format and was posted using on-line polling software. The full results of the survey are found in Annex Two and the results are used throughout this work. The url for the poll results is <http://www.bigpulse.com/pollresults?code=3bSZ4z3AQauWM7Ukrige>. Finally, the Working Group utilized the expertise within the Group<sup>9</sup>.
5. The Working Group was tasked to provide a report to the GNSO Council and conclude its work by 17 May 2007 to provide sufficient time for its report to be incorporated into the Final Report of the GNSO New gTLDs Committee.

---

<sup>9</sup> It was brought to our attention, after the poll closed, that the online poll did not offer the full listing of countries from which respondents may have come. This was a deficiency in the proprietary software and respondent were also able to respond using email and a Word document attachment.

## Final Report PRO WG

Kristina Rosette of the GNSO Intellectual Property Constituency was elected Chair by the Working Group members.

6. Working Group members were encouraged to review the following five documents, in line with the Terms of Reference:
  - a. [Draft Recommendations from the New gTLD PDP Committee](#)
  - b. [December 2003 new sTLD Application Form, Part B](#)
  - c. [IPC Evaluation Chart for Proposed TLDs \(October 2000\)](#)
  - d. [Registry Proof of Concept Reports](#)
  - e. [Evaluation of the New gTLDs: Policy and Legal Issues, Summit Strategies International, July 2004](#)
7. WG members recognized that any rights protection mechanism may be:
  - a. controversial
  - b. costly and complex for registries and registrars to operate
  - c. costly and time consuming for registrants
  - d. open to comprehensive and automated gaming
8. In addition, WG members recognize that registry and registrar business models may be different and that the introduction of IDN TLDs may present further layers of complexity which require deeper examination.

## 5. OUTCOMES

1. The PRO WG discussed various approaches to protecting the rights of others including whether to provide additional protections beyond the current registration agreement and UDRP policy in new top-level domains. The Working Group was unable to reach consensus on whether to recommend a "best practices" approach to providing such protections.
2. The WG was able to develop a list of draft principles that some WG members believe should be considered as possible principles for new TLD operators to consider in their implementation plans but the Working Group has yet to fully engage in discussion of that list of draft principles.
3. The first table below set out where there is agreement on the approach. The second table illustrates where there is some support (either with or without alternative language). Section 6 sets out where additional work may be considered by the GNSO Council for future examination.
4. For the purposes here "agreement" means that there is broad agreement within the Working Group (largely equivalent to "rough consensus" as used in the IETF). The PRO-WG did not use the word "consensus" because that term has a particular meaning as used by the GNSO Council. An "alternative view" means that a differing opinion has been expressed, without getting enough following within the Working Group to merit either "agreement" or "support". The WG used the RFC 2119 (<ftp://ftp.rfc-editor.org/in-notes/rfc2119.txt>) as the basis for determining where the words "should", "must" and "may" ought to be used.
5. The on-line questionnaire provides some interesting results which may have assisted the Working Group in their deliberations. Forty responses were received online with two others submitted by email. More than 50% of the online respondents (there were two offline respondents who identified themselves as IP rights owners or representatives) identified themselves as either IP rights owners or representatives. Thirteen respondents identified themselves as civil society representatives. Five respondents identified themselves as either a registrar or

registry. There was a 50:50 split between respondents who answered the question about whether “IP owners need new or enhanced protection rights”. Most respondents indicated, for each of the TLDs identified, that the rights protections mechanisms were not applicable to them. Of those that did respond, the majority said that the rights protection mechanism provided by the registry operator met their needs. Most respondents used either an IP claim or a sunrise registration to protect their rights. A large proportion of respondents indicated that they did own defensive registrations even in registries where there were sponsored or chartered restrictions on domain name registrations. Respondents indicated varying percentages of defensive registrations in their portfolios.

6. The overview of the results needs to be read in the context of a limited response rate and a statistically insignificant random sample from which the responses could be drawn. In addition, the questionnaire did not meet best practice survey methodology but was rather intended to get a general sense of direction from some interested stakeholders.
7. In summary, the PRO-WG reached agreement on the following areas:

1	That there is no universal rights protection mechanism.
2	That each new gTLD should adopt and implement a dispute mechanism under which a third party could challenge another’s use of that gTLD’s RPM that results in obtaining a domain name registration.
3	That the Legal Rights on which a party bases its participation and seeks to protect in an RPM should be subject to actual authentication, at least if the authenticity of such rights is challenged.
4	That if a new gTLD elects to use a Sunrise Process as its RPM, it should restrict eligible Legal Rights in such a manner as to discourage abusive registration.
5	That regardless of other authentication of Legal Rights, all new gTLDs should institute measures to deter abuse of the RPMs and clearly false submissions. These measures could be automated or conducted on an ad hoc basis to focus on RPM submissions that are nonsensical or likely to be false (e.g., registration number is 12345, date is 00/00/00, name is John Doe).
6	That all Legal Rights to be protected in an RPM must be capable of being authenticated.

**Agreed Proposals 1**

8. Alternative views which had some support are included in the following tables. “Support” is defined as “there is some gathering of positive opinion but competing positions may exist and broad agreement has not been reached. An “alternative view” indicates that a differing opinion has been expressed without getting enough following with the Working Group to merit either “agreement” or “support”.

1	<p>That all new gTLDs must provide an RPM.</p> <p>Alternative view: That all new TLDS may provide an RPM</p>
2	<p>Each gTLD applicant MUST describe in its application (a) the RPM(s) it intends to provide and; and (b) how that RPM/those RPMs will protect the rights of others and discourage abusive registrations.</p> <p>Alternative view: That each gTLD applicant MUST describe in its application the methods they will employ to protect the rights of others.</p> <p>Alternative view: That each TLD applicant MUST describe in its application the methods, if any, they will employ to protect the rights of others.</p>
3	<p>That if a new gTLD elects to adopt and implement an RPM that consists of eligibility or membership verification requirements and second-level name selection criteria (such as those used by the .museum, .aero, and .travel TLDs), an additional RPM MAY NOT be necessary.</p> <p>Alternative view that if a new gTLD elects to adopt a description that includes eligibility or membership verification requirements and second-level name selection criteria (such as those used by the .museum, .aero, and .travel) TLDs or another similar set of criteria, a RPM SHALL NOT be necessary.</p>
4	<p>That if a new gTLD elects to use a Sunrise Process as its RPM and second-level names are not awarded on a First-Come, First-Served basis, then competing applicants MAY be provided with an opportunity to reach an allocation decision between/among themselves.</p>
5	<p>That to the extent a gTLD is intended for/targeted to a particular geographic region, the Legal Right on which the owner or claimant bases its participation in the RPM SHOULD originate from the laws that apply to a country in the region or, in the case of a gTLD intended for/targeted to a region within a country, the laws that apply to the region.</p>

Final Report PRO WG

6	<p>That the creation of “Approved Model RPMs” (to be developed later) SHOULD be available at the registry’s sole discretion to select, which standardizes the RPM across a registry/registrar to minimize the costs of implementation, and eliminates the need for ICANN to scrutinize this aspect of an application during the new TLD process. A registry applicant that fails to pick an “Approved Model RPM” MUST not be prejudiced in any way if it elects not to use a “Approved Model PRM” as this is purely a voluntary standard that is meant to make the launch of new TLDs more efficient. The list of Approved Model RPMs MAY be updated from time to time.</p> <p>Alternative view that “Approved Model RPMs” (to be developed later) SHOULD be utilized by the new registry, unless there are reasonable grounds for non-use in the particular registry. Such use of a standardized RPM MAY minimize the costs of implementation for all interested parties, and would lessen the need for ICANN to scrutinize this aspect of an application during the new TLD process. The list of Approved Model RPMs could be updated from time to time.</p> <p>Alternative view that the Supported principle is acceptable subject to the substitution of “and may eliminate the need for ICANN to scrutinize this aspect of an application during the new TLD process” for “and eliminates the need for ICANN to scrutinize this aspect of an application during the new TLD process.”</p>
---	--

**Supported Proposals 1**

## 6. OUTSTANDING WORK

1. Some members of the Working Group have identified some proposals for principles which have not been fully discussed. Significant discussion took place on the mailing list and within the teleconferences about the scope and applicability of the Working Group's remit. Leaving that discussion aside, the following areas were identified as perhaps warranting more detailed analysis.

1	All potential registrants have legal rights. gTLD operators should not consider the legal rights of IP holders as superior to of the legal rights of others to register and use a domain name.
2	The Rights Protection Mechanisms used by gTLD operators should not presume that a registrant intends to infringe on or violate the legal rights of others simply by the act of registering a domain name.
3	All potential registrants should have an equal opportunity to register common words, phrases, labels or strings as domain names.
4	All principles relating to RPMs should equally apply to both ASCII/LDH TLDs and IDN TLDs.
5	Rights protection mechanisms for second level names SHOULD also apply to third and higher level names made available for general registration by the TLD operator.

### Outstanding Work 1

2. In addition, some members of the WG proposed principles regarding fee-related aspects of RPMs. All such principles have been segregated into this section and no levels of support have been developed for any of them.

1	New gTLDs should accept payment for participation in RPMs by means other than credit cards.
2	The fees charged by a gTLD for participation in its RPM should be reasonable and each gTLD applicant MUST identify in its application the basis of its fee calculation.
3	The fees charged by a gTLD for participation in its RPM must be reasonably close to their actual or expected costs.
4	The fees associated with the use of Rights Protection Mechanisms must be established at the sole discretion of the gTLD operator.

### RPM Fee Related Aspects Principles 1

3. Several members of the WG proposed new RPMs or RPM features. These proposals are listed below. The WG has not yet developed levels of support.

These proposals should be considered among the WG's Outstanding Work, but are identified separately for ease of reference.

1	<p>Centralized Mechanism for Authentication of Legal Rights by Multiple Providers. Owners of Legal Rights would identify the Legal Rights on which they would rely in an RPM, would submit the documents required to authenticate such Legal Rights, and would designate the RPM in which they desired to participate. Once authenticated, the providers would convey the confirmed authentication to the registry or registrar. A Legal Rights owner could select among/between more than one provider. Legal Rights owners would be required to affirm periodically, most likely annually, that their Legal Rights remain valid and subsisting. Legal Rights claims that were not affirmed would be deleted from the database.</p>
2	<p>Standard Sunrise Mechanism. To adequately protect Legal Rights, owners of "Existing Names" should have - in addition to the traditional Sunrise Process which accompanies the launch of a new TLD - two new methods of combating abusive registrations, namely "Defensive Removals" and "Name-String Notification". The "sunrise" itself should be outsourced to an organisation which will provide sunrise registrations and defensive removals for all new TLDs.</p>
3	<p>Outsourced Sunrise: A "Standard Sunrise Service Provider" (SSSP) would administer all future sunrise processes. The SSSP should be an internationally qualified and respected NGO or not-for-profit corporation. The SSSP would provide a website where relevant data can be collected and recycled in the future. The collection of such sunrise data involves providing input access and data storage of "official" domain name-related correspondence and documentation. Thus ICANN or WIPO would appear to be an ideal candidate for SSSP. ICANN has the advantage that it already has contractual relations with accredited registrars, and could use these to control input, avoid abuse and to track problems.</p> <p>The SSSP will provide a standardised sunrise website at <b>tld.sunrise.sssp.org</b>. The information provided to the SSSP website is standard contact information, the type of "Existing Name" and the possibility of uploading a PDF showing the existence of the name. The owner of the "Existing Name" will indicate whether the domain name at issue is to be a used, i.e. traditional sunrise application, or whether the domain name should be permanently removed from the pool of available names. Thus at the completion of the sunrise period, the SSSP will provide to the TLD two lists: one for the sunrise names which should be registered and function, and another list of names which should be permanently removed.</p> <p>The SSSP will produce the list at an at-cost basis and provide it to the new TLD in digital format such that the new TLD can "plug it in" to its registration function. The price of such a defensive removal would thus be inexpensive, probably in the neighbourhood of 1 U.S. dollar. As long as the prospective new TLD is aware at the outset that a number of domain names will be permanently removed from the pool of available domain names, and does not base its business model on the registration and renewal of cybersquatted domains, then these permanently removed domain names have no value to the TLD.</p>

Final Report PRO WG

4	<p>A "Defensive Removal" is the permanent removal of specific domain name from the pool of available domain names. An unlimited number of domain names may be removed as Defensive Removals based on the existence of a single Existing Name. In that the names are permanently removed, there is no administration and no need for renewal fees. The eligibility requirements would be the recognized Early Name rights from previous sunrises, including 1) Organisation names, 2) Public body names, 3) Geographical Indications 4) Registered trademarks, and 5) Other recognized commercial signs such as company names. Due to the possibility of challenging such defensive removals, there is no need to apply strict eligibility requirements. The basis of the removal would be a .pdf documenting the existence of the Existing Name, timely filed with the Standard Sunrise Service Provider (SSSP)</p> <p>Defensive Removals can also be made after the launch of the TLD, but there would be higher costs involved. The permanence of the defensive removal could be changed, either by the party who originally requested it, or by a Third Party Challenge (see below).</p> <p>It would not be possible to make a blanket Defensive Removal covering all new TLDs, but the SSSP would notify the owners of Existing Names by e-mail of the launch of new TLDs, and offer to reuse the existing documentation for new defensive removals. It can be anticipated that the choice of defensive removals will vary from TLD to TLD. For example, in the event that dot-xxx was a reality, an organisation like ICANN might have wanted to defensively remove</p> <p>icann.xxx icanngirls.xxx icann-girls.xxx icannbabes.xxx icann-babes.xxx etc. from the dot-xxx pool of available names.</p>
---	--

5	<p>Name-String Notification. Name-String Notification (NSN) is a paid subscription function whereby the owner of Legal Rights can be notified of an application to register a new domain name which includes the name-string, and given the opportunity to file a Protest within a short timeframe, e.g. 20 days. For example, if ICANN were notified of the following: hot-icann-girls.xxx or tammicannotsayno.xxx they might find only the first of these to be a problem and file a protest.</p> <p>If the NSN subscriber filed the protest, the applicant would be asked to confirm that the domain name application should proceed, despite the existence of the Legal Rights, and the domain name would be sent to a UDRP-like function. Each party (the owner of the Existing Name and the domain name applicant) would pay full price for a one-person UDRP, i.e. a full double payment, such that the winner would receive a refund, paid by the loser. If the domain name applicant did not pay the UDRP price (US \$ 1500 at WIPO), the domain name would not be registered, and conversely, if the subscriber/protestor did not pay the UDRP price within the specified time, the domain name would be registered. The onus would be on the domain name applicant to demonstrate that the domain name could be used without infringing the Existing Name, as set forth below. It can be assumed that the "loser pays US \$ 1500" will discourage both abusive registrations and overzealous rights owners.</p> <p>The NSN would be fully automated and e-mail based, and thus relatively inexpensive. To be most effective, it would have to be in place prior to the launch of the traditional sunrise. It should be administered by the TLD (though if this also could be centralised and outsourced like the sunrise, this would be an advantage for all involved).</p> <p>For the duration of the NSN process, the domain name will not function. If the NSN subscriber does not utilize the opportunity to lodge a protest, the he or she can still initiate a UDRP or other proceedings at a later date.</p>
6	<p>Challenge. It is well settled that to be successful in a UDRP proceeding, the complainant must demonstrate that all three of the following conditions are met:</p> <p>(i) the domain name is identical or confusingly similar to a trademark or service mark in which the complainant has rights; and (ii) the respondent has no rights or legitimate interests in respect of the domain name; and (iii) the respondent's domain name has been registered and is being used in bad faith.</p> <p>If the UDRP complainant fails on any one of these 3 elements, the UDRP Complaint should fail. Thus in a Challenge process, either under NSN or to challenge a Defensive Removal, the domain name applicant has to prove that one or more of the following elements is present:</p> <p>(i) the domain name is not identical or confusingly similar to a trademark or service mark in which the complainant has rights; or (ii) the respondent has rights or legitimate interests in respect of the domain name; or (iii) the respondent's domain name will be used in good faith.</p> <p>In other words that a regular UDRP brought against this domain name applicant would fail.</p>

Final Report PRO WG

7	<p>Traditional sunrise: The traditional sunrise, whereby owners of Existing Names get an opportunity to register domain names before the "land rush", will be available, but due to the availability of the defensive removals and the name-string notification, this will be effectively limited to the new domain names which the owners actually intend to use. No validation need take place as a general rule, but only in the case of conflict. Traditional sunrise and defensive removals can be made at the same time, on the SSSP website mentioned above.</p> <p>Conflicts can arise in several situations:</p> <ol style="list-style-type: none"><li>1) Two or more parties request defensive removals, no sunrise: here there is no conflict. All are interested in not having the domain name be registered. Both parties should be noted as having this defensively removed, which means that if one of them changes their mind, or if the removal is challenged, both will be heard. If the one party who removed the domain name now wants to use and register it, the parties can either agree, or the UDRP-type function with loser pays described above will apply. Again, it will be up to the new applicant to show that its registration of the domain name will not be harmful to the owner of the Existing Name. Thus it is unlikely that a abusive registration with a bogus Existing Name could first remove icann.xxx and thereafter activate it by registration, if ICANN had also established a defensive removal of the same name.</li><li>2) One or more parties want the domain name defensively removed and one or more parties want it registered under the sunrise. Firstly the parties should be given an opportunity to discuss this among themselves, given a one-month deadline, extendible at the joint request of all parties. If there is no agreement, the UDRP-type function with loser pays described above will apply.</li><li>3) No defensive removals, but two or more sunrise applications. Firstly the parties should be given an opportunity to discuss this among themselves, given a one-month deadline, extendible at the joint request of all parties. If there is no agreement, the parties will firstly have to validate their rights (self validation). If both parties validate their rights, there will be an auction, where the new TLD retains the proceeds. The UDRP-type function with loser pays described above will also apply.</li></ol>
---	--

Final Report PRO WG

8	<p>Principles for resolving conflicts: As regards competing rights owners who seek different goals, there are as I see it four main scenarios:</p> <ol style="list-style-type: none"><li>1) two competing genuine rights of about the same size (like United Airlines and United Van lines)</li><li>2) two competing genuine rights of very different sizes (like WENDY'S chain of restaurants and a single WENDY's hair salon)</li><li>3) two competing rights, where one can be considered in bad faith (e.g. GOOGLE from Palo Alto on the one hand and a Uzbeki registration from 2006 for GOOGLE for clothing; the bad faith could also be generic, e.g. APPLE for computers on the one hand and a Benelux registration from 2006 for APPLE for paints on the other hand)</li><li>4) two competing bad faith rights (e.g. any two of the more than 200 Benelux, Danish and other registrations for SEX in various classes that were competing for SEX.EU)</li></ol> <p>Guiding principles should be</p> <ol style="list-style-type: none"><li>1) first let the parties try to sort it out, much like the "cooling-off" period of the CTM, e.g. within two months (extendible at the joint request of both parties).</li><li>2) mediation, e.g. WIPO Arbitration and Mediation Center with UDRP panelists. Here the mediators would be given wide latitude to take all aspects of the matter into consideration, such as the size of the each rights owner, the TLD, languages etc., and may either find for one party or end in a draw. For instance for WENDYS.ASIA, the mediator might find for the restaurant chain that had over 1000 restaurants in Asia; but if the new TLD was WENDYS.HAIR, the mediator might find for the hair salon. UNITED.[TLD] would end in a draw (but the parties would probably have sorted this out themselves, probably agreeing that one of them would register the domain name and that neither would use this and similar domains during the "cooling-off" period). It is difficult to consider a scenarios where a mediator reasonably could find for the Uzbeki GOOGLE registration, but it could be GOOGLE.[TLD meaning "clothes" in Uzbeki]. The parties split the cost of the mediation.</li><li>3) auction: in the case of a draw, the parties can bid for the domain name.</li></ol>
---	--

Final Report PRO WG

9	<p>Name-String Watch Service and Notification (modeled on .biz IP Claim and .name Name Watch Service): Name-String Watch Service and Notification (NSWSN) is a paid subscription function whereby the owner of an authenticated Legal Right will receive notification of every applied-for domain name that matches the watched name-string. The domain name applicant would receive notification that its name had matched a watched string and information about the watched-string right basis and claimant. The domain name applicant would then be required to confirm that it wished to proceed with registering the domain name. The Legal Rights owner would receive notification of the registrant's intention to proceed and would be provided a relatively short (not more than 30 days) period within which to initiate a proceeding to block the name's registration.</p> <p>To prevail in a challenge, the Legal Rights owner would be required to show that (a) the applied-for name is identical or confusingly similar to its authenticated right; (b) the applicant has no right or legitimate interest in the applied-for name; and (c) the applicant has registered or seeks to use the name in bad faith. [Alternative requirements noted above.] The Legal Rights Owner would be required to pay the dispute resolution fee. However, the applicant would be required to pay a small fee (USD 50) as a "bond." If the applicant did not submit the bond, the proceeding would not go forward, the dispute resolution provider would not issue a decision, and the applicant's registration would be blocked. If the applicant submitted the bond, the proceeding would go forward to resolution. [If the applicant prevailed, it would be refunded the bond amount.] An unsuccessful challenge would have no preclusive effect on the Legal Rights owner's right to later initiate a UDRP proceeding.</p> <p>The applied-for domain name would not resolve until any proceeding challenging the name was decided. Multiple Legal Rights owners could participate in NSWSN for the identical string, and multiple Legal Rights owners could challenge the applied-for domain name. Multiple challenges would be consolidated into one proceeding, the filing fee would be divided among/between the Legal Rights owners on a pro rata basis, and only one applicant bond would be required. Any one successful Legal Rights owner would be required to block the name.</p> <p>The NSWSN would be automated and e-mail based. All proceedings would be filed and conducted solely electronically; paper filings would not be permitted.</p>
10	<p>Rapid Suspension Procedure. Registries should institute a rapid suspension procedure in which a response team of independent experts (qualified UDRP panelists) will be retained to make determinations shortly after they receive a short and simple statement of a claim involving a well-known or otherwise inherently distinctive mark and a domain name clearly used in bad faith, or for which no conceivable good faith basis exists. Such determinations MUST result in an immediate suspension of resolution of the domain name, but will not prejudice either party's election to pursue another dispute mechanism. The claim and procedural requirements SHOULD be modeled after the <i>Digital Millennium Copyright Act</i>.</p>

**Proposals: Not discussed 1**

## **ANNEX ONE – REGISTRY SUMMARIES**

A key piece of the analysis was to look at previous rights protection mechanisms from other top-level domains.

The tables below include all the summaries that were completed by members of the Working Group or constituencies represented in the Working Group. Note that there is a mix of generic, sponsored and country code registries.

**Internet Corporation for Assigned Names and Numbers**

.aero (prepared by Paul D. McGrady, Jr. (IPC Member) and Kristina Rosette)

**Part A**

<b>TLD Eligibility</b>	<b>Mechanism Type (Sunrise, IP Claim, Other, None)</b>	<b>Rights Bases Requirements</b>	<b>Submission Process</b>	<b>Submission Cost</b>
<p>An Aviation Community Membership (“ACM”) ID is a necessary prerequisite for registering or maintaining a .aero domain name registration.</p>	<p>In addition to the UDRP, the .aero domain name is governed by the Eligibility Reconsideration Policy (“ERP”) and the Charter Eligibility Dispute Resolution Policy (“CEDRP”).</p>	<p>Societe Internationale de Telecommunications Aeronautiques SC (SITA), the .aero sponsor, restricts registration to members of the aviation community. SITA recognizes 18 registrant categories including, for example, aerospace, airlines and commercial operators, airports, and pilots.</p>	<p>When .aero first launched, a two-step process applied. First, the applicant was required to obtain an ACM ID. Once issued, the applicant could then apply for registration of .aero domain names through one of about a dozen registrars. SITA later introduced a consolidated process in which an applicant could apply simultaneously for both the ACM ID and the desired .aero domain name.</p>	<p>There is no submission cost for applying for the ACM ID. There are registrar costs associated with the actual registration, which costs vary by registrar.</p>

Final Report PRO WG

**Part B**

<b>Application Verification/Authentication Process</b>	<b>Challenge Mechanism (Yes/No)</b>	<b>Challenge Mechanism Cost &amp; Arbiter</b>	<b>Challenge Mechanism Requirements (to Prevail)</b>	<b>No. of Challenges</b>
<p>SITA implemented an applicant eligibility verification process. After supporting documentation was reviewed, the ACM ID was either issued or the application was rejected. By way of example, an applicant seeking to demonstrate its eligibility as a member of the “pilots” registrant subgroup could submit a copy of a website; a copy of a Pilot’s license; or the date on which the applicant’s Pilot’s license issued.</p> <p>For the majority of categories, SITA verifies once an application is submitted online.</p>	<p>Yes</p>	<p>WIPO; its website does not list filing fees for CEDRP.</p>	<p>ERP: The applicant seeking reconsideration must identify the registrant group(s) in which it claims membership, identify the ACM ID and domain name for which reconsideration is sought, and specify how it meets the Eligibility Requirements or, as applicable, the manner in which the domain name complies with the .aero Domain Management Policy.</p> <p>CEDRP: The Registered Name violated the Eligibility Requirements.</p>	<p>None. No published decisions.</p>

.info (prepared by Damian Broadley (International Trademark Association Internet Committee Member))

Part A

TLD Eligibility	Mechanism Type (Sunrise, IP Claim, Other, None)	Rights Bases Requirements	Submission Process	Submission Cost
No restriction – open gTLD.	.info had an IP sunrise and uses the UDRP to protect trademark rights post the start-up period.	<p>Trademarks registered before 2 October 2000.</p> <p>The nationality and number of the trademark had to be provided in the sunrise application.</p> <p>The textual element of the trademark had to be identical to the domain name, but stylized marks were accepted.</p> <p>There was a sunrise challenge period during which third parties could challenge the applicant’s basis for their sunrise claim. WIPO was appointed to determine these challenges. If challenged, an applicant had to file evidence of their trademark.</p>	<p>Sunrise claims had to be filed between 25 July and 27 August 2001. Apart from the additional trademark detail, the applications were typical of a domain name registration.</p> <p>Competing sunrise claims were prioritized using a randomized round robin queuing system.</p>	There was no additional cost for a sunrise application, but there was a minimum 5 year registration period and a 180 non-transfer period.

Doc. No.:

Date:

1 June 2007

## Final Report PRO WG

### Part B

Application Verification/Authentication Process	Challenge Mechanism (Yes/No)	Challenge Mechanism Cost & Arbiter	Challenge Mechanism Requirements (to Prevail)	No. of Challenges
<p>There was no formal verification in .info. However, there was a sunrise challenge mechanism and the registry itself challenged many names in what were known as 'Challenges of Last Resort.'</p> <p>In addition, the registry reportedly cancelled 7000 Sunrise registrations when the registrants failed to respond to registry inquiries for trademark information.</p>	<p>Yes</p>	<p>Sunrise challenges could be filed from 28 August to 26 December 2001.</p> <p>Challengers had to pay a non-refundable \$75 fee and if more than one challenge was filed to a name they were ranked in order of priority. The 'priority challenger' then had to pay \$225. The applicant had to pay \$295 to defend their sunrise claim.</p> <p>The arbiter was WIPO.</p>	<p>If more than one challenge was filed against a sunrise application the challenges were ranked in order of priority.</p> <p>The challenger needed to show:</p> <ul style="list-style-type: none"> <li>• At the time of registration of the domain name, no current trademark or service mark registration was issued in the registrant's name.</li> <li>• The domain name registered is not identical to the textual or word elements of the trademark or service mark that is registered</li> <li>• The registration of the trademark or service mark registered is not of national effect or was not issued prior to October 2, 2000.</li> </ul> <p>There were no other grounds for challenging a sunrise application.</p>	<p>15172 challenges were filed, but 13593 of these were Challenges of Last Resort filed by the registry itself. Only 1579 were 'regular' challenges.</p>

Final Report PRO WG

Part C

Successful Challenges (Number & %)	Total No. Registered Names	No. of Mechanism Registrations/Claims	References
<p>Of the total 15172 challenges, the outcome was as follows:  88.6% name cancelled,  5.1% name transferred.  5.4% challenge terminated  0.9% challenge dismissed</p> <p>For the 1579 Regular challenges, the outcome was as follows:  26.5% name cancelled,  49.2% name transferred.  20.8% challenge terminated  3.5% challenge dismissed</p> <p>For the 13593 Challenges of Last Resort, the outcome was as follows:  95.8% name cancelled,  3.6% challenge terminated  0.6% challenge dismissed</p>	<p>The 4 millionth .info name was registered in March 2007.</p>	<p>51,764 names were registered during the Sunrise registration period.</p>	<p>WIPO did a report on its involvement in the .info sunrise challenges:  <a href="http://www.wipo.int/amc/en/domains/reports/info-sunrise/report/index.html">http://www.wipo.int/amc/en/domains/reports/info-sunrise/report/index.html</a></p> <p>Summary submitted to Afiliat for review, but no comments were received before the final report deadline.</p>

.jobs (prepared by Mike Rodenbaugh)

Part A

TLD Eligibility	Mechanism Type (Sunrise, IP Claim, Other, None)	Rights Bases Requirements	Submission Process	Submission Cost
.Jobs reserves all domain names at the second level to ensure fair and equitable treatment for all employers to acquire their legal or commonly known trade name at the point in time they desire to do so.	Other ("Trade Name Period")	Legal or commonly known trade names.	Initial 60-day "Trade Name Period" for companies to apply for registration with equal standing whether submitted on Day One or Day Sixty.	No cost additional to registration fee.

Doc. No.:

Date:

1 June 2007

Final Report PRO WG

Part B

Application Verification/Authentication Process	Challenge Mechanism (Yes/No)	Challenge Mechanism Cost & Arbiter	Challenge Mechanism Requirements (to Prevail)	No. of Challenges
All applications were validated by the registry, to ensure domains would be used by companies with legal or other commonly known names corresponding to requested domain name.	Yes.	No cost.	At the close of the Trade Name Period, registry examined the duplicate applications and based upon various criteria to determined a clear differentiator (criteria based upon the best interests of the community, i.e. one IBM employs 10,000 people and none of the others employed more than 10). If registry could not determine a clear differentiator, with one of the mechanisms allowing the parties to work out amongst themselves if they wanted to, it simply went to a coin flip.	Only one name was contested to a coin flip.

Final Report PRO WG

Application Verification/Authentication Process	Challenge Mechanism (Yes/No)	Challenge Mechanism Cost & Arbitrator	Challenge Mechanism Requirements (to Prevail)	No. of Challenges
n.a.	Yes.  ERDRP (general and for DRs).	WIPO and NAF were approved arbitrators. Fees were standard WIPO and NAF fees.	ERDRP: Challenger had to establish that the registrant did not meet eligibility requirements and that the challenger itself was eligible for the name.  UDRP: Usual three-prong test.	WIPO identified 6 .NAME UDRPs out of approx. 19,000, and 5 ERDRPS.

Final Report PRO WG

**.travel (prepared by Kristina Rosette)**

**Part A**

TLD Eligibility	Mechanism Type (Sunrise, IP Claim, Other, None)	Rights Bases Requirements	Submission Process	Submission Cost
<p>Sponsored TLD.</p> <p>Eligibility for .travel names was restricted to ‘people, organizations, associations, and private, governmental and non-governmental agencies in the travel and tourism industry.’ Illustrative eligible industry categories include airlines; attractions/theme parks; bed &amp; breakfast houses; bus/taxi/limousine operators; camp facility operators; car rental companies/airport specialty car park companies; computer reservation/travel technology provider; convention &amp; visitor’s bureaus; cruise lines; ferries; hotels/resorts/casinos;</p>	<p>Other.</p> <p><u>Rights-based Name Selection.</u> Tralliance restricted name selection to the .travel names corresponding to names and marks owned or used by the applicant. After an Authentication Provider authenticated the applicant’s eligibility for .travel names, the applicant was provided with a list of .travel names that, based on its eligibility application, it was entitled to register.</p> <p><u>Place Names:</u> Tralliance created a list of country and place (city, county, continental regional,</p>	<p><u>Name Selection.</u> .Travel name choices were limited to the names an applicant owned or used. Each .travel applicant received a Names List of names it was eligible to register based on information it provided during the authentication process. Documentation of use or registration of each name was required. The illustrative list of “name types” consists of :</p> <ul style="list-style-type: none"> <li>• “doing business as” names, trade names, or “usual” business names;</li> <li>• usual business name used in URL;</li> <li>• trademark (registered, applied for, or used);</li> <li>• service mark (registered, applied for, or used);</li> <li>• product name (registered or used);</li> <li>• division name;</li> <li>• subsidiary name (wholly owned or controlled);</li> <li>• promotion or venture name;</li> <li>• partnership name (registration or</li> </ul>	<p>All applicants are required to undergo an authentication process to confirm their eligibility for a .travel domain name. Once authenticated, the applicant receives a Unique Identifying Number (“UIN”) and a Names List of names for which the applicant is eligible to apply for based on the Name Selection Data it provided. The UIN and Names List for each applicant is posted to a database and made accessible to both the applicant and its Authentication Provider. Applicant selects a .travel accredited registrar and submits its .travel name registration application(s). Tralliance matches applicant name, UIN and applied-for .travel name against database. All three elements must match for registration to be successful.</p> <p>Tralliance awarded all .travel names except place names and reserved names on a “first come,</p>	<p>Unable to determine. Accredited registrars charge different prices.</p>

Final Report PRO WG

TLD Eligibility	Mechanism Type (Sunrise, IP Claim, Other, None)	Rights Bases Requirements	Submission Process	Submission Cost
<p>national tourism offices; passenger rail lines; restaurants; tour operators; travel agents; travel media; travel consumer and market research organizations; ravel insurance; and travel training institutes.</p>	<p>state, province, and territory) names, and initially reserved those names for registration by the governmental authority that holds a right to the name based on use or location.</p>	<p>use)</p> <ul style="list-style-type: none"> <li>• club name;</li> <li>• competition, games or event name (registered, applied for or used);</li> <li>• transport vessel name;</li> <li>• acronyms of eligible name as long as three letters ore more.</li> </ul> <p><u>Place Names.</u> Priority granted to governmental authority, agency, board or bureau with demonstrable rights to name. Policy indicates documentation is required.</p>	<p>first served" basis to the first qualified and eligible applicant.</p> <p><u>Pre-Authentication (July 1, 2005-September 29, 2005):</u>        Authentication available on a rolling basis for members or affiliates of Authentication Providers. Initial phase ended five days before Limited Launch. Applicants authenticated during this period could register immediately upon opening of Limited Launch. First phase started on Limited Launch start date and ran for 25 days. Applicants authenticated during this phase could register starting on second month of Limited Launch. Second phase of Pre-authentication started on 31st day of Limited Launch and ran for 25 days. Applicants authenticated during this phase could register during the third month of Limited Launch.</p> <p><u>Limited Launch (Oct. 3, - December 26, 2005):</u> Registration open to all entities that had undergone Pre-authentication.</p>	

Final Report PRO WG

TLD Eligibility	Mechanism Type (Sunrise, IP Claim, Other, None)	Rights Bases Requirements	Submission Process	Submission Cost
			<p><u>Open Launch</u> (January 2, 2006): Authentication and registration sequentially in real time.</p> <p><u>Place Names Reserved List (ended Sept. 25, 2005)</u>: Entities had an initial window to notify Tralliance that a relevant Place Name was not on the Place Names Reserved List.</p> <p><u>Place Name Priority Rights</u> (Oct. 1, 2005-December 31, 2006): Eligible entities were required to send a letter to Tralliance on letterhead stationery that set forth the .travel names they wished to claim from the Place Names Reserved List. Tralliance applied a “larger population” priority right under which the larger population entity had priority to a place name or a smaller population entity (e.g., Paris, France had priority over Paris, Texas).</p>	

Final Report PRO WG

**Part B**

Application Verification/Authentication Process	Challenge Mechanism (Yes/No)	Challenge Mechanism Cost & Arbiter	Challenge Mechanism Requirements (to Prevail)	No. of Challenges
<p>Yes, Tralliance used an authentication process, which was implemented by authorized Authentication Providers. Travel association members could be authenticated by their association or by third-party Authentication Provider. A travel association that is an Authentication Provider can authenticate only its own members.</p> <p>Applicants submitted their Identification Data, Contact Data, and Name Selection Data to an Authentication Provider. The Identification and Contact Data were used to authenticate eligibility; the Name Selection Data was used to generate the Names List for the applicant.</p> <p>An applicant could appeal to Tralliance the Authentication Provider's denial of eligibility as long as it did so within 30 days of denial. All denials are</p>	<p>No.</p>	<p>N/A</p>	<p>N/A</p>	<p>None.</p>

### Poll Results

Poll menu: New gTLDs PRO-WG

Report date: Tue 22 May 2007 11:48 BST

Country: All

1. Please categorize yourself (check all that apply):

As at: Sat 05 May 2007 07:59 BST

Number of voters: 40

Ranked by votes

Rank	Opinion	Votes	%
1	Rights owner representative	19	47.50
2	Intellectual Property Rights Owner	17	42.50
3	Civil society (non-profit or similar)	13	32.50
3	Registrant	13	32.50
3	Registrant representative	13	32.50
6	Other	4	10.00
7	Registrar	3	7.50
8	Registry	2	5.00
9	Government	0	0.00

2. Do IP owners need new intellectual property rights or enhanced protection of rights in cyberspace compared to the protection that exists in the real world?

As at: Fri 04 May 2007 23:59 BST

Number of voters: 40

Ranked by votes

Rank	Opinion	Votes	%
1	Yes	19	47.50
1	No	19	47.50
3	No opinion	2	5.00

3. Should registries be mandated to provide such enhanced protections during the introduction of new top-level domains?

As at: Fri 04 May 2007 23:59 BST

Number of voters: 22

Ranked by votes

## Final Report PRO WG

Rank	Opinion	Votes	%
1	Yes	18	81.82
2	No	2	9.09
2	No opinion	2	9.09

4. Please list all TLDs in which you have participated in a rights protection mechanism (such as a sunrise pre-registration period for the launch of a new top-level domain).

As at: Fri 04 May 2007 23:59 BST

Number of voters: 31

Ranked by votes

Rank	Opinion	Votes	%

## **ANNEX FOUR – NEW TLDS PROPOSED RECOMMENDATIONS & IMPLEMENTATION GUIDELINES**

### **NEW TLD PRINCIPLES, PROPOSED RECOMMENDATIONS AND IMPLEMENTATION GUIDELINES**

The following tables set out the principles, proposed recommendations and implementation guidelines from the GNSO Committee on the Introduction of New Top-Level Domains. They are included here to provide some detailed context for the deliberations of the PRO WG. The outputs from the PRO WG will be fed into the ongoing Committee deliberations.

Final Report PRO WG

	<b><i>PRINCIPLE</i></b>	<b><i>MISSION OR CORE VALUE</i></b>
<b>A</b>	<b>New generic top-level domains (gTLDs) must be introduced in an orderly, timely and predictable way.</b>	<b>M1 &amp; CV1 &amp; 2, 4-10</b>
<b>B</b>	Some new generic top-level domains should be internationalised domain names (IDNs) subject to the approval of IDNs being available in the root.	M1-3 & CV 1, 4 & 6
<b>C</b>	The reasons for introducing new top-level domains include that there is demand from potential applicants for new top-level domains in both ASCII and IDN formats. In addition the introduction of new top-level domain application process has the potential to promote competition in the provision of registry services, to add to consumer choice, market differentiation and geographical and service-provider diversity. <b>[Consistent with GAC Principle 2.6]</b>	M3 & CV 4-10
<b>D</b>	A set of technical criteria must be used for assessing a new gTLD registry applicant to minimise the risk of harming the operational stability, security and global interoperability of the Internet.	M1-3 & CV 1
<b>E</b>	A set of capability criteria for a new gTLD registry applicant must be used to provide an assurance that an applicant has the capability to meets its obligations under the terms of ICANN's registry agreement.	M1-3 & CV 1
<b>F</b>	<b>A set of operational criteria must be set out in contractual conditions in the registry agreement to ensure compliance with ICANN policies.</b>	<b>M1-3 &amp; CV 1</b>

---

	<b>PROPOSED RECOMMENDATION</b>	<b>MISSION &amp; CORE VALUES</b>
1	<p>ICANN must implement a process that allows the introduction of new top-level domains.</p> <p>The evaluation and selection procedure for new gTLD registries should respect the principles of fairness, transparency and non-discrimination. All applicants for a new gTLD registry should therefore be evaluated against transparent and predictable criteria, fully available to the applicants prior to the initiation of the process. Normally, therefore, no subsequent additional selection criteria should be used in the selection process. [GAC2.5]</p>	M1-3 & CV1-11
2	<p>Strings must not be confusingly similar to an existing top-level domain.</p> <p>In the interests of consumer confidence and security, new gTLDs should not be confusingly similar to existing TLDs. To avoid confusion with country-code Top Level Domains no two letter gTLDs should be introduced. [GAC2.4]</p>	M1-3 & C1-6-11
3	<p>Strings must not infringe the existing legal rights of others that are recognized or enforceable under generally accepted and internationally recognized principles of law.</p> <p>The process for introducing new gTLDs must make proper allowance for prior third party rights, in particular trademark rights as well as rights in the names and acronyms of inter-governmental organizations (IGOs). [GAC2.3]</p>	CV3
4	<p>Strings must not cause any technical instability.</p>	M1-3 & CV 1
5	<p>Strings must not be a Reserved Word.</p> <p>ICANN should avoid country, territory or place names, and country, territory or regional language or people descriptions, unless in agreement with the relevant governments or public authorities. [GAC2.2]</p>	M1-3 & CV 1 & 3

---

Final Report PRO WG

---

6	<p>Strings must not be contrary to generally accepted legal norms relating to morality and public order.</p> <p>New gTLDs should respect:</p> <p>a) The provisions of the Universal Declaration of Human Rights which seek to affirm "fundamental human rights, in the dignity and worth of the human person and in the equal rights of men and women".</p> <p>b) The sensitivities regarding terms with national, cultural, geographic and religious significance. [GAC2.1]</p>	M3 & CV 4
7	<p>Applicants must be able to demonstrate their technical capability to run a registry operation for the purpose that the applicant sets out.</p>	M1-3 & CV1
8	<p>Applicants must be able to demonstrate their financial and organisational operational capability.</p> <p>An application will be rejected or otherwise deferred if it is determined, based on public comments or otherwise, that there is substantial opposition to it from among significant established institutions of the economic sector, or cultural or language community, to which it is targeted or which it is intended to support.</p>	M1-3 & CV1
9	<p>There must be a clear and pre-published application process using objective and measurable criteria.</p>	M3 & CV6-9
10	<p>There must be a base contract provided to applicants at the beginning of the application process.</p>	CV7-9
11	<p>Staff Evaluators will be used to make preliminary determinations about applications as part of a process which includes the use of expert panels to make decisions.</p>	CV7-9
12	<p>Dispute resolution and challenge processes must be established prior to the start of the process.</p>	CV7-9

---

Final Report PRO WG

---

13	Applications must initially be assessed in rounds until the scale of demand is clear.	CV7-9
14	The initial registry agreement term must be of a commercially reasonable length.	CV5-9
15	There must be renewal expectancy.	CV5-9
16	Registries must apply existing Consensus Policies and adopt new Consensus Policies as they are approved.	CV5-9
17	A clear compliance and sanctions process must be set out in the base contract which could lead to contract termination.	M1 & CV1
18	If an applicant offers an IDN service, then ICANN's IDN guidelines must be followed.	M1 & CV1
19	Registries must use ICANN accredited registrars.	M1 & CV1

---

	Proposed Implementation Guidelines	Mission & Core Value
IG A	The application process will provide a pre-defined roadmap for applicants that encourages the submission of applications for new top-level domains.	CV 2, 5, 6, 8 & 9
IG B	Application fees will be designed to ensure that adequate resources exist to cover the total cost to administer the new gTLD process.  Application fees may differ for applicants.	CV 5, 6, 8 & 9

Final Report PRO WG

IG C	ICANN will provide frequent communications with applicants and the public including comment forums which will be used to inform evaluation panels.	CV 9 & 10
IG D	A first come first served processing schedule within the application round will be implemented and will continue for an ongoing process, if necessary.  Applications will be time and date stamped on receipt.	CV 8-10
IG E	The application submission date will be at least four months after the issue of the Request for Proposal and ICANN will promote the opening of the application round.	CV 9 & 10

Final Report PRO WG

IG F	<p><b><i>If there is contention for strings, applicants may:</i></b></p> <ul style="list-style-type: none"><li data-bbox="683 373 980 573"><b><i>i) resolve contention between them within a pre-established timeframe</i></b></li><li data-bbox="683 594 1036 898"><b><i>ii) if there is no mutual agreement, a claim to support a community by one party will be a reason to award priority to that application</i></b></li><li data-bbox="683 919 1036 1192"><b><i>iii) If there is no such claim, and no mutual agreement a process will be put in place to enable efficient resolution of contention and;</i></b></li><li data-bbox="683 1213 1036 1413"><b><i>iv) the ICANN Board may be used to make a final decision, using advice from staff and expert panels.</i></b></li></ul>	CV 7-10
------	--	---------

Final Report PRO WG

IG G	<p><b><i>Where an applicant lays any claim that the TLD is intended to support a particular community such as a sponsored TLD, or any other TLD intended for a specified community, that claim will be taken on trust with the following exception:</i></b></p> <p><b><i>i) the claim relates to a string that is also subject to another application and the claim to support a community is being used to gain priority for the application</i></b></p> <p>Under this exception, Staff Evaluators will devise criteria and procedures to investigate the claim.</p>	CV 7 - 10
IG H	External dispute providers will give decisions on complaints.	CV 10
IG I	An applicant granted a TLD string must use it within a fixed timeframe which will be specified in the application process.	CV 10
IG J	The base contract should balance market certainty and flexibility for ICANN to accommodate a rapidly changing market place.	CV 4-10
IG K	ICANN should take a consistent approach to the establishment of registry fees.	CV 5

Final Report PRO WG

IG L	The use of personal data must be limited to the purpose for which it is collected.	CV 8
IG M	ICANN may establish a capacity building and support mechanism aiming at facilitating effective communication on important and technical Internet governance functions in a way which no longer requires all participants in the conversation to be able to read and write English.	CV 3 - 7
IG N	ICANN may put in place a fee reduction scheme for gTLD applicants from economies classified by the UN as least developed.	CV 3 - 7
IG O	ICANN may put in place systems that could provide information about the gTLD process in major languages other than English, for example, in the six working languages of the United Nations.	CV 8 -10

## Approval of Minutes

Resolved (2008.06.26.01), the minutes of the Board Meeting of 29 May 2008 are approved. <<http://www.icann.org/minutes/prelim-report-29may08.htm> (/minutes/prelim-report-29may08.htm)>

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top) |

## GNSO Recommendations on New gTLDs

Whereas, the GNSO initiated a policy development process on the introduction of New gTLDs in December 2005.

<<http://gns0.icann.org/issues/new-gtlds/>  
(<http://gns0.icann.org/issues/new-gtlds/>)>

Whereas, the GNSO Committee on the Introduction of New gTLDs addressed a range of difficult technical, operational, legal, economic, and policy questions, and facilitated widespread participation and public comment throughout the process.

Whereas, the GNSO successfully completed its policy development process on the Introduction of New gTLDs and on 7 September 2007, and achieved a Supermajority vote on its 19 policy recommendations.

<<http://gns0.icann.org/meetings/minutes-gns0-06sep07.shtml>  
(<http://gns0.icann.org/meetings/minutes-gns0-06sep07.shtml>)>

Whereas, the Board instructed staff to review the GNSO recommendations and determine whether they were capable of implementation.

Whereas, staff has engaged international technical, operational and legal expertise to provide counsel on details to support the implementation of the Policy recommendations and as a result, ICANN cross-functional teams have developed implementation details in support of the GNSO's policy recommendations, and have concluded that the recommendations are capable of implementation.

Whereas, staff has provided regular updates to the community and the Board on the implementation plan. <<http://icann.org/topics/new-gtld-program.htm> (/icann.org/topics/new-gtld-program.htm)>

Whereas, consultation with the DNS technical community has led to the conclusion that there is not currently any evidence to support establishing a limit to how many TLDs can be inserted in the root based on technical stability concerns. <<http://www.icann.org/topics/dns-stability-draft-paper-06feb08.pdf> (/topics/dns-stability-draft-paper-06feb08.pdf)>

Whereas, the Board recognizes that the process will need to be resilient to unforeseen circumstances.

Whereas, the Board has listened to the concerns about the recommendations that have been raised by the community, and will continue to take into account the advice of ICANN's supporting organizations and advisory committees in the implementation plan.

Resolved (2008.06.26.02), based on both the support of the community for New gTLDs and the advice of staff that the introduction of new gTLDs is capable of implementation, the Board adopts the GNSO policy recommendations for the introduction of new gTLDs  
<<http://gnso.icann.org/issues/new-gtlds/pdp-dec05-fr-parta-08aug07.htm> (<http://gnso.icann.org/issues/new-gtlds/pdp-dec05-fr-parta-08aug07.htm>)>.

Resolved (2008.06.26.03), the Board directs staff to continue to further develop and complete its detailed implementation plan, continue communication with the community on such work, and provide the Board with a final version of the implementation proposals for the board and community to approve before the new gTLD introduction process is launched.

| [back to top](#) (/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top) |

## **IDNC / IDN Fast-track**

Whereas, the ICANN Board recognizes that the "IDNC Working Group" developed, after extensive community comment, a final report on feasible methods for timely (fast-track) introduction of a limited number of IDN ccTLDs associated with ISO 3166-1 two-letter codes while an overall, long-term IDN ccTLD policy is under development by the ccNSO.

Whereas, the IDNC Working Group has concluded its work and has submitted recommendations for the selection and delegation of "fast-track" IDN ccTLDs and, pursuant to its charter, has taken into account and was guided by consideration of the requirements to:

- Preserve the security and stability of the DNS;
- Comply with the IDNA protocols;
- Take input and advice from the technical community with respect to the implementation of IDNs; and
- Build on and maintain the current practices for the delegation of ccTLDs, which include the current IANA practices.

Whereas, the IDNC Working Group's high-level recommendations require implementation planning.

Whereas, ICANN is looking closely at interaction with the final IDN ccTLD PDP process and potential risks, and intends to implement IDN ccTLDs using a procedure that will be resilient to unforeseen circumstances.

Whereas, staff will consider the full range of implementation issues related to the introduction of IDN ccTLDs associated with the ISO 3166-1 list, including means of promoting adherence to technical standards and mechanisms to cover the costs associated with IDN ccTLDs.

Whereas, the Board intends that the timing of the process for the introduction of IDN ccTLDs should be aligned with the process for the introduction of New gTLDs.

Resolved (2008.06.26.04), the Board thanks the members of the IDNC WG for completing their chartered tasks in a timely manner.

Resolved (2008.06.26.05), the Board directs staff to: (1) post the IDNC WG final report for public comments; (2) commence work on implementation issues in consultation with relevant stakeholders; and (3) submit a detailed implementation report including a list of any outstanding issues to the Board in advance of the ICANN Cairo meeting in November 2008.

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## **GNSO Recommendation on Domain Tasting**

Whereas, ICANN community stakeholders are increasingly concerned about domain tasting, which is the practice of using the add grace period (AGP) to register domain names in bulk in order to test their profitability.

Whereas, on 17 April 2008, the GNSO Council approved, by a Supermajority vote, a motion to prohibit any gTLD operator that has implemented an AGP from offering a refund for any domain name deleted during the AGP that exceeds 10% of its net new registrations in that month, or fifty domain names, whichever is greater.

<<http://gnso.icann.org/meetings/minutes-gnso-17apr08.shtml>  
(<http://gnso.icann.org/meetings/minutes-gnso-17apr08.shtml>)>

Whereas, on 25 April 2008, the GNSO Council forwarded its formal "Report to the ICANN Board - Recommendation for Domain Tasting"

<<http://gnso.icann.org/issues/domain-tasting/domain-tasting-board-report-gnso-council-25apr08.pdf> (<http://gnso.icann.org/issues/domain-tasting/domain-tasting-board-report-gnso-council-25apr08.pdf>)>, which outlines the full text of the motion and the full context and procedural history of this proceeding.

Whereas, the Board is also considering the Proposed FY 09 Operating Plan and Budget <<http://www.icann.org/financials/fiscal-30jun09.htm>  
([/financials/fiscal-30jun09.htm](http://www.icann.org/financials/fiscal-30jun09.htm))>, which includes (at the encouragement of

the GNSO Council) a proposal similar to the GNSO policy recommendation to expand the applicability of the ICANN transaction fee in order to limit domain tasting.

Resolved (2008.06.26.06), the Board adopts the GNSO policy recommendation on domain tasting, and directs staff to implement the policy following appropriate comment and notice periods on the implementation documents.

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## **Approval of Operating Plan and Budget for Fiscal Year 2008-2009**

Whereas, ICANN approved an update to the Strategic Plan in December 2007. <<http://www.icann.org/strategic-plan/> ([/strategic-plan](#))>

Whereas, the Initial Operating Plan and Budget Framework for fiscal year 2009 was presented at the New Delhi ICANN meeting and was posted in February 2008 for community consultation. <<http://www.icann.org/announcements/announcement-2-04feb08.htm> ([/announcements/announcement-2-04feb08.htm](#))>

Whereas, community consultations were held to discuss and obtain feedback on the Initial Framework.

Whereas, the draft FY09 Operating Plan and Budget was posted for public comment in accordance with the Bylaws on 17 May 2008 based upon the Initial Framework, community consultation, and consultations with the Board Finance Committee. A slightly revised version was posted on 23 May 2008. <<http://www.icann.org/financials/fiscal-30jun09.htm> ([/financials/fiscal-30jun09.htm](#))>

Whereas, ICANN has actively solicited community feedback and consultation with ICANN's constituencies. <<http://forum.icann.org/lists/op-budget-fy2009/> ([http://forum.icann.org/lists/op-budget-fy2009/](#))>

Whereas, the ICANN Board Finance Committee has discussed, and guided staff on, the FY09 Operating Plan and Budget at each of its regularly scheduled monthly meetings.

Whereas, the final FY09 Operating Plan and Budget was posted on 26 June 2008. <<http://www.icann.org/en/financials/proposed-opplan-budget-v3-fy09-25jun08-en.pdf> ([/en/financials/proposed-opplan-budget-v3-fy09-25jun08-en.pdf](#))>

Whereas, the ICANN Board Finance Committee met in Paris on 22 June 2008 to discuss the FY09 Operating Plan and Budget, and recommended that the Board adopt the FY09 Operating Plan and Budget.

Whereas, the President has advised that the FY09 Operating Plan and Budget reflects the work of staff and community to identify the plan of activities, the expected revenue, and resources necessary to be spent in fiscal year ending 30 June 2009.

Whereas, continuing consultation on the budget has been conducted at ICANN's meeting in Paris, at constituency meetings, and during the public forum.

Resolved (2008.06.26.07), the Board adopts the Fiscal Year 2008-2009 Operating Plan and Budget.

<<http://www.icann.org/en/financials/proposed-opplan-budget-v3-fy09-25jun08-en.pdf> (</en/financials/proposed-opplan-budget-v3-fy09-25jun08-en.pdf>)>

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top) |

## **Update on Draft Amendments to the Registrar Accreditation Agreement**

(For discussion only.)

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top) |

## **Approval of PIR Request to Implement DNSSEC in .ORG**

Whereas, Public Interest Registry has submitted a proposal to implement DNS Security Extensions (DNSSEC) in .ORG.

<<http://icann.org/registries/rsep/pir-request-03apr08.pdf> (<http://icann.org/registries/rsep/pir-request-03apr08.pdf>)>

Whereas, staff has evaluated the .ORG DNSSEC proposal as a new registry service via the Registry Services Evaluation Policy <<http://icann.org/registries/rsep/> (<http://icann.org/registries/rsep/>)>, and the proposal included a requested amendment to Section 3.1(c)(i) of the .ORG Registry Agreement <<http://icann.org/tlds/agreements/org/proposed-org-amendment-23apr08.pdf> (<http://icann.org/tlds/agreements/org/proposed-org-amendment-23apr08.pdf>)> which was posted for public comment along with the PIR proposal.

Whereas, the evaluation under the threshold test of the Registry Services Evaluation Policy <<http://icann.org/registries/rsep/rsep.html> (<http://icann.org/registries/rsep/rsep.html>)> found a likelihood of security and stability issues associated with the proposed implementation. The RSTEP Review Team considered the proposal and found that there was a risk of a meaningful adverse effect on security and stability, which could be effectively mitigated by policies, decisions and actions to which PIR has expressly committed in its proposal or could be reasonably required to commit. <<http://icann.org/registries/rsep/rstep-report-pir-dnssec-04jun08.pdf> (<http://icann.org/registries/rsep/rstep-report-pir-dnssec-04jun08.pdf>)>

Whereas, the Chair of the SSAC has advised that RSTEP's thorough investigation of every issue that has been raised concerning the security and stability effects of DNSSEC deployment concludes that effective measures to deal with all of them can be taken by PIR, and that this conclusion after exhaustive review greatly increases the confidence with which DNSSEC deployment in .ORG can be undertaken.

Whereas, PIR intends to implement DNSSEC only after extended testing and consultation.

Resolved (2008.06.26.08), that PIR's proposal to implement DNSSEC in .ORG is approved, with the understanding that PIR will continue to cooperate and consult with ICANN on details of the implementation. The President and the General Counsel are authorized to enter the associated amendment to the .ORG Registry Agreement, and to take other actions as appropriate to enable the deployment of DNSSEC in .ORG.

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

### **ICANN Board of Directors' Code of Conduct**

Whereas, the members of ICANN's Board of Directors are committed to maintaining a high standard of ethical conduct.

Whereas, the Board Governance Committee has developed a Code of Conduct to provide the Board with guiding principles for conducting themselves in an ethical manner.

Resolved (2008.06.26.09), the Board directs staff to post the newly proposed ICANN Board of Directors' Code of Conduct for public comment, for consideration by the Board as soon as feasible. [Reference to PDF will be inserted when posted.]

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

### **Ratification of Selection of Consultant to Conduct Independent Review of the Board**

Whereas, the Board Governance Committee has recommended that Boston Consulting Group be selected as the consultant to perform the independent review of the ICANN Board.

Whereas, the BGC's recommendation to retain BCG was approved by the Executive Committee during its meeting on 12 June 2008.

Resolved (2008.06.26.10), the Board ratifies the Executive Committee's approval of the Board Governance Committee's recommendation to select Boston Consulting Group as the consultant to perform the independent review of the ICANN Board.

[| back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## **Appointment of Independent Review Working Groups**

Whereas, the Board Governance Committee has recommended that several working groups should be formed to coordinate pending independent reviews of ICANN structures.

Resolved (2008.06.26.11), the Board establishes the following independent review working groups:

- ICANN Board Independent Review Working Group: Amadeu Abril i Abril, Roberto Gaetano (Chair), Steve Goldstein, Thomas Narten, Rajasekhar Ramaraj, Rita Rodin, and Jean Jacques Subrenat.
- DNS Root Server System Advisory Committee (RSSAC) Independent Review Working Group: Harald Alvestrand (Chair), Steve Crocker and Bruce Tonkin.
- Security and Stability Advisory Committee (SSAC) Independent Review Working Group: Robert Blokzijl, Dennis Jennings (Chair), Reinhard Scholl and Suzanne Woolf.

[| back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## **Update on Independent Reviews of ICANN Structures**

(For discussion only.)

[| back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## **Board Committee Assignment Revisions**

Whereas, the Board Governance Committee has recommended that the membership of several Board should be revised, and that all other committees should remain unchanged until the 2008 Annual Meeting.

Resolved (2008.06.26.12), the membership of the Audit, Finance, and Reconsideration committees are revised as follows:

- Audit Committee: Raimundo Beca, Demi Getschko, Dennis Jennings, Njeri Rionge and Rita Rodin (Chair).
- Finance Committee: Raimundo Beca, Peter Dengate Thrush, Steve Goldstein, Dennis Jennings, Rajasekhar Ramaraj (Chair), and Bruce Tonkin (as observer).
- Reconsideration Committee: Susan Crawford (Chair), Demi Getschko, Dennis Jennings, Rita Rodin, and Jean-Jacques Subrenat.

[| back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## **Approval of BGC Recommendations on GNSO Improvements**

Whereas, Article IV, Section 4 of ICANN's Bylaws calls for periodic reviews of the performance and operation of ICANN's structures by an entity or entities independent of the organization under review.

Whereas, the Board created the "Board Governance Committee GNSO Review Working Group" (Working Group) to consider the independent review of the GNSO and other relevant input, and recommend to the Board Governance Committee a comprehensive proposal to improve the effectiveness of the GNSO, including its policy activities, structure, operations and communications.

Whereas, the Working Group engaged in extensive public consultation and discussions, considered all input, and developed a final report <<http://www.icann.org/topics/gnso-improvements/gnso-improvements-report-03feb08.pdf> (/topics/gnso-improvements/gnso-improvements-report-03feb08.pdf)> containing a comprehensive and exhaustive list of proposed recommendations on GNSO improvements.

Whereas, the Board Governance Committee determined that the GNSO Improvements working group had fulfilled its charter and forwarded the final report to the Board for consideration.

Whereas, a public comment forum was held open for 60 days to receive, consider and summarize <<http://forum.icann.org/lists/gnso-improvements-report-2008/msg00033.html> (<http://forum.icann.org/lists/gnso-improvements-report-2008/msg00033.html>)> public comments on the final report.

Whereas, the GNSO Council and Staff have worked diligently over the past few months to develop a top-level plan for approaching the implementation of the improvement recommendations, as requested by the Board at its New Delhi meeting.

Whereas, ICANN has a continuing need for a strong structure for developing policies that reflect to the extent possible a consensus of all stakeholders in the community including ICANN's contracted parties.

Resolved (2008.06.26.13), the Board endorses the recommendations of the Board Governance Committee's GNSO Review Working Group, other than on GNSO Council restructuring, and requests that the GNSO convene a small working group on Council restructuring including one representative from the current NomCom appointees, one member from each constituency and one member from each liaison-appointing advisory committee (if that advisory committee so desires), and that this group should reach consensus and submit a consensus recommendation on Council restructuring by no later than 25 July 2008 for consideration by the ICANN Board as soon as possible, but no later than the Board's meeting in August 2008.

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## **Receipt of Report of President's Strategy Committee Consultation**

Whereas, the Chairman of the Board requested that the President's Strategy Committee undertake a process on how to strengthen and complete the ICANN multi-stakeholder model.

Whereas, the PSC has developed three papers that outline key areas and possible responses to address them: "Transition Action Plan," "Improving Institutional Confidence in ICANN," and "FAQ."

<<http://icann.org/en/announcements/announcement-16jun08-en.htm>  
(<http://icann.org/en/announcements/announcement-16jun08-en.htm>) >

Whereas, these documents and the proposals contained in them have been discussed at ICANN's meeting in Paris.

Whereas, a dedicated webpage has been launched to provide the community with information, including regular updates

<<http://icann.org/jpa/iic/> (<http://icann.org/jpa/iic/>)>.

Resolved (2008.06.26.14), the Board thanks the President's Strategy Committee for its work to date, and instructs ICANN staff to undertake the public consultation recommended in the action plan, and strongly encourages the entire ICANN community to participate in the continuing consultations on the future of ICANN by reviewing and submitting comments to the PSC by 31 July 2008.

## **Selection of Mexico City for March 2009 ICANN Meeting**

Whereas, ICANN intends to hold its first meeting for calendar year 2009 in the Latin America region;

Whereas, the Mexican Internet Association (AMIPCI) has agreed to host the meeting;

Resolved (2008.06.26.15), the Board accepts the AMIPCI proposal to host ICANN's 34th global meeting in Mexico City, in March 2009.

## **Review of Paris Meeting Structure**

(For discussion only.)

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## **Board Response to Discussions Arising from Paris Meeting**

(For discussion only.)

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## ICANN At-Large Summit Proposal

Whereas, at the ICANN meeting in New Delhi in February 2008, the Board resolved to direct staff to work with the ALAC to finalise a proposal to fund an ICANN At-Large Summit, for consideration as part of the 2008-2009 operating plan and budget process.

<<http://www.icann.org/minutes/resolutions-15feb08.htm>  
(/minutes/resolutions-15feb08.htm)>

Whereas, potential funding for such a summit has been identified in the FY09 budget. <<http://www.icann.org/financials/fiscal-30jun09.htm>  
(/financials/fiscal-30jun09.htm)>

Whereas, a proposal for the Summit was completed and submitted shortly before the ICANN Meeting in Paris.

Resolved (2008.06.26.16), the Board approves the proposal to hold an ICANN At-Large Summit as a one-time special event, and requests that the ALAC work with ICANN Staff to implement the Summit in a manner that achieves efficiency, including considering the Mexico meeting as the venue.

Resolved (2008.06.26.17), with the maturation of At-Large and the proposal for the At-Large Summit's objectives set out, the Board expects the ALAC to look to more self-funding for At-Large travel in the fiscal year 2010 plan, consistent with the travel policies of other constituencies.

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## Other Business

(TBD)

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## Thanks to Steve Conte

Whereas, Steve Conte has served as an employee of ICANN for over five years.

Whereas, Steve has served ICANN in a number of roles, currently as ICANN's Chief Security Officer, but also as a vital support to the Board and its work at meetings.

Whereas, Steve has given notice to ICANN that he has accepted a new position with the Internet Society (ISOC), and that his employment with ICANN will conclude at the end of this meeting.

Whereas, Steve is of gentle nature, possessed of endless patience and fierce integrity, a love of music, and great dedication to the Internet and those who nurture it.

Whereas, the ICANN Board wishes to recognize Steve for his service to ICANN and the global Internet community. In particular, Steve has tirelessly and with good nature supported the past 19 ICANN meetings and his extraordinary efforts have been most appreciated.

Resolved (2008.06.26.18), the ICANN Board formally thanks Steve Conte for his service to ICANN, and expresses its good wishes to Steve for his work with ISOC and all his future endeavors.

| [back to top \(/en/board-activities-and-meetings/materials/approved-resolutions-icanns-paris-meeting-26-06-2008-en#top\)](#) |

## Thanks to Sponsors

The Board extends its thanks to all sponsors of this meeting:

L'Association Française pour le Nommage Internet en Coopération (AFNIC), France Télécom, Groupe Jutheau Husson, Stichting Internet Domeinregistratie Nederland (SIDN), Association Marocaine des Professionnels des Telecommunications (MATI), Afiliis Limited, Deutsches Network Information Center (DENIC), The European Registry of Domain Names (EURid), European Domain Name Registration (EuroDNS), INDOM, Toit de la Grande Arche Parvis de la Défense, Musee de L'informatique, NeuStar, Inc., Public Interest Registry, VeriSign, Inc., AusRegistry, Fundació puntCAT, Council of European National Top Level Domain Registries (CENTR), China Internet Network Information Center (CNNIC), Institut National de Recherche en Informatique et en Automatique (INRIA), InterNetX, Key-Systems GmbH, Directi Internet Solutions Pvt. Ltd. d/b/a PublicDomainRegistry.com, Nask, Nominet UK, The Internet Infrastructure Foundation (.SE), Registry ASP, Amen, DotAsia Organisation Ltd., Domaine FR, Golog, Iron Mountain Intellectual Property Management, Inc., Nameaction, Inc., NIC.AT Internet Verwaltungs und Betriebsgesellschaft m.b.H, UNINETT Norid A/S, IIT – CNR (Registro del ccTLD.it), Renater, Domaine.info, and ICANNWiki.

## Thanks to Local Hosts, Staff, Scribes, Interpreters, Event Teams, and Others

The Board wishes to extend its thanks to the local host organizers, AGIFEM, its President Daniel Dardailler, Vice-President Pierre Bonis and CEO Sebastien Bachollet, as well as Board Members from Afnic, Amen, Domaine.fr, Eurodns, Indom, Internet Society France, Internet fr, Namebay, Renater, and W3C.

The Board would also like to thank Eric Besson, the Minister for Forward Planning, Assessment of Public Policies and Development of the Digital Economy for his participation in the Welcome Ceremony and the Welcome Cocktail.

The Board thanks the Au Toit de la Grande Arche , its president, Francis Bouvier, and Directeur, Philippe Nieuwbourg, and Bertrand Delanoë, Maire de Paris, and Jean-Louis Missika, adjoint au Maire de Paris for their hospitality at the social events at the ICANN Paris meeting.

The Board expresses its appreciation to the scribes Laura Brewer, Teri Darrenougue, Jennifer Schuck, and Charles Motter and to the entire ICANN staff for their efforts in facilitating the smooth operation of the meeting. ICANN would particularly like to acknowledge the many efforts of Michael Evans for his assistance in organizing the past eighteen public board meetings and many other smaller events for the ICANN community.

The Board also wishes to express its appreciation to VeriLan Events Services, Inc. for technical support, Auvitec and Prosn for audio/visual support, Calliope Interpreters France for interpretation, and France Telecom for bandwidth. Additional thanks are given to the Le Meridien Montparnasse for this fine facility, and to the event facilities and support.

The Board also wishes to thank all those who worked to introduce a Business Access Agenda for the first time at this meeting, Ayesha Hassan of the International Chamber of Commerce, Marilyn Cade, and ICANN Staff.

The members of the Board wish to especially thank their fellow Board Member Jean-Jacques Subrenat for his assistance in making the arrangements for this meeting in Paris, France.

## Applicant Guidebook

The information on this page is posted for archival purposes only.

The current information on the new gTLD program is available at: <http://newgtlds.icann.org/>

This page contains all the current and archived versions of the Applicant Guidebook and key documentation related to the proposed application process. Applicants will be able to apply via an online application system called TAS – TLD Application System. The details on how to apply for a gTLD through TAS will be available in the upcoming months.

## The Internet Corporation for Assigned Names and Numbers

To All Prospective Applicants for New gTLDs –

Since ICANN's founding ten years ago as a not-for-profit, multi-stakeholder organization dedicated to coordinating the Internet's addressing system, one of its foundational principles has been to promote competition in the domain-name marketplace while ensuring Internet security and stability.

We are now engaging the Internet community in agreeing a way forward to introduce new gTLDs in the domain name space. Such expansion is driven by the demand for more innovation, choice and change to the Internet's addressing system, now constrained by only 21 generic top-level domain names. In a world with 1.5 billion Internet users—and growing—diversity, choice and competition are key to the continued success and reach of the global network.

The launch of these coming new gTLD application rounds followed a detailed and lengthy consultation process with all constituencies of the global Internet community. Representatives from a wide variety of stakeholders—governments, individuals, civil society, business and intellectual property constituencies, and the technology community—were engaged in discussions for more than 18 months. In October 2007, the Generic Names Supporting Organization (GNSO)—one of the groups that coordinate global Internet policy at ICANN—completed its policy development work on new gTLDs and approved a set of recommendations. Major contributors to this policy work were ICANN's Governmental Advisory Committee (GAC), At-Large Advisory Committee (ALAC), Country Code Names Supporting Organization (ccNSO) and Security and Stability Advisory Committee (SSAC). All this policy development work culminated with ICANN's Board of Directors deciding to adopt the community-developed policy at the ICANN Paris meeting in June 2008. You can see a thorough brief to the policy process and outcomes at <http://gns0.icann.org/issues/new-gtlds/>.

Please note that the Applicant Guidebook that follows this letter is a draft. Applicants should not rely on any of the proposed details of the new gTLD program, as the program remains subject to further consultation and revision. Also, some of the modules in this guidebook highlight areas of the process that remain under development. These areas will be made available for public consultation in the near future.

In addition to the Draft Applicant Guidebook, ICANN is posting a series of papers that serve as explanatory memoranda to assist the Internet community to better understand the implementation work.

ICANN expects to engage in a productive and robust dialogue with the Internet community through a consultative process. Comments will be used to revise and prepare the final Applicant Guidebook, to be released early in 2009.

The New gTLD Program enables the Internet community to open up the name space to new and innovative uses for top-level domains, and can meet some of the needs unmet by the current market. It has the potential to be one of the biggest influences on the future of the Internet.

Sincerely,

Paul Twomey  
President and CEO

# New gTLD Program: Draft Applicant Guidebook (Draft RFP)

Please note that this is a discussion draft only. Potential applicants should not rely on any of the proposed details of the new gTLD program as the program remains subject to further consultation and revision.

24 October 2008

# *New gTLD Program: Applicant Guidebook*

---

## *How to Use*

The Draft Applicant Guidebook (Request for Proposals) consists of a series of modules, each focused on specific topics within the application and evaluation process:

### **Module 1: Introduction to the Application Process**

*Provides an overview of the application process, documentation requirements, and fees*

### **Module 2: Evaluation Procedures**

*Describes the various reviews that occur during the evaluation process and criteria for approval of applications*

### **Module 3: Dispute Resolution Procedures**

*Contains the grounds for formal objection by third parties concerning gTLD applications submitted, and the dispute resolution procedure triggered by an objection*

### **Module 4: String Contention Procedures**

*Describes mechanisms for resolving contention when there is more than one qualified applicant for identical or similar gTLD strings*

### **Module 5: Transition to Delegation**

*Describes the final steps required of an applicant, including execution of a registry agreement and completion of pre-delegation tests*

### **Module 6: Terms and Conditions**

*Contains the terms and conditions applicable to all entities submitting an application*

### **Glossary**

*Contains definitions for terms used in the Applicant Guidebook*

ICANN is posting a series of explanatory memoranda to accompany this draft, to provide further details on the background work completed by ICANN. Links to these memoranda are noted within the relevant modules.

All materials contained in the Draft Applicant Guidebook are being presented for public comment. Please note that this is a discussion draft only. Potential applicants should not rely on any of the proposed details of the new gTLD program as the program remains subject to further consultation and revision.

# Draft Applicant Guidebook

## Module 1

Please note that this is a discussion draft only. Potential applicants should not rely on any of the proposed details of the new gTLD program as the program remains subject to further consultation and revision.

24 October 2008

---

# Module 1

---

## *Introduction to the gTLD Application Process*

This module gives applicants an overview of the process for applying for a new generic top-level domain, and includes instructions on how to complete and submit an application, the supporting documentation an applicant must submit with an application, the fees required and when and how to submit them.

This module also describes the conditions associated with particular types of applications, and the application life cycle.

For more about the origins, history and details of ICANN's policies on new gTLDs, please see <http://gns0.icann.org/issues/new-gtlds/>.

A glossary of relevant terms is included with the Draft Applicant Guidebook (Draft RFP).

Prospective applicants are encouraged to read and become familiar with the content of this entire module as well as the others, before starting the application process to make sure they understand what is required of them and what they can expect at each stage of the application evaluation process.

### *1.1 Application Life Cycle and Timelines*

---

This section provides a description of the stages that an application passes through once it is submitted. Some stages will occur for all applications submitted; others will only occur in specific circumstances. Applicants should be aware of the stages and steps involved in processing applications received.

#### *1.1.1 Application Submission Dates*

---

The application submission period opens at [time] UTC [date].

The application submission period closes at [time] UTC [date].

Applications may be submitted electronically through ICANN's online application system.

To receive consideration, all applications must be submitted electronically through the online application system by the close of the application submission period.

An application will not be considered, in the absence of exceptional circumstances, if:

- It is received after the due date.
- The application form is incomplete (either the questions have not been fully answered or required supporting documents are missing). Applicants will not ordinarily be permitted to supplement their applications after submission.
- The evaluation fee has not been paid by the deadline. Refer to Section 1.5 for fee information.

### 1.1.2 Application Processing Stages

This subsection provides an overview of the stages involved in processing an application submitted to ICANN. In Figure 1-1, the shortest and most straightforward path is marked with bold lines, while stages that may or may not apply in any given case are also shown. A brief description of each stage follows.

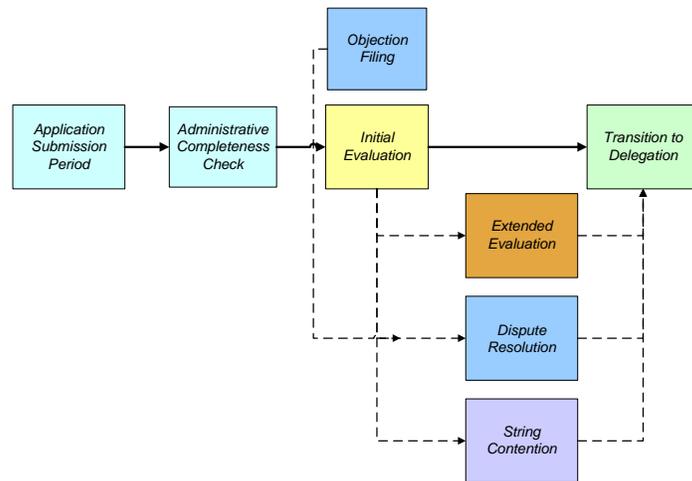

Figure 1-1 – Once submitted to ICANN, applications will pass through multiple stages of processing.

#### 1.1.2.1 Application Submission Period

At the time the application submission period opens, applicants wishing to apply for a new gTLD can become registered users of the online application system.

Through the application system, applicants will answer a series of questions to provide general information, demonstrate financial capability, and demonstrate technical and operational capability. The supporting documents listed in subsection 1.2.3 of this module must also be submitted through the application system.

Applicants must also submit their evaluation fees during this period. Refer to Section 1.5 of this module for additional information about fees and payments.

Following the close of the application period, applicants can continue to use the application system as a resource to track the progress of their applications, although they may receive communications from ICANN through other means.

### ***1.1.2.2 Administrative Completeness Check***

Immediately following the close of the application period, ICANN will check all applications for completeness. This check ensures that:

- All questions are answered (except those questions identified as optional);
- Required supporting documents are provided in the proper format(s); and
- The evaluation fees have been received.

ICANN will post a list of applications considered complete and ready for evaluation as soon as practical after the close of the application period. The status information for each application will also be updated in the online application system.

### ***1.1.2.3 Initial Evaluation***

Initial Evaluation will begin immediately after the administrative completeness check concludes. All complete applications will be reviewed during Initial Evaluation.

There are two main elements of the Initial Evaluation:

- String reviews (concerning the applied-for gTLD string); and
- Applicant reviews (concerning the entity applying for the gTLD and its proposed registry services).

Applicant reviews include a determination of whether the applicant has the requisite technical and financial capability to operate a registry.

- Panels of independent evaluators will perform these reviews based on the information provided by each applicant in its responses to the application form.
- There may be one round of questions and answers between the applicant and evaluators to clarify information contained in the application. Refer to Module 2 for further details on the evaluation process.

Evaluators will report whether the applicant passes or fails each of the parts of the Initial Evaluation. These reports will be available in the online application system.

At the conclusion of the Initial Evaluation period, ICANN will post a notice of all applications that have passed the Initial Evaluation. Depending on the volume of applications received, ICANN may post such notices in batches over the course of the Initial Evaluation period.

#### **1.1.2.4 Objection Filing**

Formal objections to applications can be filed on any of four enumerated grounds by parties with standing to object. The objection filing period will open after ICANN posts the list of complete applications as described in paragraph 1.1.2.2. Objectors will file directly with dispute resolution service providers (DRSPs). Refer to Module 3, Dispute Resolution Procedures, for further details.

The objection filing phase will close following the end of the Initial Evaluation period (refer to paragraph 1.1.2.3). Objections that have been filed during the objection filing phase will be addressed in the dispute resolution phase, which is outlined in paragraph 1.1.2.6 and discussed in detail in Module 3.

All applicants should be aware that third parties have the opportunity to file objections to any application during this period. Applicants whose applications are the subject of a formal objection will have an opportunity to file a response according to the dispute resolution service provider's rules and procedures (refer to Module 3).

An applicant wishing to file a formal objection to another application that has been submitted would do so within

the objection filing period, following the objection filing procedures in Module 3.

#### **1.1.2.5 Extended Evaluation**

*Extended Evaluation applies only to applicants that do not pass Initial Evaluation.*

Applicants failing certain elements of the Initial Evaluation can request an Extended Evaluation. If the applicant does not expressly request an Extended Evaluation, the application will proceed no further. The Extended Evaluation period allows for one additional round of questions and answers between the applicant and evaluators to clarify information contained in the application. The reviews performed in Extended Evaluation do not introduce additional evaluation criteria.

An Extended Evaluation may also be required if the applied-for gTLD string or one or more proposed registry services raise technical issues that might adversely affect the security and stability of the DNS. The Extended Evaluation period provides a time frame for these issues to be investigated. Applicants will be informed if such reviews are required at the end of the Initial Evaluation period. Evaluators and any applicable experts consulted will communicate their conclusions at the end of the Extended Evaluation period. These reports will be available in the online application system.

At the conclusion of the Extended Evaluation period, ICANN will post all evaluator reports from the Initial and Extended Evaluation periods.

If an application passes the Extended Evaluation, it can then proceed to the next stage. If the application does not pass the Extended Evaluation, it will proceed no further.

#### **1.1.2.6 Dispute Resolution**

*Dispute resolution applies only to applicants that are the subject of a formal objection.*

Where formal objections are filed and filing fees paid during the objection filing phase, dispute resolution service providers will initiate and conclude proceedings based on the objections received. The formal objection procedure exists to provide a path for those who wish to object to an application that has been received by ICANN. Dispute resolution service providers provide the fora to adjudicate the proceedings based on the subject matter and the needed expertise.

As a result of the proceeding, either the applicant will prevail (in which case the application can proceed to the next stage), or the objector will prevail (in which case either the application will proceed no further or the application will be bound to a contention resolution procedure). Refer to Module 3, Objection and Dispute Resolution, for detailed information. Applicants will be notified by the Dispute Resolution Service Provider of the results of dispute proceedings. The online application system will also be updated with these results.

#### 1.1.2.7 String Contention

*String contention applies only when there is more than one qualified applicant for the same or similar gTLD strings.*

String contention refers to the scenario in which there is more than one qualified applicant for the same gTLD or for gTLDs that are so similar that they create a probability of detrimental user confusion if more than one is delegated. ICANN will resolve cases of string contention either through comparative evaluation or through an alternative mechanism for efficient resolution of string contention.

In the event of contention between applied-for strings that represent geographical names, the parties may be asked to follow a different process to resolve the contention.

Groups of applied-for strings that are either identical or confusingly similar are called contention sets. All applicants should be aware that if an application is identified as being part of a contention set, string contention resolution procedures will not begin until all applications in the contention set have completed all aspects of evaluation, including dispute resolution, if applicable.

To illustrate, as shown in Figure 1-2, Applicants A, B, and C all apply for .EXAMPLE and are identified as a contention set. Applicants A and C pass Initial Evaluation, but Applicant B does not. Applicant B elects Extended Evaluation. A third party files an objection to Applicant C's application, and Applicant C enters the dispute resolution proceeding. Applicant A must wait to see whether Applicants B and C successfully complete the Extended Evaluation and dispute resolution phases, respectively, before it can proceed to the string contention resolution stage. In this example, Applicant B passes the Extended Evaluation, but Applicant C does not prevail in the dispute resolution proceeding. String contention resolution then proceeds between Applicants A and B.

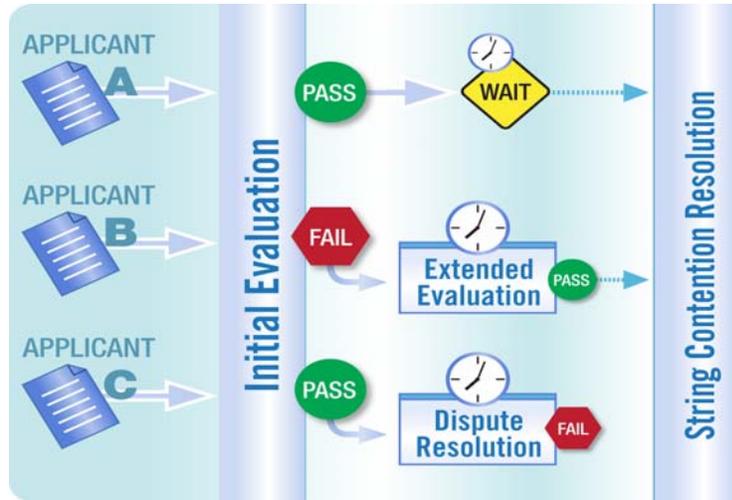

Figure 1-2 – All applications in a contention set must complete all previous evaluation and dispute resolution stages before string contention resolution can begin.

Applicants prevailing in a string contention resolution procedure will proceed toward delegation of applied-for gTLD strings. The online application system will be updated with the resolution of the string contention procedures.

#### 1.1.2.8 Transition to Delegation

Applicants that successfully complete all the relevant stages outlined in this subsection 1.1.2 are required to carry out a series of concluding steps before delegation of the applied-for gTLD string into the root zone. These steps include execution of a registry agreement with ICANN and completion of a pre-delegation technical test to validate information provided in the application.

Following execution of a registry agreement, the prospective registry operator must complete technical set-up and satisfactory performance on technical checks before delegation of the gTLD into the root zone. If the initial start-up requirements are not satisfied so that the gTLD can be delegated into the root zone within the time frame specified in the registry agreement, ICANN may in its sole and absolute discretion elect to terminate the registry agreement.

Once all of these steps have been successfully completed, the applicant is eligible for delegation of its applied-for gTLD string into the DNS root zone.

### *1.1.3 Accounting for Public Comment in the Evaluation of Applications once the New gTLD Process is Launched*

---

Public comment mechanisms are part of ICANN's policy development and implementation processes. As a private-public partnership, ICANN is dedicated to preserving the operational security and stability of the Internet, to promoting competition, to achieving broad representation of global Internet communities, and to developing policy appropriate to its mission through bottom-up, consensus-based processes. This necessarily involves the participation of many stakeholder groups in a public discussion.

In the new gTLD application process, public comments will be a mechanism for the public to bring relevant information and issues to the attention of those charged with handling new gTLD applications. ICANN will open a public comment forum at the time the applications are publicly posted on ICANN's website (refer to paragraph 1.1.2.2), which will remain open through the application round.

Public comments received will be provided to the evaluators during the Initial and Extended Evaluation periods. Evaluators will have discretion to take the information provided in these comments into consideration as deemed necessary. Consideration of the applicability of the information submitted through public comments will be included in the evaluators' reports.

Public comments may also be relevant to one or more objection grounds. (Refer to Module 3, Dispute Resolution Procedures, for the objection grounds.) ICANN will provide all public comments received to DRSPs, who will have discretion to consider them.

A distinction should be made between public comments, which may be relevant to ICANN's task of determining whether applications meet the established criteria, and formal objections that concern matters outside this evaluation. ICANN created the formal objection process to allow a full and fair consideration of objections based on subject areas outside ICANN's mission and expertise. A party contacting ICANN to pursue an objection will be referred to the formal objection channels designed specifically for resolving these matters in the new gTLD space. More information on the objection and dispute resolution processes is available in Module 3.

### 1.1.4 Sample Application Scenarios

The following scenarios briefly show a variety of ways in which an application may proceed through the evaluation process. The table that follows summarizes some processes and outcomes. This is not intended to be an exhaustive list of possibilities. There are other possible combinations of paths an application could follow.

Scenario Number	Initial Evaluation	Extended Evaluation	Objection(s) Raised	String Contention	Approved for Subsequent Steps
1	Pass	N/A	None	No	Yes
2	Fail	Pass	None	No	Yes
3	Pass	N/A	None	Yes	Yes
4	Pass	N/A	Applicant prevails	No	Yes
5	Pass	N/A	Objector prevails	N/A	No
6	Fail	Quit	n/a	N/A	No
7	Fail	Fail	n/a	N/A	No
8	Fail	Pass	Applicant prevails	Yes	Yes
9	Fail	Pass	Applicant prevails	Yes	No

**Scenario 1 – Pass Initial Evaluation, No Objection, No Contention** – In the most straightforward case, the application passes Initial Evaluation and there is no need for an Extended Evaluation. No objections are raised during the objection period, so there is no dispute to resolve. As there is no contention for the applied-for gTLD string, the applicant can enter into a registry agreement and the application can proceed toward delegation.

**Scenario 2 – Extended Evaluation, No Objection, No Contention** – In this case, the application fails one or more aspects of the Initial Evaluation. The applicant is eligible for and requests an Extended Evaluation for the appropriate elements. Here, the application passes the Extended Evaluation. As with Scenario 1, no objections are raised during the objection period, so there is no dispute to resolve. As there is no contention for the gTLD string, the applicant can enter into a registry agreement and the application can proceed toward delegation.

**Scenario 3 – Pass Initial Evaluation, No Objection, Contention** – In this case, the application passes the Initial Evaluation so there is no need for Extended Evaluation. No objections are raised during the objection period, so there is no dispute to resolve and no appeal. However, there are

other applications for the same or a similar gTLD string, so there is contention. In this case, one application wins the contention resolution, and the other contenders are denied their applications, so the winning applicant can enter into a registry agreement and the application can proceed toward delegation.

**Scenario 4 – Pass Initial Evaluation, Win Objection, No Contention** – In this case, the application passes the Initial Evaluation so there is no need for Extended Evaluation. During the objection period, a valid objection is raised by an objector with standing on one of the objection grounds (refer to Module 3, Dispute Resolution Procedures). The objection is heard by a dispute resolution service provider panel that finds in favor of the applicant. The applicant can enter into a registry agreement and the application proceeds toward delegation.

**Scenario 5 – Pass Initial Evaluation, Lose Objection** – In this case, the application passes the Initial Evaluation so there is no need for Extended Evaluation. During the objection period, multiple valid objections are raised by one or more objectors with standing in one or more of the objection grounds. Each objection category for which there are objections is heard by a dispute resolution service provider panel. In this case, the panels find in favor of the applicant for most of the objections, but one finds in favor of the objector. As one of the objections has been upheld, the application does not proceed.

**Scenario 6 – Fail Initial Evaluation, Applicant Withdraws** – In this case, the application fails one or more aspects of the Initial Evaluation. The applicant decides to withdraw the application rather than continuing with Extended Evaluation. The application does not proceed.

**Scenario 7 – Fail Initial Evaluation, Fail Extended Evaluation**  
In this case, the application fails one or more steps in the Initial Evaluation. The applicant requests Extended Evaluation for the appropriate elements. However, the application fails Extended Evaluation also. The application does not proceed.

**Scenario 8 – Extended Evaluation, Win Objection, Pass Contention** – In this case, the application fails one or more aspects of the Initial Evaluation. The applicant is eligible for and requests an Extended Evaluation for the appropriate elements. Here, the application passes the Extended Evaluation. During the objection period, one valid objection is raised by an objector with standing. The objection is heard by a dispute resolution service provider

panel that rules in favor of the applicant. However, there are other applications for the same or a similar gTLD string, so there is contention. In this case, the applicant prevails over other applications in the contention resolution procedure, the applicant can enter into a registry agreement and the application can proceed toward the delegation phase.

**Scenario 9 – Extended Evaluation, Objection, Fail Contention** – In this case, the application fails one or more aspects of the Initial Evaluation. The applicant is eligible for and requests an Extended Evaluation for the appropriate elements. Here, the application passes the Extended Evaluation. During the objection period, one valid objection is raised by an objector with standing. The objection is heard by a dispute resolution service provider that rules in favor of the applicant. However, there are other applications for the same or a similar gTLD string, so there is contention. In this case, another applicant prevails in the contention resolution procedure, and the application does not proceed.

**Transition to Delegation** – After an application has completed Initial or Extended Evaluation, dispute resolution, if applicable, and string contention, if applicable, the applicant is required to complete a set of steps leading to delegation of the gTLD, including execution of a registry agreement with ICANN, and completion of pre-delegation testing. Refer to Module 5 for a description of the relevant steps in this phase.

### **1.1.5 Subsequent Application Rounds**

---

ICANN's goal is to launch the next gTLD application rounds as quickly as possible. The exact timing will be based on experiences gained and changes required after this round is completed. The goal is for the next application round to begin within one year of the close of the application submission period for this round.

## **1.2 Information for All Applicants**

---

### **1.2.1 Eligibility**

---

Any established corporation, organization, or institution in good standing may apply for a new gTLD. Applications from individuals or sole proprietorships will not be considered.

## 1.2.2 *Two Application Types: Open or Community-Based*

---

All applicants are required to designate each application for a new gTLD as **open** or **community-based**.

### 1.2.2.1 *Definitions*

For purposes of this RFP, an **open gTLD** is one that can be used for any purpose consistent with the requirements of the application and evaluation criteria, and with the registry agreement. An open gTLD may or may not have a formal relationship with an exclusive registrant or user population. It may or may not employ eligibility or use restrictions.

For purposes of this RFP, a **community-based gTLD** is a gTLD that is operated for the benefit of a defined community consisting of a restricted population. An applicant designating its application as community-based will be asked to substantiate its status as representative of the community it names in the application, and additional information may be requested in the event of a comparative evaluation (refer to Section 4.2 of Module 4). An applicant for a community-based gTLD is expected to:

1. Demonstrate an ongoing relationship with a defined community that consists of a restricted population.
2. Have applied for a gTLD string strongly and specifically related to the community named in the application.
3. Have proposed dedicated registration and use policies for registrants in its proposed gTLD.
4. Have its application endorsed in writing by an established institution representing the community it has named.

### 1.2.2.2 *Implications of Application Designation*

Applicants should understand how their designation as open or community-based will affect application processing at particular stages, as described in the following paragraphs.

**Objection/Dispute Resolution** – All applicants should understand that an objection may be filed against any application on community opposition grounds, even if the applicant has not designated itself as community-based or declared the TLD to be aimed at a particular community. Refer to Module 3, Dispute Resolution Procedures.

**String Contention** – Any applicant that has been identified as part of a contention set (refer to Module 4.1) may be obliged to participate in either a comparative evaluation or another efficient mechanism for contention resolution if the application reaches the string contention stage and the applicant elects to proceed.

A **comparative evaluation** will take place if a community-based applicant in a contention set has elected comparative evaluation.

Another efficient mechanism for contention resolution will result in other cases. If a comparative evaluation occurs but does not produce a clear winner, the efficient mechanism will then result.

Refer to Module 4, String Contention Procedures, for detailed discussions of contention resolution procedures.

**Contract Execution and Post-Delegation** – A community-based gTLD applicant will be subject to certain post-delegation contractual obligations to operate the gTLD in a manner consistent with the restrictions associated with its community-based designation, once it begins operating the gTLD. ICANN must approve material changes to the community-based nature of the gTLD and any associated contract changes.

### 1.2.2.3 Changes to Application Designation

An applicant may not change its designation as open or community-based once it has submitted a gTLD application for processing.

### 1.2.3 Required Documents

---

Applicants should be prepared to submit the following documents, which are required to accompany each application:

1. **Proof of legal establishment** – Examples of acceptable documentation include articles or a certificate of incorporation, articles of association or equivalent documents relative to the type of entity and the jurisdiction in which it is formed, such as statutes or membership agreements of the entity.
2. **Proof of good standing** – Examples of acceptable documentation include a certificate of good standing or other equivalent official document issued by a competent government authority, if offered by a governmental authority for the jurisdiction.

Under some laws or jurisdictions, it may be possible to prove both establishment and good standing with a single document. That is, the same document may suffice for items 1 and 2.

If no such certificates or documents are available in the applicant's jurisdiction, an affidavit drafted and signed by a notary public or a legal practitioner duly qualified to represent clients before the courts of the country in which the applicant's organization is established, declaring that the organization is established and in good standing, must be submitted.

3. If the applicant is a government body or organization, it must provide a **certified copy of the act** wherein or governmental decision whereby the government body or organization was established.

ICANN is aware that practices and documentation standards vary from region to region, and has attempted to account for a variety of these practices when specifying the requirements. Applicants with exceptional circumstances should contact ICANN to determine how to provide appropriate documentation.

4. **Financial statements.** Applicants must provide audited financial statements for the most recently completed fiscal year for the applicant, and unaudited financial statements for the most recently ended interim financial period for the applicant.
5. Before delegation: **documentary evidence of ability to fund ongoing basic registry operations** for then-existing registrants for a period of three to five years in the event of registry failure, default or until a successor operator can be designated.

All documents must be valid at the time of submission.

Supporting documentation should be submitted in the original language. English translations are not required.

Some supporting documentation will be required only in certain cases:

1. **Community endorsement** – If an applicant has designated its application as community-based, it will be asked to submit a written endorsement of its application by an established institution representing the community it has named.
2. **Government support or non-objection** – If an applicant has applied for a string that is a geographical term, the

applicant is required to submit a statement of support or non-objection for its application from the relevant government(s) or public authorities. Refer to Section 2.1.1.4 for more information on the requirements for geographical names.

3. **Documentation of outside funding commitments** – If an applicant lists outside sources of funding in its application, it must provide evidence of commitment by the party committing the funds.

#### **1.2.4 Notice Concerning Technical Acceptance Issues with New gTLDs**

---

All applicants should be aware that acceptance of their applications by ICANN and entering into a registry agreement with ICANN does not guarantee that the new gTLD will immediately function throughout the Internet. Past experience indicates that ISPs and webhosters do not automatically allow passage of or access to new gTLD strings even when these strings are authorized by ICANN, since software modifications may be required that may not happen until there is a business case for doing so.

Similarly, web applications often validate namestrings on data entry and may filter out new or unknown strings. ICANN has no authority or ability to require acceptance of new gTLD namestrings although it does prominently publicize ICANN-authorized gTLD strings on its website. ICANN encourages applicants to familiarize themselves with these issues and account for them in startup and launch plans. Successful applicants may find themselves expending considerable efforts post-implementation in working with providers to achieve acceptance of their new gTLD namestring.

Applicants should review (Informational) RFC 3696 (see <http://www.ietf.org/rfc/rfc3696.txt?number=3696>) for background. IDN applicants should review the material concerning experiences with IDN test strings in the root zone (see <http://idn.icann.org/>).

#### **1.2.5 Terms and Conditions**

---

All applicants must agree to a standard set of Terms and Conditions for the application process. The Terms and Conditions are available in Module 6 of this RFP.

### 1.3 Information for Internationalized Domain Name Applicants

---

Some applied-for gTLD strings are expected to be Internationalized Domain Names (IDNs) that require the insertion of IDN-encoded A-labels into the DNS root zone. IDNs are labels that contain one or more letters or characters other than LDH (letters a,...z; digits 0,...9; and the hyphen "-").

If an applicant applies for such a string, it must provide accompanying information indicating compliance with the IDNA protocol and other requirements. The IDNA protocol is currently under revision and its documentation can be found at

<http://www.icann.org/en/topics/idn/rfcs.htm>. Applicants must provide applied-for gTLD strings in the form of both a **U-label** and an **A-label**.

An A-label is the ASCII-Compatible Encoding form of an IDNA-valid string. Every A-label begins with the IDNA ACE prefix, "xn--", followed by a string that is a valid output of the Punycode algorithm, and hence is a maximum of 59 ASCII characters in length. The prefix and string together must conform to all requirements for a label that can be stored in the DNS including conformance to the LDH (host name) rule described in RFC 1034, RFC 1123 and elsewhere.

A U-label is an IDNA-valid string of Unicode characters, including at least one non-ASCII character, expressed in a standard Unicode Encoding Form, normally UTF-8 in an Internet transmission context.

For example, using the current IDN test string in Cyrillic script, the U-label is <испытание> and the A-label is <xn--**80akhbyknj4f**>. An A-label must be capable of being produced by conversion from a U-label and a U-label must be capable of being produced by conversion from an A-label.

Applicants for IDN gTLDs will also be required to provide the following at the time of the application:

1. Short form of string (English). The applicant will provide a short description of what the string would mean in English.
2. Language of label (ISO 639-1). The applicant will specify the language of the applied-for TLD string, both

according to the ISO's codes for the representation of names of languages, and in English.

3. Script of label (ISO 15924). The applicant will specify the script of the applied-for gTLD string, both according to the ISO code for the presentation of names of scripts, and in English.
4. Unicode code points. The applicant will list all the code points contained in the U-label according to its Unicode form.
5. Representation of label in phonetic alphabet. The applicant will provide its applied-for gTLD string notated according to the International Phonetic Alphabet (<http://www.arts.gla.ac.uk/IPA/ipachart.html>).
6. Its IDN table. This table provides the list of characters eligible for registration in domain names according to registry policy. It will contain any multiple characters that can be considered "the same" for the purposes of registrations at the second level. For examples, see <http://iana.org/domains/idn-tables/>.
7. Applicants must further demonstrate that they have made reasonable efforts to ensure that the encoded IDN string does not cause any rendering or operational problems. For example, problems have been identified in strings with characters of mixed right-to-left and left-to-right directionality when numerals are adjacent to the path separator. If an applicant were applying for a string with known issues, it should document steps that will be taken to mitigate these issues in applications.

## ***1.4 Submitting an Application***

---

Applicants may complete the application form and submit supporting documents using ICANN's TLD Application System (TAS). To access the tool, applicants must first register as a TAS user, which involves paying a user registration fee of USD100.

As TAS users, applicants will be able to provide responses in open text boxes and submit required supporting documents as attachments. Restrictions on the size of attachments as well as the file formats are included in the instructions on the TAS site.

ICANN will not accept application forms or supporting materials submitted through other means than TAS (that is, hard copy, fax, email), unless such submission is in accordance with specific instructions from ICANN to applicants.

### **1.4.1 Accessing the TLD Application System**

---

The TAS site is located at [URL to be inserted in final version of RFP].

TAS features include:

#### **1.4.1.1 Sub-user Management**

This feature allows applicants to create sub-users with varying permission levels to assist in completing the application. For example, if an applicant wishes to designate a user to complete the technical section of the application, the applicant can create a sub-user account with access only to that section.

#### **1.4.1.2 Workflow Management**

This feature allows applicants to check the status of their applications through TAS.

#### **1.4.1.3 Security**

ICANN uses all reasonable efforts to protect applicant information submitted through TAS. TAS uses advanced Internet security technology to protect applicant information against unauthorized access. This technology includes:

**Secure Socket Layer (SSL)** – To ensure that confidential information remains confidential, it is sent to TAS in a secure session using SSL technology. SSL technology scrambles or encrypts information as it moves between the user's browser and TAS.

**Limited TAS Authorized Users and Permission Levels** – TAS is a hierarchical system with defined user roles and permissions. ICANN-authorized personnel have access only to the portions of the system they need. For example, an accounting user may only need access to perform updates to the portion of a record indicating whether an applicant's evaluation fee has been received.

Although ICANN intends to follow the security precautions outlined here, it offers no assurances that these procedures will keep an applicant's data confidential and secure from access by unauthorized third parties.

### **1.4.2 Technical Support**

---

TAS users can refer to the FAQ/knowledge base or contact [email address to be inserted in final version of RFP] for help using the system. Users can expect to receive a tracking

ticket number and a response within 24 to 48 hours through the TAS submission tool.

### **1.4.3 Backup Application Process**

---

If the online application system is not available, ICANN will provide alternative instructions for submitting applications.

## **1.5 Fees and Payments**

---

This section describes the fees to be paid by the applicant. Payment instructions are also included here.

### **1.5.1 Breakdown of Fees and Amounts**

---

The following fees are required from all applicants:

- **TAS User Registration Fee** – USD 100. This fee enables a user to enter the online application system. This fee is nonrefundable.
- **gTLD Evaluation fee** – USD 185,000. ICANN will not begin its evaluation of an application unless it has received the gTLD evaluation fee by the due date. Refer to subsection 1.5.4. The gTLD evaluation fee is set to recover costs associated with the new gTLD program. The fee is set to ensure that the program is fully funded, and doesn't take resources from other ICANN funding sources, including generic registries and registrars, cc TLD contributions and RIR contributions.

In certain cases, refunds of a portion of this fee may be available for applications that are withdrawn before the evaluation process is complete. The amount of refund will depend on the point in the process at which the withdrawal is made. (Refer to subsection 1.5.5.) Details will be made available when the application process is launched.

Applicants may be required to pay additional fees in certain cases. Those possible additional fees include:

- **Registry Services Review Fee** – If applicable, this fee is payable for additional costs incurred in referring an application to the RSTEP for an extended review. Applicants will be notified if such a fee is due. The fee for a three member RSTEP review team is anticipated to be USD 50,000. In some cases, five-member panels might be required, or there might be increased scrutiny at a greater cost. In every case, the applicant will be advised of the review

cost before its initiation. Refer to Section 2.1.3 of Module 2 on Registry Services review.

- **Dispute Resolution Filing Fee** – This amount must accompany any filing of a formal objection and any response that an applicant files to an objection. This fee is payable to the applicable dispute resolution service provider in accordance with the provider’s payment instructions. ICANN estimates that non-refundable filing fees could range from approximately USD 1,000 to USD 5,000 (or more) per party per proceeding. Refer to the appropriate provider for the relevant amount. Refer to Module 3 for dispute resolution procedures.
- **Dispute Resolution Adjudication Fee** – This fee is payable to the applicable dispute resolution service provider in accordance with that provider’s procedures and schedule of costs. Both parties in the dispute resolution proceeding will be required to submit an advance payment of costs in an estimated amount to cover the entire cost of the proceeding. This may be either an hourly fee based on the estimated number of hours the panelists will spend on the case (including review of submissions, facilitation of a hearing, if allowed, and preparation of a decision), or a fixed amount. The prevailing party in a dispute resolution proceeding will have its advance payment refunded, while the non-prevailing party will not receive a refund and thus will bear the cost of the proceeding.

ICANN estimates that a proceeding involving a fixed amount could range from USD 2,000 to USD 8,000 (or more) per proceeding. ICANN further estimates that an hourly rate based proceeding with a one-member panel could range from USD 32,000 to USD 56,000 (or more) and with a three-member panel it could range from USD 70,000 to USD 122,000 (or more). These estimates may be lower if the panel does not call for written submissions beyond the objection and response, and does not allow a hearing. Please refer to the appropriate provider for the relevant amounts or fee structures. Refer also to Section 3.2 of Module 3 for further details.

- **Comparative Evaluation Fee** – This fee is payable to the provider appointed to handle comparative evaluations, in the event that the applicant participates in a comparative evaluation.

Applicants will be notified if such a fee is due. Refer to Section 4.2 of Module 4.

This list does not include fees (that is, registry fees) that will be payable to ICANN following execution of a registry agreement. See <http://www.icann.org/en/topics/new-gtld-draft-agreement-24oct08-en.pdf>.

## 1.5.2 *Payment Methods*

---

Payments to ICANN may be submitted by wire transfer, ACH, money order, or check.

### 1.5.2.1 *Wire Transfer Payment*

Instructions for making a payment by **wire transfer** will be available in TAS.

### 1.5.2.2 *ACH Payment*

Instructions for making **ACH payments** will be available in TAS.

### 1.5.2.3 *Credit Card Payment*

To make a **credit card payment**, note:

ICANN accepts Visa, MasterCard/Maestro, American Express and Discover credit cards as forms of payment. The maximum amount accepted is USD 20,000 per invoice.

- Fill out and sign the Credit Card Payment Form at <http://www.icann.org/en/financials/credit.pdf>.
- Send the completed form to ICANN at fax:  
+1.310.823.8649

Or mail the form to:

Internet Corporation for Assigned Names and Numbers  
(ICANN)  
Attention: Finance Department  
4676 Admiralty Way, Suite 330  
Marina del Rey, CA 90292-6601 USA

### 1.5.2.4 *Check or Money Order Payment*

To make a **payment by check or money order** (USD only), mail or deliver by private carrier to:

Internet Corporation for Assigned Names and Numbers  
(ICANN)  
Attention: Finance Department  
4676 Admiralty Way, Suite 330  
Marina del Rey, CA 90292-6601 USA

### *1.5.3 Requesting an Invoice*

---

The TAS interface allows applicants to request issuance of an invoice for any of the fees payable to ICANN. This service is for the convenience of applicants that require an invoice to process payments.

### *1.5.4 Deadlines for Payments*

---

The Evaluation Fee must be received by [time] UTC [date].

ICANN or its providers will notify the applicants of due dates for payment in respect of additional fees (if applicable).

### *1.5.5 Withdrawals and Refunds*

---

Refunds may be available to applicants who choose to withdraw at certain stages of the process.

An applicant that wishes to withdraw an application must use the TAS interface to request a refund. ICANN will not consider any other form of request for refunds. Refunds will only be issued to the organization that submitted the original payment. All refunds are paid by wire transfer. Any bank transfer or transaction fees incurred by ICANN will be deducted from the amount paid.

Further details on refund amounts will be available in the final version of the RFP.

## *1.6 Questions about this RFP*

---

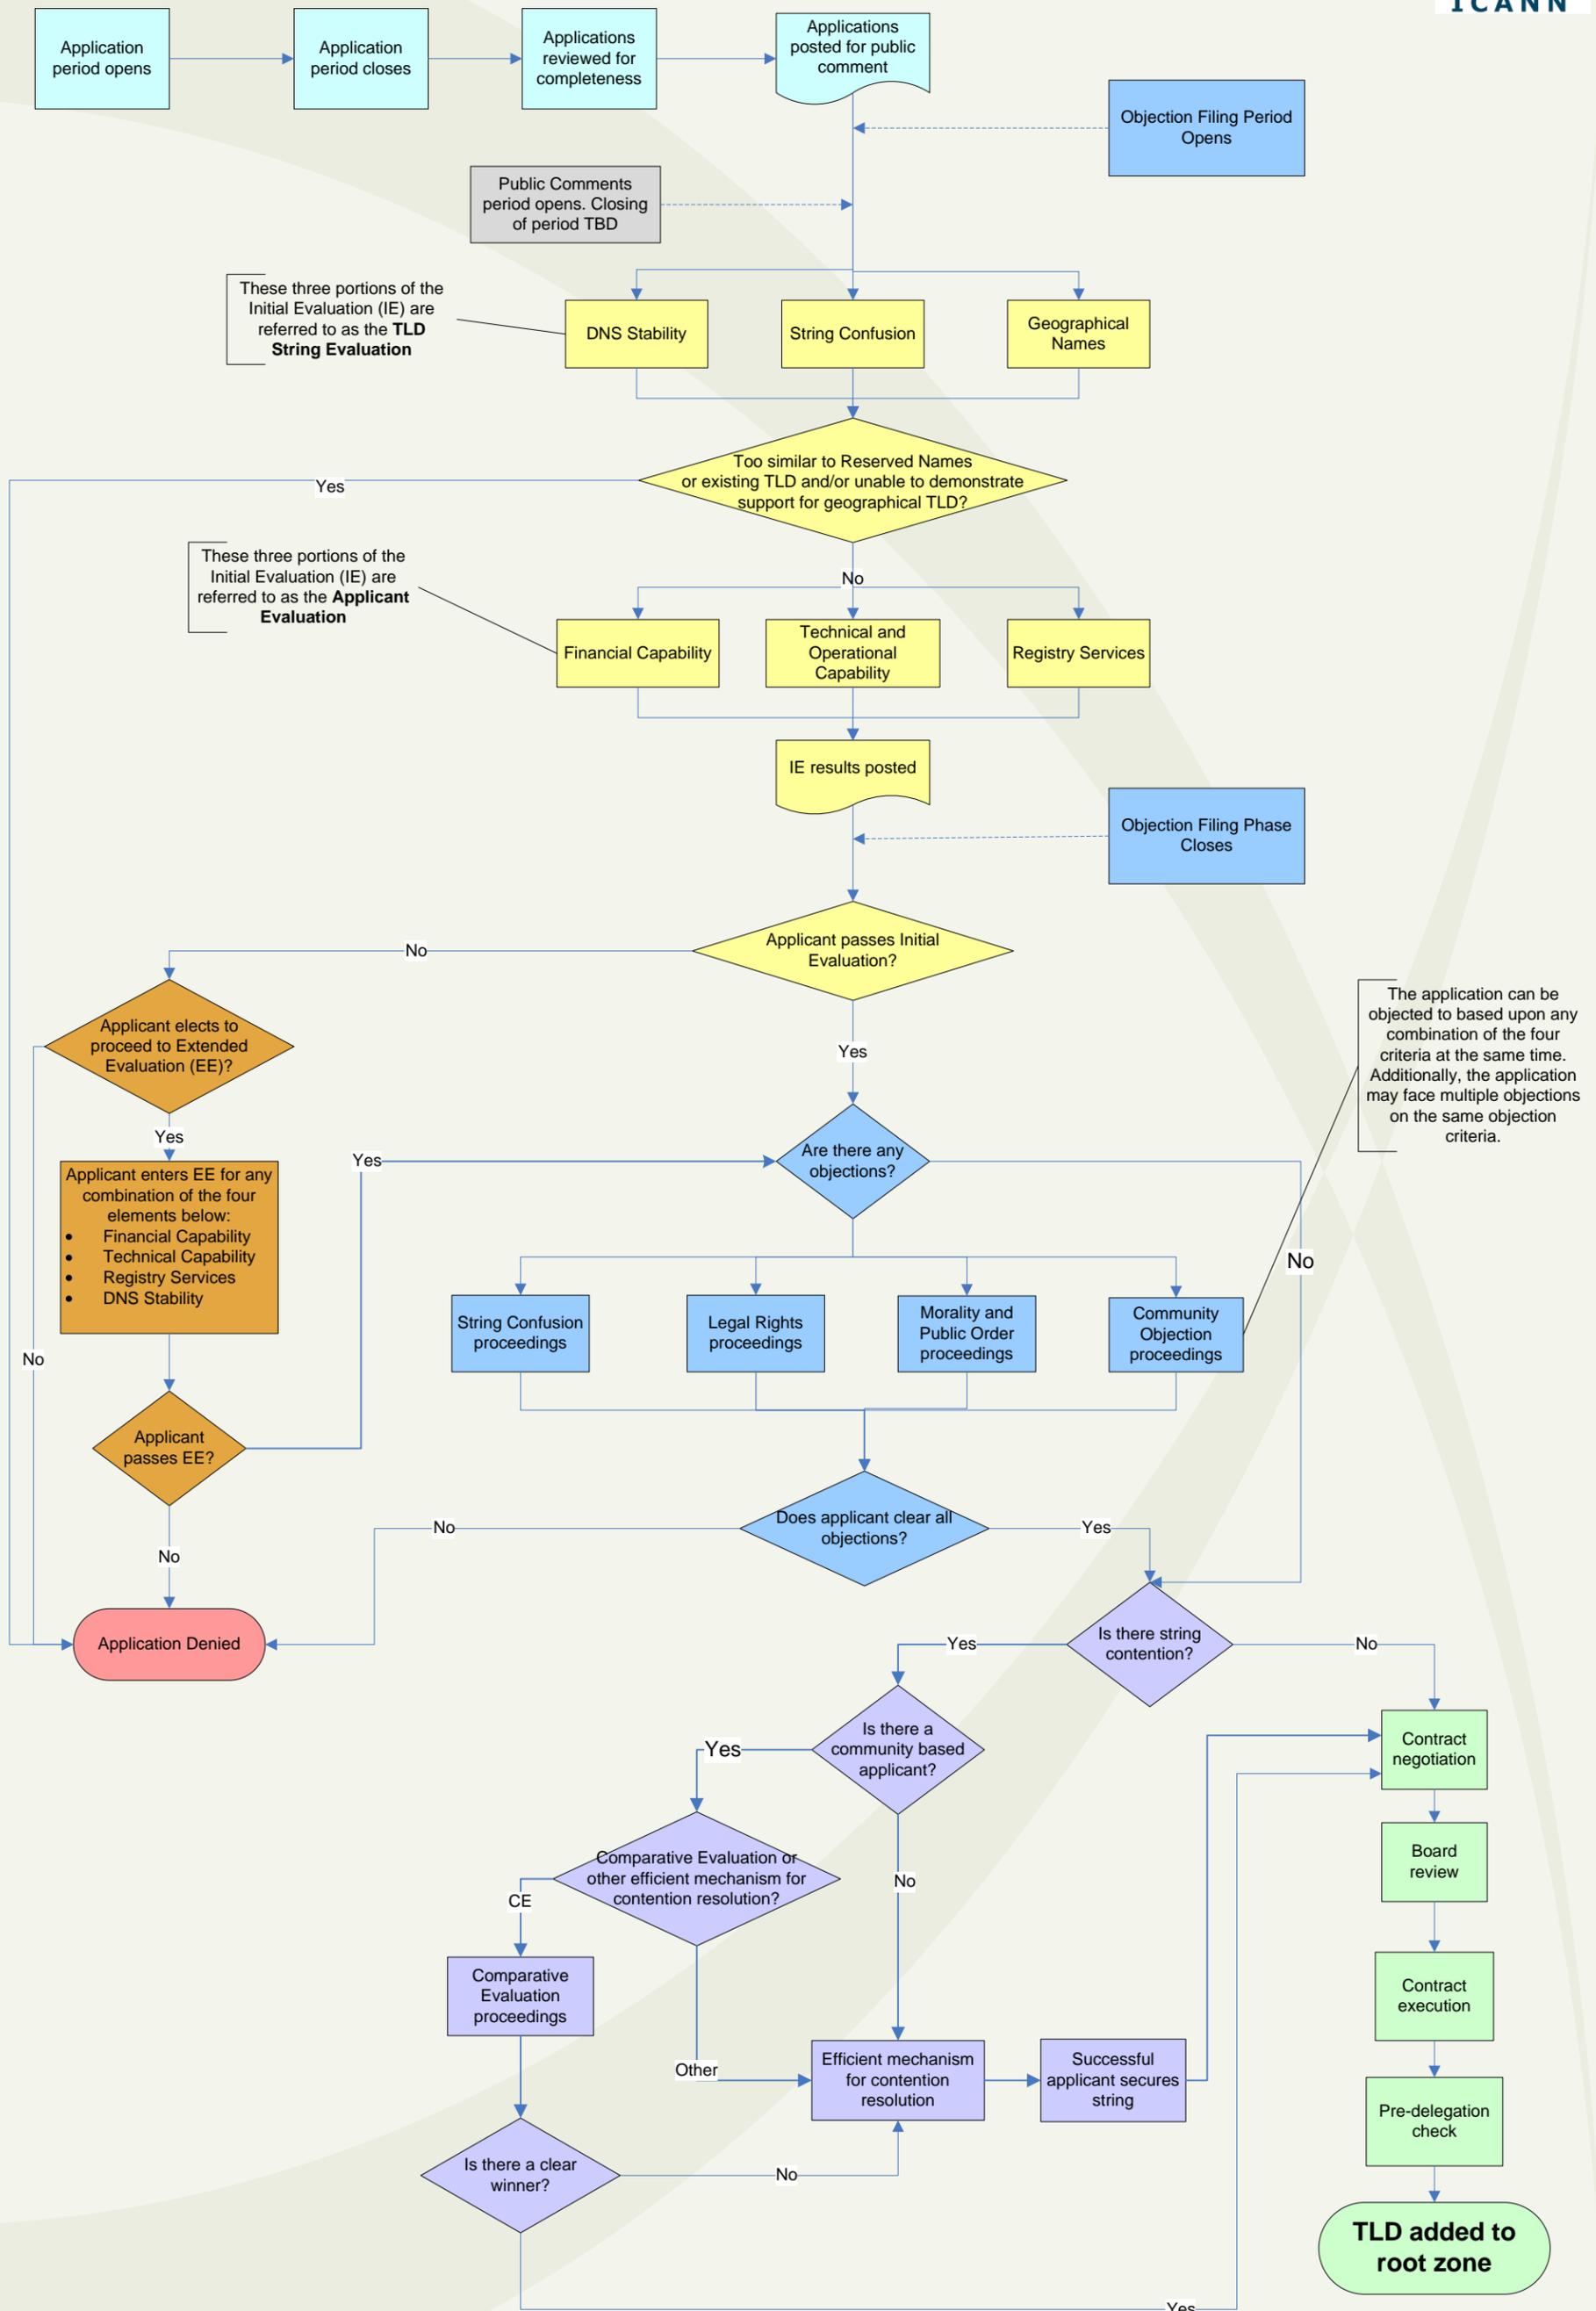

Applicants may submit questions about completing the application form to [email address to be inserted in final version of RFP]. To provide all applicants equitable access to information, ICANN will post all questions and answers in a centralized location on its website.

All requests to ICANN for information about the process or issues surrounding preparation of an application must be submitted in writing to the designated email address. ICANN will not grant requests from applicants for personal or telephone consultations regarding the preparation of an application. Applicants that contact ICANN for clarification about aspects of the application will be referred to the dedicated online question and answer area.

Answers to inquiries will only provide clarification about the application forms and procedures. ICANN will not provide consulting, financial, or legal advice.

# New gTLD Program - Evaluation Process

## DRAFT- For Discussion Purposes

The application can be objected to based upon any combination of the four criteria at the same time. Additionally, the application may face multiple objections on the same objection criteria.

# Draft Applicant Guidebook

## Module 2

Please note that this is a discussion draft only. Potential applicants should not rely on any of the proposed details of the new gTLD program as the program remains subject to further consultation and revision.

24 October 2008

---

# Module 2

---

## *Evaluation Procedures*

This module describes the evaluation procedures and criteria used to determine whether applications are approved for delegation as a gTLD. All applicants will undergo an Initial Evaluation and those that do not pass all phases may enter into an Extended Evaluation.

The first, required evaluation is the **Initial Evaluation**, during which ICANN first assesses an applied-for gTLD string, an applicant's qualifications, and proposed registry services.

The following elements make up **Initial Evaluation**:

- String Reviews
  - String confusion
  - Reserved Names
  - DNS stability
  - Geographical names
- Applicant Reviews
  - Demonstration of technical and operational capability
  - Demonstration of financial capability
  - Registry services

These elements, which are described in greater detail later in this module, are intended to ensure applied-for gTLD strings do not negatively impact DNS security or stability, and to ensure that applicants are capable of operating the gTLD in a stable and secure manner, and that new services can be introduced without adverse effect on the security or stability of the DNS.

An applicant must pass all these reviews to pass the Initial Evaluation. Failure to pass any one of these reviews will result in a failure to pass the Initial Evaluation.

**Extended Evaluation** may be applicable in cases in which an applicant does not pass the Initial Evaluation or additional inquiry is required.

## 2.1 Initial Evaluation

---

The Initial Evaluation consists of two types of examination. Each type is composed of several elements.

The first examination focuses on the applied for string to test:

- Whether the applied-for gTLD string is similar to others and would cause user confusion;
- Whether the applied-for gTLD string might disrupt DNS security or stability; and
- Whether requisite government approval is given in the case of certain geographical names.

The second examination focuses on the applicant to test:

- Whether the applicant has the requisite technical and financial capability; and
- Whether the registry services offered by the applicant might adversely affect DNS security or stability.

### 2.1.1 String Reviews

---

In the Initial Evaluation, ICANN reviews every applied-for gTLD string for string confusion, potential to introduce instability into the DNS, and whether relevant government approval is required. Those reviews are described in greater detail in the following paragraphs.

#### 2.1.1.1 String Confusion Review

The objective of this review is to prevent user confusion and loss of confidence in the DNS. This review involves a comparison of each applied-for gTLD string against existing TLDs and against other applied-for gTLD strings. The examination is to determine whether the applied-for gTLD string is so similar to one of the others that it would create a probability of detrimental user confusion if it were to be delegated to the root zone. ICANN will perform determinations of string similarity in accordance with the steps outlined here.

The similarity review will be conducted by a panel of String Similarity Examiners. This examination will be informed by an algorithmic score for the visual similarity between each applied-for string and each of other existing and applied-for TLDs. The score will provide one objective measure for consideration by the panel.

The examiners' task is to identify string similarities that would create a probability of detrimental user confusion. The examiners will use a common standard to test for whether string confusion exists, as follows:

**Standard for String Confusion** – String confusion exists where a string so nearly resembles another visually that it is likely to deceive or cause confusion. For the likelihood of confusion to exist, it must be probable, not merely possible that confusion will arise in the mind of the average, reasonable Internet user. Mere association, in the sense that the string brings another string to mind, is insufficient to find a likelihood of confusion.

The standard will be applied in two sets of circumstances, when comparing:

- Applied-for gTLD strings against existing TLDs and reserved names.
- Applied-for gTLD strings against other applied for gTLD strings or strings requested in ccTLD processes).

**Existing String Similarity Examination** – This review involves cross-checking between each applied-for string and the list of existing TLD strings to determine whether the two strings are so similar to one another that they create a probability of detrimental user confusion.

All TLDs currently in the root zone can be found at <http://iana.org/domains/root/db/>.

An application that fails the string confusion review and is found too similar to an existing string will not pass the Initial Evaluation, and no further reviews will be available.

In the simple case in which an applied-for TLD string is identical to an existing TLD, the application system will recognize the existing TLD and not allow the application to be submitted.

Such testing for identical strings also takes into consideration the code point variants listed in any relevant language reference table.

For example, protocols treat equivalent labels as alternative forms of the same label, just as "foo" and "Foo" are treated as alternate forms of the same label (RFC 3490).

An applied-for gTLD string that passes the string confusion review is still subject to challenge by an existing TLD operator or by another gTLD applicant in the current

application round. That process requires that a specific objection be filed by an objector having the standing to make such an objection. Refer to Module 3, Dispute Resolution Procedures, for more information about the objection process.

***String Contention Sets: Similarity with Other Applied-for gTLD Strings*** – All applied-for gTLD strings will be reviewed against one another to identify any strings that are so similar that they create a probability of detrimental user confusion would result if more than one is delegated into the root zone. In performing the string confusion review, the panel of String Similarity Examiners will create contention sets that may be used later in the process. A contention set contains at least two applied-for strings identical to one another or so similar that string confusion would result if more than one were delegated into the root zone. Refer to Module 4, String Contention Procedures, for more information on contention sets and contention resolution. ICANN will notify applicants who are part of a contention set by the conclusion of the Initial Evaluation period. These contention sets will also be published on ICANN’s website.

***Similarity to TLD strings applied for as ccTLDs*** -- Applied-for gTLD strings will also be reviewed for similarity to TLD strings applied for in the IDN ccTLD Fast Track process (see <http://www.icann.org/en/topics/idn/fast-track/>). Should conflict with a prospective fast-track IDN ccTLD be identified, ICANN will take steps to resolve the conflict. (See process for Geographical Names in paragraph 2.1.1.4.)

***String Similarity Algorithm*** – The String Similarity Algorithm (Algorithm) is a tool the examiners use to provide one objective measure as part of the process of identifying strings likely to result in confusion. The Algorithm is also available to applicants for testing and informational purposes. The Algorithm and user guidelines are available at <http://80.124.160.66/icann-algorithm>.

The Algorithm calculates scores for visual similarity between any two strings, using factors such as letters in sequence, number of similar letters, number of dissimilar letters, common prefixes, common suffixes, and string length.

#### ***2.1.1.2 Review for Reserved Names***

The Reserved Names review involves comparison with the list of top-level Reserved Names to ensure that the applied-for gTLD string does not appear on that list.

**Top-Level Reserved Names List**

<i>AFRINIC</i>	<i>IANA-SERVERS</i>	<i>NRO</i>
<i>ALAC</i>	<i>ICANN</i>	<i>RFC-EDITOR</i>
<i>APNIC</i>	<i>IESG</i>	<i>RIPE</i>
<i>ARIN</i>	<i>IETF</i>	<i>ROOT-SERVERS</i>
<i>ASO</i>	<i>INTERNIC</i>	<i>RSSAC</i>
<i>CCNSO</i>	<i>INVALID</i>	<i>SSAC</i>
<i>EXAMPLE*</i>	<i>IRTF</i>	<i>TEST*</i>
<i>GAC</i>	<i>ISTF</i>	<i>TLD</i>
<i>GNSO</i>	<i>LACNIC</i>	<i>WHOIS</i>
<i>GTLD-SERVERS</i>	<i>LOCAL</i>	<i>WWW</i>
<i>IAB</i>	<i>LOCALHOST</i>	
<i>IANA</i>	<i>NIC</i>	
*Note that in addition to the above strings, ICANN will also reserve translations of the terms "test" and "example" in multiple languages.		

If an applicant enters a Reserved Name as its applied-for gTLD string, the application system will recognize the Reserved Name and not allow the application to be submitted.

In addition, applied-for gTLD strings are reviewed in a process identical to that described in the preceding section to determine whether they exceed a similarity threshold with a Reserved Name. An application for a gTLD string that is identified as too similar to a Reserved Name will not pass the Reserved Names review.

**2.1.1.3 Review for Potential DNS Instability**

This review determines whether an applied-for gTLD string might cause instability to the DNS. In all cases, this will involve a review for conformance with technical and other requirements for gTLD labels. In some exceptional cases, an extended review may be necessary to investigate possible technical stability problems with the applied-for gTLD string.

**2.1.1.3.1 String Stability Review**

New gTLD labels must not adversely affect on the security or stability of the DNS. Although no string complying with the requirements in paragraph 2.1.1.3.2 of this module is expected to adversely affect DNS security or stability, an extended review is possible if technical reviewers identify an issue with the applied-for gTLD string that requires further investigation.

**String Stability Review Procedure** – During the Initial Evaluation period, ICANN will conduct a preliminary review on the set of applied-for gTLD strings to ensure that proposed strings comply with relevant standards provided in the preceding section and determine whether any strings raise significant technical stability issues that may require an Extended Evaluation.

There is low probability that this review will be necessary for a string that fully complies with the string requirements in paragraph 2.1.1.3.2 of this module. However, the technical stability review process provides an additional safeguard if unanticipated security or stability issues arise concerning an applied-for gTLD string.

See Section 2.2 for further information on the Extended Evaluation process.

### 2.1.1.3.2 String Requirements

ICANN will review each applied-for gTLD string to ensure that it conforms with the requirements outlined in the following paragraphs.

If an applied-for gTLD string is found to violate any of these rules, the application will be denied. No further reviews are available.

**Technical Requirements for all Labels (Strings)** – The technical requirements for the selection of top-level domain labels follow.

- The ASCII label (that is, the label as transmitted on the wire) must be valid as specified in the technical standards *Domain Names: Implementation and Specification* (RFC 1035), and *Clarifications to the DNS Specification* (RFC 2181). This includes the following:
  - The label must have no more than 63 characters.
  - Upper and lower case characters are treated as identical.
- The ASCII label must be a valid host name, as specified in the technical standards *DOD Internet Host Table Specification* (RFC 952), *Requirements for Internet Hosts — Application and Support* (RFC 1123), and *Application Techniques for Checking and Transformation of Names* (RFC 3696). This includes the following:

- The label must consist entirely of letters, digits and hyphens.
- The label must not start or end with a hyphen.
- There must be no possibility for confusing an ASCII label for an IP address or other numerical identifier by application software. For example, representations such as "255", "0377" or "0xff" representing decimal, octal, and hexadecimal strings, can be confused for IP addresses. As such, labels:
  - Must not be wholly composed of digits between "0" and "9".
  - Must not commence with "0x" or "x", and have the remainder of the label wholly composed of hexadecimal digits, "0" to "9" and "a" through "f".
  - Must not commence with "0o" or "o", and have the remainder of the label wholly composed of digits between "0" and "7".
- The ASCII label may only include hyphens in the third and fourth position if it represents a valid Internationalized Domain Name in its A-label form (ASCII encoding).
- The presentation format of the domain (that is, either the label for ASCII domains, or the U-label for Internationalized Domain Names) must not begin or end with a digit.

***Requirements for Internationalized Domain Names*** – These requirements apply only to prospective top-level domains that use non-ASCII characters. Applicants for these internationalized top-level domain labels are expected to be familiar with the IETF IDNA standards, Unicode standards, and the terminology associated with Internationalized Domain Names.

- The label must be a valid internationalized domain name, as specified in the technical standard *Internationalizing Domain Names in Applications* (RFC 3490). This includes the following nonexhaustive list of limitations:
  - Must only contain Unicode code points that are defined as "Valid" in *The Unicode Codepoints and IDNA* (<http://www.ietf.org/internet->

[drafts/draft-ietf-idnabis-tables-02.txt](#)) and be accompanied by unambiguous contextual rules where necessary.

- Must be fully compliant with Normalization Form C, as described in *Unicode Standard Annex #15: Unicode Normalization Forms*. See also examples in <http://unicode.org/faq/normalization.html>.
- Must consist entirely of characters with the same directional property.
- The label must meet the relevant criteria of the ICANN *Guidelines for the Implementation of Internationalised Domain Names*. See <http://www.icann.org/en/topics/idn/implementation-guidelines.htm>. This includes the following nonexhaustive list of limitations:
  - All code points in a single label must be taken from the same script as determined by the Unicode Standard Annex #24: Unicode Script Property.
  - Exceptions are permissible for languages with established orthographies and conventions that require the commingled use of multiple scripts. However, even with this exception, visually confusable characters from different scripts will not be allowed to co-exist in a single set of permissible code points unless a corresponding policy and character table is clearly defined.

The IDNA protocol used for internationalized labels is currently under revision through the Internet standardization process. As such, additional requirements may be specified that need to be adhered to as this revision is being completed. The current status of the protocol revision is documented at <http://tools.ietf.org/wg/idnabis>.

***Policy Requirements for Generic Top-Level Domains –***  
Applied-for strings must be composed of three or more visually distinct letters or characters in the script, as appropriate.

#### ***2.1.1.4 Geographical Names***

ICANN will review all applied-for strings to ensure that appropriate consideration is given to the interests of governments or public authorities in country or territory

names, as well as certain other types of sub-national place names. The requirements and procedure ICANN will follow is described in the following paragraphs.

#### 2.1.1.4.1 *Requirements for Strings Intended to Represent Geographical Entities*

The following types of applications must be accompanied by documents of support or non-objection from the relevant government(s) or public authority(ies).

- Applications for any string that is a meaningful representation of a *country or territory name* listed in the ISO 3166-1 standard (see [http://www.iso.org/iso/country\\_codes/iso\\_3166\\_data\\_bases.htm](http://www.iso.org/iso/country_codes/iso_3166_data_bases.htm)). This includes a representation of the country or territory name in any of the six official United Nations languages (French, Spanish, Chinese, Arabic, Russian and English) and the country or territory's local language.
- Applications for any string that represents a *sub-national place name*, such as a county, province, or state, listed in the ISO 3166-2 standard.
- Applications for a city name, where the applicant clearly intends to use the gTLD to leverage from the city name.
- An application for a string which represents a continent or UN region appearing on the

Composition of macro geographical (continental) regions, geographical sub-regions, and selected economic and other groupings list at <http://unstats.un.org/unsd/methods/m49/m49regin.htm>.

An applied-for gTLD string that falls into the above categories is considered to represent a geographical name. It is the applicant's responsibility to identify whether its applied-for gTLD string falls into the above categories and to determine the relevant government or governments, or the relevant public authority or authorities. In the case of an application for a string which represents a continent or UN region, evidence of support, or non-objection, will be required from a substantial number of the relevant governments and/or public authorities associated with the continent or the UN region.

The evidence of support or non-objection from the relevant government or public authority should include a signed

letter of support or non-objection from the minister with the portfolio responsible for domain name administration, ICT, foreign affairs or the Office of the Prime Minister or President of the relevant jurisdiction. If there are reasons for doubt about the authenticity of the communication, ICANN will consult with the diplomatic authorities or members of ICANN's Governmental Advisory Committee for the government or public authority concerned on the competent authority and appropriate point of contact with their administration for communications.

The letter must clearly express the government's or public authority's support or non-objection for the applicant's application and demonstrate the government's or public authority's understanding of the string being requested and what it will be used for.

The requirement to include evidence of support for certain applications does not preclude or exempt applications from being the subject of objections on community grounds (refer to section 3.1.1 of Module 3), under which applications may be rejected based on objections showing substantial opposition from the targeted community.

#### *2.1.1.4.2 Review Procedure for Geographical Names*

A Geographical Names Panel (GNP) will be established to evaluate applications and confirm whether each string represents a geographic term, and to verify the authenticity of the supporting documentation where necessary. The Geographic Names Panel may consult with additional experts as they consider appropriate.

The steps ICANN and the Geographical Names Panel intend to follow to ensure compliance with these requirements are described here.

1. During the Initial Evaluation period, ICANN evaluates each application for a geographical name to confirm that the applicant has provided a letter of support or nonobjection from the relevant government.
2. ICANN forwards applications considered complete to the GNP for confirmation that:
  - The strings are a meaningful representation of a country or territory name or a subnational place name, and

- The communication from the government or public authority is legitimate and contains the suggested content.
3. The GNP also reviews applications that are not self-identified as a geographical name to ensure that the applied-for string is not a meaningful representation of a country or territory name or a sub-national place name.
  4. All applications determined to be geographical but without necessary supporting documents will be considered incomplete. The applicant will be notified and the application will not pass Initial Evaluation.
  5. The GNP may consult additional expertise if uncertainty arises about the name the applied-for gTLD string is claimed to represent.

The results of the evaluation will be publicly posted on ICANN's website at the conclusion of the Initial Evaluation, and will also be available to applicants.

If there is more than one application for a string representing a certain geographical term as described in this section, and the applications are considered complete (that is, have requisite government approvals), the applications will be suspended pending resolution by the applicants. If there is contention between identical (or similar) applicants where one is identified as a geographical name, the string contention will be settled using the string contention methodology described in Module 4.

### *2.1.2 Applicant Reviews*

---

Concurrent with the applied-for gTLD string reviews described in subsection 2.1.1, ICANN will review the applicant's technical and operational capability, its financial capability, and its proposed registry services. Those reviews are described in greater detail in the following subsections.

#### *2.1.2.1 Information Sought*

The questions provided for applicants in the application form are available at <http://www.icann.org/en/topics/new-gtld-draft-evaluation-criteria-24oct08-en.pdf>. Applicants answer questions which cover the following three areas in relation to themselves: general information, technical and operational capability, and financial capability.

Applicants should be aware that the application materials submitted in the online application system, as well as any evaluation materials and correspondence, will be publicly posted on ICANN's website. The sections in the application that are marked CONFIDENTIAL will not be posted. Any sections of the application that ICANN has not designated CONFIDENTIAL will be posted.

The applicant questions cover the following three areas:

**General Information** – These questions are intended to gather information about an applicant's legal identity, contact information, and applied-for gTLD string. Failure to provide any of this information will result in an application being considered incomplete. Under specific areas of questions under this category are: the identification of the applied-for string; selection of TLD type; and requests for certain documents.

**Demonstration of Technical and Operational Capability** – These questions are intended to gather information about an applicant's technical capabilities and plans for operation of the proposed gTLD.

Applicants are not required to have deployed an actual registry to complete the requirements for a successful application. It will be sufficient at application time for an applicant to demonstrate a clear understanding and accomplishment of some groundwork toward the key technical and operational aspects of running a gTLD registry. Each applicant that passes the technical evaluation and all other steps will be required, following execution of a registry agreement, to complete a pre-delegation technical test before delegation of the applied-for gTLD. Refer to Module 5, Transition to Delegation, for additional information.

**Demonstration of Financial Capability** – These questions are intended to gather information about an applicant's financial capabilities to operate a gTLD registry business and its financial planning in preparation for long-term operation of a new gTLD.

#### **2.1.2.2 Evaluation Methodology**

Initial Evaluations are conducted on the basis of the information each applicant makes available to ICANN in its response to the questions in the application form. ICANN and its evaluators are not obliged to take into account any information or evidence that is not made available in the application and submitted by the due date, unless explicitly requested by the evaluators.

Evaluators are entitled, but not obliged, to request further information or evidence from an applicant, and any such request will be made solely through TAS, rather than by direct means such as phone, letter, email, or other similar means. Only one exchange of information between the applicant and the evaluators may take place within the Initial Evaluation period.

Because different registry types and purposes may justify different responses to individual questions, evaluators will pay particular attention to the consistency of an application across all criteria. For example, an applicant's scaling plans noting hardware to ensure its capacity to operate at a particular volume level should be consistent with its financial plans to secure the necessary equipment.

### *2.1.3 Registry Services Review*

---

Concurrent with the string reviews described in subsection 2.1.1, ICANN will review the applicant's proposed registry services. The applicant will be required to provide a list of proposed registry services in its application.

Registry services are defined as: (1) operations of the registry critical to the following tasks: the receipt of data from registrars concerning registrations of domain names and name servers; provision to registrars of status information relating to the zone servers for the TLD; dissemination of TLD zone files; operation of the registry zone servers; and dissemination of contact and other information concerning domain name server registrations in the TLD as required by the registry agreement; (2) other products or services that the registry operator is required to provide because of the establishment of a consensus policy; and (3) any other products or services that only a registry operator is capable of providing, by reason of its designation as the registry operator.

A full definition of registry service can be found at <http://www.icann.org/en/registries/rsep/rsep.html> and in the draft registry agreement at <http://www.icann.org/en/topics/new-gtld-draft-agreement-24oct08-en.pdf>. Registry services will be examined to determine if the proposed registry service might raise significant stability or security issues. Examples of services submitted to the registry services process by established registries can be found at <http://www.icann.org/en/registries/rsep>.

The registration of domain names, for example, is a registry service. Lists of registry services currently provided by

registries can be found in registry agreement appendices. In general cases, these services successfully pass this inquiry. See

<http://www.icann.org/en/registries/agreements.htm>.

Review of all applicants' proposed registry services will occur during the Initial Evaluation.

**Procedure** – ICANN's first review will be a preliminary determination of whether a proposed registry service requires further consideration based on whether the registry service may raise significant security or stability issues.

If ICANN's preliminary determination reveals that there may be significant security or stability issues surrounding the proposed service, the application will be flagged for an extended review by the RSTEP (see <http://www.icann.org/en/registries/rsep/rstep.html>). This review will occur during the Extended Evaluation phase (refer to section 2.2).

Definitions for security and stability applied in the registry services review are:

**Security** – an effect on security by the proposed registry service means (1) the unauthorized disclosure, alteration, insertion or destruction of registry data, or (2) the unauthorized access to or disclosure of information or resources on the Internet by systems operating in accordance with all applicable standards.

**Stability** – an effect on stability means that the proposed registry service (1) does not comply with applicable relevant standards that are authoritative and published by a well-established, recognized, and authoritative standards body, such as relevant standards-track or best current practice RFCs sponsored by the IETF, or (2) creates a condition that adversely affects the throughput, response time, consistency, or coherence of responses to Internet servers or end systems, operating in accordance with applicable relevant standards that are authoritative and published by a well-established, recognized and authoritative standards body, such as relevant standards-track or best current practice RFCs and relying on registry operator's delegation information or provisioning services.

#### ***2.1.4 Applicant's Withdrawal of an Application***

---

An applicant who does not pass the Initial Evaluation may be permitted to withdraw its application at this stage for a partial refund (refer to subsection 1.5.5 of Module 1, Introduction to gTLD Application Process).

## 2.2 *Extended Evaluation*

---

An applicant may request an Extended Evaluation if the application has failed to pass the Initial Evaluation elements concerning:

- Demonstration of technical and operational capability (refer to paragraph 2.1.2.1).
- Demonstration of financial capability (refer to paragraph 2.1.2.1).

An Extended Evaluation may also result if ICANN identifies a need for further review on the following elements:

- DNS stability (refer to paragraph 2.1.1.3).
- Registry services (refer to subsection 2.1.3). Note that this investigation incurs an additional fee (the Registry Services Review Fee) if the applicant wishes to proceed. See Section 1.5 of Module 1 for fee and payment information.

From the time an applicant receives notice of failure to pass the Initial Evaluation, it has 15 calendar days to submit to ICANN the Notice of Request for Extended Evaluation through the online application interface. If the applicant does not explicitly request the Extended Evaluation, and pay any additional fees as applicable, the application will not proceed.

### 2.2.1 *Technical and Operational or Financial Extended Evaluation*

---

This subsection applies to an Extended Evaluation of an applicant's technical and operational capability or financial capability, as described in paragraph 2.1.2.1.

The Extended Evaluation allows one additional round of inquiry and answer between the evaluators and the applicant to clarify information contained in the application. This supplemental information will become part of the application. Applicants may not change the information submitted in their original applications. Through the online system, the evaluators will provide the applicant a set of questions describing any deficiencies in the application and request clarification. Such communications will include a deadline for the applicant to respond.

The same panel that reviewed an application during Initial Evaluation will conduct the Extended Evaluation, using the

same criteria as outlined at <http://www.icann.org/en/topics/new-gtld-draft-evaluation-criteria-24oct08-en.pdf>, to determine whether the application, now that certain information has been clarified, meets the criteria.

ICANN will notify applicants at the end of the Extended Evaluation period as to whether they have passed. If an applicant passes Extended Evaluation, its application continues to the next stage in the process. If an applicant does not pass Extended Evaluation, the application will proceed no further. No further reviews are available.

### *2.2.2 String Stability Extended Evaluation*

---

This section applies to an Extended Evaluation of DNS security or stability issues with an applied-for gTLD string, as described in paragraph 2.1.1.3.

If the evaluators determine that a string poses stability issues that require further investigation, the applicant must either confirm that it intends to move forward with the application process or withdraw its application.

If an application is subject to such an Extended Evaluation, an independent 3-member panel will be formed to review the security or stability issues identified during the Initial Evaluation.

The panel will review the string and determine whether the string complies with relevant standards or creates a condition that adversely affects the throughput, response time, consistency, or coherence of responses to Internet servers or end systems, and will communicate its findings to ICANN and to the applicant.

If the panel determines that the string does not comply with relevant standards or creates a condition that adversely affects the throughput, response time, consistency, or coherence of responses to Internet servers or end systems, the application cannot proceed.

### *2.2.3 Registry Services Extended Evaluation*

---

This section applies to an Extended Evaluation of Registry Services, as described in subsection 2.1.3.

If a proposed registry service has been referred to the Registry Services Technical Evaluation Panel (RSTEP) for an extended review, the RSTEP will form a review team of members with the appropriate qualifications.

The review team will generally consist of 3 members, depending on the complexity of the registry service proposed. In a 3-member panel, the review could be conducted within 30 to 45 days. In cases where a 5-member panel is needed, this will be identified before the extended evaluation starts. In a 5-member panel, the review could be conducted in 45 days or fewer.

The cost of an RSTEP review will be covered by the applicant through payment of the Registry Services Review Fee. Refer to payment procedures in section 1.5 of Module 1. The RSTEP team review will not commence until payment has been received.

If the RSTEP finds that one or more of the applicant's proposed registry services may be introduced without risk of a meaningful adverse effect on security or stability, these services may be included in the applicant's contract with ICANN.

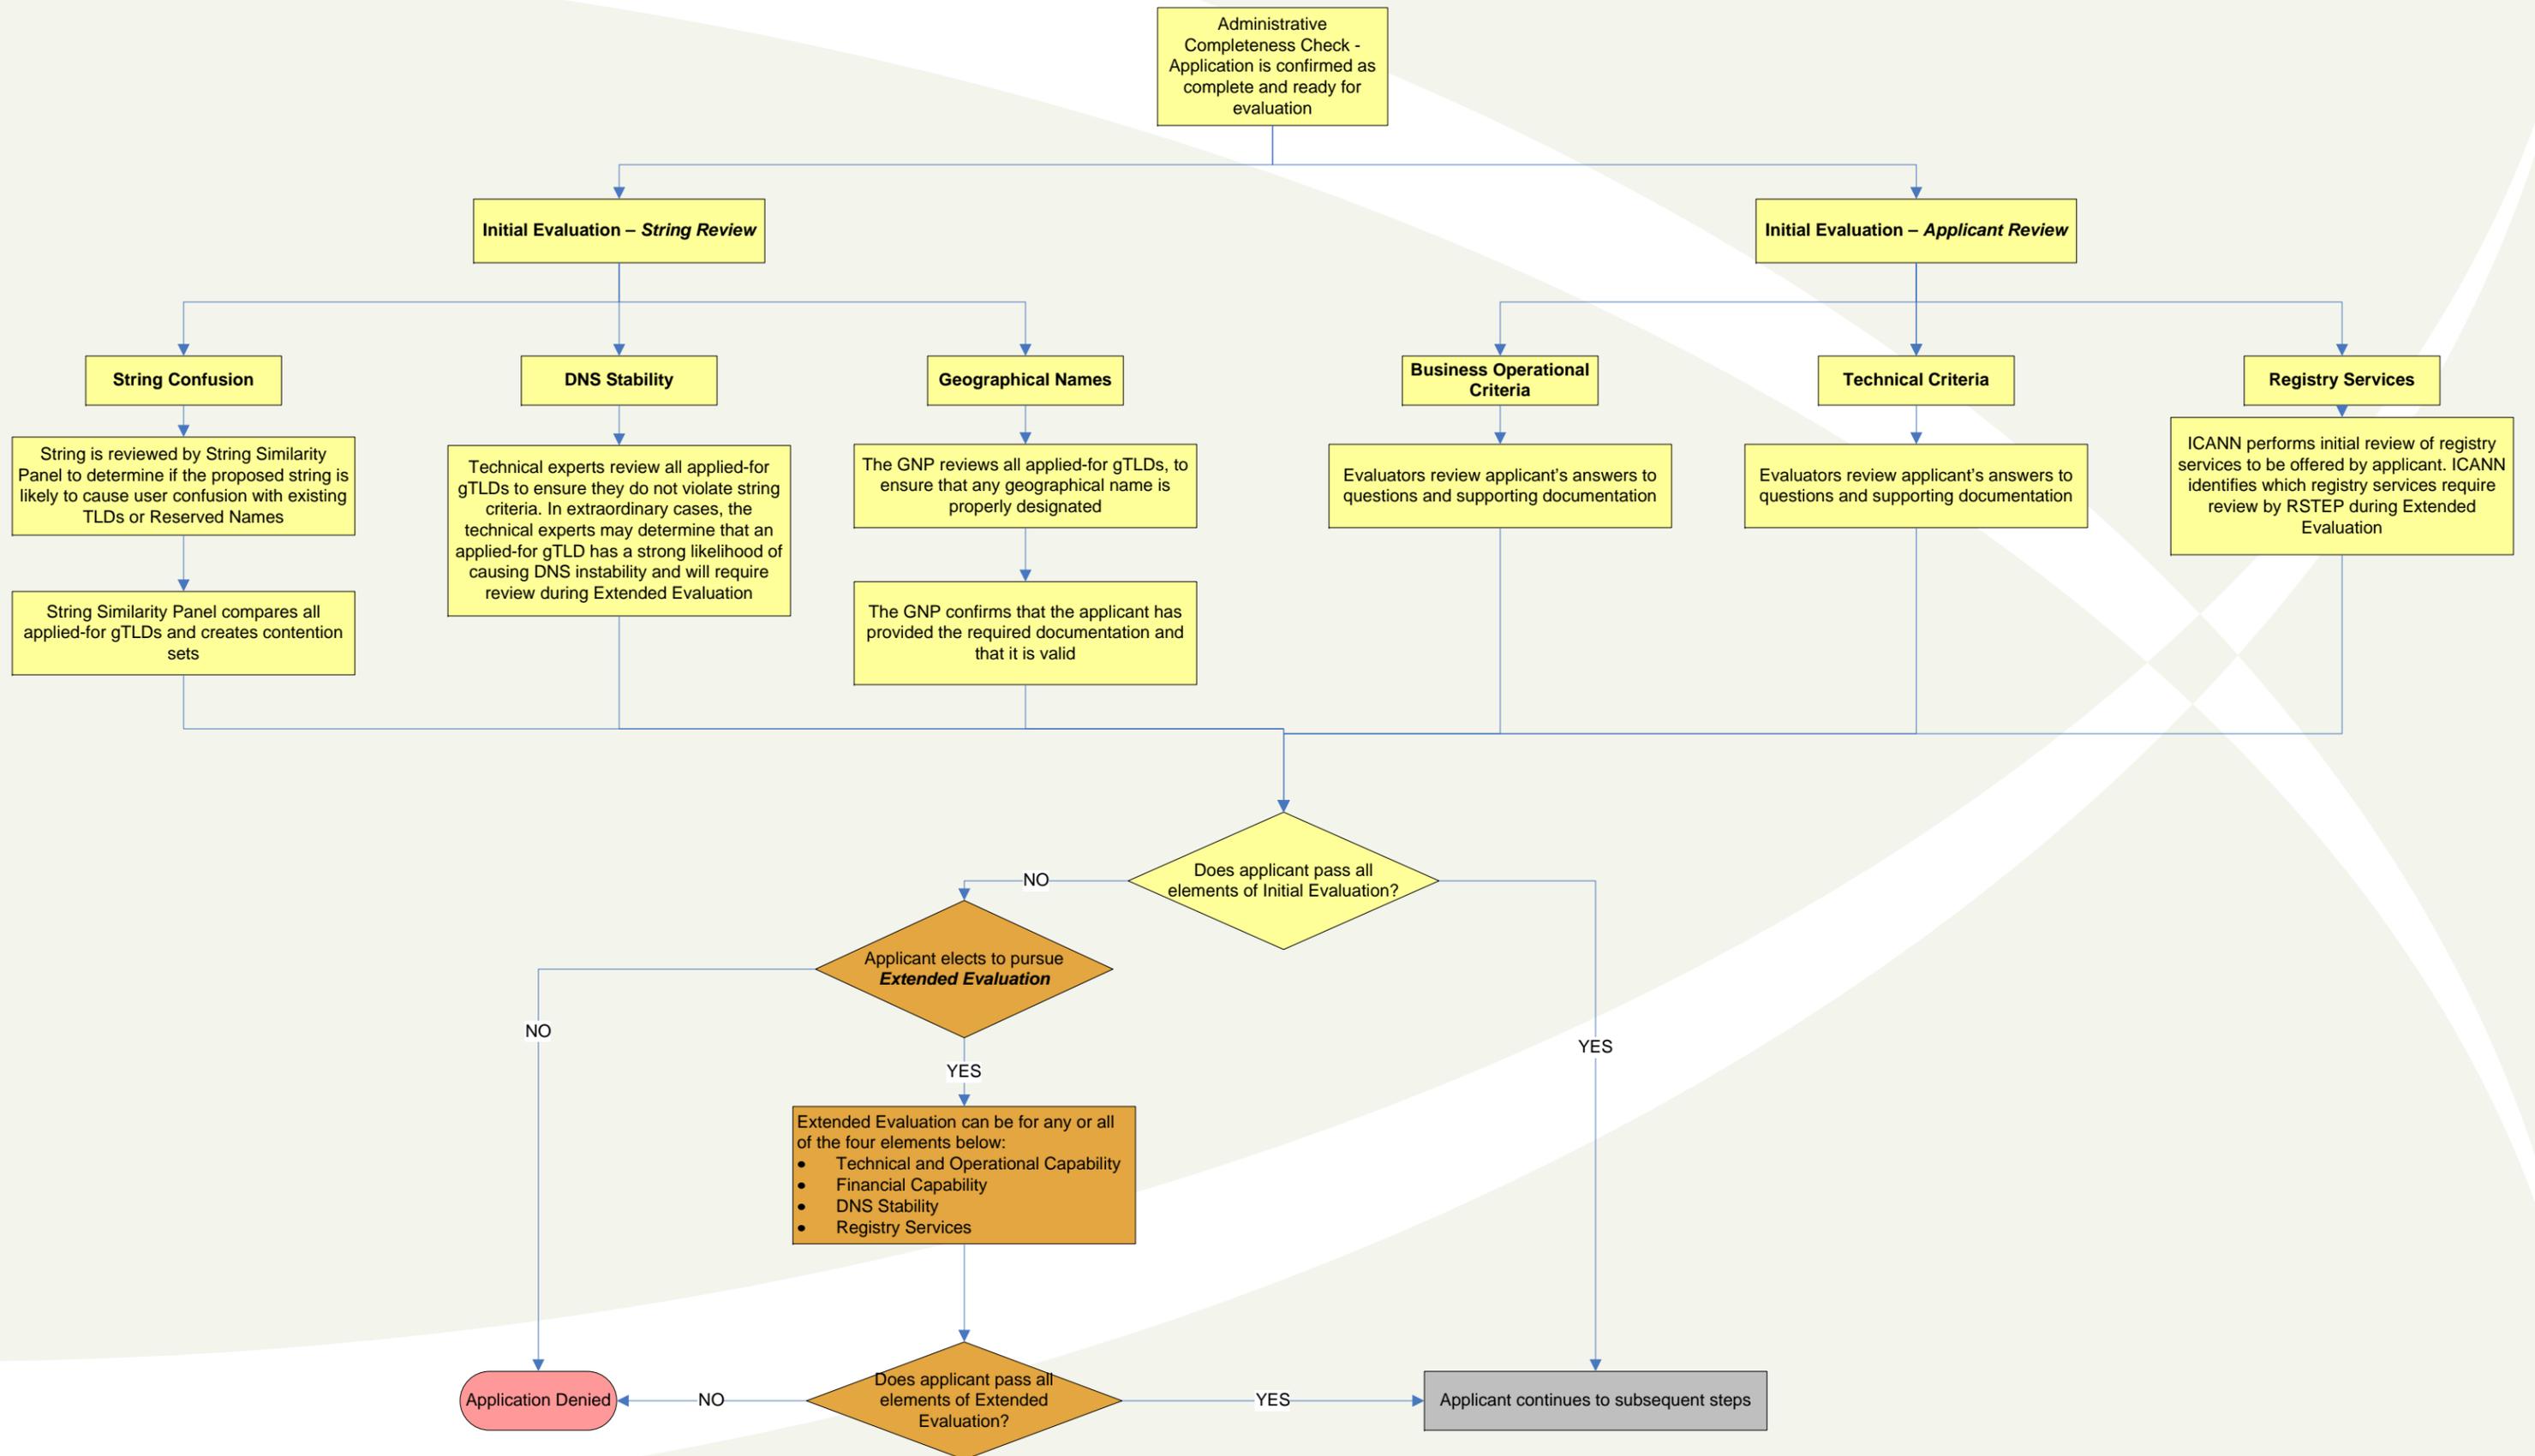

If the RSTEP finds that the proposed service would create a risk of a meaningful adverse effect on security or stability, the applicant may elect to proceed with its application without the proposed service, or withdraw its application for the gTLD.

### **2.3** *Probity and Conflicts of Interest*

---

ICANN staff and by various independent service providers will review all applications during **Initial Evaluation** and **Extended Evaluation**. During this entire evaluation process, applicants must not approach, or have any other person or entity approach on their behalf, any ICANN staff member, any ICANN Board member, or any person associated with the evaluation process, including any evaluators, experts, examiners, or reviewers retained by ICANN.

# DRAFT - New gTLD Program – Initial Evaluation and Extended Evaluation

# Draft Applicant Guidebook

## Module 3

Please note that this is a discussion draft only. Potential applicants should not rely on any of the proposed details of the new gTLD program as the program remains subject to further consultation and revision.

24 October 2008

---

# Module 3

---

## *Dispute Resolution Procedures*

This module describes the purpose of the objection and dispute resolution mechanisms, the grounds for lodging an objection to a gTLD application, the general procedures for filing or responding to an objection, and the manner in which dispute resolution proceedings are conducted.

This module also discusses the guiding principles, or standards, that each DRSP will apply in its decisions.

All applicants should be aware of the possibility that an objection may be filed against their applications, and of the options available in the event of such an objection.

### *3.1 Purpose and Overview of the Dispute Resolution Process*

---

The independent dispute resolution process is designed to protect certain interests and rights. The process provides a path for formal objections during evaluation of the applications. It allows certain parties with standing to have their objections considered before a panel of qualified experts. A formal objection can be filed only on four enumerated grounds, as described in this module. A formal objection initiates a dispute resolution proceeding. In filing an application for a gTLD, the applicant agrees to accept this gTLD dispute resolution process. Similarly, an objector accepts the gTLD dispute resolution process by filing its objection.

#### *3.1.1 Grounds for Objection*

---

An objection may be filed on any one of the following four grounds:

***String Confusion Objection*** – The applied-for gTLD string is confusingly similar to an existing TLD or to another applied-for gTLD string.

***Legal Rights Objection*** – The applied-for gTLD string infringes existing legal rights of the objector.

***Morality and Public Order Objection*** – The applied-for gTLD string is contrary to generally accepted legal norms of morality and public order that are recognized under international principles of law.

**Community Objection** – There is substantial opposition to the gTLD application from a significant portion of the community to which the gTLD string may be explicitly or implicitly targeted.

The rationales for these grounds are discussed in the final report of the ICANN policy development process for new gTLDs. For more information on this process, see <http://gnso.icann.org/issues/new-gtlds/pdp-dec05-fr-part-08aug07.htm>.

### 3.1.2 *Standing to Object*

---

Objectors must satisfy standing requirements to have their objections considered. As part of the dispute proceedings, all objections will be reviewed by panelists designated by the applicable Dispute Resolution Service Provider (DRSP) to determine whether the objector has standing to object. Standing requirements for the four objection grounds are:

Objection Ground	Who may object
String confusion	Existing TLD operator or gTLD applicant in current round
Legal rights	Rightsholders
Morality and Public Order	To be determined
Community	Established institution

#### 3.1.2.1 *String Confusion Objection*

Two types of entities have standing to object:

- An existing TLD operator may file a string confusion objection to assert string confusion between an applied-for gTLD and the TLD that it currently operates.
- Any gTLD applicant in this application round may also file a string confusion objection to assert string confusion between an applied-for gTLD and the gTLD for which it has applied.

In the case where a gTLD applicant successfully asserts string confusion with another applicant, the only possible outcome is for both applicants to be placed in a contention set and to be referred to a contention resolution procedure (refer to Module 4). If an objection by a gTLD applicant to another gTLD applicant is unsuccessful, the applicants may both move forward in the process without being considered in contention with one another.

### 3.1.2.2 *Legal Rights Objection*

Only a rightsholder has standing to file a legal rights objection. The source and documentation of the existing legal rights the objector is claiming are infringed by the applied-for gTLD must be included in the filing.

### 3.1.2.3 *Morality and Public Order Objection*

Standing requirements for morality and public order objections remain under study. In the case of morality and public order objections, it may be appropriate to grant standing only to parties who have recognized authority in the arena of morality or public order, such as governments, or it may be appropriate to make this option available to any interested parties who assert harm due to an applied-for gTLD string.

### 3.1.2.4 *Community Objection*

Established institutions associated with defined communities are eligible to file a community objection. To qualify for standing for a community objection, the objector must prove both of the following:

***It is an established institution*** – Factors that may be considered in making this determination include:

- Level of global recognition of the institution;
- Length of time the institution has been in existence; and
- Public historical evidence of its existence, such as the presence of formal charter or national or international registration, or validation by a government, inter-governmental organization, or treaty. The institution must not have been established solely in conjunction with the gTLD application process.

***It has an ongoing relationship with a defined community that consists of a restricted population*** – Factors that may be considered in making this determination include:

- The presence of mechanisms for participation in activities, membership, and leadership;
- Institutional purpose related to benefit of the associated community;
- Performance of regular activities that benefit the associated community; and
- The level of formal boundaries around the community.

### **3.1.3 Options in the Event of Objection**

---

Applicants whose applications are the subject of an objection have the following options:

The applicant can file a response to the objection and enter the dispute resolution process (refer to subsection 3.3); or

The applicant can withdraw, in which case the objector will prevail by default and the application will not proceed further.

If for any reason the applicant does not file a response to an objection, the objector will prevail by default.

## **3.2 Procedure for Filing an Objection**

---

To trigger a dispute resolution proceeding, an objection must be filed by the posted deadline date. Objections must be filed directly with the appropriate DRSP for each objection ground.

The **International Centre for Dispute Resolution** has agreed in principle to administer disputes brought pursuant to string confusion objections.

The **Arbitration and Mediation Center of the World Intellectual Property Organization** has agreed in principle to administer disputes brought pursuant to legal rights objections.

The **International Chamber of Commerce** has agreed in principle to administer disputes brought pursuant to Morality and Public Order and Community Objections.

### **3.2.1 Objection Filing Procedures**

---

The procedures outlined in this subsection must be followed by any party wishing to file a formal objection to an application that has been posted by ICANN. These procedures are provided to applicants for reference and are intended to cover dispute resolution procedures generally. Each provider has its own rules and procedures that also must be followed when filing an objection.

Should an applicant wish to file a formal objection to another gTLD application, it would follow these procedures.

- All objections must be filed by the posted deadline date. Objections will not be accepted by the DRSPs after this date.

- All objections must be filed in English.
- Each objection must be filed separately. That is, if any objector wishes to object to several applications at the same time, the objector must file an objection and pay a filing fee for each application that is the subject of an objection. If an objector wishes to object to one application on different grounds, the objector must file an objection and pay a filing fee for each objection ground.
- All objections must be filed with the appropriate DRSP. If an objection is filed with a DRSP other than the DRSP specified for the objection ground, that DRSP will promptly notify the objector of the error. The objector then has 5 calendar days after receiving that notification to file its objection with the appropriate DRSP.
- Objections must be filed electronically and all interactions with the DRSPs during the objection process must be conducted online.

Each objection filed by an objector must include:

- The name and contact information, including address, phone, and email address, of all parties submitting an objection.
- The basis for standing; that is, why the objector believes it has the right to object.
- A statement of the nature of the dispute, which should include:
  - A statement giving the specific ground under which the objection is being filed.
  - A detailed explanation of how the objector's claim meets the requirements for filing a claim pursuant to that particular ground or standard.
  - A detailed explanation of the validity of the objection and why the application should be denied.
- Copies of any documents that the objector considers to be a basis for the objection.

Objections are limited to 2500 words, excluding attachments.

The DRSP will use electronic means to deliver copies of all materials filed to the applicant and to all objectors.

Each applicant and all objectors must provide copies of all submissions to the DRSP associated with the objection proceedings to one another, and to ICANN.

ICANN will publish a document on its website identifying all objections shortly after the deadline for filing objections has passed (refer to Item 1 above). Objections will not be published before that deadline.

### ***3.2.2 Objection Filing Fees***

---

At the time an objection is filed, the objector is required to pay a nonrefundable filing fee in the amount set and published by the relevant DRSP. If the filing fee is not paid, the DRSP will dismiss the objection without prejudice. See Section 1.5 of Module 1 regarding fees.

## ***3.3 Filing a Response to an Objection***

---

### ***3.3.1 Filing Procedures***

---

These procedures are intended to cover dispute resolution procedures generally. Each DRSP will have its own rules that also must be followed.

Upon notification that ICANN has published the list of objections filed (refer to subsection 3.2.1), the DRSPs will notify the parties that responses must be filed within 30 calendar days of receipt of that notice. DRSPs will not accept late responses. Any applicant that fails to respond to an objection within the 30-day response period will be in default, which will result in the objector prevailing.

- All responses must be filed in English.
- Each response must be filed separately. That is, if an applicant wishes to respond to several objections, the applicant must file a response and pay a filing fee to respond to each objection.
- All responses must be filed with the appropriate DRSP. If a response is filed with a DRSP other than the DRSP specified for the objection ground, that DRSP will promptly notify the applicant of the error. The applicant then has 5 calendar days after receiving the notification to file its objection with the appropriate DRSP.

- Responses must be filed electronically and all interactions with the DRSPs during the dispute resolution process must be conducted online.
- Each response filed by an applicant must include the name and contact information, including address, phone, and email address, of all parties submitting the response.
- Each responding applicant's response must contain a point-by-point confirmation or denial of the claims made by each objector. The applicant also should attach any copies of documents that it considers to be a basis for the response.
- Responses are limited to 2500, excluding attachments.
- The DRSP will use electronic means to deliver copies of all materials filed to the applicant and to all objectors.
- Each applicant and all objectors must provide copies of all submissions to the DRSP associated with the objection proceedings to one another and to ICANN.

### ***3.3.2 Response Filing Fees***

---

At the time an applicant files its response, it is required to pay a nonrefundable filing fee in the amount set and published by the relevant DRSP, which will be the same as the filing fee paid by the objector. If the filing fee is not paid, the response will be disregarded.

## ***3.4 Dispute Resolution Procedure***

---

### ***3.4.1 Preliminary Objection Processing***

---

Each DRSP will conduct an administrative review of each objection for compliance with all procedural rules within 14 calendar days of receiving the objection. Depending on the number of objections received, the DRSP may ask ICANN for a short extension of this deadline.

If the DRSP finds that the objection complies with procedural rules, the objection will be deemed filed, and the proceedings will continue. If the DRSP finds that the objection does not comply with procedural rules, the DRSP will dismiss the objection and close the proceedings without prejudice to the objector's submission of a new objection that complies with procedural rules. The DRSP's review or rejection of the objection will not interrupt the time limit for submitting an objection.

### ***3.4.2 Consolidation of Objections***

---

Once the DRSP receives and processes all objections, at its discretion the DRSP may elect to consolidate certain objections.

An example of circumstances in which consolidation might occur is multiple objections to the same application based on the same ground.

In assessing whether to consolidate objections, the DRSP will weigh the efficiencies in time, money, effort, and consistency that may be gained by consolidation against the prejudice or inconvenience consolidation may cause. The DRSPs will endeavor to have all objections resolved on a similar timeline. It is intended that no sequencing of objections will be established.

New gTLD applicants and objectors also will be permitted to propose consolidation of objections, but it will be at the DRSP's discretion whether to agree to the proposal.

### ***3.4.3 Negotiation and Mediation***

---

The parties to a dispute resolution proceeding are encouraged—but not required—to participate in a cooling off period to determine whether the dispute can be resolved by the parties. Each DRSP has panelists who can be retained as mediators to facilitate this process, should the parties elect to do so, and the DRSPs will communicate with the parties concerning this option and any associated fees.

If a mediator is appointed, that person may not serve on the panel to resolve the objection.

There are no automatic extensions of time associated with any cooling off period. The parties may submit joint requests for extensions of time to the DRSP according to its procedures, and the DRSP or the panel, if appointed, will decide whether to grant the requests, although extensions will be discouraged. The parties must limit their requests for extension to 30 calendar days.

### ***3.4.4 Selection and Number of Panelists***

---

Appropriately qualified panelists will be appointed to each proceeding by the designated DRSP.

Panelists must be independent of the parties to an objection resolution proceeding. Each DRSP will follow its adopted procedures for requiring such independence,

including procedures for challenging and replacing a panelist for lack of independence.

There will be one panelist in proceedings involving a **string confusion objection**.

There will be one panelist with relevant experience in intellectual property rights disputes in proceedings involving an existing **legal rights objection**.

There will be three panelists recognized as eminent jurists of international reputation, in proceedings involving a **morality and public order objection**.

There will be one panelist in proceedings involving a **community objection**.

Neither the panelists, the DRSP, ICANN, nor their respective employees, Board members, or consultants will be liable to any party in any action for damages or injunctive relief for any act or omission in connection with any proceeding under the dispute resolution procedures.

#### **3.4.5 Adjudication**

---

At its discretion, the panel appointed by the DRSP may request further statements or documents from the parties, although such requests will be limited and infrequent.

To keep costs down and limit delays, the panel will discourage and, if practicable, not permit any document production or other discovery-style requests from the parties.

Without its being requested by the parties, the panelists may appoint experts to be paid for by the parties, request live or written witness testimony, or request limited exchange of documents.

Any party may request a hearing; however, it is within the panel's discretion whether to allow such a hearing. The presumption is that the panel will render decisions based on written submissions and without a hearing.

If a request for a hearing is granted, videoconferences are to be used if possible. If not possible, then the DRSP panel will select a place for hearing if the parties cannot agree. The panel will determine whether the hearings are to be public or private. Hearings will last no more than one day, except in the most exceptional circumstances.

Typically, dispute resolution proceedings will be conducted in English, but may be conducted in another language in accordance with the rules of the provider.

### 3.4.6 *Decision*

---

The DRSPs' final decisions will be in writing and will include:

- A summary of the dispute and findings; and
- The reasoning upon which the decision is based.

Each DRSP will develop a single format for all final decisions that its panelists render. The DRSP will notify the parties of the decision via email.

ICANN will strongly encourage DRSPs to use reasonable efforts to issue all final decisions within 45 days of the panel appointment date unless, after both parties have completed their initial submissions, the parties jointly request a short postponement of their adjudication date to accommodate negotiation or mediation or to accommodate other aspects of the proceedings, and the panel agrees.

When the panel is composed of three panelists, the decision will be made by a majority of the panelists.

Unless the panel decides otherwise, each DRSP will publish all decisions rendered by its panels in full on its website.

A dispute resolution panel decision will be considered an expert determination, and will be considered by ICANN in making a final decision regarding the success of any application.

### 3.4.7 *Dispute Resolution Fees*

---

Before acceptance of objections, each DRSP will publish a schedule of costs for the proceedings that it administers under this procedure. These costs cover the fees and expenses of the members of the panel and the DRSP's administrative costs.

ICANN expects that string confusion and legal rights objection proceedings will involve a fixed amount charged by the panelists while morality and public order and community objection proceedings will involve hourly rates charged by the panelists.

Within 7 business days of constituting the panel, the DRSP will estimate the total costs and request advance payment in full of its costs from both the objector and the applicant.

Each party must make its advance payment within 15 calendar days of receiving the DRSP's request for payment. The respective filing fees paid by the parties will be credited against the amounts due for this advance payment of costs.

The DRSP may revise its estimate of the total costs and request additional advance payments from the parties during the resolution proceedings.

Additional fees may be required in specific circumstances; for example, if the DRSP receives supplemental submissions or elects to hold a hearing.

If an objector fails to pay these costs in advance, the DRSP will dismiss its objection and no fees paid by the objector will be refunded.

If an applicant fails to pay these costs in advance, the DRSP will sustain the objection and no fees paid by the applicant will be refunded.

After the hearing has taken place and the panel renders its decision, the DRSP will refund any costs paid in advance to the prevailing party.

### **3.5 *Dispute Resolution Principles (Standards)***

---

Each panel will use appropriate general principles (standards) to evaluate the merits of each objection. The principles for adjudication on each type of objection are specified in the paragraphs that follow. The panel may also refer to other relevant rules of international law in connection with the standards.

The objector bears the burden of proof in each case.

The principles outlined below are subject to evolution based on ongoing consultation with DRSPs, legal experts, and the public.

#### **3.5.1 *String Confusion Objection***

---

A DRSP panel hearing a string confusion objection will consider whether the applied-for gTLD string is likely to result in string confusion.

String confusion exists where a string so nearly resembles another that it is likely to deceive or cause confusion. For a likelihood of confusion to exist, it must be probable, not merely possible that confusion will arise in the mind of the

average, reasonable Internet user. Mere association, in the sense that the string brings another string to mind, is insufficient to find a likelihood of confusion.

### 3.5.2 *Legal Rights Objection*

---

In interpreting and giving meaning to GNSO Recommendation 3 (“Strings must not infringe the existing legal rights of others that are recognized or enforceable under generally accepted and internationally recognized principles of law”), a DRSP panel presiding over a legal rights objection will determine whether the potential use of the applied-for TLD by the applicant takes unfair advantage of the distinctive character or the reputation of the objector’s trademark or service mark (“mark”), or unjustifiably impairs the distinctive character or the reputation of the objector’s mark, or otherwise creates an impermissible likelihood of confusion between the applied-for TLD and the objector’s mark, by considering the following non-exclusive factors:

1. Whether the applied-for TLD is identical or similar, including in appearance, phonetic sound or meaning, to the objector’s existing mark.
2. Whether the objector’s acquisition and use of rights in the mark has been bona fide.
3. Whether and to what extent there is recognition in the relevant sector of the public of the sign corresponding to the TLD, as the mark of the objector, of the applicant or of a third party.
4. Applicant’s intent in applying for the TLD, including whether the applicant, at the time of application for the TLD, had knowledge of the objector’s mark, or could not have reasonably been unaware of that mark, and including whether the applicant has engaged in a pattern of conduct whereby it applied for or operates TLDs or registrations in TLDs which are identical or confusingly similar to the marks of others.
5. Whether and to what extent the applicant has used, or has made demonstrable preparations to use, the sign corresponding to the TLD in connection with a bona fide offering of goods or services or a bona fide provision of information in a way that does not interfere with the legitimate exercise by the objector of its mark rights.
6. Whether the applicant has marks or other intellectual property rights in the sign corresponding to the TLD,

and, if so, whether any acquisition of such a right in the sign, and use of the sign, has been bona fide, and whether the purported or likely use of the TLD by the applicant is consistent with such acquisition or use.

7. Whether and to what extent the applicant has been commonly known by the sign corresponding to the TLD, and if so, whether any purported or likely use of the TLD by the applicant is consistent therewith and bona fide.
8. Whether the applicant's intended-use of the TLD would create a likelihood of confusion with the objector's mark as to the source, sponsorship, affiliation, or endorsement of the TLD.

### ***3.5.3 Morality and Public Order Objection***

---

This section is under construction. ICANN expects to implement a standard for morality and public order objections in accordance with international legal principles. Accordingly, ICANN has reviewed legal systems in all ICANN regions. ICANN has also consulted with judges, attorneys, and legal experts in many jurisdictions. The general principles guiding ICANN in the establishment of dispute resolution standards are: (1) everyone has the right to freedom of expression; and (2) such freedom of expression may be subject to certain narrowly interpreted exceptions that are necessary to protect other important rights. See Articles 19 and 20 of the International Covenant on Civil and Political Rights. ICANN continues to address the challenge of identifying standards appropriate for the global namespace.

### ***3.5.4 Community Objection***

---

The four tests described here will enable a DRSP panel to determine whether there is substantial opposition from a significant portion of the community to which the string may be targeted. For an objection to be successful, the objector must prove that:

- The community invoked by the objector is a defined community; and
- Community opposition to the application is substantial; and
- There is a strong association between the community invoked and the applied-for gTLD string; and

- There is a likelihood of detriment to the community named by the objector if the gTLD application is approved.

Each of these tests is described in further detail below.

**Community** – The objector must prove that the community expressing opposition can be regarded as a well-defined community. A panel could balance a number of factors to determine this, including:

- Level of public recognition of the group as a community at a local and / or global level;
- Level of formal boundaries around the community and what elements are considered to form the community;
- How long the community has been in existence;
- How globally distributed is the community (breadth, level of importance)(this may not apply if the community is territorial); and
- How many people make up the community.

If opposition by a number of people is found, but the group claiming opposition is not determined to be a distinct community, the objection will fail.

**Substantial opposition** – The objector must prove substantial opposition within the community it has identified. A panel could balance a number of factors to determine whether there is substantial opposition, including:

- Number of expressions of opposition relative to the composition of the community;
- Distribution or diversity among sources of expressions of opposition, including:
  - Regional
  - Subsectors of community
  - Leadership of community
  - Membership of community
- Nature/intensity of opposition; and
- Costs incurred by objector in expressing opposition, including what other channels they have used to convey their opposition.

If some opposition within the community is determined, but it does not meet the standard of substantial opposition, the objection will fail.

**Targeting** – The objector must prove an association between the applied-for gTLD string and the community expressing opposition. Factors that could be balanced by a panel to determine this include:

- Statements contained in application;
- Other public statements by the applicant;
- Associations by the public.

If opposition by a community is determined, but there is no clear connection between the community and the applied-for gTLD string, the objection will fail.

**Detriment** – The objector must prove that there is a likelihood of detriment to the rights or legitimate interests of its associated community. Factors that could be used by a panel in making this determination include:

- Damage to the reputation of the community that would result from the applicant's operation of the applied-for gTLD string;
- Evidence that the applicant is not acting or does not intend to act in accordance with the interests of the community;
- Interference with the core activities of the community that would result from the applicant's operation of the applied-for gTLD string; and
- Dependence of the community on the DNS for its core activities.

**Defenses** – Satisfaction of the standing requirements for filing a Community Objection (refer to paragraph 3.1.2.4) by the applicant is a complete defense to an objection filed on community grounds.

# DRAFT - New gTLD Program – Objection and Dispute Resolution

An applicant may face anywhere from zero objections to multiple objections in any of the four areas

Objection filing phase opens

Party with standing files objection directly with DRSP for these grounds:

- **String Confusion**
- **Legal Rights**
- **Morality and Public Order; and/or**
- **Community**

Objector pays filing fee directly to DRSP

Objection filing phase closes

Applicant responds to objection by paying filing fee and responding to claims made by objector

Once the DRSPs receive all objections, at their discretion, the DRSPs may elect to consolidate certain objections if there are multiple objections to the same application based on the same ground

Panel reviews parties' submissions and renders decision

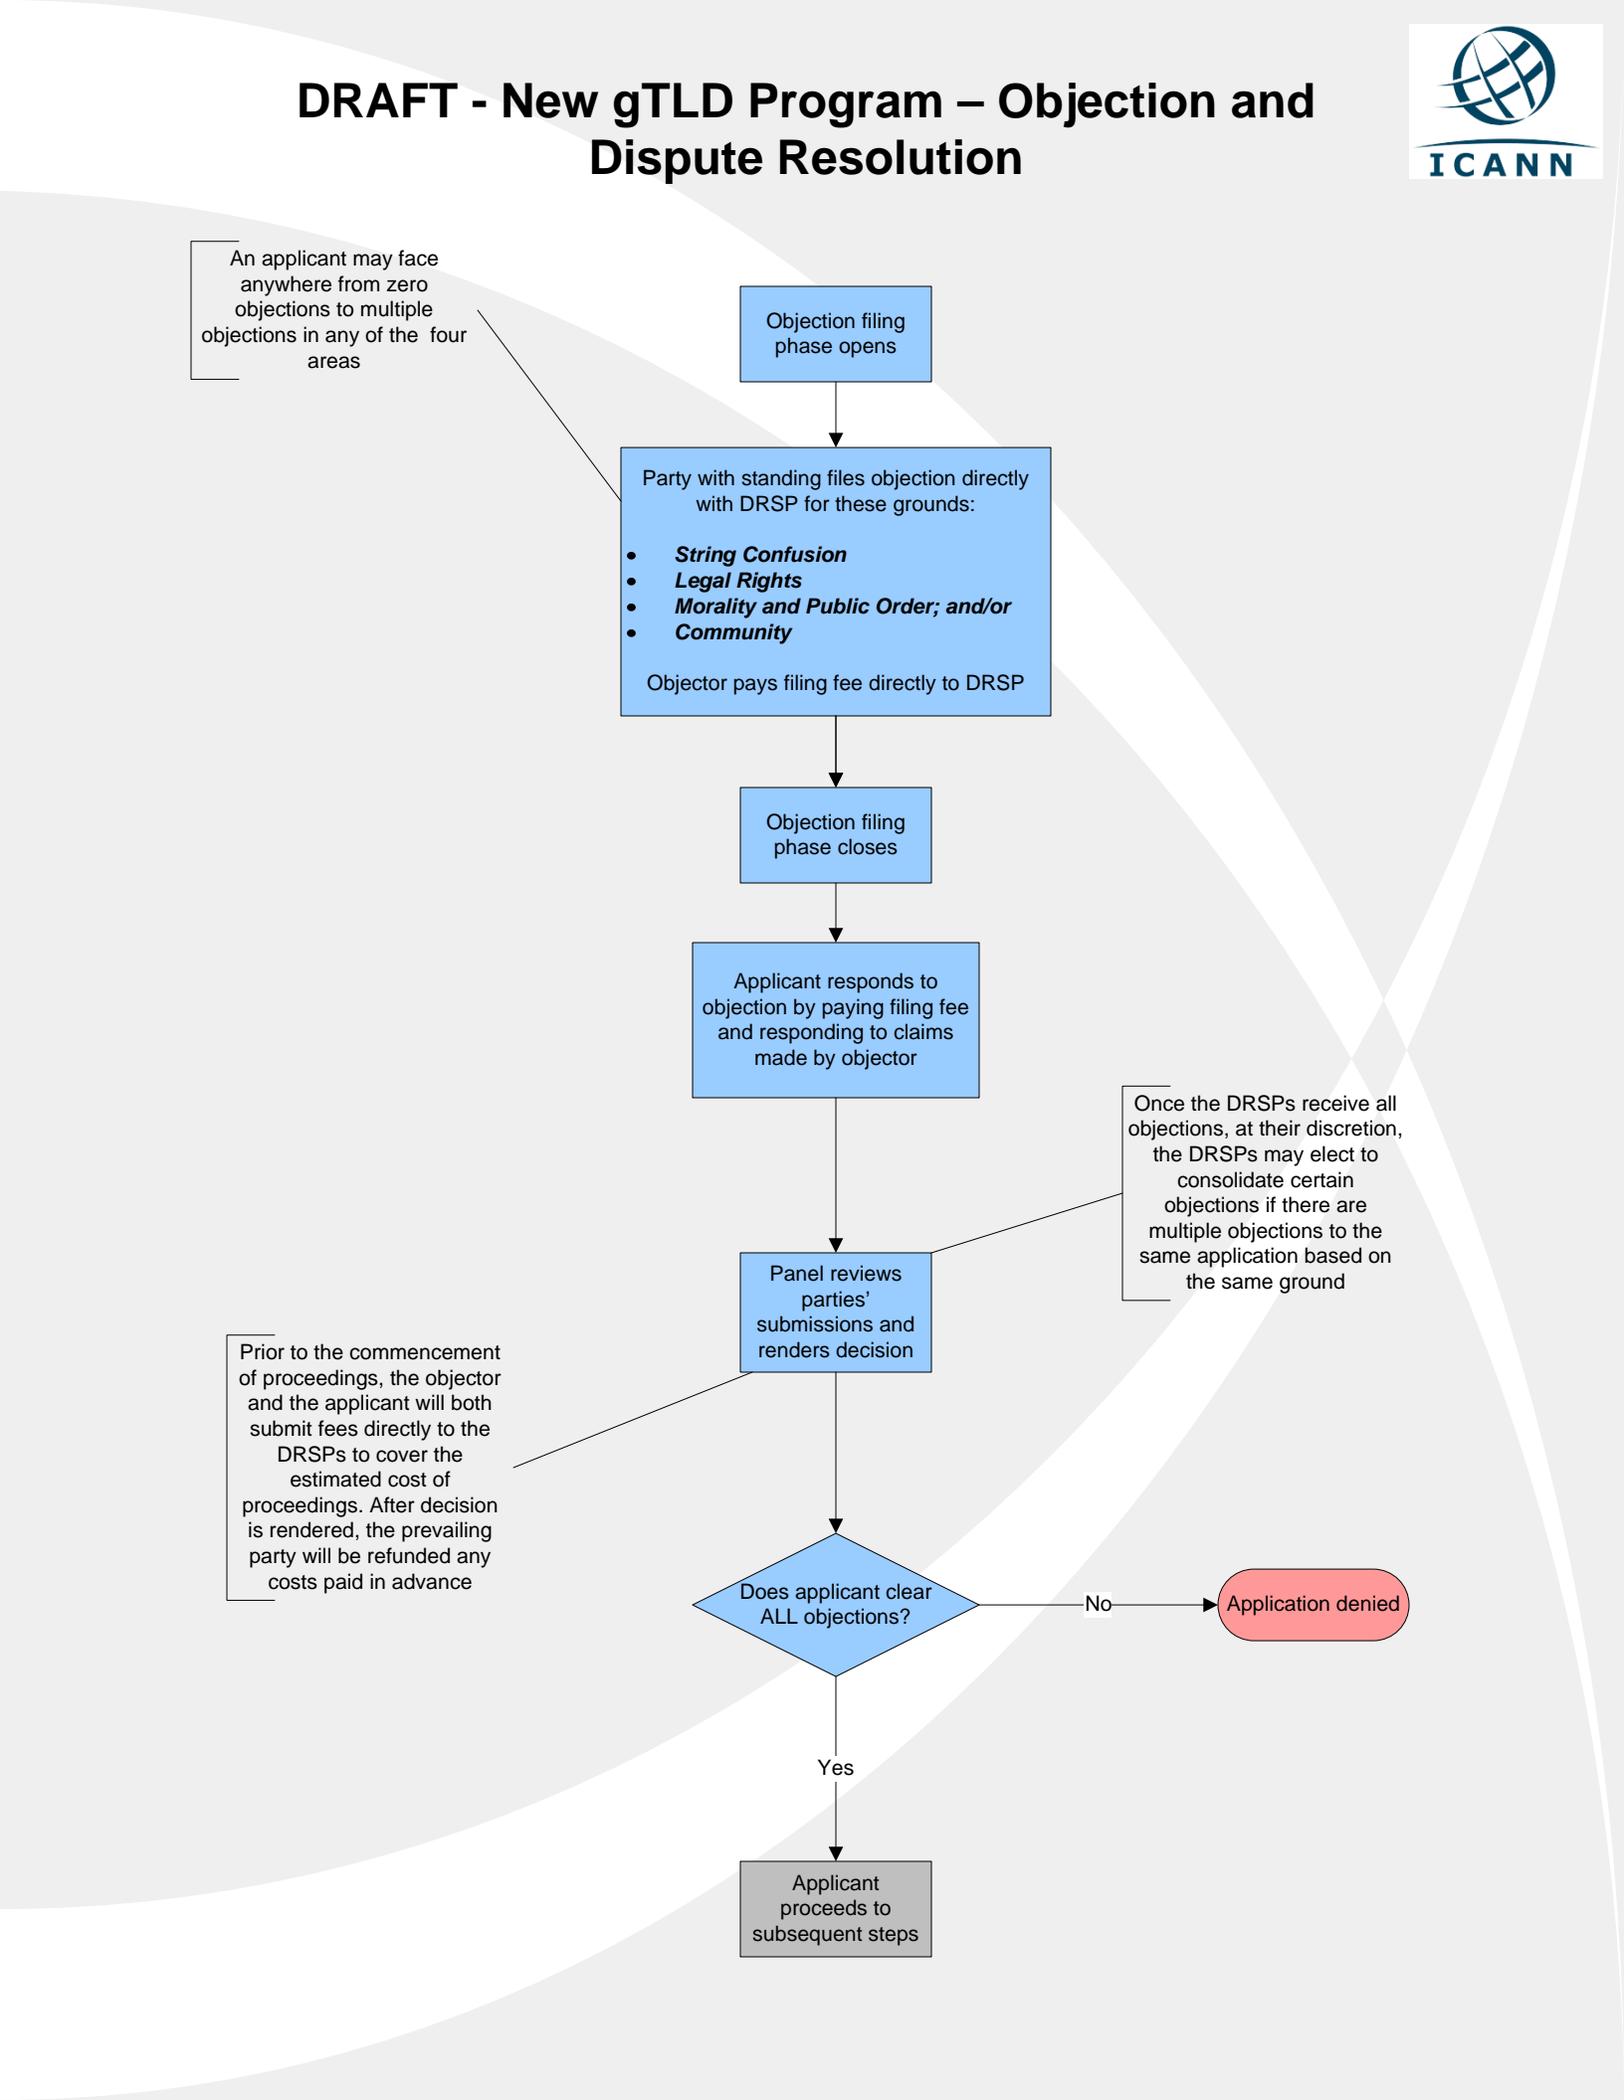

Prior to the commencement of proceedings, the objector and the applicant will both submit fees directly to the DRSPs to cover the estimated cost of proceedings. After decision is rendered, the prevailing party will be refunded any costs paid in advance

Does applicant clear ALL objections?

No → Application denied

Yes

Applicant proceeds to subsequent steps

# Draft Applicant Guidebook

## Module 4

Please note that this is a discussion draft only. Potential applicants should not rely on any of the proposed details of the new gTLD program as the program remains subject to further consultation and revision.

24 October 2008

---

# Module 4

---

## *String Contention Procedures*

This module describes situations in which contention over applied-for gTLD strings occurs, and the two methods available to applicants for resolving such contention cases.

### *4.1 String Contention*

---

String contention occurs when either:

1. Two or more applicants for an identical gTLD string successfully complete all previous stages of the evaluation and dispute resolution processes; or
2. Two or more applicants for similar gTLD strings successfully complete all previous stages of the evaluation and dispute resolution processes, and the similarity of the strings is identified as creating a probability of user confusion if more than one of the strings is delegated.

ICANN will not approve applications for proposed gTLD strings that are identical or that would result in string confusion, called contending strings. If either situation 1 or 2 above occurs, such applications will proceed to contention resolution through either comparative evaluation or an efficient mechanism for contention resolution, both of which are described in this module. A group of applications for contending strings is referred to as a contention set.

#### *4.1.1 Identification of Contention Sets*

---

Contention sets are groups of applications containing identical or similar applied-for gTLD strings. (In this RFP, “similar” means strings so similar that it is probable that detrimental user confusion would result if the two similar gTLDs are delegated into the root zone.) Contention sets are identified during Initial Evaluation from review of all applied-for TLD strings by the panel of String Similarity Examiners. ICANN will publish contention sets by the close of the Initial Evaluation period.

Applications for identical gTLD strings will be automatically assigned to a contention set. For example, if Applicant A and Applicant B both apply for .TLDSTRING, they will be

identified as being in a contention set. Such testing for identical strings also takes into consideration the code point variants listed in any relevant language reference table.

The String Similarity Examiners will also review the entire pool of applied-for strings to determine whether the strings proposed in any two or more applications are so similar that they would create a probability of user confusion if allowed to coexist in the DNS. The panel will make such a determination for each pair of applied-for gTLD strings. The outcome of the String Confusion Review described in subsection 2.1.1 is the identification of contention sets among applications that have direct or indirect contention relationships with one another.

Two strings are in **direct contention** if they are identical or so similar that there is a probability of user confusion if both were to be delegated as TLDs in the root zone. More than two applicants might be represented in a direct contention situation: if four different applicants applied for the same gTLD string, they would all be in direct contention with one another.

Two strings are in **indirect contention** if they are both in direct contention with a third string, but not with one another. Direct and indirect contention are explained in greater detail in the example that follows.

In Figure 4-1, Strings A and B are an example of direct contention. Strings C and G are an example of indirect contention. C and G both contend with B, but not with one another. The figure as a whole is one contention set. A contention set consists of all applications that are linked by string contention to one another, directly or indirectly.

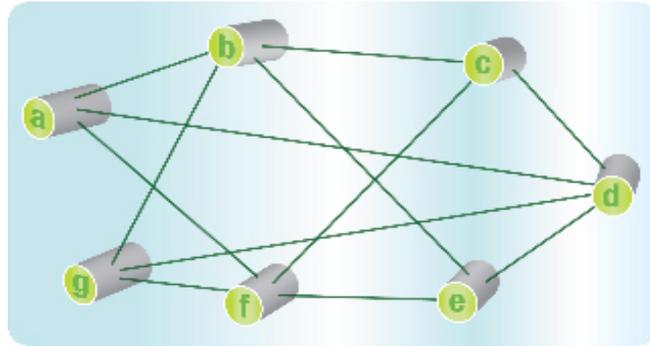

Figure 4-1 – This diagram represents one contention set, featuring both directly and indirectly contending strings.

While contention sets are determined during Initial Evaluation, the final configuration of the contention sets can only be established once the evaluation and dispute resolution process steps have concluded. This is because any application excluded through those steps might modify a contention set identified earlier. A contention set may be split it into two sets or it may be eliminated altogether as a result of an Extended Evaluation or dispute resolution proceeding.

Refer to Figure 4-2: In contention set 1, applications D and G are eliminated. Application A is the only remaining application, so there is no contention left to resolve.

In contention set 2, all applications successfully complete Extended Evaluation and Dispute Resolution, so the original contention set remains to be resolved.

In contention set 3, application F is eliminated. Since application F was in direct contention with E and J, but E and J are not in contention with one other, the original contention set splits into two sets: one containing E and K in direct contention, and one containing I and J.

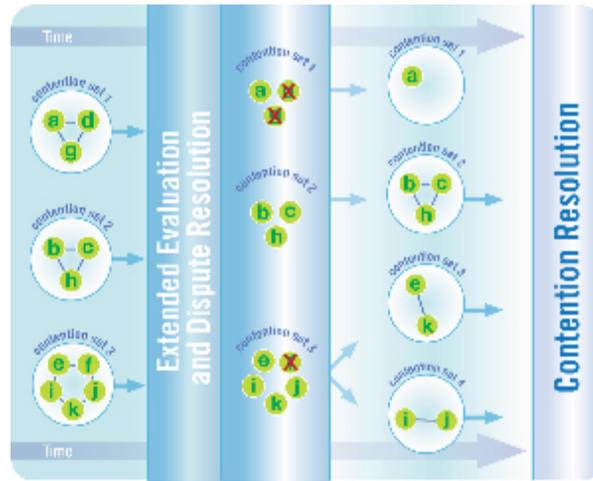

Figure 4-2 – Resolution of string contention cannot begin until all applicants within a contention set have completed all applicable previous stages.

The remaining contention cases must then be resolved through comparative evaluation or an efficient mechanism for contention resolution, depending on the circumstances. In this process, ICANN addresses each contention set to achieve an unambiguous resolution.

In their policy advice, the GNSO called for an efficient process to resolve cases of contention where there was no claim of community representation to be used as a factor for resolving the contention. While not settled, candidate means for this process are discussed below and in more detail in a companion paper to the Draft Applicant Guidebook called “Resolving string contention—a complete lifecycle including string contention resolution.”

#### 4.1.2 *Impact of Dispute Resolution Proceedings on Contention Sets*

If an applicant files a string confusion objection against another applicant (refer to Module 3), and the panel does find that string confusion exists; that is, rules in favor of the objector, the two applicants will be placed in direct contention with each other. Thus, the outcome of a proceeding based on a string confusion objection would result in a new contention set structure for the relevant applications.

### ***4.1.3 Self-Resolution of String Contention***

---

Applicants that are identified as being in contention may elect to reach a settlement or agreement among themselves whereby one or more applicants withdraws its application. This may occur at any stage of the process, once ICANN publicly posts the applications received on its website.

Applicants may not resolve a case of string contention by changing their applications by, for instance, selecting a new TLD string or creating a joint venture as a means to resolve the contention case.

### ***4.1.4 Possible Contention Resolution Outcomes***

---

Any application with no contention situation left to resolve is allowed to proceed to the next step. In some cases, an applicant who is not the outright winner of a string contention resolution process can still proceed. This situation is explained in the following paragraphs.

There may be more than one application that passes contention resolution within a contention set. If the strings within a given contention set are all identical, the applications are in direct contention with each other and there can only be one winner that proceeds to the next step.

However, where there are both direct and indirect contention situations within a set, more than one string may survive the resolution.

For example, if string A is in contention with B, B is in contention with C, but C is not in contention with A. If A wins the contention, B is eliminated but C can go on since C is not in direct contention with the winner and both strings can coexist in the DNS without risk for confusion.

## ***4.2 Comparative Evaluation***

---

Comparative evaluation can begin once all applicants in the contention set have completed all previous stages of the process.

The comparative evaluation is an independent analysis. Scores received in the applicant reviews are not carried forward to the comparative evaluation. Each applicant participating in the comparative evaluation begins with a score of zero.

### 4.2.1 Eligibility for Comparative Evaluation

As described in subsection 1.2.2 of Module 1, all applicants are required to identify whether their application type is:

- Open; or
- Community-based.

Only community-based applicants may elect a comparative evaluation. ICANN policy states that if there is contention for strings, a claim to support a community by one party will be a reason to award priority to that application. If one community-based applicant within a contention set makes this election, all other community-based applicants in the same contention set will be part of the comparative evaluation.

Applicants designating their applications as community-based will also be asked to respond to a set of questions in the application form that would provide relevant information if a comparative evaluation occurs.

Before the comparative evaluation begins, all community-based applicants in the contention set may be asked to provide additional information relevant to the comparative evaluation. Additionally, the community-based applicants will be required to pay a Comparative Evaluation Fee (refer to Section 1.5 of Module 1) to participate in the comparative evaluation.

### 4.2.2 Comparative Evaluation Procedure

Comparative evaluations for each contention set will be performed by a comparative evaluation provider appointed by ICANN to review all applications for contending gTLD strings. The panel's charter is to determine whether one of the community-based applications clearly and demonstrably would add more value to the Internet's Domain Name System. Open applicants within the contention set will not participate in the comparative evaluation.

If no single community-based applicant emerges as one that clearly and demonstrably adds more value to the namespace than all the competing contending applications, then all of the parties in the contention set (both open and community-based applicants) will proceed to an alternate mechanism for efficient contention resolution.

### 4.2.3 Comparative Evaluation Criteria

A panel appointed by the comparative evaluation provider will review and score the one or more community-based applicants who elected comparative evaluation against the criteria in the following table:

Criteria	Score		
	3	2	1
<b>Nexus between Proposed String and Community</b>	String is name or well-known abbreviation of community institution.	String is relevant to applicant's area of interest but also has other well-known associations.	No connection.
<b>Dedicated Registration Policies</b>	Registration eligibility is strictly limited to members of the pre-established community identified in the application. Registration policies also include name selection and use requirements consistent with the articulated scope and community-based nature of the TLD. Proposed policies include specific enforcement measures including investigation practices, penalties, takedown procedures and appeal mechanisms.	Registration eligibility is predominantly available to members of the pre-established community identified in the application, and also permits people or groups informally associated with the community to register. Policies include some elements of the above but one or more elements are missing.	No dedicated registration policies.
<b>Community Establishment</b>	Clearly identified, organized and pre-established community of considerable size and longevity.	The community addressed fulfills some but not all the requirements for a score of 3.	No community addressed.
<b>Community Endorsement</b>	Endorsement by a recognized institution or by member organizations.	Endorsement by some groups with apparent relevance, but also some opposition by groups with apparent relevance.	Assorted endorsements from individuals or groups of unknown relevance – or – no endorsement by any community.

If no applicant scores 11 or more, there is no clear winner. If only one applicant scores 11 or more, that applicant will be declared the winner.

If more than one applicant scores 11 or more, the evaluators will consider what portion of the community is represented by the application. *If one applicant represents*

*a much larger share of the relevant community than another, that will be a basis for awarding priority.*

Following the comparative evaluation, ICANN will review the results and reconfigure the contention set as needed. The same procedure will occur for remaining contention sets involving any community-based application that has elected comparative evaluation. If no community-based applicant that has elected comparative evaluation is left in the contention set, any applications remaining in contention will proceed to a subsequent contention resolution process. Applications not in contention will proceed toward delegation.

### ***4.3 Efficient Mechanism for Contention Resolution***

---

A tie-breaker mechanism will be developed for resolving string contention among the applicants within a contention set, if the contention has not been resolved by other means. Unless the specific conditions for comparative evaluation outlined in Section 4.2 apply, this mechanism will be used to resolve the contention. This mechanism may also be used if no clear winner is identified during the comparative evaluation process.

The GNSO policy recommendations call for an efficient means of resolution. Continued investigation regarding the availability of alternative methods will guide ICANN's development of this mechanism.

The first efficient means of resolution that will be employed is a settlement arrived at by contending parties. Applicants for identical or similar TLDs can arrive at an accommodation where all in direct contention withdraw except for one. As described earlier, those withdrawing cannot apply for a new string. Nor can contending parties combine to form a new applicant. It is expected that many cases of contention will be resolved in this manner as it will be the most efficient and economical for the contending parties.

Failing to arrive at accommodation of the type described just above, auctions are one means of last resort that is being explored to resolve the contention. The purpose of an auction is to resolve contention in a clear, objective manner.

**Auction proceeds** – The purpose of an auction is to resolve contention in a clear, objective manner. It is not to raise revenue. While there may be significant proceeds from auctions in the event they occur, it is important to understand that this in no way the purpose of the auction. The annual budget process sets ICANN’s funding and spending limits. ICANN has no authorization to spend beyond the budget. ICANN already has precedent of returning revenue to the community when last year and in 2006 ICANN reduced registration fees from 25¢ to 20¢ over two years as a result of an unforeseen growth in revenue. Proceeds from auctions will be reserved until the uses of the proceeds are determined through a community consultation. The proceeds will not go into ICANN’s general expense budget but will be separately earmarked for projects or uses identified by the community. This important aspect of the auction process and its result will be an important part of the communications plan for the new gTLD program.

The new gTLD application fee is designed to be cost/revenue neutral. It factors in costs already forgone, future processing costs and legal expenses that are significant and would be a large drain on the Corporation’s established budget.

See further details on the exploration of an auction model in the contention lifecycle at <http://www.icann.org/en/topics/string-contention-22oct08.pdf>.

In practice, ICANN expects that most contention cases will be resolved through other means before reaching this stage.

#### ***4.4 Contention Resolution and Contract Execution***

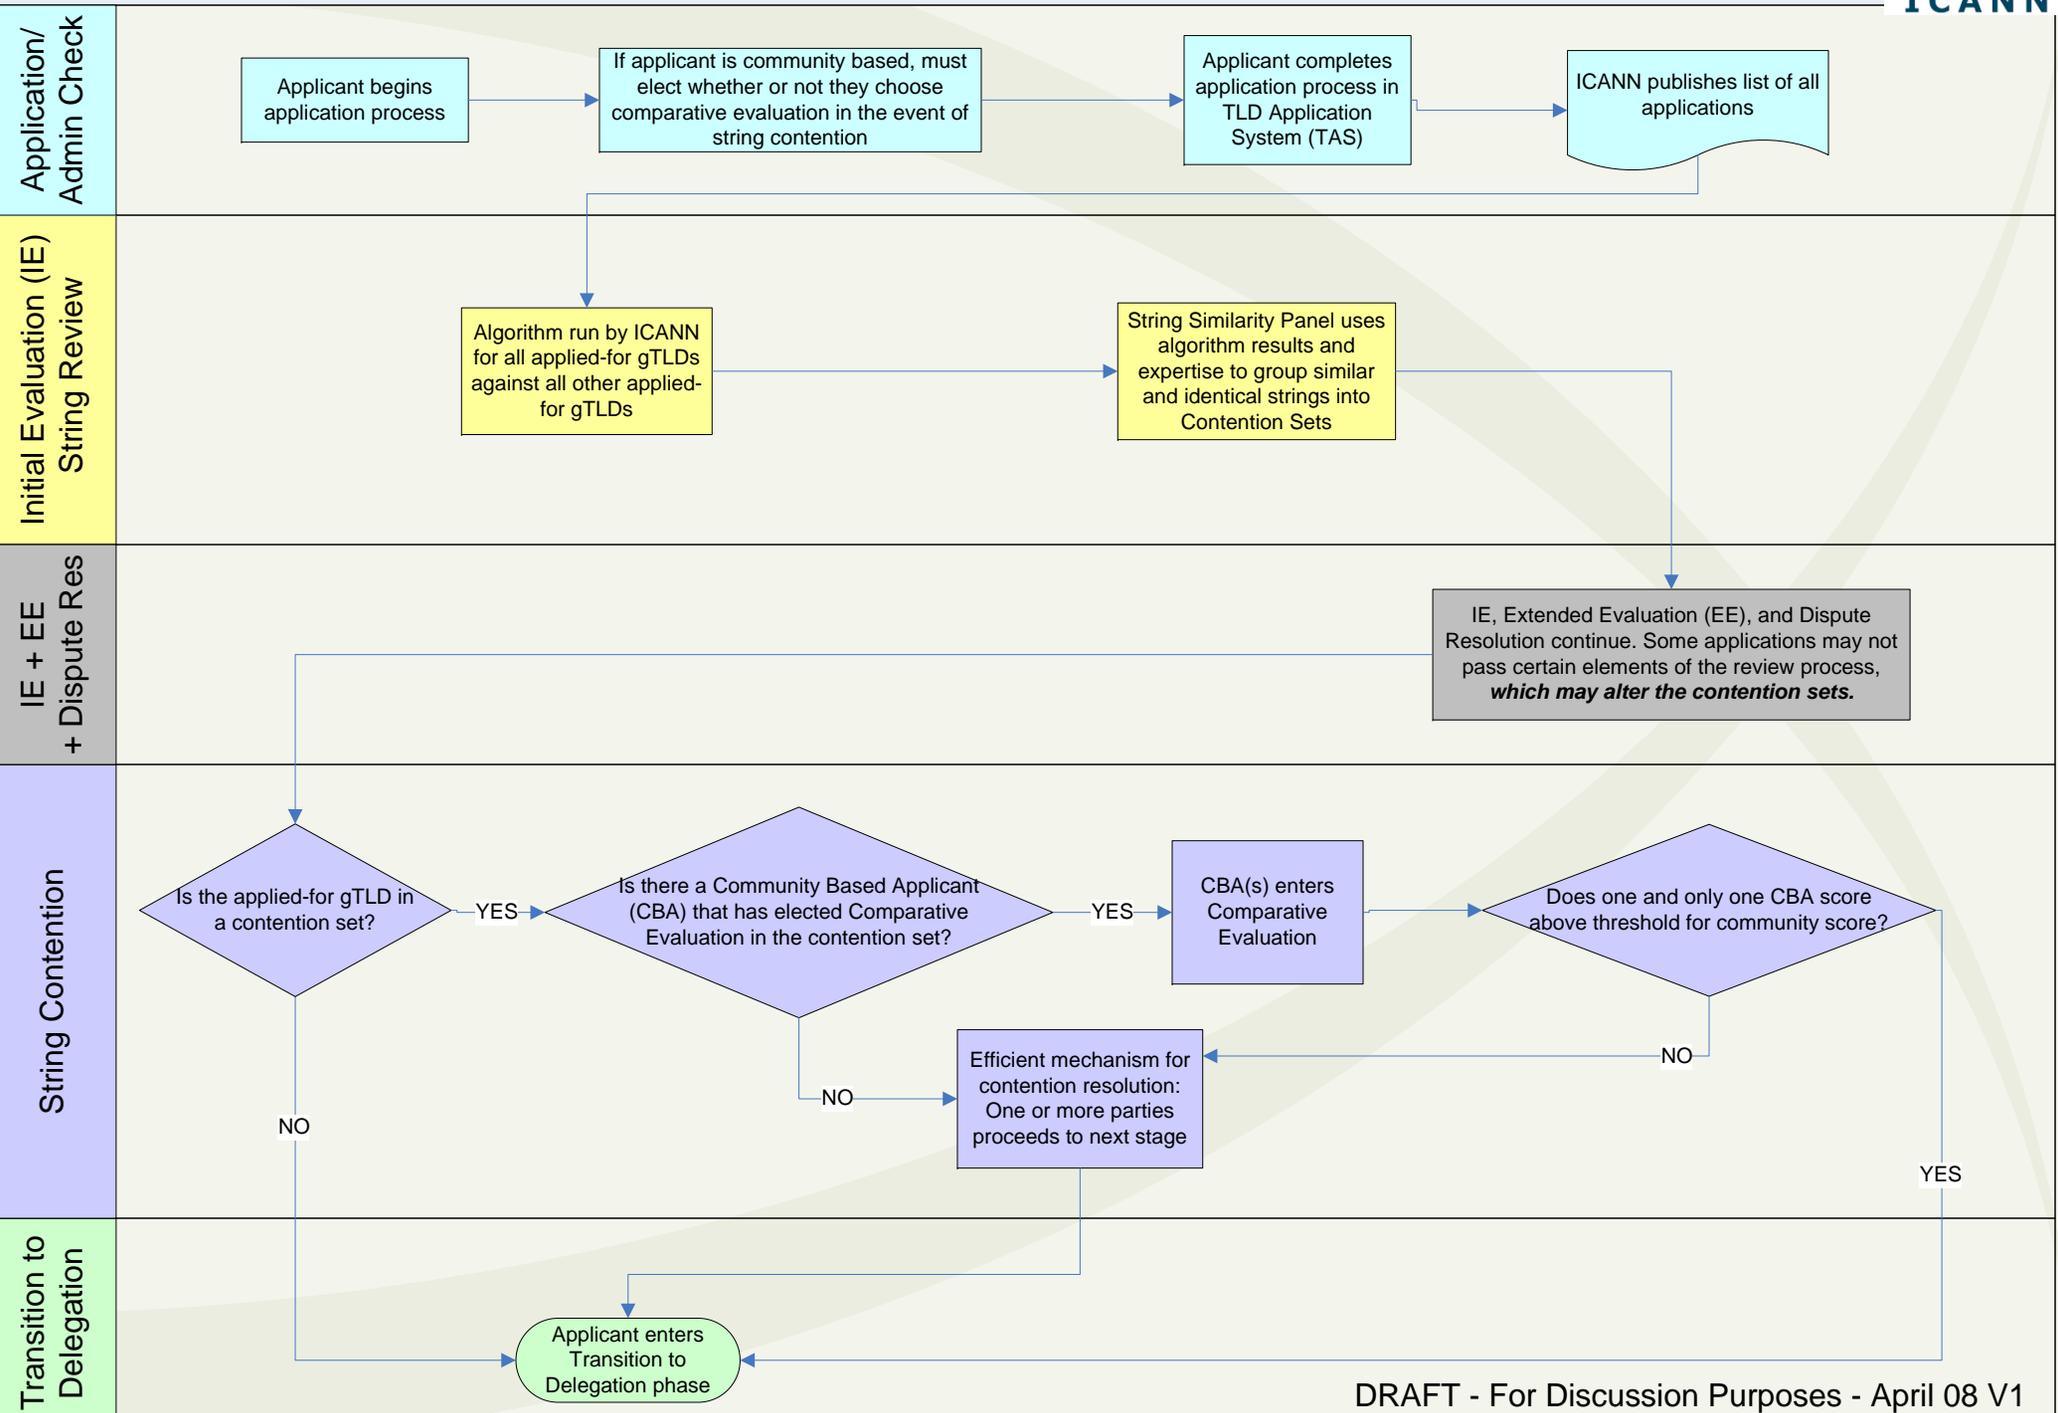

---

An applicant that has been declared winner of a contention resolution process will proceed by entering into the contract execution phase. (Refer to section 5.1 of Module 5.)

If the winner of the contention resolution has not executed a contract within 90 days of the decision, ICANN has the right to extend an offer to the runner-up applicant to proceed with its application. For example, in a comparative evaluation, the applicant with the second-

highest score (if equal to or greater than eleven, might be selected to go on to the next step, delegation. (Refer to Module 5.) Similarly, in an efficient mechanism for contention resolution, another applicant who would be considered the runner-up applicant might proceed to the delegation step. This offer is at ICANN's option only. The runner-up applicant in a contention resolution process has no automatic right to an applied-for gTLD string if the first place winner does not execute a contract within a specified time.

## *Transition to Delegation*

This module describes the final steps required of an applicant, including execution of a registry agreement with ICANN and preparing for delegation of the new gTLD string into the root zone.

### *5.1 Registry Agreement*

---

All applicants that have successfully completed the evaluation process—including, if necessary, the dispute resolution and string contention processes—are required to enter into a registry agreement with ICANN in order to proceed to delegation.

It is important to note that the agreement referred to below does not constitute a formal position by ICANN and has not been approved by the ICANN Board of Directors. The agreement is set out here for review and community discussion purposes and as a means to improve the effectiveness of the agreement in providing for increased competition and choice for consumers in a stable, secure DNS.

The contract terms can be reviewed at <http://www.icann.org/en/topics/new-gtld-draft-agreement-24oct08-en.pdf>. All successful applicants are expected to enter into the agreement substantially as written. The terms of the contract and, in particular, differences with existing registry agreements are explained in a companion paper to the agreement, *Summary of Changes to Base Agreement for New gTLDs*, <http://www.icann.org/en/topics/new-gtld-draft-summary-changes-24oct08-en.pdf>.

After an applicant has successfully completed the application process, ICANN may conduct a pre-contract review. To ensure that an applicant continues to be a going concern in good legal standing, ICANN reserves the right to ask the applicant to submit updated documentation and information before entering into the registry agreement.

If at any time during the evaluation process information previously submitted by an applicant becomes untrue or

inaccurate, the applicant must promptly notify ICANN and submit updated information. This includes applicant-specific information such as changes in financial position and changes in ownership or control of the applicant.

## 5.2 Pre-Delegation Testing

Following completion of the Board review, each applicant will be required to complete pre-delegation steps as a prerequisite to entering the IANA process for delegation into the root zone. The pre-delegation check must be completed within the time period specified in the registry agreement.

### 5.2.1 Technical Testing

The purpose of the pre-delegation technical test is to verify the applicant has met its commitment to establish registry operations in accordance with the technical and operational criteria described, along with the applicant questions. (Refer to Module 2.) The checks are also intended to ensure that the applicant can operate the gTLD in a stable and secure manner. All applicants will be tested on a pass/fail basis according to the questions and criteria that follow.

Question	Criteria
<b>1 IDN (variant) tables</b>	
If applicant will be supporting IDNs, was the IDN table attached to the application when originally submitted and does it fulfill IDN and IANA guidelines and requirements?	IDN tables must be developed and provided by the IDN string applicant at the time the application was submitted. The table must fulfill the requirements from the IDN Guidelines as well as the IANA repository requirements in order to be considered valid (see <a href="http://iana.org/procedures/idn-repository.html">http://iana.org/procedures/idn-repository.html</a> ).
<b>2 DNSSEC keys, materials</b>	
If DNSSEC is offered as part of registry services at time of application, can applicant comply with requirements?	Trust anchor for the registry will be published in the IANA Interim Trust Anchor Repository. Validity will be determined by verifying that DNS resolvers that support DNSSEC can successfully retrieve and DNSSEC validate information from that zone when configured with the published trust anchor for the zone.
<b>3 Architecture load requirements</b>	
Has the applicant implemented a network architecture necessary to support load characteristics, as outlined in its application?	Applicant will self-certify adherence to this requirement and provide materials to ICANN that demonstrate adherence. Examples of self-certification documents include but are not limited to a network/system diagram of the as-built network system (demonstrating correspondence to documentation in initial application), results of load testing performed by the applicant, and actual performance of the configuration in use for other registries. At ICANN's discretion, aspects of this self-certification documentation can be audited on-site at the services delivery point of the registry.

Question	Criteria
<b>4 IPv6 for registrants</b>	
Does registry support provisioning of IPv6 services for its registrants?	Registry must support provisioning of IPv6 services on behalf of its registrants. This means that registrar systems will allow entry of IPv6 addresses in all relevant address fields, that the SRS system is set up to support the communication of IPv6 addresses, and that registry name servers can be provisioned with IPv6 addresses. Applicant will demonstrate successful provisioning of a test account with IPv6 name server entries.
<b>5 IPv6 reachability</b>	<i>Note: This requirement is under consideration and the community is urged to provide feedback on this requirement.</i>
Does registry support access to DNS servers over an IPv6 network?	IANA currently has a minimum set of technical requirements for IPv4 name service. These include two nameservers separated by geography and by network topology, which each serve a consistent set of data, and are reachable from multiple locations across the globe. The registry will meet this same criterion for IPv6, requiring IPv6 transport to their network. Applicant will identify IPv6-reachable name servers that meet these requirements, and reachability will be verified by ICANN.
<b>6 Escrow deposit sample</b>	
Has the applicant demonstrated the ability to conform to registry escrow requirements? See <a href="http://www.icann.org/en/topics/new-gtld-draft-escrow-spec-24oct-08-en.pdf">http://www.icann.org/en/topics/new-gtld-draft-escrow-spec-24oct-08-en.pdf</a> .	The applicant will provide a conforming sample of a dummy data deposit showing correct type and formatting of content. The applicant will also provide evidence of an agreement with an escrow provider complying with Part B of the Data Escrow Requirements.
<b>7 System monitoring</b>	
Has the applicant implemented the system monitoring described by the applicant in the initial application?	Applicant will self-certify adherence to this requirement and provide materials to ICANN that demonstrate adherence. Examples of self-certification documents include but are not limited to: diagrams of monitoring systems (demonstrating correspondence to documentation provided in the application), output of periodic monitoring runs performed by the applicant demonstrating capability claimed in the application, and actual performance of this monitoring set up in use for other registries. At ICANN's discretion, aspects of this self-certification documentation can be audited on-site at the services delivery point of the registry.
<b>8 Registry continuity planning</b>	
Has applicant demonstrated capability to comply with ICANN's Registry Continuity Plan? See <a href="http://www.icann.org/registries/failover/icann-registry-failover-plan-15jul08.pdf">http://www.icann.org/registries/failover/icann-registry-failover-plan-15jul08.pdf</a>	Applicant will self-certify adherence to this requirement and provide materials to ICANN that demonstrate adherence. Examples include identification of appropriate contact points and evidence of the registry's own continuity plan, and identification of a registry services continuity provider.
<b>9 System performance requirements</b>	
Has applicant demonstrated capability to comply with the performance specifications? See <a href="http://www.icann.org/en/topics/new-gtld-draft-performance-spec-24oct08-en.pdf">http://www.icann.org/en/topics/new-gtld-draft-performance-spec-24oct08-en.pdf</a>	Applicant will self-certify adherence to this requirement and provide materials to ICANN that demonstrate adherence. Examples of self-certification documents include but are not limited to performance and availability results that demonstrate DNS availability at stated levels for at least one month, and Whois service availability for at least one month. At ICANN's discretion, aspects of this self-certification documentation can be audited on-site at the services delivery point of the registry.

### *5.2.2 Additional Requirements*

---

At the pre-delegation stage, an applicant must also provide documentary evidence of its ability to fund ongoing basic registry operations for then-existing registrants for a period of three to five years in the event of registry failure, default or until a successor operator can be designated. This obligation can be met by securing a financial instrument such as a bond or letter of credit (i.e., evidence of ability to provide financial security guaranteed by a creditworthy financial institution); contracting with and funding a services provider to extend services; segregating funding; or other means.

Once an applicant has met the requirements in 5.2.1 and 5.2.2 above, it is eligible to proceed to delegation of its applied-for gTLD string by IANA.

If an applicant does not complete the pre-delegation steps within the time period specified in the registry agreement, ICANN reserves the right to terminate the registry agreement.

### *5.3 IANA Delegation Process*

---

Upon notice of successful completion of the ICANN pre-delegation testing, applicants may initiate the process for delegation of the new gTLD into the root zone database. Information about the delegation process is available at <http://iana.org/domains/root/>.

### *5.4 Ongoing Operations*

---

ICANN will continue to provide support for gTLD registry operators as they launch and maintain registry operations. ICANN's gTLD registry liaison function provides a point of contact for gTLD registry operators for assistance on a continuing basis.

The registry agreement contains a provision for ICANN to perform audits to ensure that the registry operators remain in compliance with agreement obligations.

# Draft Applicant Guidebook

## Module 6

Please note that this is a discussion draft only. Potential applicants should not rely on any of the proposed details of the new gTLD program as the program remains subject to further consultation and revision.

24 October 2008

## *Top-Level Domain Application - Terms and Conditions*

By submitting this application through ICANN's online interface for a generic Top Level Domain (gTLD) (this application), applicant (including all parent companies, subsidiaries, affiliates, agents, contractors, employees and any and all others acting on its behalf) agrees to the following terms and conditions (these terms and conditions) without modification. Applicant understands and agrees that these terms and conditions are binding on applicant and are a material part of this application.

1. Applicant warrants that the statements and representations contained in the application (including any documents submitted and oral statements made in connection with the application) are true and accurate and complete in all material respects, and that ICANN may rely on those statements and representations fully in evaluating this application. Applicant acknowledges that any material misstatement or misrepresentation (or omission of material information) will reflect negatively on this application and may cause ICANN and the evaluators to reject the application.
2. Applicant warrants that it has the requisite organizational power and authority to make this application on behalf of applicant, and is able to make all agreements, representations, waivers, and understandings stated in these terms and conditions and to enter into the form of registry agreement as posted with these terms and conditions.
3. Applicant acknowledges and agrees that ICANN has the right to reject any and all applications for new gTLDs, and that there is no assurance that any additional gTLDs will be created. The decision to proceed with review and consideration of an application to establish one or more gTLDs is entirely at ICANN's discretion. ICANN reserves the right to reject any application that ICANN is prohibited from considering for a gTLD under applicable law or policy, in which case any fees submitted in connection with such application will be returned to the applicant.

4. Applicant agrees to pay all fees that are associated with this application. These fees include the evaluation fee (which is to be paid in conjunction with the submission of this application), and any fees associated with the progress of the application to the extended evaluation stages of the review and consideration process with respect to the application, including any and all fees as may be required in conjunction with the dispute resolution process as set forth in the application. Applicant acknowledges that the initial fee due upon submission of the application is only to obtain consideration of an application. ICANN makes no assurances that an application will be approved or will result in the delegation of a gTLD proposed in an application. Applicant acknowledges that if it fails to pay fees within the designated time period at any stage of the application review and consideration process, applicant will forfeit any fees paid up to that point and the application will be cancelled.
5. Applicant shall indemnify, defend, and hold harmless ICANN (including its affiliates, subsidiaries, directors, officers, employees, consultants, evaluators, and agents, collectively the ICANN Affiliated Parties) from and against any and all third-party claims, damages, liabilities, costs, and expenses, including legal fees and expenses, arising out of or relating to: (a) ICANN's consideration of the application, and any approval or rejection of the application; and/or (b) ICANN's reliance on information provided by applicant in the application.
6. Applicant hereby releases ICANN and the ICANN Affiliated Parties from any and all claims by applicant that arise out of, are based upon, or are in any way related to, any action, or failure to act, by ICANN or any ICANN Affiliated Party in connection with ICANN's review of this application, investigation or verification, any characterization or description of applicant or the information in this application, or the decision by ICANN to recommend, or not to recommend, the approval of applicant's gTLD application. APPLICANT AGREES NOT TO CHALLENGE, IN COURT OR IN ANY OTHER JUDICIAL FORA, ANY FINAL DECISION MADE BY ICANN WITH RESPECT TO THE APPLICATION, AND IRREVOCABLY WAIVES ANY RIGHT TO SUE OR PROCEED ON THE BASIS OF ANY OTHER LEGAL CLAIM AGAINST ICANN AND ICANN AFFILIATED PARTIES WITH RESPECT TO THE APPLICATION. APPLICANT ACKNOWLEDGES AND

ACCEPTS THAT APPLICANT'S NONENTITLEMENT TO PURSUE ANY RIGHTS, REMEDIES, OR LEGAL CLAIMS AGAINST ICANN OR THE ICANN AFFILIATED PARTIES WITH RESPECT TO THE APPLICATION SHALL MEAN THAT APPLICANT WILL FOREGO ANY RECOVERY OF ANY APPLICATION FEES, MONIES INVESTED IN BUSINESS INFRASTRUCTURE OR OTHER START-UP COSTS AND ANY AND ALL PROFITS THAT APPLICANT MAY EXPECT TO REALIZE FROM THE OPERATION OF A REGISTRY FOR THE TLD.

7. Applicant hereby authorizes ICANN to publish on ICANN's website, and to disclose or publicize in any other manner, any materials submitted to, or obtained or generated by, ICANN and the ICANN Affiliated Parties in connection with the application, including evaluations, analyses and any other materials prepared in connection with the evaluation of the application; provided, however, that information will not be published to the extent that the application specifically identifies such information as confidential. A general statement as the confidentiality of the application will not be sufficient for these purposes. Except for information that ICANN determines to treat as confidential, applicant understands and acknowledges that ICANN does not and will not keep the remaining portion of the application or materials submitted with the application confidential.
8. Applicant certifies that it has obtained permission for the posting of any personally identifying information included in this application or materials submitted with this application. Applicant acknowledges that the information that ICANN posts may remain in the public domain in perpetuity, at ICANN's discretion.
9. Applicant gives ICANN permission to use applicant's name and/or logo in ICANN's public announcements (including informational web pages) relating to top-level domain space expansion.
10. Applicant understands and agrees that it will acquire rights in connection with a gTLD only in the event that it enters into a registry agreement with ICANN, and that applicant's rights in connection with such gTLD will be limited to those expressly stated in the registry agreement. In the event ICANN agrees to recommend the approval of the application for applicant's proposed gTLD, applicant agrees to enter into the registry agreement with ICANN in the form published in

connection with the application materials. Applicant may not resell, assign, or transfer any of applicant's rights or obligations in connection with the application.

11. Applicant authorizes ICANN to:
  - a. Contact any person, group, or entity to request, obtain, and discuss any documentation or other information that, in ICANN's sole judgment, may be pertinent to the application;
  - b. Consult with persons of ICANN's choosing regarding the information in the application or otherwise coming into ICANN's possession.
12. For the convenience of applicants around the world, the application materials published by ICANN in the English language have been translated into certain other languages frequently used around the world. applicant recognizes that the English language version of the application materials (of which these terms and conditions is a part) is the version that binds the parties, that such translations are non-official interpretations and may not be relied upon as accurate in all respects, and that in the event of any conflict between the translated versions of the application materials and the English language version, the English language version controls.

---

# Glossary

---

## *Terms Applicable to this RFP and to the New gTLD Application Process*

A-Label	The ASCII-Compatible Encoding (ACE) form of an IDNA-valid string.
Applicant	An entity that has applied to ICANN for a new gTLD by submitting its application form through the online application system.
Application	An application for a new gTLD lodged in response to this RFP. An application includes the completed Application Form any supporting documents, and any other information that may be submitted by the applicant at ICANN's request.
Application form	The set of questions to which applicants provide responses, as at <a href="http://www.icann.org/en/topics/new-gtld-draft-evaluation-criteria-24oct08-en.pdf">http://www.icann.org/en/topics/new-gtld-draft-evaluation-criteria-24oct08-en.pdf</a> .
Application interface	The web-based interface operated by ICANN, available at [URL to be inserted in final version of RFP]
Application round	The complete succession of stages for processing the applications received during one application submission period for gTLDs. This RFP is for one application round. Any subsequent application rounds will be the subject of subsequent RFPs.
Application submission period	The period during which applicants may submit applications through the application interface.
Applied for gTLD string	A gTLD string that is subject of an application.
American Standard Code for Information Interchange (ASCII)	A character encoding based on the English alphabet. ASCII codes represent text in computers, communications equipment, and other devices that work with text. Most modern character encodings—which support many more characters than did the original—have a historical basis in ASCII.
AXFR	Asynchronous full transfer, a DNS protocol mechanism through which a DNS zone can be replicated to a remote DNS server.
Business ID	A number such as a federal tax ID number or employer information number.

ccTLD	Two-letter top-level domains corresponding with the ISO 3166-1 country code list. See <a href="http://iana.org/domains/root/db/">http://iana.org/domains/root/db/</a> .
Community-based TLD	A community-based gTLD is a gTLD that is operated for the benefit of a defined community consisting of a restricted population. An applicant designating its application as community-based must be prepared to substantiate its status as representative of the community it names in the application
Community objection	An objection based on the grounds that there is substantial opposition to a gTLD application from a significant portion of the community to which the gTLD string may be explicitly or implicitly targeted.
Comparative evaluation	A process to resolve string contention, which may be elected by a community-based applicant.
Consensus policy	A policy created through the GNSO policy development process listed in Annex A of the ICANN Bylaws. See <a href="http://www.icann.org/en/general/bylaws.htm#AnnexA">http://www.icann.org/en/general/bylaws.htm#AnnexA</a> . A list of current consensus policies is available at <a href="http://www.icann.org/en/general/consensus-policies.htm">http://www.icann.org/en/general/consensus-policies.htm</a> .
Contention sets	A group of applications containing identical or similar applied-for gTLD strings.
Country-code TLD	See ccTLD.
Delegation	The process through which the root zone is edited to include a new TLD, and the management of domain name registrations under such TLD is turned over to the registry operator.
Digit	Any digit between "0" and "9" (Unicode code points U+0030 to U+0039).
Dispute Resolution Service Provider (DRSP)	An entity engaged by ICANN to adjudicate dispute resolution proceedings in response to formally filed objections.
Domain name	A name consisting of two or more (for example, john.smith.name) levels, maintained in a registry database.
Domain Name System Security Extensions (DNSSEC)	DNSSEC secures domain name look-ups on the Internet by incorporating a chain of digital signatures into the DNS hierarchy.
Existing TLD	A string included on the list at <a href="http://iana.org/domains/root/db">http://iana.org/domains/root/db</a>

Extended Evaluation	The second stage of evaluation applicable for applications that do not pass the Initial Evaluation, but are eligible for further review.
Extended Evaluation period	The period that may follow the Initial Evaluation period, for eligible applications which do not pass the Initial Evaluation.
Evaluator	The individuals or organization(s) appointed by ICANN to perform review tasks within Initial Evaluation and Extended Evaluation under ICANN direction
Evaluation fee	The fee due from each applicant to obtain consideration of its application.
Geographical Names Panel (GNP)	A panel of experts charged by ICANN with reviewing applied-for TLD strings that relate to geographical names.
Generic Names Supporting Organization (GNSO)	ICANN's policy-development body for generic TLDs and the lead in developing the policy recommendations for the introduction of new gTLDs.
Generic top-level domain gTLD	See gTLD A TLD with three or more characters that does not correspond to any country code.
Hyphen	The hyphen "-" (Unicode code point U+0029).
Internet Assigned Numbers Authority (IANA)	IANA is the authority originally responsible for overseeing IP address allocation, coordinating the assignment of protocol parameters provided for in Internet technical standards, and managing the DNS, including delegating top-level domains and overseeing the root name server system. Under ICANN, IANA distributes addresses to the Regional Internet Registries, coordinate with the IETF and other technical bodies to assign protocol parameters, and oversees DNS operation.
ICANN	Internet Corporation for Assigned Names and Numbers
ICANN-accredited registrar	A company that registers domain names for Internet users. There are more than 900 ICANN-accredited registrars who provide domains to Internet users. The list of ICANN-accredited registrars is available at <a href="http://www.icann.org/en/registrars/accredited-list.html">http://www.icann.org/en/registrars/accredited-list.html</a>
Internationalized Domain Name (IDN)	A domain name including at least one character other than those in letters (a,...,z), digits (0,...,9) and the hyphen (-).
Internationalizing Domain Names in Applications (IDNA)	The technical protocol used for processing domain names containing non-ASCII characters in the DNS.

IDN ccTLD Fast Track	The process for introducing a limited number of IDN ccTLDs associated with the ISO-3166 two-letter codes. See <a href="http://www.icann.org/en/topics/idn/fast-track/">http://www.icann.org/en/topics/idn/fast-track/</a> .
IDN table	A table listing all those characters that a particular TLD registry supports. If one or more of these characters are considered a variant this is indicated next to that/those characters. It is also indicated which character a particular character is a variant to. The IDN tables usually hold characters representing a specific language, or they can be characters from a specific script. Therefore the IDN table is sometimes referred to as "language variant table", "language table", "script table" or something similar.
IGO	Inter-governmental organization.
Internet Engineering Task Force (IETF)	The IETF is a large, open international community of network designers, operators, vendors, and researchers concerned with the evolution of the Internet architecture and the smooth operation of the Internet.
Initial Evaluation period	The period during which ICANN will review an applied-for gTLD string, an applicant's technical and financial capabilities, and an applicant's proposed registry services.
International Phonetic Alphabet	A notational standard for phonetic representation in multiple languages. See <a href="http://www.arts.gla.ac.uk/IPA/IPA_chart_(C)2005.pdf">http://www.arts.gla.ac.uk/IPA/IPA_chart_(C)2005.pdf</a> .
IXFR	Incremental Zone Transfer, a DNS protocol mechanism through which a partial copy of a DNS zone can be replicated to a remote DNS server.
LDH (Letter Digit Hyphen)	The hostname convention defined in RFC 952, as modified by RFC 1123.
Legal Rights objection	An objection on the grounds that the applied-for gTLD string infringes existing legal rights of the objector.
Letter	Any character between "a" and "z" (in either case) (Unicode code points U+0061 to U+007A or U+0041 to U+005A).
LLC	Limited liability corporation.
Morality and public order objection	An objection made on the grounds that the applied-for gTLD string is contrary to generally accepted legal norms of morality and public order that are recognized under international principles of law.
Objection	A formal objection filed with a Dispute Resolution Service Provider in accordance with that provider's procedures.
Objection filing period	The period during which formal objections may be filed

	concerning a gTLD application submitted to ICANN
Objector	One or more persons or entities that have filed a formal objection against a new gTLD application with the appropriate DRSP.
Open TLD	An open TLD can be used for any purpose consistent with the requirements of the application and evaluation criteria, and with the registry agreement. An open TLD may or may not have a formal relationship with an exclusive registrant or user population. It may or may not employ eligibility or use restrictions.
Pre-delegation test	A technical test and other steps required of applicants before delegation of the applied-for gTLD string into the root zone.
Primary contact	The person named by the applicant as the main contact for the application, and having authority to execute decisions concerning the application.
Principal place of business	The location of the head office of a business or organization.
Registrar	See ICANN-accredited registrar.
Registry	A registry is the authoritative, master database of all domain names registered in each top-level domain. The registry operator keeps the master database and also generates the zone file that allows computers to route Internet traffic to and from top-level domains anywhere in the world.
Registry Agreement	The agreement executed between ICANN and successful gTLD applicants, which appears in draft form at <a href="http://www.icann.org/en/topics/new-gtld-draft-agreement-24oct08-en.pdf">http://www.icann.org/en/topics/new-gtld-draft-agreement-24oct08-en.pdf</a> .
Registry operator	The entity entering into the Registry Agreement with ICANN, responsible for setting up and maintaining the operation of the registry.
Registry services	(1) Operations of the registry critical to the following tasks: (i) the receipt of data from registrars concerning registrations of domain names and name servers; (ii) provision to registrars of status information relating to the zone servers for the TLD; (iii) dissemination of TLD zone files; (iv) operation of the registry zone servers; and (v) dissemination of contact and other information concerning domain name server registrations in the TLD as required by the registry agreement; and (2) other products or services that the registry operator is required to provide because of the establishment of a consensus policy; and (3) any other products or services that only a registry operator is capable of providing, by reason of its

	designation as the registry operator.
Registry Services Technical Evaluation Panel (RSTEP)	The Registry Services Technical Evaluation Panel is a group of experts in the design, management, and implementation of the complex systems and standards-protocols used in the Internet infrastructure and DNS. RSTEP members are selected by its chair. All RSTEP members and the chair have executed an agreement requiring that they consider the issues before the panel neutrally and according to the definitions of security and stability.
Reserved Name	A string included on the Top-Level Reserved Names List (Refer to paragraph 2.1.1.2 of Module 2.)
Request for Comments (RFC)	The RFC document series is the official publication channel for Internet standards documents and other publications of the IESG, IAB, and Internet community.
Rightsholder	The person or entity that maintains a set of rights to a certain piece of property.
Root Zone	The root zone database represents the delegation details of top-level domains, including gTLDs and country-code TLDs. As manager of the DNS root zone, IANA is responsible for coordinating these delegations in accordance with its policies and procedures.
Round	See application round.
Script	<p>A collection of symbols used for writing a language. There are three basic kinds of script. One is the alphabetic (e.g. Arabic, Cyrillic, Latin), with individual elements termed "letters". A second is ideographic (e.g. Chinese), the elements of which are "ideographs". The third is termed a syllabary (e.g. Hangul), with its individual elements represent syllables. The writing systems of most languages use only one script but there are exceptions such as for example, Japanese, which uses four different scripts, representing all three of the categories listed here.</p> <p>It is important to note that scripts which do not appear in the Unicode Code Chart are completely unavailable for inclusion in IDNs.</p>
Security	In relation to a proposed registry service, an effect on security by the proposed Registry Service means (1) unauthorized disclosure, alteration, insertion, or destruction of registry data, or (2) unauthorized access to or disclosure of information or resources on the Internet by systems operating in accordance with all applicable standards.
Shared Registry System (SRS)	A system that allows multiple registrars to make changes

	to a registry simultaneously.
Stability	In relation to a proposed registry service, an effect on stability means that the proposed registry service (1) does not comply with applicable relevant standards that are authoritative and published by a well-established, recognized, and authoritative standards body, such as relevant standards-track or best current practice RFCs sponsored by the IETF; or (2) creates a condition that adversely affects the throughput, response time, consistency, or coherence of responses to Internet servers or end systems, operating in accordance with applicable relevant standards that are authoritative and published by a well-established, recognized and authoritative standards body, such as relevant standards-track or best current practice RFCs and relying on registry operator's delegation information or provisioning services.
String	The string of characters comprising an applied-for gTLD.
String confusion objection	An objection filed on the grounds that the applied-for gTLD string is confusingly similar to an existing TLD or to another applied-for gTLD.
String Similarity Algorithm	An algorithmic tool used to identify applied-for gTLD strings that may result in string confusion.
String Similarity Examiners	A panel charged with identifying applied-for gTLD strings that may result in string confusion.
String contention	The scenario in which there is more than one qualified applicant for the same gTLD or for gTLDs that are so similar that detrimental user confusion would be the probable result if more than one were to be delegated to the root zone.
TLD Application System (TAS)	The online interface for submission of applications to ICANN.
Top-level domain (TLD)	TLDs are the names at the top of the DNS naming hierarchy. They appear in domain names as the string of letters following the last (right-most) dot, such as "net" in <a href="http://www.example.net">www.example.net</a> . The TLD administrator controls what second-level names are recognized in that TLD. The administrators of the root domain or root zone control what TLDs are recognized by the DNS.
U-Label	A "U-label" is an IDNA-valid string of Unicode characters, including at least one non-ASCII character, expressed in a standard Unicode Encoding Form, normally UTF-8 in an Internet transmission context.
Uniform Domain Name Dispute Resolution Policy	A policy for resolving disputes arising from alleged abusive registrations of domain names (for example, cybersquatting), allowing expedited administrative

(UDRP)	proceedings that a trademark rights holder initiates by filing a complaint with an approved dispute resolution service provider.
User registration fee	The fee paid by prospective applicants for new TLDs to obtain access to the TLD Application System (TAS).
Whois	Records containing registration information about registered domain names.

**EXHIBIT JJN-45**

## NEW gTLD DRAFT APPLICANT GUIDEBOOK VERSION 4 PUBLIC COMMENT SUMMARY AND ANALYSIS

### Sources

Public Comment Postings (31 May to 21 July 2010). The full text of the comments may be found at: <http://icann.org/en/topics/new-gtlds/comments-4-en.htm>.

### GENERAL COMMENTS

#### Key points

- There should be a level playing field for the introduction of new gTLDs, with no privileged treatment for potential applicants.
- By working with SO and AC working groups, ICANN has sought to ameliorate concerns that, in considering and responding to public comments, staff is making policy.
- By publishing these comment summaries and making significant amendments to the Guidebook, ICANN has sought to ameliorate concerns that it is not responsive to comment.
- ICANN has created staffing and resource plans to be in a position to adequately monitor contractual compliance.
- The New gTLD Program has introduced new rights protection mechanisms and malicious conduct mitigation measure to help provide for the safety of Internet users.
- Success of the New gTLD Program will be measured by the benefits to Internet users and not by the number of gTLD applicants.
- The ICANN community is striving to avoid delays in launching the new gTLD process that would undermine the credibility of ICANN's multi-stakeholder, bottom-up policy development process.

#### Summary of Comments

Public Interest TLDs. The sale of TLDs needs to be balanced with sound public policy. E.g., the potential use of a .health to signify health providers could make it increasingly difficult for consumers to differentiate between legitimate health providers and general commercial organizations. Also, TLDs such as .physio could be misused and potentially breach national laws (e.g. in Australia, use of physio.au by anyone other than a registered physiotherapist would breach registration laws). The fees for new TLDs are prohibitive for small not-for-profit groups that might appropriately manage public interest-oriented TLDs (e.g. a national physiotherapy association managing a .physio). ICANN should therefore reserve some TLDs where the public interest does or should outweigh commercial interests. *D. Mitsch (16 June 2010)*.

#### No privileged treatment and a level playing field.

In response to many requests for privileged treatment by various potential applicants, ICANN has wisely resisted these pleas. We support a single application window, a single set of rules, and no special priority to any type of application beyond those already contemplated in the DAG. *Minds + Machines 21 July 2010*.

Proposals for advantaged applicants should not be adopted. There will be an official communications and marketing period to give everyone the possibility (not just “insiders”) to get their community, geographical or standard TLD. Giving advantage to some applicants would compromise the ability of communities or governments to find the best TLD solution. *Bayern Connect (21 July 2010)*.

#### Glossary.

Definitions are often circular (e.g., the community-based TLD definition uses the term “community” and does not explain what comprises a “community”) and do not adequately describe the technical terms for those new to ICANN processes. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*.

CORE appreciates additions made to the DAG to address the specific needs of intergovernmental organizations or governmental entities. CORE requests a further clarification that “governmental entities” means any level of public authorities, according to their respective legal systems, be that national, federal, state, regional, local, municipal or other. In many languages there is a clear distinction between “governments” and “public authorities” where the former is sometimes reserved to the highest political body representing the sovereign state, and may go further down to federal or regional level, but rarely encompasses all levels of public authorities with a political and administrative mandate to manage a territory. *A. Abril i Abril (Module 5, 21 July 2010)*.

New gTLD-related enforcement resources--not-for-profits. ICANN should consider including in the Applicant Guidebook mechanisms that allow not-for-profit organizations to conduct enforcement activities in a more efficient and cost effective manner. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*.

Compliance. The new gTLD program raises concerns over abuse in the secondary market for new TLDs which ICANN is not in a position to adequately monitor from a contract compliance standpoint due to the unlimited nature of the proposed gTLDs, and also raises concerns over abuse of solicitations for defensive registrations. *A. Aikman-Scalese (21 July 2010)*.

Compliance Officer. The entity awarded a new gTLD should be required to designate by name a Compliance Officer responsible for contract compliance and should be required to notify ICANN immediately of any changes in that designation. They should also be required to provide prominent public notice on their home page of the name and contact information for the designated Compliance Officer. *A. Aikman-Scalese (21 July 2010)*.

Whois concerns. Concerns about inaccurate Whois information should be addressed prior to implementation of the new gTLD program. *A. Aikman-Scalese (21 July 2010)*.

Costs. The effect of each new version of the guidebook is to raise operational costs for all kinds of TLD registries, when most of them don’t need the highest possible standards. One size does not fit all. *A. Abril i Abril (21 July 2010)*.

#### Overall approach.

ICANN must discard the mantra that more is better. Per the advice of the Economic Framework paper, it should analyze the likely costs and benefits of new gTLDs and move forward to authorize only those that can demonstrate a net public benefit. *MPAA (21 July 2010)*. *BITS (22 July 2010)*.

The Business and Commercial Users' Constituency (BC) wants to see new gTLDs rolled out in a systematic manner. All new names should meet five key principles—differentiation, certainty, good faith, competition and diversity. *BC (26 July 2010)*.

The four overarching issues are not integrated into the DAGv4 and ICANN's development of the implementation plan for new gTLDs. ICANN should develop a holistic implementation plan that includes a comprehensive set of safeguards for addressing these issues. *AT&T (21 July 2010)*.

ICANN's multistakeholder, bottom up process loses all credibility if delays continue. It is time to concede that the gTLD process has been overloaded. It must be redesigned in a way to constrain (a) the range of issues to be dealt with in the application documents; and (b) the range of gTLD applications accepted in the coming round. Both constraints can be applied by specifying a simple set of guiding principles rather than scoring systems or lists of names and codes. Examples of possible principles:

(1) ICANN must maintain an environment conducive to the beneficial development of the Internet  
(2) ICANN may deny the delegation of gTLDs or kinds of gTLDs whose likely negative externalities (external costs) outweigh their benefits for the development of the Internet in the public interest. *W. Staub (21 July 2010)*.

Flaws in policymaking process. Where public comments suggest a policy that does not yet have consensus through the bottom-up process, that proposed policy should not be introduced at the discretion of the ICANN staff. In such cases the proposed policy should go to the appropriate policy making body (e.g., the GNSO). The three issues of vertical integration/separation, single registrant single user (SRSU), and HSTLD do not have consensus and the ICANN staff exceeded its role by including them in some versions of the DAG in the implementation process despite that these issues are not explicitly discussed in the final report for new gTLDs. The staff's role is to make an implementation plan for what is figured out in policy discussions, not to introduce a new policy. Public comments of value to the staff are comments that: (1) suggest that a policy issue which became consensus is not implemented; (2) suggest that the implementation plan contradicts the policy consensus or ICANN bylaws, etc.; (3) suggest that there is a flaw in the plan so that there is difficulty in actual implementation; and (4) suggest an improvement for implementation of a policy issue which became consensus. *JPNIC (2 Sept. 2010)*.

Criterion for measuring success of new gTLD program. Belief in meeting consumer demand and eagerness for new gTLD business are deeply connected. But beyond the issues of competition and consumer choice is the additional issue of stability. Threats to stability caused by eagerness for new gTLD business have not completely disappeared. A high number of applications received and processed is not the measure of success for ICANN. In reality only a few applicants will succeed; others will fail because they do not represent real consumer demand. After this stage we will be able to enter into a new era in which people can calmly predict consumer demand and the stability threat will be reduced. Reaching that point will be an achievement for ICANN. It is of concern that by recommending single registrant single user (SRSU) TLDs, ICANN staff may be intending to increase the number of applications. This should not be true. *JPNIC (2 Sept. 2010)*.

### **Support for New gTLD Program**

Complete the guidebook and do not delay the program. Further delay of the launch will erode the credibility of the new gTLD program. The Guidebook is in very good shape and reflects hard-won

compromises. *Minds + Machines (21 July 2010)*. *Bayern Connect (21 July 2010)*. *R. Tindal (21 July 2010)*. *D. Schindler (22 July 2010)*. *J. Frakes (22 July 2010)*.

It is almost time to move to the gTLD implementation stage. Demand Media strongly believes that introducing new gTLDs will provide more choices for consumers, genuine uniqueness and specificity in TLDs and greater competition among registries. Many issues have been addressed by ICANN in the various version of the DAG with community's input. The Applicant Guidebook may need to be amended to deal with future issues and that is to be expected. The DAGv4 represents sound judgment and consensus in most respects. *Demand Media (22 July 2010)*. *J. Frakes (22 July 2010)*.

## **Opposition to New gTLD Program**

### Opposition.

The International Olympic Committee (IOC) opposes introduction of new gTLDs. IOC's recommendations should not be taken as a waiver of IOC's right to proceed against ICANN for damages resulting to the IOC or the Olympic movement from implementation of the proposed new gTLD system. *IOC (21 July 2010)*.

Introduction of new gTLDs is premature and launch should not proceed without further review and revision. It is imperative that any plan put in place will guarantee the safety of Internet users and protect the rights of all parties. *CADNA (21 July 2010)*. *Rosetta Stone (21 July 2010)*. *AIPLA (21 July 2010)*. *IACC (21 July 2010)*.

ICANN has not adequately addressed the overarching issues. Unresolved malicious conduct concerns alone require that the gTLD program not go forward because it is far from ready. At minimum ICANN should assume at least another 18-24 months will be needed before it could launch new gTLDs given all the unresolved matters. As evidenced by the economic work produced by ICANN this summer, it is far from clear whether the public interest will be served; there has been no demonstration of demand for new gTLDs, or that a flood of new gTLDs will result in constructive, new competition. *SIIA (21 July 2010)*.

The case has not been made for and no sensible advantages would be gained by introduction of new gTLDs. The new program will create more confusion and worsen cybersquatting and trademark infringement problems. Instead of introducing an unlimited number of additional TLDs, ICANN should concentrate on improving the current DNS by finding effective solutions to cybersquatting and trademark infringement problems. *H. Lundbeck (8 July 2010)*. *VKR Holding (13 July 2010)*. *LEO Pharma (14 July 2010)*. *Vestas (16 July 2010)*.

ICANN should cease its headlong rush to authorize an unlimited number of new gTLDs and instead follow a more considered approach based on an assessment of the need for new gTLDs and how they can be judiciously authorized so as to protect the interest of commercial users and the general public. *MPAA (21 July 2010)*.

Microsoft continues to object to ICANN's planned simultaneous introduction of an unlimited number of new ASCII gTLDs. If ICANN nonetheless proceeds despite the widespread opposition to the program and the economic downturn, then it should take the time necessary to consider and address the issues and questions raised by the community about the intended implementation of the plan. It is essential that ICANN "get it right" and as written the DAGv4 effectively ensures that it will not. *Microsoft (21 July 2010)*.

ICANN is not promoting competition. ICANN is not promoting competition with the new gTLD program but is acting in favor of registrars and registries and against the interests of the public. If competition is working, this will be seen through registration prices lower than .com. ICANN refuses to take steps to eliminate VeriSign's abusive .com monopoly by implementing a regular tender process so that each TLD is managed by a registry that will give consumers the lowest price for a set level of service. *G. Kirikos (1 June 2010).*

ICANN does not value public input. We will passively resist by not participating in a process that only leads to predetermined outcomes. We request that ICANN notify the community when it is ready and willing to demonstrate that it properly values public comments. *G. Kirikos (17 July 2010).*

## Analysis of Comments

### Policy development process and public comment

Since it was founded in 1998, one of ICANN's key mandates has been to create competition in the domain name market, "The new corporation ultimately should ... oversee policy for determining the circumstances under which new TLDs are added to the root system." The secure introduction of new gTLDs, as specified in the White Paper, remains an essential element in fostering competition and choice for Internet users in the provision of domain registration services.

The introduction of new gTLDs continued to be identified as a core objective for ICANN in several key agreements, for example "Define and implement a predictable strategy for selecting new TLDs" in the 2003 Memorandum of Understanding. The study and planning stages, extending back several years, include two trial rounds of top-level domain applications held in 2000 and 2003. Experiences from those rounds have been used to shape the current process.

The New gTLD Program has its origins in carefully deliberated policy development work by the ICANN community. In October 2007, the GNSO, formally completed its policy development work on new gTLDs and approved a set of 19 policy recommendations. Representatives from a wide variety of stakeholders, including governments, individuals, civil society, business and intellectual property constituencies, and the technology community were engaged in discussions for more than 18 months on such questions as demand, benefits and risks of new gTLDs, the selection criteria that should be applied, how gTLDs should be allocated, and the contractual conditions that should be required for new gTLD registries going forward. The ICANN Board subsequently approved these recommendations in June 2008, and directed staff to develop an implementation plan.

The development of the Applicant Guidebook, and the resolution of the overarching issues identified during the process, has been a challenging task. Recommendations adopted from the trademark and malicious conduct working groups have been, where possible, incorporated into the Applicant Guidebook, while issues of root zone scaling and the overall demand for new gTLDs are being addressed in separate reports.

Since creation of the consensus policy to introduce new gTLDs, ICANN has commissioned several economic studies to describe the costs, benefits and conditions necessary to maximize net social benefit of the program. The studies have also explored anticipated benefits of gTLD expansion.

The program implementation contains several elements in mitigation of certain concerns, including:

- Developing dispute resolution procedures for:
  - Similar TLD applications causing user confusion
  - Misuse of community labels
  - Infringement of rights
- Introduction of additional rights protection mechanisms
- Measures to mitigate and reduce malicious conduct
- Root zone scaling and DNS stability measures

The multi-stakeholder model means that ICANN is responsible to a diverse range of stakeholders, and the ICANN community has done an outstanding job of considering, in many cases, diverse views on issues and finding workable solutions. While there are claims that the failure to launch new gTLDs could be interpreted as a failing of the multi-stakeholder model, the process is, on the contrary, an example of its success. The implementation of this program has been a truly collaborative, community effort, involving a number of individuals who have worked very hard to resolve many contentious and important issues in large part through dedicated working groups such as:

- The Implementation Recommendations Team - proposed solutions on trademark protection;
- The Special Trademark Issues group - made recommendations for a Uniform Rapid Suspense System and a Trademark Clearinghouse;
- The Zone File Access group - recommended a standard zone file access model to aid those addressing potential DNS abuse;
- The Temporary Drafting Group - worked with ICANN to draft selected proposed elements of the registry agreement;
- The IDN Working Group – completed work on definitions and solutions for variant TLD management.

Some may question the value of the public comment process, if all comments are not going to be acted upon. However, the analysis of public comments received on the new gTLD process has set a new benchmark for ICANN. It is acknowledged that the content of the Applicant Guidebook will not please everyone, but there has been a genuine commitment to consider and respond thoughtfully to the public comments that people have taken the time to make, and in many cases these comments have been directly acted upon. This is evidenced by the considerable number of changes that have been made to the various iterations of the Guidebook and the consideration of the overarching issues that arose during the process.

While listening carefully to the public feedback, one of the challenges has been to be careful not to reopen for debate issues that had been discussed and resolved during the policy development process while also ensuring that the consideration of public comment did not lead to new policy discussions. The Applicant Guidebook was developed around the principles, recommendations and implementation guidelines provided by the GNSO policy development process. These guiding principles in developing the Applicant Guidebook have been to: preserve DNS stability and security; provide a clear, predictable and smooth-running process; and address and mitigate risks and costs to ICANN and the global Internet community.

Registry-registrar cross-ownership was discussed in the context of promoting choice and competition. The GNSO considered the issue and was not able to come to consensus, which ultimately led to the Board making a decision supporting cross-ownership, with some protections built in.

The High Security Top Level Domain discussion was part of the overall concern about potential for increased malicious conduct and the principle that the introduction of new gTLDs should not cause security or stability issues. The community undertook a great deal of work on malicious conduct, which included a working group on a possible HSTLD designation. As a result of discussion on strategies for mitigating malicious conduct in the namespace, nine measures were recommended to increase the benefits to overall security and stability for registrants and trust by all users of new gTLD zones.

A well-defined process was undertaken which recommended the introduction of new gTLDs and was supported by the ICANN Board. We believe that many of the reasons for not supporting the introduction of new gTLDs that have been identified through public comment and public workshops and fora have been heard and addressed during the development of the Applicant Guidebook.

## **Compliance**

In addition to the development of the Applicant Guidebook and the operational readiness of the New gTLD Program itself, ICANN has allocated considerable time and effort to ensure the overall organization, including its Compliance group, will be able to manage the potentially increased volume from new Registries.

## **Glossary and definitions**

In addition to the glossary provided at the back of the Applicant Guidebook, Module 1 provides more detailed explanations of the meaning of terms such as “community” in the context of the new gTLD process.

We acknowledge that there are varying levels of governments, and differing terminology and levels among governments. Additions have been made to the next version of the Applicant Guidebook to respond to comments for clearer definitions. The geographic names section has attempted to identify the expected level of government support, non-objection, required for the different categories.

## **Success of the new gTLD program**

There are many ways to measure the success of the new gTLD program. From an operational standpoint, for example, we will look at the efficiency with which applications are processed, the performance of the TLD Application System (TAS), and the overall process flow and timelines.

There are other ways success could be measured. The Affirmation of Commitments calls for a review of Competition, Consumer Trust and Consumer Choice one year after new gTLDs go into operation. This analysis will likely answer critical questions that are asked today, for instance: has there been an increase in choice for consumers? Has the stability and interoperability of the DNS been impacted by the increased number of gTLDs in the root? Has the program allowed for more geographic diversity in the gTLD namespace?

## TIMELINE / MODELS

### Key Points

- The Board has directed staff to adopt as a working plan the Launch Scenario with launch date of Q2 2011.

### Summary of Comments

#### Finalize the new gTLD process.

ICANN should finalize the gTLD process and start accepting new applications. Actions to facilitate this are highly welcome, such as the proposed “ICANN Summit” in September. *dotBERLIN (3 July 2010)*. *dotBayern (20 July 2010)*. *dotHamburg (21 July 2010)*. *dotZON (21 July 2010)*.

It is important for the credibility of ICANN and the vast number of already existing applicants to continue with the process so that a final guidebook can be published as soon as possible. *Bayern Connect (21 July 2010)*. *Domain Dimensions (22 July 2010)*.

A reliable timeframe for the next application round should be set. *dotZON (21 July 2010)*. *eco (21 July 2010)*. *HOTEL (21 July 2010)*. *NIC Mexico (21 July 2010)*. *EuroDNS (22 July 2010)*. *dotKoeln (22 July 2010)*.

Now is the time for the new gTLD program to move forward. The guidebook should be in final form no later than the end of 2010 and the application window and communication/outreach completed by summer 2011. A schedule for the next 18-24 months should be provided which clearly delineates what will happen and when as it relates to the new gTLD program. *J. Frakes (22 July 2010)*.

ICANN should move forward with the program in a timely fashion. ICANN needs to recognize that it cannot focus the community’s time and energy on the “unknown”. It would be unreasonable to expect any group of people to draft policies today that would remain unaltered for eternity. It would be beneficial for all parties if these limitations were recognized. If and when issues arise let us all address them then. *Blacknight Solutions (21 July 2010)*.

Changes in the latest version of the DAG allow for the launching of the application round in the near future. *AFNIC (23 Aug. 2010)*.

With a few tweaks we believe the new gTLD program will be ready to launch later this year or early 2011. *Neustar (21 July 2010)*.

#### Official timeline and benefits of an incremental approach.

ICANN now needs to focus on publishing an official timeline as much as it needs to work on the final adjustment of the new gTLD program. Accumulated delays are detrimental to new gTLD applicants with projects having “net social benefit” and undermine ICANN’s credibility and legitimacy. The incremental approach previously suggested by AFNIC is still valid. If an incremental approach were not deemed appropriate for the application process (reserved windows for applications with defined characteristics), it could still be highly beneficial in the subsequent processing of applications, i.e., either for the actual processing of the application and/or later on upon negotiation of the Registry Agreements. Once ICANN

accepts applications, it would seem fairly reasonable that groups of like-featured applications could naturally appear (objectives, governance, policies and/or targeted audiences, etc.) Efficiency, simplicity and justice principles would then argue for specialization of the processing of such applications. Specialization could intelligently combine with the incremental approach. Batches of applications would form on the basis of rationality rather than mere chance. ICANN would gain time to deal with the most difficult problems posed by projects of uncertain “net social benefit” while it would realize and prove the value of its new gTLD program by unleashing initiatives that are of evident “net social benefit.” *AFNIC (23 Aug. 2010).*

#### Indifference toward public comments.

ICANN has admitted that it is ultimately indifferent to comments submitted by stakeholders in this process. Time Warner is deeply concerned that ICANN appears poised to move forward with the launch of new gTLDs despite the fact that none of the “overarching issues” identified by ICANN in early 2009 have been adequately addressed in the DAGv4. If ICANN plans to launch a successful gTLD program, it has more work to do before claiming “mission accomplished” and accepting applications. *Time Warner (21 July 2010).*

#### ICANN should revisit issues with open mind.

ICANN should revisit issues with an open mind and propose needed changes before the Board meets in September to consider all of the outstanding issues relating to implementation of the new gTLD program. *COA (21 July 2010).*

#### Take more time before introducing new gTLDs because issues remain unresolved.

Three substantive issues remain unresolved in the DAGv4: (1) the economic study; (2) proposed rights protection mechanisms; and (3) root scaling. *MarkMonitor (19 July 2010). Carlson (21 July 2010). BBC (21 July 2010). HSBC (21 July 2010). DuPont (21 July 2010). Comerica (3 Aug. 2010). Sunkist (21 July 2010). LifeScan (22 July 2010). Solvay (22 July 2010). ETS (22 July 2010). Liberty Mutual (22 July 2010).*

As advised in the Economic Framework report, ICANN should move slowly in rolling out new gTLDs and study the implementation, demand, and potentially negative consequences arising from a new gTLD rollout. There has not been significant progress on the four overarching issues. *Verizon (20 July 2010). HSBC (21 July 2010). A. Aikman-Scalese (21 July 2010). Adobe Systems (21 July 2010). Rosetta Stone (21 July 2010).*

#### Clarity on next steps.

USCIB members would appreciate some clarity on how ongoing community discussions, the release of the Economic Framework study and expected second phase of that study, as well as the expected root scaling study, will affect the DAGv4 and possible launch of new gTLDs. For example, the Economic Framework study stated that it may be wise to continue ICANN’s practice of introducing new gTLDs in discrete, limited rounds. *USCIB (21 July 2010).*

ICANN should prioritize IDNs and introduce new gTLDs in discrete, limited rounds, consistent with the Economic Framework paper’s recommendations. *AT&T (21 July 2010). Coca-Cola (21 July 2010).*

#### Launch the less contentious cultural and linguistic TLDs.

Many of them will help developing countries and are less likely to be problematic with rights holders. *Blacknight Solutions (21 July 2010).*

## Analysis of Comments

### Finalizing the new gTLD process

ICANN continues to approach the implementation of the program with due diligence and plans to conduct a launch as soon as practicable along with the resolution of these issues.

### Timeline and benefits of an incremental approach.

A Special Meeting of the ICANN Board of Directors was held via teleconference on 28 October 2010 in which the Board discussed proposed timelines for publishing a final version of the Applicant Guidebook and the extent of public comment to be received on the Applicant Guidebook. After agreement on a proposed workplan to guide the remainder of staff's work, the Board directed staff to adopt as a working plan the scenario including a launch date in Q2 2011.

Staff continues to make progress towards the program development while, at the same time, working with the global Internet community towards a level of consensus on the Program's outstanding issues.

## COMMUNICATIONS

### Key Points

- The communications campaign is designed to address concerns about whether communications letting all parties know of the opportunity to operate a new gTLD are appropriately detailed, began soon enough, and contain enough detail to help entities that are new to ICANN's processes.

### Summary of Comments

Start communications period. The communications period should start sooner rather than later; 'outsiders' should get enough time to become familiar with the new gTLD opportunities. dotZON (21 July 2010).

Evaluation procedures—technical requirements training, education outreach. ICANN should provide greater detail and instruction regarding how to prepare for the technical requirements associated with the new gTLD application and process, and should provide education and training outreach for organizations such as not-for-profits that are new to ICANN activities. This outreach should begin immediately but be increased once the final Applicant Guidebook is released so that parties will have access to the final policy information. It should cover the application process as well as areas of interest to third parties, such as the objection procedures and rights protection mechanisms. Outreach should be done in all five ICANN regions, and ICANN should provide live in-person seminars open to the public rather than only posting information on its website or hosting webinars. AAMC (21 July 2010). Red Cross (21 July 2010). NPOC-FC (21 July 2010).

### Analysis of Comments

The Applicant Guidebook, exceeding 300 pages in length, is already quite detailed about the application process. It covers topics that the commenters requested, such as objection procedures and rights

protection mechanisms. Regarding the request to provide greater technical instruction, the questions contained in the application are intended to inform and guide the applicant in aspects of registry start-up and operation. Inexperienced applicants should find them a natural part of planning. Supplemental documentation or more detailed guidance on particular areas of technical operations are referenced in the guidebook where available, and a number of resources are available elsewhere in the community.

Regarding the communications plan for new gTLDs, ICANN has already undertaken significant effort to achieve the objective of the four-month requirement recommended by the Generic Names Supporting Organization. ICANN's staff remains deeply committed to the primary goal of ensuring that all those who wish to participate in, and benefit from, the new gTLD Program have opportunity to do so.

A communications plan has already been posted, received public comment, and is being revised. The current plan includes live outreach presentations in all five ICANN regions, in addition to written and recorded educational materials. In order to give due consideration to all publicly expressed views, the plan will be finalized after ICANN's international meeting in Cartagena, December 5 – 10 2011.

## APPLICATION PROCESS

### Key Points

- An Applicant Support Working Group has been established to evaluate options to provide support for defined groups of applicants. This has resulted in various types of outreach and education that ICANN expects to offer to applicants. This group will continue to work to find sources of funds and criteria for awarding them.
- A reduction in the application fee for efficiencies gained from certain types of applicants (i.e. multi-string, single entity applicant) has already been considered in determining the \$185,000 fee. ICANN staff will review processes after Round One to determine where additional efficiencies may be gained for subsequent rounds and additional efficiencies gained will be passed on to applicants in future rounds.

### Summary of Comments

Fee standards—developing and undeveloped countries. Huge fees (\$185K evaluation fee, US\$70K-\$122K and US\$32K-\$56K for the M&PO and community objections respectively) would stifle the initiative of developing and undeveloped countries and dampen globally balanced development of the Internet. ICANN should be able to set a fee standard based on the costs and adopt a favorable fee policy for the developing and undeveloped countries. ISC (21 July 2010).

Discounted fees--IDNs and Exact String Translations.

ICANN should significantly decrease application fees for exact translation equivalents of the same TLD to reflect the effort the evaluating team would require to process the applicant. If all TLDs fall under the same applicant, community, business plan, string, backend registry, etc., then ICANN does not need to spend additional time repeating the same evaluation step needlessly since economies of scale/scope are reasonably justified. .MUSIC (20 July 2010). dotKoeln (22 July 2010).

Each community-based applicant should be allowed to increase their utility within their specific community by having the option to apply for their respective IDN-equivalent TLDs for a nominal additional fee (per IDN or translated equivalent). It would not be justified to ask a community based applicant to pay an additional \$185K for each translation to the approved string. BC (26 July 2010). R. Andruff (Module 1, 21 July 2010).

Different fee models for different types of TLDs. Given the high fees and costs associated with applying for and operating a new gTLD, ICANN should consider setting up different fee models for different types of TLD applications to alleviate the costs on applicants. A sensible fee model will greatly enhance the chance of success for the new gTLD process. CNNIC (21 July 2010).

Reduced fees for small cities, small cultural and linguistic community TLDs. Special consideration, including reduction of the \$185K application fee and \$25K annual fee, should be given for small cities and small cultural and linguistic communities which do not intend to compete with general commercial TLDs such as .com or new brand TLDs and for whom the current level of fees is not affordable. It is understood that a lower but appropriate application fee is still needed in order to prevent excessive applications. JIDNC (21 July 2010).

Special consideration regarding technical requirements and fees for developing country applicants representing cultural, linguistic and geographical communities is appropriate and consistent with the advice of the GAC in its Brussels communication. A. Al-Zoman (21 July 2010). Arab Team (21 July 2010).

Reduced fee for bundled variants. ICANN should provide for a lower fee in the case where the TLD names are not chosen but are pre-existing (e.g. geographical names, many of which have more than one common name including IDN variants). Charging \$185K for each variant seems punitive and unfair. Minds + Machines (21 July 2010). Bayern Connect (21 July 2010).

Not-for-profit organizations. ICANN should reveal and detail its actual costs for reviewing each new gTLD application and consider setting a lower cost pricing structure for not-for-profit organizations that will allow ICANN to recover its costs without imposing additional overhead on the not-for-profit applicants. This transparency and pricing consideration should also apply to extended evaluation fees, objection filing and proceeding fees (in objection proceedings fees should be capped, or at least the initial fees that must be paid as a “deposit” on the proceeding). ICANN should consider a two-tiered cost structure to separate commercial uses of the new gTLDs from the informational, educational and lifesaving functions served by not-for-profit organizations. AAMC (21 July 2010). Red Cross (21 July 2010). NPOC-FC (21 July 2010).

Support for African new gTLD applications. The African ICANN Community urges that support be given for new gTLD applications from Africa and be prioritized. Civil society, NGOs and non for profit organizations in Africa are most in need of such support, and support is of utmost importance for geographic, cultural and linguistic and community based applications.

- Support should include but not be limited to: financial (reduced fees); linguistic (translation in the six UN languages); legal; and technical.
- Cost reduction is the key element in fulfilling the goals of Board Resolution 20, and the following should be entertained to achieve cost reduction: waiving the program development cost (\$26K); waiving the risk/contingency cost (\$60K); lowering the application cost (\$100K); waiving the registry fixed fees (\$25K per year); and charge only the registry-level transaction fee (\$.25 per

domain name registration or renewal). The reduced cost should be paid incrementally to give African applicants more time to raise money and since investors will be more encouraged to fund an application that has passed initial evaluation.

*African ICANN Community (28 June 2010).*

Developing countries applicant support working group—support for initiative. We welcome the recent ICANN initiative regarding possible support for applications from developing countries. The results of the working group should be taken into consideration in the final Applicant Guidebook. *Arab Team (21 July 2010).*

Developing country non-profit applicant financial support efforts by ICANN, where the applied for TLDs are for the public good, are welcome, and should include reduced fees for application, evaluation and the annual contract. For proposed gTLDs financially sponsored by certain governments, ICANN should consider the government's financial support commitment in place of the irrevocable standby letter of credit or deposit into an irrevocable cash escrow account, since some governments are reliable enough to guarantee sustainable operation of the registry(s). DNSSEC cost burdens should also be reduced and the application process should be made more accessible to global stakeholders. ICANN should provide document translations and conference simultaneous interpretations in six UN languages which may also help reduce costs for non-English speaking applicants. As for technical support, DNSSEC support is a necessity. *CONAC (22 July 2010).*

The consensus in the At-Large Community is that whatever the finalized processes and procedures, ICANN must embrace the prospect of providing affirmative support for participation of hitherto marginalized communities, especially those entrusted to act on behalf of disadvantaged groups or those with agendas widely recognized as active in the general public interest in the new gTLD economy. The ALAC strongly endorses continuation of these efforts. *ALAC (September 2010)*

Reduced application fee--brand and charitable organizations. The application fee is too high and could be discriminatory against certain types of applicants such as .brands restricted to employees of a company or charitable organizations. Such applicants should be eligible for a lower fee. *Hogan Lovells (21 July 2010).*

Application fee level is generally appropriate. The \$185K fee is likely to be a realistic average estimate of ICANN's costs to manage the program. Substantial changes to the new TLD process as described in DAGv4 could result in an increase in the fee. I support practical ways to reduce costs for the discrete group of applicants in need, especially those from developing countries. *R. Tindal (21 July 2010).*

Terms of payment—exchange rate. The following is suggested as addition in DAGv4 after section 1.5.4: "Section 1.5.5—Terms of payment: Payment to ICANN may be effected in USD or in the legal currency of the applicant's country. If the applicant decides to use his local currency for processing payments, the exchange rate used shall be the one which applies on the day the applicant registers with TAS (refer to paragraph 1.5.1)." This section is justified because the risk of exchange rates should not be borne by applicants alone, but shared with ICANN. It may be fair for ICANN to acquire financial products to hedge this currency risk, rather than each and every applicant having to provide this insurance on its own. *E. Blocher (Module 1, 5 June 2010).*

Refund of evaluation fee (1.5.1). The proposed 20% refund of the evaluation fee to unsuccessful applicants after having completed dispute resolution seems unreasonable. While it may be reasonable

to make such a refund if the applicant decides to withdraw at the outset of objection proceedings, there will be less incentive to take such an approach if the applicant knows that they will recover this sum whatever the outcome of the dispute resolution. BBC (21 July 2010)

## Analysis of Comments

### Fee Issues

Comments regarding fees have generally been consistent with previous versions of the Draft Applicant Guidebook. One comment is generally in support of the application fee to cover costs, while a number of comments have suggested a reduction in the application fee either based on where the applying organization is located (e.g., a developing country), its organization type (not-for profit, charities, small cities, a brand holder) or based on a presumed level of effort required to review an application (IDN variants, or multiple strings from the same organization).

Comments suggest a reduction of the \$185,000 application fee based on the type of TLD being applied for (linguistic, small community), the organization applying (not-for-profit) or where there may be multiple TLD strings applied for (e.g., IDN variants, translations of a string) by a single applicant. The processing steps and associated costs to perform each application evaluation are based on an average number of steps to complete each application and do not change based on the TLD type or organization applying. In addition, applications for translated versions of the same string would undergo the complete evaluation process as each application is expected to stand alone. Consequently, the current application fee is not expected to change for the initial application round. However, as stated previously, it is anticipated that subsequent application rounds will enable adjustments to the fee structure based on historical costs from previous rounds, the effectiveness and efficiency of the application evaluation process, and other data as it becomes available.

Currently, a working group, comprised of representatives from various Internet constituencies, is evaluating options to provide support for a defined set of applicants. The working group's preliminary recommendations were presented to the Board in September and a resolution was agreed on regarding the support to be provided by ICANN (<http://www.icann.org/en/minutes/resolutions-25sep10-en.htm#2.2>).

Progress is being made by the Applicant Support Working Group, tasked with, among other things, locating sources of funds to provide financial support for certain deserving applicants and determining criteria for releasing those funds in a way that avoids abuse and is fair.

There was a suggestion that payment of the application fee should be allowed in US dollars or in the legal currency of applicant's country to share exchange rate fluctuation risks. The payment of the application fee follows standard ICANN practices with respect to fees collected globally. For this process, ICANN receives funds in US currency only. It is the applicant's responsibility to arrange for funding in their own currency to equate to the evaluation fee at the time of the each wire transfer. ICANN does allow for normal fluctuations as the funds are applied to their respective application.

A comment questioned the relative incentives for applicants to participate in a dispute resolution proceeding or withdraw prior to the dispute resolution process. This was considered previously. The dispute resolution process is in place to allow a weighing of the objection in regard to the application. In

the event of an objection, an applicant may choose to withdraw at an earlier stage for a larger refund. The process is not designed to discourage applicants from completing a dispute resolution process just to afford some recovery to applicants who do not go through the entire evaluation.

## APPLICATION CATEGORIES

### Key Points

- Newly formed entities must be formally established prior to application submission. These entities will be evaluated similarly to established entities. Information required by newly formed entities is discussed in the Criteria section of the Application questionnaire.
- The standard for a successful community objection requires that the opposition be substantial so that the dispute resolution process is a consideration of the issues rather than a means for a single entity to eliminate an application.
- New TLD categories beyond what has already been described (community, geographic, and standard) will not be introduced, as ICANN believes that over time, the market and community interests are better suited to sorting TLD types. In addition, the introduction of categories may mean an unintended increase in compliance-related costs in areas without benefit to DNS security.

### Summary of Comments

Proposal for two categories under community-based TLDs—commercial and noncommercial. ICANN’s one-size-fits all approach does not accommodate all stakeholders. There should be two categories of community-based gTLDs—a commercial use and noncommercial use. Differentiated policies and evaluation procedures should be established for noncommercial TLDs—their evaluation should be simpler, as they may not be involved in trademark protection issues. ICANN should provide more support to noncommercial applicants—financially, technically and linguistically—and give some exceptions to them regarding vertical integration and Whois policies. This will simplify new gTLD management and accelerate the pace of evaluation to some extent. Moreover, GNSO has the commercial and noncommercial stakeholder groups, which perfectly matches the proposal. *CONAC (22 July 2010).*

Community-based application definition (1.2.3). The fourth factor (“Have its application endorsed in writing by one or more established institutions...”) seems too narrow in specifying “one or more” and is imbalanced when compared with the Section 3.3.1 grounds for a community objection. If it takes substantial opposition from a significant portion of the community to object, how is it possible that only one institution can represent a community in the application process? BITS suggests also that during the Initial Review process, reviewers should be required to change the designation from a “standard” to a “community-based” application if it is clear that the applicant intends the gTLD string to be targeted explicitly or implicitly at a specific community. It is also not clear why ICANN in Section 1.2.3.2 makes the assumption that community-based applications are intended to be a “narrow category.” *BITS (22 July 2010).*

Financial TLDs. Any domain name associated with financial services should be restricted to financial services companies, with substantial restrictions, guidelines and proof of eligibility. There should be a

formal Financial Services Panel for assessing financial service-oriented gTLD applications. Specific higher levels of security and stability should be mandated. The DAGv4 does not adequately address these recommendations. *ABA (22 July 2010)*.

Applicant Evaluation: yet-to-be formed entity. Clarification by ICANN is requested as to whether it is possible under the current DAG to submit an application in name and on behalf of a yet-to-be-formed entity, where checks and evaluations are performed on the submitting entity(s) while the future registry has to be defined in all terms, but not yet prove legal existence. ICANN is asked to clarify the required documentation for the future designated registry on behalf of which the application is submitted. Examples of such a situation would be community-based, non-profit entities wishing to form a Foundation to manage a given TLD, or a city that might establish an agency to manage a city TLD. *A. Abril i Abril (Module 2, 21 July 2010)*.

Brand category of applications. A third category of applications for brand owners would be beneficial. It is still unclear if brand owners could qualify to file a community-based application and whether a corporation could be considered to represent a community consisting of a restricted population such as its customers or employees. *Hogan Lovells (21 July 2010)*.

Closed gTLDs—lack of provisions.

The DAGv4 lacks provisions for operation of closed gTLDs. Would this mean that trademark owners owning a gTLD would need to open the registration procedure to second-level domain names applied for to third unrelated parties? In this case, what is the incentive of actually registering and operating such a gTLD? *PMI (21 July 2010)*.

Unique procedures are needed for single registrant TLDs. Such single registrant TLDs need different requirements in the utilization of ICANN authorized registrars. The DAGv4 does not address the unique procedures that are required for these unique registries, which are being used to increase online visibility of the TLD holder and not offering open registrations of second level names. *AT&T (21 July 2010)*.

Single registrant, brand, corporate TLDs—beyond scope of new gTLD program. Based on the GNSO report to the Board (11 Sept. 2007), single registrant, brand and corporate TLDs are beyond the scope of the current new gTLD process. We strongly urge ICANN to state this fact explicitly in the forthcoming final version of the new gTLD RFP for the next round. ICANN should also clearly state that “community-based TLDs” will not open the door for proprietary TLDs. *JPNIC (21 July 2010)*.

Opposition to single registrant, single user (SRSU) TLD category. ICANN staff should not propose single registrant single user (SRSU) TLDs because this proposal does not have consensus within the ICANN community. If the ICANN staff proposes it in its discretion, that would be a violation of process. In addition, such a proposal could increase the risk of lawsuits against ICANN by the SRSU applicants since many of the required elements of the new gTLD process do not properly fit for SRSU TLDs (e.g., mandatory use of ICANN registrars, data escrow and vertical integration). Therefore the third paragraph in the Background section addressing brand holders and organizations seeking to manage their own name should be deleted. The issue of SRSU TLDs is an important policy issue which should be discussed in the GNSO. It is not a consensus policy included in the 2007 GNSO final report for new gTLDs and it should be treated by a dedicated PDP. In case the dedicated PDP does not end in a timely manner, the next round of new gTLDs should exclude SRSU TLDs. This argument has the same logical structure as the

underlying logic of Board Resolutions 2010.03.12.17 and 2010.03.12.18 for Vertical Integration/Separation. *JPNIC (2 Sept. 2010)*.

## Analysis of Comments

A comment requests clarity on “yet-to-be formed entities” applying for a gTLD. Applications from or on behalf of yet to be formed legal entities, or applications presupposing the future formation of a legal entity (for example, a pending Joint Venture) will not be considered. All requirements of an existing entity continue to apply: proof of planned technical/operational and financial capabilities (see Criteria for Question 45 for financial information required by newly formed entities) will be required, background screening of the organizations forming the new entity as well as the new entity’s key officers and shareholders will be conducted, all required documentation for geographic names and/or community based applications must be presented, and all other requirements, as outlined in the draft Applicant Guidebook must be met to submit a complete application.

A comment notes a potential imbalance between the requirement for at least one endorsement of a community-based application, and the requirement that there be substantial opposition in the event of a community objection. It is intended that the application should have substantial support as well; however, this is difficult to establish based on a certain number threshold. It may well be that an applicant supported by one institution or group means substantial support for that case (e.g., a highly structured community with only one relevant institution or endorsement from the pre-eminent institution in that area). Conversely, the standard for a successful community objection requires that the opposition be substantial so that the dispute resolution process is a consideration of the issues rather than a means for a single entity to eliminate an application. Opposition from a single entity might also be determined substantial in a given case.

Comments provided suggestions for possible approaches to application categorization. Depending on the category, various accommodations are suggested: for example, no requirements for an ICANN contract, or to use accredited registrars, or to follow consensus policy, or policy provisions outlined in the GAC’s ccTLD principles. Some might be restricted to not-for-profit status, be eligible for reduced fees, require registration restrictions, and have names reserved in anticipation of registration by certain parties. There will be considerable debate and discussion in the community as to whether certain accommodations should be made. Should certain gTLDs not be required to have an agreement with ICANN or not be required to follow consensus policy? Should certain TLDs be required to maintain not-for-profit status? These discussions and debates will take considerable time and resources and may ultimately not result in consensus. The structure of TLD categories, if granted different accommodations with differing contractual obligations, would result in significantly higher compliance costs and therefore, annual fees.

Significant consideration has been given to the issue of introducing category-based TLDs in the new gTLD process. ICANN remains a strong proponent of innovative uses of new TLDs. This is especially so in cases where TLDs can be delegated to address the needs of specific communities such as intergovernmental organizations, socio-cultural groups and registered brands. Rather than having ICANN limit this type of innovation and identification with certain TLD models, more creativity might be spawned by allowing different groups to self-identify the type of TLD they purport to be and promote that model among their community.

If a self-declaration program is instituted and contractual accommodations are eliminated or minimized, fees can remain constant. Socio-economic groups, brand holders and other groups all can be accommodated under the existing structure and self-identify as a particular type of TLD. Over time, the market and community interests will sort TLD types – a model preferable to having ICANN make that determination a priori.

It may well be that as definitive categories of applicants emerge in practice, and as ICANN and the respective communities gain further experience of possible benefits of additional gTLD categorization over time, organizational structures might be developed with ICANN to reflect these categories. That will be a consequence of bottom-up policy developments by affected participants, according to the ICANN model. Nothing in the current implementation procedures forecloses those future developments.

Comments suggest that single registrant TLDs not be allowed as these may not have support from within the ICANN community nor is there policy to support such a category. Categorization of TLDs beyond what has been proposed (community, geographic, and standard) is not being introduced. In addition, an applicant is not required to have a minimum number of registrants to qualify for a TLD.

## PROCEDURES

### Key Points

- ICANN staff will conduct a Completeness Check of applications after the close of the 90-day Application Submission Period. Depending on the severity of missing information, incomplete applications may either be rejected or may be provided with an opportunity to provide missing information. Only after all applications have been designated as complete or have been rejected during the Completeness Check period will ICANN post the applied for strings and applicant data.
- The objection filing period begins with the posting of applied for strings and applicant data and ends 2 weeks after the close of Initial Evaluation. Applicant data necessary to file an objection will be made available via ICANN's website.
- It is important to note the distinction that reviews in Initial Evaluation offer no chance for appeal – the opportunity exists for clarifications only. Limited clarifications may be sought for String Similarity, DNS Stability and Background Screening as needed.

### Summary of Comments

#### Timing for amendment of incomplete applications.

The provisions in paragraph 1.1.2.8 (string contention) can be expected to be used in competing applications (contention sets) to take speculative advantage of intentionally caused delays by incomplete applications. Therefore applications should be given a limited time of a maximum 4 weeks to mend incomplete application parts. *dotBERLIN (13 July 2010)*. *dotBayern (20 July 2010)*. *dotHamburg (21 July 2010)*. *HOTEL (21 July 2010)*. *dotKoeln (22 July 2010)*.

Paragraph 1.1.2.8 should be amended so that applicants should be required to provide all information they can provide within a reasonable deadline set by ICANN. The string contention procedures will not

begin until all applicants in the contention set have completed all aspects of the evaluation. The deadline should help prevent applicants of speculative registrations from delaying the dispute resolution process. *eco (21 July 2010)*.

Supplements to applications. ICANN should allow supplements to applications after submission. This would help not for profit organizations that may have a learning curve to understand the process. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*.

Notice of changes (1.2.7). Part of the application should contractually or otherwise obligate applicants to notify ICANN of changes. *BITS (22 July 2010)*.

Clarify objection filing timeframe (1.1.2.4). ICANN needs to clarify the objection filing timeframe. One part of this area suggests that the objection period is based on the Administrative Completeness Check, but another section suggests it is based on the Initial Evaluation Period with a two week window of time between posting of the Initial Evaluation results and the close of the objection filing window. *BITS (21 July 2010)*.

Reconsideration. In every case, an applicant should have an opportunity within the ICANN process to request reconsideration of an erroneous or adverse decision. The current process has three places where an applicant or application can fail without opportunity for appeal or extended review: background check, string similarity, and DNS stability tests. *W. Seltzer (21 July 2010)*. *R. Dammak (July 2010)*.

Proof of good standing. ICANN should require proof of good standing in the application process. The DAGv4's elimination of this step at the early stage of the process raises concern about its impact on the entire process—it could potentially lead to a greater number of illicit applicants ending up in the applicant pool. Even if ill-intentioned applicants end up getting eliminated at a later point, it may still result in a waste of time of resources for ICANN and others which could have been prevented earlier in the process. *CADNA (21 July 2010)*.

ICANN permission to use Applicant logos (Module 6, section 9). There is no basis to give ICANN unfettered permission to use an Applicant's logos as section 9 provides. It is basic trademark law that the value and distinctiveness of a trademark such as a logo can be destroyed through unregulated use by parties other than the trademark owner. If ICANN requires the right to use an Applicant's logo, it should enter into a proper trademark license with the trademark owner. *IBM (21 July 2010)*.

Confidentiality (section 11.b). The confidentiality standard in this provision is insufficient. Rather than state that ICANN use "reasonable efforts" IBM proposes that the section should state that ICANN will have "sufficient agreements in place" to ensure confidentiality is maintained. *IBM (21 July 2010)*.

TLD Application System Access. Sections 1.1.2.1, 1.4.1 and 1.4.1.1 speak to applicants, but it is not clear what process ICANN will use for other users who wish to review open applications for possible objection. It is also unclear how 1.1.2.2. and ICANN not posting certain information on the TAS (e.g. related to finances, architecture and security) will affect potential objectors' ability to assess an application and its applicants. *BITS (22 July 2010)*.

Timing of subsequent application rounds (1.1.6). Given the timeframes of other sections, is it realistic for ICANN to assume the launch of a next round of applications “within one year of the close of the application submission period for this round”? *BITS (22 July 2010).*

Required financial documents (1.2.2). BITS recommends that ICANN ask for 3 years of audited financial statements instead of just one. Multiple years of statements would serve to validate the applicant’s ongoing fiscal strength. *BITS (22 July 2010).*

Application form (1.4.1.2)—encryption of data. ICANN should encrypt the application data in transit across the Internet (i.e. use HTTPS) and while it is at rest in storage at ICANN—at least for selected information such as financials. *BITS (22 July 2010).*

Evaluation fee (1.5.1)—proof of concept round. Can ICANN provide a table of the 200 Proof-of-Concept round applications, and are these eligible for re-application? *BITS (22 July 2010).*

## Analysis of Comments

Comments have requested clarity on the timing of providing complete applications to ensure string contention procedures begin appropriately. Although timelines are not yet final, it is expected that all Applicants will submit completed applications, including the receipt by ICANN of the full application fee, throughout and up to the final day of the Application Submission period. A 4-week completeness check period will ensue, allowing ICANN staff to validate that all applications question are complete and all necessary supplemental documents are attached. This review will not look at the adequacy of answers; rather it will focus on ensuring that each question has an answer. If an application is deemed incomplete, the applicant will have one opportunity to provide any missing data during this period. If the application remains incomplete at the end of this 4-week period, then it will be ineligible for further review and application fees (less any expenses incurred) will be refunded. Only after the completeness check is complete for all applications will ICANN post the applied for strings and other relevant information. The posting will also mark the beginning of Initial Evaluation. String Similarity analysis will begin immediately thereafter and string contention sets will be posted once this analysis is complete. Contention sets will be posted prior to the end of Initial Evaluation.

Another comment seeks clarity on the objection filing period as well the availability of applicant information necessary to file. The objection filing period will begin at the end of the completeness check period and will close two weeks after the Initial Evaluation results are posted. Based on current estimates, the objection filing period is expected to last approximately 5 1/2 months. In relation to the availability of applicant information, the objection process allows for interested parties to file objections against the organization applying for the string and/or the string on any of four grounds: [Limited Public Interest], Community, String Confusion, and Existing Legal Rights. This process does not allow for objections to be made on the applicant’s ability to meet financial, technical or operational criteria. Accordingly, relevant and necessary applicant data to file an objection will be made available via ICANN’s website.

A comment asked about the viability of committing to a subsequent application round “within one year of the close of the application submission period for this round.” The GNSO’s New gTLD Policy Development Final Report suggests that “Applications must initially be assessed in rounds until the scale of demand is clear” and that “...the first round will include scheduling information for the subsequent

rounds to occur within one year.” ICANN expects to meet this recommendation; however, the timing of the second round may be affected by necessary changes and improvements to the new gTLD program. Any potential delays in beginning the subsequent round will be communicated as soon as practical.

Comments have requested clarity, or made suggestions regarding several areas of the guidebook. One suggests that applicants should be contractually bound to inform ICANN if any material changes arise in regards to their submitted application. The current wording in the guidebook requires notice of changes to information, and makes it clear that if an applicant is found to have failed to notify ICANN of a material change, their application may be rendered invalid.

Another comment mentioned the three areas of Initial Evaluation (IE) that do not allow for appeal or extended evaluation; background check, string similarity, and DNS stability. It is important to note the distinction that no area of IE offers a chance for appeal – the opportunity exists for clarifications only. Limited clarifications may be sought for the three areas mentioned above in IE, as needed. For DNS Stability and String Similarity, as the submitted string cannot be modified, the need for clarifications is expected to be minimal.

A comment concerns the usage of the applicant’s name and logo in section 9 of the Terms and Conditions (Module 6). While the language does constrain the areas of usage, it will be further narrowed in the next version of the guidebook to reflect only the use of the applicant name. The other comment on Application Terms and Conditions relates to maintaining the confidentiality of applicant information in seeking consultation to evaluate an application. The Terms and Conditions state that ICANN will use reasonable efforts to ensure that panelists maintain confidentiality of information in the application. This would include having agreements in place with panelists and other experts that may be consulted, as suggested in the comment.

One comment suggests that three years of audited financial data should be requested as opposed to the one required in the current version of the guidebook. Requiring only one year of audited financials is intended to provide sufficient data on the applicant’s financial capability and broaden the range of applicants by avoiding overly burdensome requirements.

One comment reiterated that confidential data collected in TAS must be protected. We agree and ICANN is taking reasonable and necessary steps, including hiring an independent security consultant, to ensure that Applicant data is secured throughout the process.

One comment asked for a list of the year 2000 proof of concept participants. That information can be found here: <http://www.icann.org/en/tlds/app-index.htm>

## **EVALUATION**

### **Key Points**

- Applicants are expected to provide all necessary and relevant information at the time their application is submitted including disclosing any known concerns as described in Section 1.2.1 Eligibility (Questions 11d – f of the Application questionnaire).

- ICANN is moving forward with developing additional Eligibility (Section 1.2.1) guidelines that will be communicated to both potential applicants as well as Applicant evaluators prior to receiving applications.
- Protocols are being developed to ensure that all Applicants are aware of communications on a timely basis and are provided with same time period to respond to any clarifications requests.
- A clear process describing the Board’s role in evaluation and delegation has been developed and communicated.
- Initial Evaluations cannot be completed until all relevant public comments have been considered and addressed. A summary of how public comments were addressed per application will be provided after the end of Initial Evaluation.

## Summary of Comments

Question 18 and additional questions. The BC urges ICANN to add two more questions to sharpen the criteria for new gTLDs that add value and differentiation: (1) which users/registrants/organization/group/community do you intend to serve? (2) How does your TLD differentiate itself from others in the DNS? ICANN should initiate the new gTLD rollout with safeguards for an orderly approach to market differentiation and if or when necessary make adjustments in future applicant guidebooks. *BC (26 July 2010). R. Andruff (Module 1, 21 July 2010).*

Guidelines are needed regarding how Section 1.2.1 of the DAG will be applied. This section enables ICANN to deny a new gTLD application if any applicant, partner, officer, director or manager or any person owning more than 15% of the applicant “is the subject of a pattern of decisions indicating liability for, or repeated practice of bad faith in regard to domain name registrations.” Applicant evaluators need to be provided with additional guidance on this eligibility factor. For example, a statute of limitations of 5 years should apply in regard to past infringing activities, given that trademark infringement can be unintentional and the UDRP process is unpredictable. Also, a few adverse UDRP findings over many years in the context of a large domain portfolio should not be presumed to indicate that an entity or individual is a “bad actor” who should be barred from any significant involvement in a new gTLD. *ICA (21 July 2010).*

Definitions—security (2.2.3.1). The “security” section of this area is very minimalist. BITS recommends either direct inclusion of other security related requirements or at least reference to other areas of the applicant guidebook containing those requirements (e.g. 5.4.1). *BITS (22 July 2010).*

Evaluation team—communications (attachment to Module 2, scoring, p. A-3). How will applicants be notified that there is a communication to them from the evaluation team available at the “online interface” (e.g. will there be email notification to check the interface)? *BITS (22 July 2010).*

“Average, reasonable Internet user”. This term in Section 2.1.1.1.2 should be more clearly defined. *Red Cross (21 July 2010).*

Public interest prioritization. Rather than randomizing applications for batch processing, ICANN should consider prioritizing applications based on public interest need. *Red Cross (21 July 2010).*

World Health Organization (WHO) concerns not addressed. Concerns of the WHO regarding public health and safety issues involved with International Nonproprietary Names for pharmaceutical products (from WHO letter to ICANN dated 9 December 2009) have not been addressed. *A. Aikman-Scalese (21 July 2010).*

Financial evaluation—not-for-profits. Evaluation should take into account the different financial picture and sources of funding for not-for-profit organizations when reviewing whether an organization has adequate funding for three years of registry operations. *Red Cross (21 July 2010).*

Reserved names—regional ccTLD organizations (2.2.1.2). The four regional organizations of ccTLDs (AfTLD, APTLD, CENTR and LACTLD) should be added into paragraph 2.2.1.2 like reserved names. Like ARIN, LACNIC, AFRNIC, RIPE and APNIC, for IP numbers the regional organizations of ccTLDs are involved directly in the process of ccTLDs and ICANN. The four regional organizations have liaisons in the ccNSO Council and participate in different working groups and are recognized by the community. *E.I Ahon (Module 2, 17 June 2010).*

Section 2.2.2.3—Evaluation—clarifying questions. With respect to language changes made in this section, note that the evaluators are under no obligation to ask clarifying questions. RySG repeats its recommendation from its DAGv3 comments that evaluators should be obligated to ask clarifying questions where needed. *RySG (10 Aug. 2010). VeriSign (22 July 2010).*

Section 2.2.3.1—Definitions—Security and Stability.

No changes were made to the definitions of security and stability. They need to be revised. They conflict with and exceed the draft gTLD agreement, and are based on a misunderstanding of IETF practices and definitions. The contract language must be revised to adhere to proper terminology (e.g., contracted parties should not be required to adhere to IETF best practices; by definition best practices are not mandatory.) *RySG (10 Aug. 2010). VeriSign (22 July 2010).*

Some language in the “security” definition is too broad and opens it up to expansive interpretation. It potentially takes in a wide variety of small and large security incidents on the Internet. The mere fact that services are operating on a domain name does not imply or require registry involvement. The current language in the guidebook seems to come from the RSEP definition of an “effect on security” but it is missing the context of that definition. After the DAGv3 RySG suggested that the “security” language be changed to read: “Unauthorized disclosure, alteration, insertion or destruction of registry data, or the unauthorized access to or disclosure of registry information or resources on the Internet by registry systems operating in accordance with all applicable standards.” *RySG (10 Aug. 2010). VeriSign (22 July 2010).*

The “stability” definition’s phrase “authoritative and published by a well-established, recognized, and authoritative standards body” is unacceptable. ICANN should not leave the language open-ended and make contracted parties subject to any and all standards bodies. ICANN needs to explicitly enumerate the standards and name the authoritative body, which we believe is the IETF. Application of additional standards should be considered via the consensus process. *RySG (10 Aug. 2010).*

Question 11(f)—allegations of intellectual property infringement. The question as written is ambiguous. The more relevant question is whether the applicant has been charged with activities that infringe intellectual property rights in which a domain name has been used. The question should be rephrased to

refer to “allegations of intellectual property infringement relating to registration or use of a domain name.” The Notes column should make clear that ICANN can reject an application in which the applicant cannot provide a satisfactory explanation. *COA (21 July 2010)*.

Whois data quality policy disclosure. ICANN should require applicants to disclose their policies for Whois data quality—i.e. spell out how they will require registrars who sponsor registrations in the new gTLD to ensure the accuracy and currency of Whois data that they collect. The best approach is to include Whois data quality requirements in registry agreements with new gTLD operators, but disclosure in the application is a worthwhile fallback. ICANN should be able to use contract compliance tools to pursue registries that misrepresent their plans on critical issues such as improving Whois data quality. *COA (21 July 2010)*.

WHOIS requirements should be uniform. Whois enforcement must be stronger. The rules should be as specific as possible and ensure that accurate data is maintained. Applicants should be held to a uniform set of requirements in order to avoid any discrepancies. *CADNA (21 July 2010)*.

High Security Zone TLD Program—application-based incentives.

A specific evaluation question should be included to provide application-based incentives for applicants to protect the public by adopting the more rigorous protections spelled out in the High Security Zone TLD Program. Applicants should be awarded one or more optional points for a positive response, or alternatively points could be deducted from the evaluation score of an applicant who declines to take these additional steps to protect the public. *COA (21 July 2010)*.

We are concerned that an applicant’s decision to not pursue High Security Zone verification does not reflect negatively on the applicant or affect its scores in the evaluation process. There should be a right to object against any financial services gTLD applicant that seeks to avoid high security verification and such avoidance should be grounds for denial of the application. *ABA (22 July 2010)*. *BITS (22 July 2010)*.

ICANN Board role in evaluation and delegation.

The Board’s role in any part of the evaluation and delegation process is not sufficiently articulated or constrained. The Board’s role needs to be extremely clearly defined so that all parties know when and under what conditions the Board may step in. The Board, like the evaluators, needs to be bound by probity requirements to ensure there is no background lobbying (e.g. from national governments or others). The Board’s role in delegation must be clearly articulated (e.g., a Board bottleneck due to workload would be very unfair to an applicant who had successfully completed the application process). A full refund of costs of the evaluation would need to apply in cases of an applicant that passes evaluation but for which the Board denies delegation. *L. Williams (23 June 2010)*.

ICANN should assure that the Board’s role is to ensure that once submitted to ICANN that applications meet the criteria in the Final Applicant Guidebook as approved by the Board. ICANN should provide clarifying language in the Final Applicant Guidebook that if an application is deemed to have met the criteria, it is not the Board’s role to make further deliberations about the application’s validity or eligibility. *AusRegistry (20 July 2010)*.

Technical evaluation of new backend registry operators. Given the established registry backend operators—i.e., VeriSign, Afilias, Neustar, AusRegistry and CORE, ICANN should evaluate them once and “pass” all applicants who have them as their backend registry providers. This would save ICANN money

and simplify the application process. The only backend registry technical evaluation that would make sense is if the backend registry is new and has no prior history in the business. *MUSIC (20 July 2010)*.

Delegation decision—certainty of process. The Final Applicant Guidebook should provide clarifying information about certainty of process so that each successful gTLD applicant has a clear indication of when their delegation will occur. It is not clear how ICANN decides the order of delegation and how and when successful applicants are informed. *AusRegistry (20 July 2010)*.

Registry Failure—continuity of operations and financial instrument requirement.

The requirement for a financial instrument that will guarantee at least 3 years of operation of essential registry services in the event of business failure is an unnecessary drain on the resources of prospective registries already damaged by the long delay of the new gTLD program. The requirement is especially punitive for small registries and will tie up important resources. It will discourage deserving applications and contribute to the failure of others. The goal of protecting registrants can be met by different means. Instead, continuity can be assured through cooperative agreements between registries and/or registry service providers who agree to provide these services in the failed registry. This sort of arrangement, already contemplated by ICANN in its Registry Transition Process document, should be extended to the application evaluation portion of the DAG. ICANN should provide for alternative, non-financial means of guaranteeing registry service continuity, either wholly or in part. *Minds + Machines 21 July 2010*). *NIC Mexico (21 July 2010)*.

Neustar supports the financial instrument requirement. ICANN has done a comprehensive job to deal with situations where a registry operator is also the back-end registry services provider. A financial instrument is appropriate in such a case since there is no third party to continue the registry operations and therefore ICANN could incur significant costs for transition. The current language does not adequately address the situation where the registry operator does not operate the registry services itself but outsources it to a back end registry services provider. In such cases failure of the registry may not result in loss of critical services if the back-end provider continues operations in the event of an applicant failure. This approach would not require a financial instrument. Neustar notes that ICANN has already addressed the issue of the back-end registry service provider failure by requiring contingency planning and submission of a transition plan. *Neustar (21 July 2010)*.

Clarifications of language—public comments.

In 1.1.2.5, who will handle public comments and in which way (e.g. ICANN staff, independent evaluators) and how will they be reflected in the evaluation process? *DOTZON (21 July 2010)*.

There should be guidelines for evaluators to use when assessing public comments. How will they be determined? How will comment periods be managed? Comments may be used in dispute resolution (1.1.2.7); DRPs should be given guidelines regarding how to assess comments. *RySG (10 Aug. 2010)*. *VeriSign (22 July 2010)*.

RSEP fees. The cost estimate for fees for use of the RSEP process seems extremely high (\$50K for a three person RSEP panel). What are the individual cost factors that make up this estimate? There are now actual RSEP cases that have been processed, so that the cost model should now be re-evaluated and made more cost effective. *RySG (10 Aug. 2010)*. *VeriSign (22 July 2010)*.

## Analysis of Comments

Some comments suggested that “market differentiation” should be reflected as a criterion in the evaluation process. This point can be interpreted in a number of ways. Implementing market-differentiating criteria could be construed as limiting competition for existing registries and potentially stifling innovation. As with any industry, two or more organizations focused on the same consumer provide that consumer with choice. It is this choice that drives competition which can lead to innovation, product/service differentiation, and price reduction. Additionally, evaluating (i.e., scoring) the beneficial effect of innovation is difficult or impossible and presents contract enforceability issues.

The proposed question “Which users/registrants/organization/group/community do you intend to serve?” is already explicitly part of the application for those designating their applications as community-based. It is also implicitly part of the existing question required of all applicants to state their mission and purpose (question 18). This is an open-ended question to give the applicant the opportunity to describe the overall scope of its proposal, and to enable informed comment on the application. There is no expectation that this question should be used to eliminate any overlapping user groups, nor is there an assumption that the same group cannot be served by more than one TLD.

The second proposed question, “How does your TLD differentiate itself from others in the DNS?” might provide an interesting perspective, but it is unclear how responses to this question could be scored, used as a threshold item, or enforced without a significant expansion of the scope of ICANN’s responsibilities.

ICANN’s Core Values include “...depending on market mechanisms to promote and sustain a competitive environment.” How applicants will differentiate themselves within a given market or industry should be a decision left to the applicants and the relevant markets. ICANN should not judge the effectiveness of an applicant’s business model. Rather, ICANN is focused on DNS stability, preventing user confusion, determining whether an applicant has demonstrated basic competencies to run a registry, and protecting registrants and users.

A comment suggests that additional guidelines are needed for the Eligibility requirements as covered in section 1.2.1 of the Draft Applicant Guidebook. ICANN agrees and is moving forward with developing additional guidelines that will be communicated to both potential applicants as well as Applicant evaluators prior to receiving applications. Applicants will still be required to disclose any known issues and can provide clarification of these issues upon submitting the application. Should other issues be found, not previously disclosed by the Applicant, ICANN will seek additional clarification from the Applicant. This clarification request will be conducted during Initial Evaluation.

A comment suggests rephrasing question 11(f), regarding relevant infringing activity in the applicant’s background, for greater clarity, to refer to “allegations of intellectual property infringement relating to registration or use of a domain name.” This is a useful suggestion and this change will be made in the revision.

Comments have been raised seeking clarity on communication with Evaluation Panelists. One comment asks how Applicants will be notified of communications from Evaluation Panelists while another seeks to ensure that Evaluation Panelists be obligated to seek clarifying questions where needed. Protocols are being developed and will be published to ensure that all Applicants are aware of communications on a timely basis and are provided with same time period to respond to any clarification requests.

In addition, Applicants are expected to provide all necessary and relevant information at the time their application is submitted. This includes complete and accurate information to support relevant criteria in the Applicant Guidebook. Evaluation Panelists are experts in their respective fields and are expected to conduct a thorough analysis based on the information provided by each applicant. If a thorough analysis cannot be completed, then clarification questions may be asked. However, as the Applicant can provide no new information - only clarifying information for the answer or information previously provided - a clarification request may not be needed. Accordingly, clarifications will be at the discretion of the Evaluation Panelist.

Note that the evaluation process is designed to afford several opportunities for clarification and amplification when needed. Applicants are expected to provide complete and accurate applications and supplemental data upon the first submission. A Customer Service function will be available to handle questions from applicants during the Application Submission Period. The Customer Service function will endeavor to provide and publish answers to all relevant questions from all applicants, to the extent practicable, in the applicant's language of choice. The guidebook encourages applicants to take advantage of this Question/Answer mechanism to address any particular areas of uncertainty before the application is submitted, to reduce the need for additional clarification and review steps. Once the Initial Evaluation has commenced, the evaluation panels and applicants will conduct a coordinated exchange of information, if needed, which should address any remaining oversights or misunderstandings. Finally, applications not passing Initial Evaluation will have the option of requesting Extended Evaluation procedures in which they may provide further data supporting their applications (there is no extra cost to the applicant for electing this option). The availability of these opportunities before, during, and after application submission should allow the applicant to provide all necessary information to the evaluators.

A comment suggests there should be some prioritization of batch processing applications versus random selection. Note that batching will only occur if the volume of applications is so high that the process as already built cannot accommodate it. In such a case, the same concerns highlighted in the discussion of application categorization also apply to establishing categories of applications and prioritization thereof for batch processing. Providing benefit to one set of applicants over another does not promote a fair and impartial process.

A comment suggests that the evaluation should account for differing funding sources when reviewing an application from a not-for-profit entity as opposed to a for-profit entity. It should be noted that the estimated level of funds required for three years of operation is determined by the applicant, not the evaluators. The financial review panel considers the information provided and assesses whether the proposed funding level will be adequate to maintain a secure and stable TLD. This is the case regardless of what type of entity the applicant is.

In relation to Whois requirements, comments suggest that additional steps should be undertaken in regard to Whois accuracy measures as part of the evaluation process. This was discussed and considered previously. Changes in Whois policy require a consensus based, bottom-up decision. ICANN is working on several fronts to improve Whois accuracy: policymaking support, technical, compliance, and performance reviews. In the meantime, there are improvements in the Guidebook including the requirement to maintain a thick Whois database and an option to implement searchable Whois.

In relation to increased security, one comment suggests providing an incentive to encourage applicants to implement more rigorous protections as highlighted in the proposed High Security Zone TLD Program

and another suggests that such rigorous protections be required of certain applicants. Continual improvement in security will always be part of the new gTLD program. Adoption of an HSTLD type certification will be urged for registries whose model connotes “security, such as a TLD providing financial services.” There are a number of reasons for making this a requirement of a specific type of application.

Comments seek clarity of Board’s role in the evaluation and delegation processes. We agree that further clarification is needed, and consultations with the Board have resulted in the detail provided in the new Guidebook.

A comment suggests that established back-end registry providers be evaluated once as opposed to on a per-application basis. It is agreed that certain efficiencies can be gained in the approach to reviewing applications with the same back-end registry provider, and this will be tested in the evaluation process. However, there is no assumption that all such applications will be identical or should be subject to a less thorough standard of review.

A comment seeks clarification about the order of delegation and how and when successful applicants are informed. This process has been clarified in the Guidebook. The order of delegation depends strictly on how quickly the applicant can complete each step in the process after Initial Evaluation. Note, all applications will complete Initial Evaluation at the same time. If an application passes Initial Evaluation and is not part of a string contention set or does not have any objections pending, then it moves straight to contract execution. Once the contract is signed, the applicant will move straight to pre-delegation check. As this check is passed then it will move directly to IANA for delegation. ICANN expects to have resources available to execute each step as the application progresses. Note, however, that this part of the process is dependent on many factors – including applicant level of readiness – and not solely controlled by ICANN.

In terms of communication, clear posting dates will be communicated to the public and the pool of applicants throughout the evaluation process. As the Applicant progresses through each step, updates will be communicated to the public and to the Applicant directly.

One comment suggests the addition of the names of regional ccTLD organizations to the list of names that are reserved at the top level. This was considered; however, the top-level reserved names list is intended to be as narrow as possible, and cover only those names which have an impact on the DNS infrastructure or are part of the organizational structure of ICANN. The bodies mentioned are certainly contributors to ICANN, but fall more into the category of constituencies, which are more loosely formed and self-governed, and it would expand the list considerably to include all of these as reserved names.

Several comments seek clarification of the public comment process. As discussed in the Applicant Guidebook, the public comment period will open with the public posting of applicant data at the end of the completeness check and prior to commencing Initial Evaluation. To ensure that Evaluation Panels and Dispute Resolution Providers are able to effectively and timely consider public comments, the public comment window will remain open for 45 days. A general comment forum will remain available, but if comments are to inform Initial Evaluation, they must be submitted within the 45-day period. All panelist and dispute resolution providers will have access to the comments. The availability and use of public comments will be discussed with the Evaluation Panels and Dispute Resolution Service Providers as part of their training. In the case of a dispute resolution proceeding, the panel must provide the reasoning

upon which the expert determination is based, which might include consideration of relevant public comments.

Comments regarding the financial instrument requirement suggest that ICANN should provide alternatives, or that the requirement would be irrelevant in the case where part or all of the registry operations are outsourced to a third-party service provider. The two options currently included in the guidebook ([a] letter of credit or [b] cash escrow deposit) are in place because they provide the most efficient and reliable means for transfer of funds in the event of a registry failure scenario. Other options (such as those contained in earlier drafts of the guidebook) have been considered in detail for implementation, but could not offer the same speed or reliability without being cost-prohibitive for applicants. Note that the funds are only released if a threshold is met for failure of one of the critical functions. It should be considered that even if the existing service provider continues to execute the critical functions in the short term, it is not clear that such a provider would be willing to continue such operations indefinitely, especially in the absence of financial provision for it by the registry operator. The financial instrument is considered a cornerstone of registrant protection and thus is a requirement across all new gTLDs for a particular time period.

With regard to the registry services portion of the evaluation process, a set of comments suggested changes to the definitions of ‘security’ and ‘stability’ that are employed. The current definitions are found in existing registry agreements and can also be found in the Registry Services Evaluation Policy (“RSEP”) -- see <http://www.icann.org/en/registries/rsep/rsep.html>, which was adopted as an ICANN consensus policy. The definitions are intentionally broad -- anything a registry might do that could harm other systems on the Internet would be considered a security/stability issue and could cause ICANN to withhold approval of a particular service. These definitions are critically important terms and part of a process that has a significant impact on the DNS. A change to the currently accepted and workable process should be subject to a broader stakeholder discussion.

With regard to estimated RSEP fees, comments suggested that the model could be more cost-effective. The current expected fee of \$50,000 was estimated based on a significant decrease from historical costs. Efficiencies were introduced so that the fee is less than 50% of the current cost per RSTEP evaluation. In the three years that the Registry Services Evaluation Policy has been in place, a small fraction of registry services proposed by existing gTLD registries have resulted in an RSTEP review. Each inquiry involving the RSTEP involves a 5-person panel and costs \$100,000-\$125,000. In the new gTLD process it is anticipated that most cases will be addressed using a 3-person panel.

## **TRADEMARK PROTECTION**

### **Key Points**

- Comments from every section of the ICANN community and broader Internet community have been thoroughly considered in the development of the current trademark protection mechanisms called for in the Applicant Guidebook.
- These trademark protections reflect carefully crafted compromises that received broad support within the GNSO and At-Large communities.
- Although some debate adequacy, the new trademark protections are unprecedented and aim to create a balance between all interested parties with a main focus of protecting rights holders and consumers, including both registrants and Internet users.

## Summary of Comments

Registry option to exceed baseline rights protection. Most of the comments to date from the IP community are of a “baseline” nature, while registries themselves can choose to go over and above these requirements. Big Room invites feedback from IP and trademark experts as to what a “best in class” sunrise and ongoing rights protection mechanism(s) would entail. *Big Room (21 July 2010)*. What is expected of a registry operator section (5.4.1). This is an important section which includes key requirements such as DNSSEC deployment requirement, Whois service, maintenance of an abuse point of contact, and continuity. BITS suggests that ICANN require both the Trademark Rights Service and the Sunrise period at startup. *BITS (22 July 2010)*.

### Support for level of IP protection

The DAG is sufficient and is a significant concession to trademark owners even though the IRT’s recommendations were not accepted in their entirety. Every interest group within the ICANN community has found that they need to live with something that is, from their point of view, less than perfect. The IP community should be no exception especially in light of the considerable concessions already made to them. *Minds + Machines 21 July 2010*.

We work in the interest of the global hotel industry and we support the proposed instruments for rights protection, which are the result of intense discussions within the ICANN community. *HOTEL (21 July 2010)*.

Subject to minor drafting matters the trademark overarching issue should be considered complete. The protections developed through stakeholder discussion and compromise will provide trademark holders with significantly more protection than exists in current gTLDs. *R. Tindal (21 July 2010)*. *Domain Dimensions (22 July 2010)*. *Demand Media (22 July 2010)*. *D. Schindler (22 July 2010)*.

### Trademark protection not adequate.

IOC appreciates ICANN’s recognition of IOC’s comments regarding special statutory trademark protection as a proposed standard for inclusion in the trademark clearinghouse. However, IOC finds troubling the statements from ICANN leadership confirming that trademark protection in new gTLDs is believed to be a settled issue. *IOC (21 July 2010)*.

Current RPMs do not adequately address trademark concerns. *WIPO Center (16 June 2010)*. *Arla Foods (6 July 2010)*. *LEGO (6 July 2010)*. *JONAS (11 July 2010)*. *VKR Holding (13 July 2010)*. *Nilfisk (13 July 2010)*. *LEO Pharma (14 July 2010)*. *Vestas (16 July 2010)*. *Coloplast (19 July 2010)*. *MarkMonitor (19 July 2010)*. *BBC (21 July 2010)*. *C. Speed (21 July 2010)*. *Hogan Lovells (21 July 2010)*. *IPC (21 July 2010)*. *DuPont (21 July 2010)*. *Comerica (3 Aug. 2010)*. *Carlson (21 July 2010)*. *Sunkist (21 July 2010)*. *Solvay (22 July 2010)*. *ETS (22 July 2010)*. *LifeScan (22 July 2010)*. *INTA Internet Committee (21 July 2010)*. *Coca-Cola (21 July 2010)*. *News Corporation (21 July 2010)*. *Adobe Systems (21 July 2010)*. *SIIA (21 July 2010)*. *Microsoft (21 July 2010)*. *ABA (22 July 2010)*. *Liberty Mutual (22 July 2010)*. *AIM (Module 5, 14 July 2010)*. *Nestle (21 July 2010)*.

Nilfisk is against introduction of new TLDs as long as the current system does not secure effective solutions to cybersquatting and trademark infringement. *Nilfisk (13 July 2010)*.

ICANN has not adequately addressed the overarching issue of trademark protection in the new gTLDs. *INTA Internet Committee (21 July 2010). Adobe Systems (21 July 2010)*

Introduction of new gTLDs will create vast opportunities for bad faith registrations and harm intellectual property owners and consumers. Consumers will lose trust in trademarks as guides in the global market. *JONAS (11 July 2010). INTA Internet Committee (21 July 2010).*

It is inevitable that conflicts will arise between competing brand owners in different jurisdictions. It is naïve to suggest (as ICANN does) that applicants identified as in contention can be encouraged to reach a settlement or agreement to resolve that contention, at least where trademark rights are concerned. It is highly unlikely that a brand owner would be prepared to share or relinquish control over its brand to a competing brand owner either in the same industry in a different country or a different industry in the same or a different country. We do not consider it possible to reconcile the conflict between territorial trademark rights and the global nature of the Internet. It is for this reason among others that BBC has opposed and maintains its opposition to ICANN's proposals. ICANN needs to adopt a solution which genuinely lessens the need for defensive registrations and the administrative and financial burden on trademark owners. *BBC (21 July 2010).*

It is extremely disappointing that ICANN has failed to take the opportunity to require registry operators to adopt and implement rapid takedown or suspension systems to combat malicious conduct. Microsoft reiterates the proposal it made for this in its version 3 comments, including being amenable to having one or more Microsoft employees with relevant expertise to work on an ICANN-convened expert group to develop a required rapid takedown or suspension system. *Microsoft (21 July 2010).* Notwithstanding a succession of processes, there has been little truly substantive dialog on trademark considerations. Exchanges are subject to palpable registration-driven pressures, and have not lived up to a proper standard of open and informed dialog, which is key to a long-term, stable DNS framework. This is illustrated by the heavily compromised state of the envisaged protection mechanisms: the PDDRP ignoring willful blindness; the URS becoming overburdened; and the TMC not providing a level playing field. These circumstances support the Economic Framework paper's recommendations that ICANN proceed in a controlled manner, i.e., in discrete limited rounds. WIPO staff will continue to monitor developments and remains available to contribute to rights protection systems that work for durable DNS expansion. *WIPO Center (21 June 2010).*

The trademark protections in the current guidebook are weak and inadequate. If ICANN does not review the current guidebook and adapt it to respond positively to our concerns, our members will appeal to national governments and other bodies. *MARQUES/ECTA (21 July 2010).*

Significant issues of concern remain regarding intellectual property protection. The online community will benefit from a smartly designed TMC and URS and IHG looks forward to seeing them through. *IHG (20 July 2010).*

The cost of acquiring a gTLD is too high for most companies, as well as the cost of enforcement of their trademark rights. At the very least, ICANN should allow for a period of time for existing companies with established, registered trademarks to register those trademarks with ICANN (or ICANN should be required to do a trademark search) to avoid this problem. *Piper Aircraft (14 July 2010).*

AAFA requests that ICANN reevaluate and revise the current rights protection mechanisms proposed for both the application process and post-delegation to ensure that brand owners' (i.e., the apparel and footwear industry that is so dependent on the strength of their reputation and brand names) legitimate concerns and rights are properly protected and assured in the new gTLD space. Without requisite mechanisms in place to protect brand owners in the application process and post-delegation, AAFA is concerned that the new gTLD program could provide a vehicle for rampant abuses and exploitation of its apparel and footwear members' valuable marks and brands to increase exponentially. The apparel and footwear industry is concerned that the proposed high costs of registering a new gTLD will not deter the often well-funded and highly organized counterfeiting operations that are prevalent online. As cost alone is unlikely an impediment to these bad actors, stronger brand protection mechanisms are critical. The RPMs need to be stronger, less costly and more efficient than the RPMs currently proposed in the DAGv4 for protecting trademarks. The overwhelming burden still falls substantially on brand owners to stop infringement, and the proposed processes to do so remain overly cumbersome, expensive and time intensive for brand owners. *AAFA (21 July 2010)*.

ICANN should address trademark owners' concerns about the current inadequate protection measures in DAGv4 by providing for rules that:

- Avoid discriminatory treatment of trademark registrations;
- Provide for equitable and efficient resolution of situations of split trademark ownership (e.g. geographic split or product category split);
- Include clear procedures for the trademark repository and recognition of trademark registrations;
- Include IP rights other than trademarks alone;
- Provide for an equitable and efficient dispute resolution system (a shifting burden of proof after demonstration of a prior IP right, including the "loser pays" principle);
- Streamlining the appellate procedure;
- Providing unambiguous provisions for transfer or cancellation of domain names; and
- Including clarification on closed gTLDs.

*PMI (21 July 2010)*.

#### Dilution of IRT work.

ICANN has allowed the mechanisms proposed by the IRT to be worn away, as ICANN evidently hopes that stakeholders will be worn down until they can be ignored entirely. The relevant provisions in AGBv4 have changed little from the STI Review Team recommendations. There is not consensus on the RPMs in DAGv4 which, if taken together, fall well short of an effective response to the problem of trademark-related external costs in the new gTLD process. ICANN's refusal to strengthen these mechanisms, even so far as to bring them back to the level originally recommended by the IRT, is tantamount to concluding that trademark holders and the public at large should bear these costs, which is contrary to the public interest that ICANN has pledged to serve. *Time Warner (21 July 2010)*. *Com Laude (21 July 2010)*. *Hogan Lovells (21 July 2010)*. *HSBC (21 July 2010)*. *MPAA (21 July 2010)*. *INTA Internet Committee (21 July 2010)*.

ICANN should proceed generally with all of the mechanisms set forth in the IRT report. *USCIB (21 July 2010)*. *Microsoft (21 July 2010)*.

The overarching trademark issues have not been resolved. It would not be a backwards step to re-form the IRT; changes are needed and the IRT is well placed to advise in this area. *C. Speed (21 July 2010)*.

ICANN should either turn to qualified IP experts to craft a package of effective protection measures or return to the original recommendations of the IRT report. WIPO could have a key role in this process and could use the IRT's original proposals as the starting point. ICANN should start out with strong measures that could be liberalized later if necessary. To satisfy the broader community, a review of such measures could be instigated after they are operational (e.g. after two years). *MARQUES/ECTA (21 July 2010)*.

The AGBv4 is a step backwards—ICANN has inexplicably chosen to dilute the long-term solutions presented by the IRT. Without adequate remedies, the issue of trademark protection remains unresolved. The current proposals are too burdensome, expensive and unwieldy compared with existing remedies such as the UDRP or civil remedies available under the ACPA. We do not expect the business or trademark community to endorse or make wide use of the current trademark protection proposals in the future. At a minimum, all trademark protection remedies must be: (1) effective as a remedy; (2) reasonably expedited; (3) stringent enough to avoid gaming; (4) based on actual costs (which avoids further monetization and extraction of unnecessary fees from trademark holders); (5) provide for increased certainty; and (6) result in making the trademark holder whole. *Verizon (20 July 2010)*. *IPC (21 July 2010)*. *DuPont (21 July 2010)*. *Rosetta Stone (21 July 2010)*.

#### Process.

It is clear from comments of senior ICANN staff at the Brussels meeting that no further major changes to the AGBv4 on rights protection mechanisms will be seriously entertained. The cross-community efforts to date are not a triumph of the bottom-up policy development process. Rather, the almost complete lack of support for the final outcome (the insufficient mechanisms now included in AGBv4) among members of the community with the most at risk demonstrates that the process has been a failure. The real losers will be the consuming public on whose interests in avoiding marketplace confusion and fraud the entire trademark system is based. *COA (21 July 2010)*. *BBC (21 July 2010)*. *Adobe Systems (21 July 2010)*.

It is ironic that ICANN prepares to announce “mission accomplished” on RPMs just when its Economic Framework paper calls for an objective study of the full costs to trademark owners of new TLDs (e.g., enforcement, monitoring, defensive registrations). This should have been step one in devising a sound and efficient system of RPMs, not an epilogue to a tale on which ICANN is about to close the book. *COA (21 July 2010)*. *BBC (21 July 2010)*.

Relationship to UDRP. The current new gTLD program's RPMs should meaningfully complement, not destabilize, the proven, globally recognized UDRP. *WIPO Center (16 June 2010)*.

Expansion. There is a substantial gap in coverage among the currently proposed trademark protection proposals. Currently there is no DRP or other mechanism that allows a brand owner directly to confront registrar misconduct. *INTA Internet Committee (21 July 2010)*.

#### Globally protected marks list (GPML).

The lack of a GPML in AGBv4 is very disappointing as it could have provided some relief for trademark owners of such marks. *Arla Foods (6 July 2010)*. *LEGO (6 July 2010)*. *Nilfisk (13 July 2010)*. *Vestas (16 July 2010)*. *MARQUES/ECTA (21 July 2010)*. *HSBC (21 July 2010)*. *IPC (21 July 2010)*. *DuPont (21 July 2010)*. *IPOA (21 July 2010)*. *Coca-Cola (21 July 2010)*. *News Corporation (21 July 2010)*. *Adobe Systems (21 July 2010)*. *SIIA (21 July 2010)*. *Nestle (21 July 2010)*.

Without the GPML there is no proactive trademark protection provided with the launch of new gTLDs. *AT&T (21 July 2010). AIPLA (21 July 2010). BC (26 July 2010). AIM (Module 5, 14 July 2010).*

## Analysis of Comments

Many have commented on the general nature of trademark protections that have been put in place for the New gTLD Program. Some think they are sufficient, some think they are not sufficient and some have said that there has not been enough substantive discussion on the issues. Still others state that any protections put in place should extend to registrars.

It is important to reflect on the chronology of events that led to the development of the trademark protections now included in the New gTLD Program for new gTLDs. After the early versions of the Applicant Guidebook were posted, the trademark community spoke out loudly and clearly – more trademark protections were needed. Those comments were heard by ICANN. In response, the Board resolved to establish an Implementation Recommendation Team (IRT), to help identify and propose rights protection mechanisms (RPMs) for trademark holders within the New gTLD Program (see <http://www.icann.org/en/minutes/resolutions-06mar09.htm#07>). The IRT described itself as a group of 18 people experienced in trademark protection on the Internet.

Specifically, the Board asked the IRT to develop a set of solutions that addressed trademark protection and consumer protection in a way that was workable, and that was acceptable to other interests. Other parties were invited to respond to the IRT work, to propose solutions, and an extensive public outreach process was initiated, including several regional events held throughout the world.

In a series of face-to-face meeting, conference calls, and public consultations, the IRT engaged in intensive substantive discussion and developed specific recommendations (<http://icann.org/en/topics/new-gtlds/irt-final-report-trademark-protection-29may09-en.pdf>), reflecting “the views of business and trademark interests in general.” Those recommendations included proposals for an IP Clearinghouse (“Clearinghouse”), a Uniform Rapid Suspension System (“URS”), a Trademark Post-delegation dispute resolution procedure (“PDDRP”), and a globally protected marks list (“GPML”). Concerns from the broader ICANN Community immediately emerged with respect to several IRT recommendations. After significant public comment, through both the public comment forum and numerous face-to-face meetings, additional refinement of the IRT proposals were needed in order to balance the interests of the community as a whole, the trademark holders, and registrants with legitimate interests in registering domains that might also be the subject of a trademark. Compromises were also required in light of the implementation difficulties of some of the IRT proposals.

The next iteration of the Guidebook included nearly all of the trademark protection mechanisms suggested by the IRT, including the Clearinghouse, the URS and the PDDRP. The GPML was not included in light of the implementation difficulties with, and the significant opposition to, such a list.

After further comment, discussion and revision, the Board sent the Clearinghouse and the URS proposals back to the GNSO. The Board requested the GNSO Council’s view on whether the Clearinghouse and URS recommended by the staff were consistent with the GNSO’s proposed policy on the introduction of new gTLDs, and were appropriate and effective for achieving the GNSO’s stated principles and objectives.

In response to the Board's request, the GNSO established the Special Trademark Issues Review Team ("STI"), consisting of members of each Stakeholder Group, At-Large, Nominating Committee Appointees, and the GAC. The STI issued a final report on 17 December 2009, including several recommended revisions to the Clearinghouse and the URS proposals (see <http://www.icann.org/en/announcements/announcement-2-17dec09-en.htm>), which were unanimously adopted by the GNSO.

In addition, ICANN invited community participation in an open consultation process to discuss and propose revisions to, among other things, the PDDRP. This group was formed as the temporary drafting group ("TDG").

Together, the IRT recommendations, the STI revisions, the TDG revisions, and comments from every section of the ICANN community and broader Internet community were taken into consideration in the development of the current trademark protection mechanisms called for in the Applicant Guidebook. These new trademark protections are unprecedented and are intended to create a balance between all interested parties with a main focus of protecting consumers, including both registrants and Internet users.

These trademark protections now part of the new gTLD Program include:

- The requirement for all new registries to offer either a Trademark Claims service or a sunrise period at launch.
- The establishment of a Trademark Clearinghouse as a central repository for rights information, creating efficiencies for trademark holders, registries, and registrars.
- Implementation of the URS that provides a streamlined, lower-cost mechanism to suspend infringing names.
- The requirement for all new gTLD operators to provide access to "thick" Whois data. This access to registration data aids those seeking responsible parties as part of rights enforcement activities.
- The availability of a post-delegation dispute resolution mechanism that allows rights holders to address infringing activity by the registry operator that may be taking place after delegation.

And of course, the existing Uniform Domain Name Dispute Resolution Policy (UDRP) continues to be available where a complainant seeks transfer of names. Compliance with UDRP decisions is required in all new, as well as existing, gTLDs.

Each of the recommendations above is intended to provide a path other than defensive registrations for trademark holders.

The application process itself, based on the policy advice, contains an objection-based procedure by which a rights holder may allege infringement by the TLD applicant. A successful legal rights objection prevents the new gTLD application from moving forward: a string is not delegated if an objector can demonstrate that it infringes their rights.

Contrary to the comment that there has been very little substantive discussion on this issue, the likely thousands of emails and hundreds of teleconferences had by the IRT, the STI, the TDG, the GNSO Council, the At-Large and numerous other stakeholder groups and constituencies relating to trademark

protection point to the significant effort and attention dedicated to the evaluation of these new trademark protections. These are in addition to the face-to-face meetings held at each of the ICANN Public Meetings as well as apart from those public meetings, such as those held by ICANN in Marina del Rey, New York and London.

Finally, in response to other trademark protections proposed but not included in the Applicant Guidebook, such as extending applicable trademark protections to registrar conduct, such ideas could be further explored through the initiation of policy development through the GNSO Council.

## TRADEMARK CLEARINGHOUSE

### General

### Key Points

- In terms of entry into the Clearinghouse, all nationally or multi-nationally registered marks are eligible, as well as mark validated by a court, or protected by statute or treaty (subject to some date limitations).
- Steps have been taken to ensure consistency and to prevent similarly situated applicants from being treated differently.

### Summary of Comments

#### Clearinghouse Proposals.

ICANN should share first drafts of the IP clearinghouse process as soon as possible. *dotZON (21 July 2010)*. *HOTEL (21 July 2010)*.

The Clearinghouse section should focus on “what we want” and avoid “how it gets done” as this section will be the nucleus for a later RFP and it is important to stimulate creative and competitive proposals from a wide range of service providers of the trademark industry. *EnCirca (Module 5, 21 July 2010)*.

Evolution of Clearinghouse. There should be a mechanism for the Clearinghouse to evolve in its uses in the future. To enable this, following the sentence “The reason for such a provision would be to prevent the Clearinghouse from using the data in other ways” add the phrase “without undergoing the ICANN public participation process.” *EnCirca (Module 5, 21 July 2010)*.

Support for Clearinghouse as drafted in AGBv4. It was supported by both the IRT and STI, has broad acceptance from ICANN constituencies and received approval from the GNSO Council. *R. Tindal (21 July 2010)*. *Domain Dimensions (22 July 2010)*. *Demand Media (22 July 2010)*.

#### Clearinghouse is not an RPM.

The Clearinghouse is not a protection mechanism—it is merely a database. *VKR Holding (13 July 2010)*. *MarkMonitor (19 July 2010)*. *Comerica (21 July 2010)*. *Solvay (22 July 2010)*. *ETS (22 July 2010)*. *Carlson (21 July 2010)*. *C. Speed (21 July 2010)*. *CADNA (21 July 2010)*. *Sunkist (21 July 2010)*. *Adobe Systems (21 July 2010)*. *LifeScan (22 July 2010)*. *Liberty Mutual (22 July 2010)*. *BC (26 July 2010)*. *NCTA (Module 3, 21 July 2010)*. *AIM (Module 5, 14 July 2010)*.

The Clearinghouse is just a database, and it would promote the need for defensive registrations. *Arla Foods (6 July 2010)*. *LEGO (6 July 2010)*. *LEO Pharma (14 July 2010)*. *Vestas (16 July 2010)*. *Coloplast (19 July 2010)*. *BBC (21 July 2010)*. *Verizon (20 July 2010)*. *PMI (21 July 2010)*. *HSBC (21 July 2010)*. *DuPont (21 July 2010)*. *AIM (Module 5, 14 July 2010)*.

The Clearinghouse provisions in AGBv4 do not fully encompass the IRT recommendations in focusing support of pre-launch service. *USCIB (21 July 2010)*.

#### Burden on trademark owners.

The Clearinghouse potentially obliges the trademark owner to record all of their trademarks from all territories, significantly increasing costs and workload. Since the trademark owner receives no notice of the application for registration and no opportunity to communicate with the registrant prior to registration, one national registration per mark may not be sufficient for inclusion in the Clearinghouse.

The Clearinghouse requires an extra charge for brand holders, does not provide comprehensive coverage given that only identical marks can be registered and common law marks are left out. The Clearinghouse is given unprecedented discretion to validate and authenticate trademarks for registration in the Clearinghouse. *MarkMonitor (19 July 2010)*. *Carlson (21 July 2010)*. *Comerica (21 July 2010)*. *Sunkist (21 July 2010)*. *Solvay (22 July 2010)*. *LifeScan (22 July 2010)*. *ETS (22 July 2010)*. *Liberty Mutual (22 July 2010)*.

## **Analysis of Comments**

There have been some comments about the timing and openness of the Clearinghouse proposal process. It should be noted that each version of the proposal (originating with the IRT proposal) has been published for public comment and continues to be revised and improved as a result of public comment. Importantly, as can be seen from the Clearinghouse proposal, not all aspects have been fully addressed as some are necessarily left to the potential providers to explore and develop.

Some commentators have suggested that the Clearinghouse is simply a database and others suggest it will promote the need for defensive registrations. It is unclear as to why that might be the case. The need for defensive registrations should be reduced if trademark holders register their marks in the Clearinghouse because it will better enable the trademark holder to avail itself of all rights protection mechanisms in the pre-delegation process.

The IRT recommendations with respect to the Clearinghouse have been the subject of substantial review and comment. The GNSO appointed the STI to evaluate the recommendations of the IRT and provide input. The STI then set forth its proposal at <http://www.icann.org/en/announcements/announcement-2-17dec09-en.htm>. That revision was posted in February 2010 and was the subject of public comment. Again the model was reviewed and published for additional comment in April 2010. In balancing the competing comments, not all suggestions could be incorporated as they often reflected opposite ideas, many of which had been considered by the STI. The resulting Clearinghouse is the product of this detailed review and analysis.

Much discussion surrounded which marks should be eligible for inclusion in the Clearinghouse. On the one hand, trademark holders wanted to be sure that they could register their marks but at the same time there were concerns that fraudulently obtained registrations could be used to game the system. The

result of review and input from a variety of constituencies was to create a list of specific criteria for entry. In terms of entry into the Clearinghouse, all nationally or multi-nationally registered marks are eligible, as well as marks validated by a court, or protected by statute or treaty (subject to some date limitations). In creating objective criteria, steps have been taken to prevent the exercise of discretion and to prevent similarly situated applicants from being treated differently.

## Procedural Aspects

### Key Points

- Costs should be borne by the parties utilizing the services.
- In order to protect access to data, providers will be the only entities that have full access to Clearinghouse data.

### Summary of Comments

#### Costs.

Registries and registrars (not most trademark owners) will be the main beneficiaries of the Clearinghouse and they should also contribute to its costs. ICANN should also bear some of this cost. ICANN stands to generate substantial revenues through the new gTLD process and it should bear some responsibility to ensure that the new program does not facilitate widespread infringement of brand owner rights and widespread confusion and deception of the public. *BBC (21 July 2010)*. *CADNA (21 July 2010)*. *NCTA (Module 3, 21 July 2010)*.

The cost of funding the Clearinghouse should be apportioned between the entities that will profit economically from new gTLDs—ICANN, registry operators and registrars (see Clearinghouse, sec. 10). *IOC (21 July 2010)*.

Trademark owners should pay only the transaction costs directly associated with the inclusion of their individual trademarks and they should not pay for elements of Clearinghouse overhead and its fixed operational costs. *IPOA (21 July 2010)*. *AIPLA (21 July 2010)*.

If the cost of the Clearinghouse is to be borne by those using the service, then there should be not additional charges by registries to trademark owners for sunrise/claims services other than the annual domain name registration fee and the fees should be the same as those charged for general landrush registrations. *Grainger (Module 5, 19 July 2010)*.

IBM agrees that the cost of running the Clearinghouse should be borne by the parties utilizing the service and this cost should be nominal. The cost of establishing the Clearinghouse should be assumed by ICANN. Every study indicates that the new gTLD program will be a significant cost to brand owners for enforcement and cessation of brand misuse. The cost of the Clearinghouse should be shared with the new registries via a portion of the funds collected by ICANN for gTLD applications and maintenance. *IBM (21 July 2010)*.

#### Setting Clearinghouse Fees.

Under subsection 4.2 fees for services should be set by ICANN. We also agree under subsection 4.2 that the detailed registrar accreditation agreement is an appropriate model. *IPOA (21 July 2010)*.

Fees relating to the Clearinghouse should be determined as soon as possible so that not-for-profit organizations can budget in advance for the new gTLD process. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*.

Fees under subsection 4.2 should be set by ICANN. *AIPLA (21 July 2010)*.

Clearinghouse operator. ICANN must choose a third party contractor with extensive experience in trademark protection issues and do so via an open and transparent process. CADNA requests a preview of the proposed contractual arrangement in order to gain a fuller understanding of what this role will entail. *CADNA (21 July 2010)*.

Access to Clearinghouse. Who will have access to Clearinghouse data and services must be clarified. *CADNA (21 July 2010)*.

Deposit of marks. Deposit of marks into the Clearinghouse should be clarified so that it is clear that a trademark owner does not need to register the corresponding domain name in the many new gTLDs. Trademark owners will not have a significant incentive to participate in the Clearinghouse if they have to deposit both their marks and also engage in multiple defensive registrations. *IPOA (21 July 2010)*. *AIPLA (21 July 2010)*.

## Analysis of Comments

Many comments revolve around who will pay for the Clearinghouse and the fees that will be charged. ICANN recognizes that this is an important issue, which has been often discussed, including by the IRT and the STI. As stated by the STI and adopted in the latest version of the Trademark Clearinghouse, “Costs should be completely borne by the parties utilizing the services. ICANN should not be expected to fund the costs of ... operating the TC. The TC should not be expected to fund ICANN from its fees.” The cost of establishing the Clearinghouse is to be borne by ICANN and the Clearinghouse provider(s). As for the fees that the Clearinghouse provider(s) will charge, ICANN will select provider on open bidding process and economical fees will be part of the consideration process.

One commenter notes that the Clearinghouse provider should be experienced in trademark issues and be chosen in open and transparent manner. As set forth in AGBv4, the service provider(s) will be selected on the basis of predetermined criteria which includes the ability to store, authenticate, validate and disseminate the data at the highest level of technical stability and security without interference with the integrity or timeliness of the registration process or registry operations. The process will continue to be transparent and subject to public comment. The details of the contractual relationship as it is currently envisioned is set forth in the AGBv4 at section 4.

In terms of access to data, the Providers will be the only entities that have full access to Clearinghouse data. As set forth in the current AGBv4, it is envisioned that one provider will house the repository and another provider will authenticate/validate the marks. There will be extensive provisions in the contract relating to maintenance of the data.

In terms of use of the Clearinghouse, it is not meant to be a bar to registrations of the trademark TLDs or an automatic registration in each TLD. It is a database that registry operators are required to utilize when offering either a pre-launch Sunrise service or Trademark claims process.

## Authentication and Validation

### Key Points

- ICANN intends to utilize a provider with regional presences so that appropriate expertise exists for complaints from any geographic area.
- Some form of penalty or graduated penalty system will be implemented for a rights holder's failure to keep information current in the Clearinghouse.

### Summary of Comments

Regional Authentication. No basis for the regional authentication service appears in the IRT or GNSO-STI reports. IPOA opposes it unless there is some justification. *IPOA (21 July 2010). AIPLA (21 July 2010).*

Updated information. A trademark owner's failure to respond to a legitimate request from the Clearinghouse Administrator to update could yield a series of warnings and ultimately suspension from the Clearinghouse pending a response. It would be impractical to try to collect monetary penalties from trademark owners who may be out of business or who may have failed to advise their successors in interest of their Clearinghouse entries. IPOA also supports mandated periodic renewals (e.g., perhaps every 5 or 10 years) to maintain the quality of information contained in the database. *IPOA (21 July 2010). AIPLA (21 July 2010).*

Data and Authentication Guidelines.

What is the intent of the last paragraph of Section 7, Data Authentication and Validation Guidelines? Is that a backdoor mechanism for Clearinghouse entry for marks that could not otherwise qualify? *AIPLA (21 July 2010).*

A qualifier is missing in the last paragraph for validation of marks by the clearinghouse. For the sentence that reads "in connection with a bona fide offering for sale of goods or services" should be inserted the phrase "in the goods specified in the trademark registration." This will help prevent the inclusion of sham trademarks in the Clearinghouse (e.g. generic words applied for in obscure trademark classes that have never been used in commerce for the goods specified). *EnCirca (Module 5, 21 July 2010).*

The criterion that a trademark owner must submit a declaration is costly and burdensome. Why does it not suffice to use a certified copy of a valid trademark registration certificate or the official online database record of the relevant trademarks registry? *BBC (21 July 2010).*

We strongly object to the Clearinghouse being used as a validator for marks because this is beyond the intended purpose of the Clearinghouse. The term "Clearinghouse—validated marks" should be removed. *K. Komaitis (21 July 2010). R. Dammak (22 July 2010).*

Evidence of use for mark validation.

ICANN's proposal for the Clearinghouse's validation of marks through the trademark owner's production of evidence of continuous use of the mark is burdensome and inconsistent with national legislation where there is a grace period between registration of mark and the obligation to use it. Such evidence of use, if produced to "validate" the mark, should

not be published in any way or to any person as it could be highly confidential and commercially sensitive. *BBC (21 July 2010)*

A trademark owner should be required to provide evidence of current bona fide use, but should not be required to prove that they had rights “continuously” since registration. *INTA Internet Committee (21 July 2010)*.

## Analysis of Comments

Regional authentication has been the subject of public comment. Because the Clearinghouse will be a central repository that will be tasked with authenticating/validating data from all over the world, it was suggested that a provider with regional presence be enlisted to assist and expedite the process. On balance, given the efficiencies that can be achieved the current proposal suggests utilizing a provider with regional presences to be called upon when appropriate. All will still be subject to the same rigorous standards.

Some have commented on the particular penalties to be implemented for a failure to keep information current in the Clearinghouse. Currently, it is envisioned that some form of penalty or graduated penalty system will be implemented for a failure to keep information current, the details of which will be finalized when the provider(s) are selected. It is understood that monetary penalties will not be practical and will not serve the intended purpose of encouraging prompt communication with the Clearinghouse and keeping information current.

Comments have been submitted surrounding the use and description of the terms “authentication” and “validation”. One commenter requested clarification of the last paragraph of the Data and Authentication Guidelines and another suggested one addition. After careful review, this language will be revised. First, only authentication of registration of marks is required for entry into the Clearinghouse. The “validation” referenced in the final paragraph of this section of the Clearinghouse proposal refers to validation of “use”, which will be needed to ensure protection in a sunrise services offering by a registry. Second, the addition recommended does make the statement more clear and will be included.

In terms of safeguarding data, it is anticipated that to the extent there is confidential or commercially sensitive submissions made to the Clearinghouse for validation purposes, the provider will have the appropriate means in which to safeguard the confidentiality/access to such information. Such means for maintaining confidentiality will be required in the provider(s) contract(s) with ICANN and the tender process will require demonstration of this capability.

One group has commented that a standard for the Sunrise process inclusion that “continuous” use of the mark should not be required. Such level of use was included to ensure that only valid registrations are capable of registration in a Sunrise period. If the rights were not continuous, the registration in some jurisdictions will no longer be valid. Continuous does not mean, however, that it is used everyday, but rather that the use continued over time.

## Eligibility for Inclusion and Protection

### Key Points

- Substantive review by Trademark Clearinghouse validation service provider shall require: (i) evaluation on absolute grounds; and (ii) evaluation of use.
- Both the IRT and the STI agreed that identical match is required for a mark to be protected in sunrise or provide notice under claims services.

### Summary of Comments

Many critical, open issues remain with the Clearinghouse. It still limits the intellectual property that may be registered in the database to text marks that are (1) nationally registered; (2) court-validated; or (3) protected by statute or treaty. Much greater clarification is needed before the Clearinghouse can serve the objective for which it was intended by the IRT. *News Corporation (21 July 2010). IACC (21 July 2010).*

#### Substantive Review or Evaluation.

IOC is encouraged that “substantive review” of nationally registered trademarks is no longer a prerequisite for inclusion in the Clearinghouse (Clearinghouse secs. 5 & 9). But this will be futile if later rights protection mechanisms (e.g. Sunrise Registration Services and the URS) apply any “substantive review” standard. IOC reiterates that if domain name speculators are concerned about the ease by which generic words can be registered in certain countries, then the domain name speculators should bear the onus of initiating the challenge procedures previously recommended by ICANN. *IOC (21 July 2010).*

The “substantive review” or “substantive examination” language should be changed to “examination on absolute grounds”. This should address the problem of gTLD applicants basing applications/objections on trademark registrations for purely descriptive words obtained in countries that conduct no examination on absolute grounds. *C. Speed (21 July 2010).*

Under sec. 4.1.1, the language provides that the entity would “validate” marks from jurisdictions that do not conduct substantive review. If the disparate treatment of such marks remains in the Clearinghouse implementation scheme then the criteria for this validation should be specified. *IPOA (21 July 2010). AIPLA (21 July 2010).*

The term “substantive examination” should be clarified to specify that “substantive review” refers to examination for “inherent registrability” or “on absolute grounds”. *IPOA (21 July 2010). AIPLA (21 July 2010).*

“Substantive review” needs to be clarified to eliminate confusion as to what types of marks qualify for the Clearinghouse. *AT&T (21 July 2010). INTA Internet Committee (21 July 2010).*

ICANN should create a proper definition of “substantive review” or better still abandon the idea in favor, e.g., of “review on absolute grounds.” It is unfair to expect the operators of the Clearinghouse to decide which marks from which jurisdictions can be included. Discriminating between official trademark registries is not a role for the Clearinghouse operator or an appropriate issue upon which ICANN itself

has any standing to influence. *MARQUES/ECTA (21 July 2010)*. *Microsoft (21 July 2010)*. *AIM (Module 5, 14 July 2010)*.

Absence of a proper definition of “substantive review” means that mark owners in some parts of the world will be discriminated against (including the EU). Any Clearinghouse must be nondiscriminatory and the Clearinghouse operators must not be the arbiter of the validity of trademarks. *Com Laude (21 July 2010)*. *PMI (21 July 2010)*. *BBC (21 July 2010)*

ICANN should clarify what constitutes “substantive review” and what validation processes will be required, e.g., for marks registered in jurisdictions that do not require a “substantive” review. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*. *Hogan Lovells (21 July 2010)*. *IPC (21 July 2010)*. *INTA Internet Committee (21 July 2010)*. *SIIA (21 July 2010)*.

“Substantive review” clarification is needed as it pertains to eligibility for Sunrise Services. I.e., whether “substantive review” includes: (1) absolute grounds; (2) relative grounds; or (3) absolute grounds plus an opposition period. Trademarks in many jurisdictions (e.g. from some European national trademark offices) could be excluded from eligibility for Sunrise Services if “substantive review” does not include examination based only upon “absolute grounds.” The trend for trademark examination in several jurisdictions such as Europe is moving away from a relative ground review and towards solely an absolute ground review, leaving relative ground review to oppositions. It would be anomalous if such trademarks were only eligible for Sunrise Services if they have been successfully opposed. *IBM (21 July 2010)*.

The current design appears to turn the Clearinghouse into an arbiter of the validity of trademarks legitimately obtained through systems applied in many jurisdictions. The Clearinghouse must be non-discriminatory to counter possible gaming. (The possibility could be explored of treating registered marks as prima facie valid, e.g., where subject to later challenge.) *WIPO Center (16 June 2010)*.

The Clearinghouse falls short because registries are not required to incorporate their pre-launch RPMs protections for all trademark registrations of national or multinational effect. *COA (21 July 2010)*.

The Clearinghouse should not be biased in a selective recognition of valid trademarks. If the Clearinghouse adopts exclusionary standards, many trademark holders will remain unjustly exposed to fraud and abuse. It is not the role of the Clearinghouse to judge the quality of international trademark regulations, but to enforce them. *IHG (20 July 2010)*. *AIPLA (21 July 2010)*. *Nestle (21 July 2010)*.

#### Identical match limitation.

Limiting use of clearinghouse data to identical matches (and only at launch) would miss many abusive domain name registrations. *WIPO Center (16 June 2010)*. *Verizon (20 July 2010)*. *C. Speed (21 July 2010)*. *PMI (21 July 2010)*. *BBC (21 July 2010)*. *Coca-Cola (21 July 2010)*. *Adobe Systems (21 July 2010)*. *Rosetta Stone (21 July 2010)*. *USCIB (21 July 2010)*. *ABA (22 July 2010)*. *NCTA (Module 3, 21 July 2010)*.

The identical match definition should at least be the same as IRT, should take into account the singular and plural of the Mark, and account for typographical variations (for typosquatting). *BC (26 July 2010)*.

The “identical match” for the Clearinghouse should be expanded slightly to avoid numerous potential instances of typosquatting (e.g. plural forms of domain names containing the mark). *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*.

Given how cybersquatters and phishers operate, it is imperative that the Clearinghouse be broadened to include domain names which are “confusingly similar” not just identical. *IHG (20 July 2010)*.

The failure of Sunrise or Claims Services to recognize confusing similarity and foreign equivalents ignores rampant typosquatting in the domain name system (see Clearinghouse sec. 8). At a minimum, Claims Services should require registries to report domain names that are confusingly similar to, or a foreign equivalent of, trademarks in the Clearinghouse. If registries utilizing a Claims Service simply must provide notice and a mark holder does not obtain an advantage as it does if the registry offers a Sunrise Registration period, then no advantage is obtained in a Claims Service and “similarly situated applications are treated in the same way” regardless of whether the Claims Service protects against confusingly similar or foreign equivalent domain names. *IOC (21 July 2010)*.

Trademark owners should be permitted to deposit into the Clearinghouse names consisting of exact registered trademarks plus generic terms incorporated into their goods or services. We support the solution set forth by the Commercial and Business Users Minority Position under Annex 4 of the STI Work Team Recommendations. Such procedures have been used successfully with prior gTLD launches such as for the ASIA registry. *IPOA (21 July 2010)*. *AIPLA (21 July 2010)*.

Plural and singular forms of marks should be included in the Clearinghouse either through automatic operation or express request of a trademark owner. A substantial portion of abusive domain name registrations take advantage of either variant plural or singular forms, and the current rules do not address this issue. *AIPLA (21 July 2010)*.

The scope of searches for matching should be determined with input from proposed Clearinghouse operators about what searches could reasonably be conducted. ICANN’s rationale for limiting it to “identical matches” has not been supported. At a minimum, a match should include plurals of and domain names containing the exact trademark. *INTA Internet Committee (21 July 2010)*.

Contrary to the language about punctuation or special character replacement in the definition of identical match in this section, “underscores” are not a valid character for a domain name. *EnCirca (Module 5, 21 July 2010)*.

To maintain operational integrity and keep the processing volume manageable, it should not be expanded to include typographical variations of a mark. ICA questions whether any meaningful standard can be established to define the acceptable limits of such variations. Trademark owners should not be given the ability to assert potential control and have the Clearinghouse fire “warning shots” to potential registrants for the many thousands of possible variations of a single mark—especially as trademark infringement involving such names must arise from actual use and cannot be determined from the domain name alone. *ICA (21 July 2010)*.

The identical match definition (2.3) should be widened to catch “obvious misspellings.” *AIM (Module 5, 14 July 2010)*.

The refusal to extend clearinghouse-based RPMs beyond exact matches, or to incorporate any form of a globally protected marks list, means that the impact on reducing the volume of defensive registrations will likely be negligible. *COA (21 July 2010)*.

Design marks with a slight design element should be included in the “identical match” definition. *IBM (21 July 2010)*

Per comments with recommendations previously submitted by the BC: if the applied-for domain string anywhere contains text of a trademark listed in the Clearinghouse, then a TM notice is given to the applicant per the proposal in the Staff recommendation. If the domain is registered then the trademark owner is notified. Trademark owners would also have the option of triggering notices in the event that the applied-for domain string includes the trademark string altered by typographical errors as determined by an algorithmic tool. The domain applicant must affirmatively respond to the trademark notice either on screen or email and the registrar must maintain written records of such responses for every domain name. The trademark owner must get notice of every registration that occurs. The trademark notice should allow registrant the option of stipulating their intended response. *BC (26 July 2010)*.

Marks included in the Clearinghouse should generally include the text elements of marks consisting of stylized text, or designs plus text, rather than only word marks. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*. *BBC (21 July 2010)*.

ICANN should further define the term “text mark” to avoid misinterpretation. *IBM (21 July 2010)*.

Text marks should be defined to include the text elements of design marks where the text in its entirety has not been disclaimed. *IPOA (21 July 2010)*. *AIPLA (21 July 2010)*.

Best practice as used in recent RPMs should be explored with regard to the Clearinghouse. For example, the Clearinghouse scope should be widened to include device marks and plurals. *Com Laude (21 July 2010)*.

ICANN must clarify the definition of a “text mark” included in the Clearinghouse—it should include protection for stylized letters and text with design components. *CADNA (21 July 2010)*. *AT&T (21 July 2010)*. *INTA Internet Committee (21 July 2010)*. *News Corporation (21 July 2010)*. *BC (26 July 2010)*.

#### Marks protected by treaty.

ICANN should clarify to which marks “protected by treaty” it refers (page 2). *K. Komaitis (21 July 2010)*. *R. Dammak (22 July 2010)*.

Inclusion in the Clearinghouse of “Any text marks protected by a statute or treaty” should not be limited to those “in effect on or before 26 June 2008.” That limitation discriminates against future Olympic Games in new host cities that will receive statutory protection. *IOC (21 July 2010)*.

The punctuation used in section 2 for the two bullets labeled A and B is unclear. Does the phrase “and that was in effect on or before 26 June 2008” apply only to (iii), as it currently reads? That was not the intent. *EnCirca (Module 5, 21 July 2010)*

Reserved marks list for Olympic trademarks. If and when new gTLDs are introduced, the Olympic trademarks should be put on a list of reserved marks—just as ICANN currently reserves its own trademarks (see Module 2.2.1.2). ICANN is subject to and must act in a manner consistent with the U.S. Olympic and Amateur Sports Act and the Anti-Cybersquatting Consumer Protection Act in deciding whether or not to offer for sale any new gTLDs containing Olympic trademarks. *IOC (21 July 2010)*.

Classes of trademarks. Missing from the Clearinghouse is a provision that allows trademarks to be put in classes mirroring the International Classes of Goods and Services. This is crucial as it will compensate for similar and identical trademarks that under traditional law co-exist harmoniously. This is especially important for small and medium sized businesses and for trademark owners in developing countries. *K. Komaitis (21 July 2010). R. Dammak (22 July 2010).*

#### Dot-Trademark.

Exclusion of registrations that include top level domains as part of the trademark or service mark appears to be discriminating against valid trademark registrations and fails to take into account contemporary business trends. ICANN needs to provide the rationale why such trademarks cannot be included in the Clearinghouse. *K. Komaitis (21 July 2010). R. Dammak (22 July 2010). BBC (21 July 2010).*

The AGB should specifically prohibit any advantage to holders of trademarks for a top-level domain (i.e., a trademark on “dot TLD”). While dot-TLD trademarks are not granted by the U.S. Patent and Trademark office, they are available in other jurisdictions to the detriment of all applicants. ICANN should provide assurances that not only will such TLD-specific trademarks be denied any priority in an application but that they will not be considered a valid ground for objection. *Minds + Machines (21 July 2010). NIC Mexico (21 July 2010). Domain Dimensions (22 July 2010).*

It is important that a “dot TLD” not put an applicant into any unjustified advantage and not be a ground for a later objection. In the case of a geographical application, this would compromise the position of a relevant government that wants to support the initiative that works in the best interest for the geographical area. *Bayern Connect (21 July 2010).*

ICANN offers no protection against the gaming of TLD applicants who have been publicly announced initiatives and have done all the leg work and communications outreach campaigns. Given this, TLD trademarks for publicly announced TLDs with years of exposure, lobbying, participation and business activities are warranted and in the public interest if used legitimately. While trademarks alone should not be the sole determinant of earning a TLD, it is the only means we have of protection since ICANN has not incorporated any mechanisms to prevent TLD applicant abuse, gaming and unfair piggybacking. *.MUSIC (21 July 2010).*

Use of Clearinghouse in URS and UDRP proceedings. The Clearinghouse has a potential to provide authentication of rights for both complainants and respondents in the case of any ICANN dispute proceeding. The Clearinghouse should incorporate a recognition of its use for this purpose in any ICANN dispute proceeding. *AIPLA (21 July 2010).*

## **Analysis of Comments**

The Clearinghouse is intended to be a repository for trademarks. In keeping with that aim, specific criteria for entry and management had to be articulated. The aim was to create a list of criteria that could be verified in a cost effective, consistent and efficient manner while, at the same time, prevent gaming of the system since it is intended to form as a basis for rights protection mechanisms. When the provider(s) are selected further detail will be provided.

Criteria for entry, and later validation, has been the subject of widespread comment and review. Authentication will ensure that all marks submitted for inclusion in the Clearinghouse are in fact nationally or multi-nationally registered. Validation will be required if a trademark holder wants to be ensured protection in a sunrise service - that mark must be either: validated for use at registration or by a court, protected by statute or treaty (subject to some date restrictions), or (if none of these above), validated by the Clearinghouse provider.

To be an effective RPM, the Clearinghouse must operate efficiently. Out-of-date or inaccurate data in the Clearinghouse will harm applicants, trademark holders, and others. To that end, it was agreed that as an additional safeguard to ensure reliable and accurate data, mark holders will verify the accuracy of their information and agree to keep it current. The mere fact that a certified copy of a registration exists does not mean that the named registrant is the mark holder or that the information is current and accurate. A sworn declaration in many cases is less time consuming and much less costly than a certified copy of a registration.

Numerous comments, as seen above, seek understanding and clarification of “substantive evaluation” as it is set forth in the guidebook. In order to make clear what was required for substantive evaluation, the Board adopted the following resolution on 25 September 2010 (see <http://www.icann.org/en/minutes/resolutions-25sep10-en.htm#2.6>:

Substantive Evaluation: The Applicant Guidebook will provide a clear description of "substantive evaluation" at registration, and retain the requirement for at least substantive review of marks to warrant protection under sunrise services and utilization of the URS, both of which provide a specific benefit to trademark holders. Specifically, evaluation, whether at registration or by a validation service provider, is required on absolute grounds AND use of the mark. Substantive evaluation upon trademark registration has essentially three requirements: (i) evaluation on absolute grounds - to ensure that the applied for mark can in fact serve as a trademark; (ii) evaluation on relative grounds - to determine if previously filed marks preclude the registration; and (iii) evaluation of use - to ensure that the applied for mark is in current use. Substantive review by Trademark Clearinghouse validation service provider shall require: (i) evaluation on absolute grounds; and (ii) evaluation of use.

The Applicant Guidebook language will be revised to reflect the above clarifications.

A variety of comments suggest that limiting protections to “identical match” under trademark claims or sunrise services is too restrictive. This suggestion has been the topic of much discussion. Both the IRT and the STI adopted this same limitation to identical match. Accordingly, this definition and scope will not be revised.

Clarifying questions have been raised with respect protection for names or marks that are protected by treaty or statute. To address each of the questions above:

- Inclusion into the Clearinghouse does not require protection under statute or treaty.
- The reference to effective date is the effective date of the statute or treaty, not the date of the mark registration (i.e., the punctuation in the AGB paper is correct).
- Only marks under existing treaties are protected. While some future protections might be excluded, the limitation was developed in order to prevent potential abuse.

Two commenters suggest that classification of goods and services must be addressed. The Clearinghouse allows for entry regardless of international classification (“IC”) of goods and services. The description of the goods/services drives whether there is a possibility of confusion, not the class in which the good or service might be assigned. Moreover, not every jurisdiction follows the international classification system so to require it would result in unfair or inconsistent treatment for those registrations which issue from jurisdictions that do not use the IC system.

In response to comment for clarification about national effect, the language in Section 9 should be revised to be of national effect, not multinational effect. (The reference to the word “applications” refers to gTLD applications, not Clearinghouse applications.)

Whether a “dot-TLD” mark (e.g., “ICANN.ORG” or “.ICANN”) should be included in the Clearinghouse has raised differing views. Some do not understand why they should be excluded, while others support the exclusion. The Clearinghouse is designed as a repository for trademarks. To fulfill the objectives of the IRT and the STI, it has been decided that those marks that actually function as trademarks, i.e., indicate source, are those that will be eligible for inclusion. Many safeguards have been established to prevent abuse and to ensure neutral application of validation standards, including objectively verifiable data that the mark does serve a legitimate trademark purpose. It has been successfully argued that TLDs standing alone do not serve the trademark function of source identification. Instead of telling consumers “what” a product is or who makes it, they tell consumers where to get it. Because the TLD does not indicate source, and because allowing marks in the Clearinghouse that include a TLD will increase the likelihood of abuse and gaming substantially, on balance they are excluded. This will obviate the need for registration of defensive trademarks.

In answer to a query about potential uses of the Clearinghouse: the Clearinghouse was designed to serve the Sunrise and IP Claims services specifically. It may or may not also support the URS depending upon the results of the tender of services for the URS.

## Clearinghouse Provider Services

### Key Points

- The Clearinghouse can provide ancillary services but cannot use its position to a competitive advantage.
- Optional services may include post-launch registry services such as IP Watch.
- The standard for “match” to identify Clearinghouse “hits” was developed by the IRT.

### Summary of Comments

#### Pre-launch versus post-launch sunrise and claims services.

Both of these RPMs are pre-launch and they need to be post-launch to have any real value. Limiting the Claims Service to exact matches is clearly insufficient as most cybersquatting is not an exact match. There is no explanation for the different recognition accorded trademark rights for Sunrise Services and Trademark Claims Services (regarding substantive review/examination). *Arla Foods (6 July 2010)*. *LEGO (6 July 2010)*. *VKR Holding (13 July 2010)*. *Nilfisk 913 July 2010)*. *LEO Pharma (14 July 2010)*. *Vestas (16 July 2010)*. *Coloplast (19 July 2010)*. *PMI (21 July 2010)*. *BBC (21 July 2010)*. *DuPont (21 July 2010)*.

Additional protection for trademarks in the Clearinghouse should be extended by requiring mandatory post-launch notification procedures. A substantial portion of cybersquatting can be expected to occur well after a registry has launched. *AIPLA (21 July 2010)*. *Grainger (Module 5, 19 July 2010)*.

The Trademark Claims service should not be limited to pre-launch but should be required for post-launch registration applications, despite whether the registry uses Trademark Claims or Sunrise services at the pre-launch stage. *IPOA (21 July 2010)*. *AIPLA (21 July 2010)*.

Making the clearinghouse-based mechanisms such as trademark claims services wholly voluntary for registries in the post-launch environment kicks the bulk of the abusive registration problem into a later time frame. In many cases the RPMs will be wholly inadequate without these post-launch protections. *COA (21 July 2010)*.

In their present form neither the Claims nor Sunrise services reduces the number of domains being registered in bad faith. To be effective, the services should be mandatory both pre-launch and post-launch. *C. Speed (21 July 2010)*. *BC (26 July 2010)*.

Will not solve cybersquatting. No one should assume that the new gTLD registry operator’s option in the current proposal to have the Sunrise or Trademark Claims Services, while a positive development, will in fact solve the abuse problems given the limitations of these services in deterring cybersquatting and other abuses. *Coca-Cola (21 July 2010)*.

The requirement for registries for claims and sunrise should be standardized so that they are the same. *C. Speed (21 July 2010)*. *BC (26 July 2010)*. *AIM (Module 5, 14 July 2010)*.

Exclusive use of Clearinghouse. It should be made clear that registries must use the Clearinghouse exclusively for the submission of Sunrise or IP Claims submissions. *EnCirca (Module 5, 21 July 2010)*.

The Trademark Claims and Sunrise Services are not feasible for or applicable to all applicants. ICANN should not force a policy that is inapplicable to some entities. E.g. Chinese governmental organizations are prohibited from practicing commercial-related activities. CONAC, the registry for domain names of Chinese governmental organizations and public interest organizations, must pre-check all the domain names before registration. There is no way for a single brand name to be registered as a domain name in such categories, so that it is of no value to utilize Sunrise or Trademark Claims in these circumstances. It would force CONAC to bear the cost of using the Clearinghouse also. *CONAC (22 July 2010).*

Option for “Sunrise Period” or “Claims Service”. A Sunrise is likely unnecessary for a .brand registry operator planning to use its gTLD as a private registry, so it should have the option to implement only a Claims Service rights protection mechanism. *IBM (21 July 2010).*

Notice to trademark owner.

We disagree with the advantage given to prospective registrants by delaying notice to the trademark owner under the Trademark Claims service until after the registration is effectuated. The objective should be to prevent registrations by would-be cybersquatters and innocent prospective registrants to the extent possible before after-the-fact enforcement efforts by trademark owners are required. *IPOA (21 July 2010). AIPLA (21 July 2010).*

The Trademark Claims service should require a waiting period before registration is effectuated following notice to both the prospective registrant and the trademark owner. The notice to the prospective registrant should include the following: “A copy of this Trademark Notice has been sent to the Trademark Owner. If the Trademark Owner deems that granting your requested domain name conflicts with existing trademark rights, it may initiate an ICANN dispute resolution proceeding and/or court action against you.” *IPOA (21 July 2010). AIPLA (21 July 2010).*

The pre-launch proposals are unfairly balanced in favor of registrants. Trademark owners should be able to object prior to registration of a domain name. This could save time and money, instead of forcing parties into the post-grant URS. *BBC (21 July 2010)*

Sunrise fees.

Most registries will continue the established practice of offering pre-launch “sunrise processes” which only work to extract additional fees for defensive registrations most brand owners have no affirmative reason to want. There is no provision to limit sunrise fees; ICANN recommends that they operate “based on market needs” which means the highest fee the market can extract from the trademark holder. *Verizon (20 July 2010).*

CADNA noted the addition of a mandatory sunrise period, which could be beneficial to the trademark community as long as the domain names are not offered for inflated prices. Domains should not be held “hostage” by requiring trademark owners to pay more than anyone else would for their own trademarks. *CADNA (21 July 2010).*

Not-for-profits are concerned that most registries will pick the Sunrise service in order to create a revenue stream for registries. Not-for-profits with limited resources for registering numerous domains may not be able to take part in all or any of these Sunrise services. ICANN should consider suggesting or requiring alternative domain name pricing for not-for-profits. *AAMC (21 July 2010). Red Cross (21 July 2010). NPOC-FC (21 July 2010).*

### Ancillary services.

The proposal allowing the Clearinghouse operator to provide ancillary services is contrary to what the STI recommended. The STI made clear that any ancillary services should be directly related only to trademarks (common law marks, etc.). It was decided that all other intellectual property rights fall outside the scope of the Clearinghouse and therefore should not be included. *K. Komaitis (21 July 2010). R. Dammak (22 July 2010).*

INTA Internet Committee applauds ICANN's recognition that the Clearinghouse operator may offer certain ancillary services and maintain a separate database containing a "panoply" of rights, such as "unregistered trademarks, company names, trading names, designations of origin, family and personal names, etc." These services would be for the purpose of allowing trademark owners to better police their marks. Offering of such services should be mandatory in the evaluation and grant of certain TLDs (e.g. High Security Zone). *INTA Internet Committee (21 July 2010).*

ICANN must reconsider the provision allowing ancillary services to be provided by the Clearinghouse operator on a non-exclusive basis. These services could include release of lists of generic words or common typographical variations of various trademarks—exactly the type of information that facilitates and enables cybersquatting and typosquatting. This data should not be available on a non-exclusive basis; it should be guarded for exclusive use by relevant trademark owners. Third parties should not be able to profit from public confusion by warehousing variant spelling and combination domain names that derive value precisely because of the association with the trademark owner. *CADNA (21 July 2010). INTA Internet Committee (21 July 2010)*

## Analysis of Comments

Comments question that:

- some pre-launch services, such as IP Claims, should also be required post-launch,
- identical match is not sufficient to protect marks, and
- there is no explanation for distinction between marks afforded protection in Sunrise versus those afforded protection in claims services.

With respect to suggestion that pre-launch claims services be extended to post-launch, the IRT stated the following: "The IRT considered whether the IP Claims Service should also extend to the post-launch period. The IRT concluded that it was unnecessary to extend the IP Claims Service post-launch because of the protections afforded by the URS that the IRT also recommends herein." (See <http://www.icann.org/en/topics/new-gtlds/irt-final-report-trademark-protection-29may09-en.pdf>, footnote 6.) Such services will not be mandatorily extended to a post-launch environment. Although post-launch services are certainly something that the Clearinghouse service provider could offer as an ancillary service. Discussion about why exact matches are required for protection is set forth above. As to why there is a difference between marks afforded protection in sunrise versus claims, it has previously been made clear that in Sunrise there is an affirmative advantage, while a claims service is just notification. Other post-launch rights protection mechanisms are available including the URS procedure, the UDRP and the PDDRP as well as any remedy available in a court of competent jurisdiction.

Comments suggest that Sunrise or claims be required. This is the case. As set forth in the AGBv4, all new gTLD registries will be required to use the Clearinghouse to support its pre-launch rights protection mechanisms. These must, at a minimum, consist of either a Sunrise or Trademark Claims Service.

Some have suggested that notice to trademark holders should be provided before someone is allowed to register a name that is in the Clearinghouse, thereby allowing for a pre-registration dispute. As set out by the IRT, the goal of the service is not to be a blocking mechanism, as there are often numerous legitimate reasons for many different people to use the same word or phrase that may be trademarked. In addition, the potential registrant must indicate that it has a legitimate interest in the applied for name.

The Fee structure for Clearinghouse is that fees will be matched to transactions. Mark holders will pay for registrations of a name and registries will pay for administration of a Sunrise or IP Claims service. Matching the transaction to the fee will enable most efficient, economical operation.

Allowing the Trademark Clearinghouse Service Provider to offer ancillary services is something that the STI discussed at length. The Clearinghouse proposal has adopted the intent of the STI to ensure that the Trademark Clearinghouse Service Provider does not obtain any competitive advantage over competitors for ancillary services, such as post-launch claims services, or databases making other information available.

## UNIFORM RAPID SUSPENSION SYSTEM (URS)

### General

### Key Points

- The URS is meant to supplement other rights protection mechanisms, such as the UDRP, and is purposefully drafted to target a very narrow class of clear-cut cases of abuse.
- Further, feedback on the effectiveness of the URS once it is implemented is encouraged so that it can be evaluated in the future.

### Summary of Comments

#### Lack of Support for URS as drafted.

The URS is unlikely to achieve its full potential because it will in many cases be hardly faster than the UDRP and with weaker remedies, without adequate protections against abusive registrants, such as a loser-pays system for cases brought against high-volume registrants. *COA (21 July 2010)*. *Arla Foods (6 July 2010)*. *LEGO (6 July 2010)*. *Nilfisk (13 July 2010)*. *LEO Pharma (14 July 2010)*. *Vestas (16 July 2010)*. *Coloplast (19 July 2010)*. *PMI (21 July 2010)*. *DuPont (21 July 2010)*. *AT&T (21 July 2010)*

The URS is overburdened for just a transfer and the burden consists of a combination of factors including: panel appointment even in default cases; panel examination of possible defenses in default cases; appeal possibility during two years from default; a higher burden of proof; uncertainty as to results (e.g., possible gaming and “revolving door” monitoring); use of the conjunctive bad faith registration and use; limiting marks forming the basis for a URS claim to either so-called substantive

review or clearinghouse validated marks (with cost and time implications); apparent translation requirements; a seeming option for re-filing; the possibility for de novo appeals; and significant timelines. *WIPO Center (16 June 2010)*. We support WIPO's call for the URS to be re-engineered. *JONAS (11 July 2010)*.

The BC has urged ICANN to undertake a feasibility study before making any decision to address whether the URS will be implementable as a sustainable business model and if it would be more sustainable if transfer were allowed (i.e. how many more complainants would use it). *BC (26 July 2010)*.

The URS is not "rapid" and given its required procedural elements it is not inexpensive. Since the ultimate remedy of the URS yields only suspension, it is likely that a majority of brand holders will be forced to buy a domain name in each gTLD corresponding to their trademarks or will be filing requisite UDRPs as opposed to relying on the equally time consuming and costly URS process. *MarkMonitor (19 July 2010)*. *Comerica (21 July 2010)*; *Carlson (21 July 2010)*. *C. Speed (21 July 2010)*. *Hogan Lovells (21 July 2010)*. *BBC (21 July 2010)*. *HSBC (21 July 2010)*. *IPC (21 July 2010)*. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*. *Adobe Systems (21 July 2010)*. *IACC (21 July 2010)*. *Sunkist (21 July 2010)*. *ABA (22 July 2010)*. *Solvay (22 July 2010)*.

Given the intent underlying the URS, it is imperative that the URS not be crippled by unnecessary, burdensome regulations, high expenses and limited remedies. *IHG (20 July 2010)*. *CADNA (21 July 2010)*. *M. Jaeger (22 July 2010)*

As currently structured the URS screams uncertainty for trademark owners and they will rationally choose the certainty and full remedies afforded by the UDRP. *Verizon (20 July 2010)*. *IPOA (21 July 2010)*. *Rosetta Stone (21 July 2010)*. *AIPLA (21 July 2010)*. *NCTA (Module 3, 21 July 2010)*.

All the changes and alterations have turned the URS into a weaker version of the UDRP (cheaper but no speedier and a weak means of redress—i.e. no transfer of the domain to the complainant). *C. Speed (21 July 2010)*. *AT&T (21 July 2010)*.

The URS has been watered down from the IRT version and is not effective: it is not rapid, it has become complex, burdensome and unworkable. ICANN should return to the version proposed by the IRT and improve it by making it faster (21 days at most); simpler (pro forma complaint with copy of Whois and website copy, not a 5,000 word document); practical (only for case with no real contestable issue); efficient (experienced examiners); and reasonable (remove the "questionable fact" defense and dismissal if examiner thinks defense would have been possible). The concept of "loser pays" should be looked at again and the URS should be open to all trademark owners without discrimination provided their registration is current. *MARQUES/ECTA (21 July 2010)*.

The URS has been seriously diluted; ICANN should revert to the URS as proposed by the IRT. *Com Laude (21 July 2010)*. *News Corporation (21 July 2010)*.

#### Support for URS as drafted.

I support the URS as detailed in the DAGv4. Critics who say it will be longer than the UDRP do not make a valid comparison—they compare the longest possible URS action to the shortest possible UDRP action. Similarly it seems very likely that the average URS cost will be substantially less than the average UDRP cost. *R. Tindal (21 July 2010)*. *Domain Dimensions (22 July 2010)*. *Demand Media (22 July 2010)*.

The changes have addressed many concerns of ICA members regarding due process, adequate notice and meaningful appeals. *ICA (21 July 2010)*.

#### Fees.

Fees relating to the URS should be determined as soon as possible so that not-for-profit organizations can budget in advance for the new gTLD process. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*.

ICANN should firmly commit to the URS being much less expensive than the UDRP—i.e., commit to a “not to exceed” fee (e.g. a URS complaint shall not exceed \$400) in final Guidebook. This would give trademark holders much more comfort. *Domain Dimensions (22 July 2010)*.

Paragraph 2--Fees edit. The phrase “it is thought, more often than not, that no response to complaints will be submitted” should be deleted. This sentence makes it appear that the URS is instructing its examiners to view URS disputes under a presumption of guilt for respondents, which is unfair, and against due process. *K. Komaitis (21 July 2010)*. *R. Dammak (22 July 2010)*.

All URS providers should be put under contract. The STI-RT reached unanimous consensus on this point. This will promote uniformity. *ICA (21 July 2010)*.

Qualifications of examiners. Examiners need only a legal background. How is this to be defined? *Hogan Lovells (21 July 2010)*.

Rotation of examiners. There might be an issue with the rotation of examiners given the variety of jurisdictions and languages. *Hogan Lovells (21 July 2010)*.

## **Analysis of Comments**

Some comments suggest that the URS as currently drafted will be effective. Others suggest it will not be effective, that the burden of proof is too high, that its remedies are not sufficient, that it is not fast enough and that it will lead to uncertainty.

The URS was devised by the IRT, modified by the STI and influenced and revised to take into account significant public comment. This procedure is not intended to be a replacement for any other additional methods of redress that a trademark holder may have for infringement. Rather, the URS is meant to supplement those other methods, such as the UDRP, and is purposefully drafted to target a very narrow class of clear-cut cases of abuse.

Indeed the URS is not intended to provide uncertainty. Different procedures in different jurisdictions provide different types of relief. If immediate relief for clear-cut cases of abuse is the goal the URS may be the right alternative, if transfer of a domain is sought the UDRP might be the right alternative, if damages are sought a court might be the right alternative. The objective of the trademark holder will ultimately drive where an action is brought. The URS provides an additional remedy, not a replacement.

Further, feedback on the effectiveness of the URS once it is implemented is encouraged so that it can be evaluated in the future. As a part of its introduction, as set forth in Section 14 of the URS, a review of the procedure will be initiated one year after the first Determination is issued. It is expected that the

evaluation will cover usage and statistics and will be posted for public comment to gauge the overall effectiveness.

Each of the specific comments as to the deficiency of the URS is addressed in detail in the sections below.

The amount of the fee for a URS has been the subject of comments. The precise amount is still under consideration and will be set by the provider with the goal of being as cost effective as possible. A suggested revision to omit an editorial comment regarding why a loser pays provision has not been adopted for the URS will be adopted.

While one comments suggests that all URS providers should be put under contract, it should be clear that all providers will be required to comply with standards and procedures, regardless of the mechanism under which they are engaged to provide URS services.

There has been one comment on examiners legal background and another on the rotation of examiners. Legal background of examiners will be determined based upon legal training or training in dispute resolution processes. With respect to the rotation and examiners in light of jurisdiction and language variations, this is something that the URS providers will be required to consider in rotating examiners.

## Complaints and Responses

### Key Points

- The trademark holder will have the burden of proof since it is the person or entity that seeks relief.
- Given other safeguards that are in place, the time to respond to a complaint has been changed from 20 days back to 14 days, with an opportunity for an extension of seven additional days.

### Summary of Comments

#### Trademark owner burdens.

The URS is flawed because the burden is on the trademark owner to prove that the registrant has no legitimate interest in the domain name. *Arla Foods (6 July 2010)*. *LEGO (6 July 2010)*. *VKR Holding (13 July 2010)*. *Nilfisk (13 July 2010)*. *LEO Pharma (14 July 2010)*. *Vestas (16 July 2010)*. *Coloplast (19 July 2010)*. *PMI (21 July 2010)*. *Adobe Systems (21 July 2010)*.

The burden of proof should not fall on the trademark holder. The complainant's case should be considered legitimate by virtue of evidence of a valid trademark and in such instances the registrant should be responsible for proving its "good faith". *IHG (20 July)*

#### Response filing fee.

The URS lacks a fee for filing a response to a complaint. *Arla Foods (6 July 2010)*. *LEGO (6 July 2010)*. *VKR Holding (13 July 2010)*. *Nilfisk (13 July 2010)*. *LEO Pharma (14 July 2010)*. *Vestas (16 July 2010)*. *Coloplast (19 July 2010)*.

What is the reasoning behind allowing the respondent to be in default for up to 30 days following a determination before they would be charged any fee with their response? The respondent should be obliged to file a fee in all cases where it files a response to provide some balance between the parties. Even if this is not the case there should be a fee when a response is filed late. *BBC (21 July 2010)*. *NCTA (Module 3, 21 July 2010)*.

A fee should be charged for any response filed after a decision has been entered. No 30-day "grace" period should be allowed as currently proposed. *Grainger (Module 5, 19 July 2010)*.

Notification to registrar (6.2 & 6.5): Is essential that a copy of the notification must also be sent to the domain's sponsoring Registrar by the URS Provider. The Registrar should always be informed of actions that change the domain's status, because the Registrar is the party with the service and contractual relationship with the Registrant. Registry Operators are not in a position to communicate with Registrants. *RySG (21 July 2010)*.

Simple forms. ICANN should develop simple forms for the complaint, answer and decision, with a requirement that complaints that are too lengthy or complex to make use of such a form instead be required to be filed as UDRP complaints or that the complainant seek other remedies. This would reduce burdens and likely expedite the process. *AAMC (21 July 2010)*. *CADNA (21 July 2010)*. *INTA Internet Committee (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*.

### Word Limitations.

The 5,000-word limit for the complaint and response is too high for what should be a clear cut case and will increase preparation costs. *Hogan Lovells (21 July 2010). CADNA (21 July 2010).*

Any word limitation should be much smaller, such as 250 or 500 words. AT&T suggests a return to the initial form complaint and response approaches. *AT&T (21 July 2010).*

### Timeframes.

The registrant should have 14 days to file an answer. *AAMC (21 July 2010). INTA Internet Committee (21 July 2010). Red Cross (21 July 2010). NPOC-FC (21 July 2010). Microsoft (21 July 2010). NCTA (Module 3, 21 July 2010).*

The examiner should be required to render a decision within 7 business days, with a goal of providing it within 3 days as a best practice. *AAMC (21 July 2010). NPOC-FC (21 July 2010). Red Cross (21 July 2010).*

At a minimum, a decision should be rendered within 3 business days in cases of default. *INTA Internet Committee (21 July 2010).*

The response and decision-making timeframes are too long. The process needs to be streamlined. *CADNA (21 July 2010). AT&T (21 July 2010). AIPLA (21 July 2010).*

The URS fails to provide an expedited remedy; the URS timeline proposed by the IRT has been so extended in the current draft proposal that the timing for an initial decision may often be equal to or longer than under the UDRP. *INTA Internet Committee (21 July 2010). Red Cross (21 July 2010). SIIA (21 July 2010). USCIB (21 July 2010). Microsoft (21 July 2010). EuroDNS (22 July 2010). BC (26 July 2010). AIM (Module 5, 14 July 2010). Nestle (21 July 2010).*

URS needs to be refocused to immediately take down a website. The role of the URS provider is to act as a rapid check on the bona fides of the complainant and to be a conduit between the complainant and the registry. The URS should operate with dramatically reduced timelines, which will stop the criminal act being conducted and cover probably 99% of URS cases:

- Complaint starts
- 24 hours—URS provider validates bona fides of complaint and notifies registry;
- 24 hours—Registry notifies Registrant that it will act to lock and then prevent resolution of the web site in 24 hours.

If the registrant reacts (defined as confirmation of registrant data and a statement that the complaint is or is not valid) within 24 hours the presumption of bad faith should be reversed and the web site should immediately be allowed to resolve again. If the registrant reacts as defined, the Registry notifies the URS provider who notifies the complainant within 24 hours and the URS finishes. At that point the complainant should then be invited to instead launch a de novo UDRP. *AIM (Module 5, 14 July 2010).*

### Revisions needed.

Section 1.2(f) seems to need revision, as it is inconsistent with the examination standards in Section 8.1(a). *INTA Internet Committee (21 July 2010).*

Paragraph 1.2(f) should be rewritten to place the word “and” in front of (ii), deleting the word “and” after (ii) in the original, and so that “;and” appears before (iii), deleting “and;” before the (iii) in the original. *K. Komaitis (21 July 2010). R. Dammak (22 July 2010).*

This edit does not change the content, seems to make sense.

Split Paragraph 4.3. For purposes of clarity paragraph 4.3 should be split into two sections:

- 4.3—“All Notices to the Registrant shall be sent through email, fax (where available) and postal mail. The complaint and accompanying exhibits, if any, shall be served electronically.”
- 4.4—“The URS provider shall also notify the registrar of record for the domain name at issue via the addresses the registrar has on file with ICANN.”

*K. Komaitis (21 July 2010). R. Dammak (22 July 2010)*

## Analysis of Comments

Who has the burden of proof and what the standard of proof should be have been the subject of comments. The trademark holder will have the burden of proof since it is the person that seeks relief. To hold any other way would afford the trademark holder a presumption it is not entitled to hold. All use of a trademark is not unlawful or infringing use, as such, the mere ownership of a mark by “A” and use of a similar mark by “B” does not mean that A should prevail.

Whether a respondent should have to pay a fee and at what point in time has been the subject of comments. A loser pays system was rejected by the IRT and STI but is still being discussed. Currently, the respondent needn't pay a filing fee for the action to commence. This is because in most cases the registrant abandons the registered name and does not reply or pay. In other cases, the respondent may respond but not pay. Therefore, waiting for a reply and fee before proceeding would delay righting the wrong while not garnering any extra fees.

Therefore, it was decided there would be no filing fee unless the registrant decides to respond after being in default for a prolonged period of time. The ability to respond after default provides legitimate registrants the right to regain the use of a legitimate domain name. Thus, default responses will continue to be allowed under the URS Proposal.

Some commenters suggest use of “form complaints” and answers, and others suggest a limitation on the submission. While forms can facilitate filings in certain situations, given the fact-intensive nature of the bad faith standard, a form complaint would not be appropriate. In a similar vein, the 5000-word limit was arrived at by balancing the need for the RPM to be rapid against the need of the complainant to be able to plead and prove its case with a clear and convincing standard of review. There is no requirement that a complainant use all 5,000 words.

Many think that the time frame to respond is too long. ICANN agrees. The Board has stated as follows: “URS timing: In response to public comment, change the time to respond to a complaint from 20 days to 14 days, with one opportunity for an extension of seven days if there is a good faith basis for such an extension.” (See <http://www.icann.org/en/minutes/resolutions-25sep10-en.htm#2.6>.) The URS Proposal will be revised to reflect this change.

There are other protections available for registrants in the event they cannot respond within 14 days. First, a seven-day extension can be requested. Second, there are opportunities for filing after default and for appeal. It is thought that there will be very few legitimate cases where the registrant will not be able to respond within the prescribed period. For those instances, there are the safeguards of default

filing and appeal. On the other hand, increasing the period to reply from 14 to 20 days means that every harmful registration can be misused for an additional period.

While some have suggested that a URS complainant should be referred to UDRP under certain scenarios, the UDRP and the URS are separate procedures, tying rights to initiate one to the result of another is therefore inappropriate.

Comments relating to language revisions are appreciated, will be considered and made where appropriate.

## Eligibility and Standards

### Key Points

- The URS is meant to provide a quick process in the most clear-cut cases of abuse, thus a clear and convincing burden of proof is appropriate.
- Standing is not limited to certain jurisdictions; standing is afforded to those holding trademarks registered in jurisdictions that conduct substantive review or that are otherwise validated in certain ways.

### Summary of Comments

#### Eligibility requirements.

By requiring that complainants' trademarks be registered in jurisdictions requiring "substantive review", ICANN is making the eligibility requirements for the URS unreasonably high. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*.

There is no reason why the URS should be available only for certain marks that were registered in countries with substantive review. A procedure for rapid take down of a clearly abusive site is needed regardless of where the mark at issue was registered. Remedies can be put in place (and indeed are in place) against abusive use of the URS proceeding. *Coca-Cola (21 July 2010)*.

The URS, now much weaker than what the IRT report proposed, is apparently only available to owners of trademarks registered in countries conducting a so-called substantive review (para. 1.2(f)), so that all CTMs and most national European trademarks are excluded. *Arla Foods (6 July 2010)*. *LEGO (6 July 2010)*. *VKR Holding (13 July 2010)*. *Nilfisk (13 July 2010)*. *LEO Pharma (14 July 2010)*. *Vestas (16 July 2010)*. *Coloplast (19 July 2010)*. *PMI (21 July 2010)*. *BBC (21 July 2010)*. *Red Cross (21 July 2010)*.

#### Clear and convincing standard.

It will be difficult for many trademark owners to meet and will be easily gamed by defendants to thwart a URS finding. This standard is not only higher than the UDRP but higher than that required in most civil actions. *Verizon (20 July 2010)*. *Hogan Lovells (21 July 2010)*. *News Corporation (21 July 2010)*. *Rosetta Stone (21 July 2010)*. *BC (26 July 2010)*.

A clear and convincing standard is appropriate. *Domain Dimensions (22 July 2010)*. *ICA (21 July 2010)*.

The URS clear and convincing standard is higher than the UDRP; mark owners will continue to use the UDRP as they have in the past with success. The statement that a URS complaint will only be granted in favor of complainant if there is no genuine issue of material fact seems appropriate. *IPOA (21 July 2010)*. *AIPLA (21 July 2010)*.

Dismissal threshold for complaints is far too low. ICANN permits a URS complaint to be dismissed by an examiner based on a vague and exceedingly low threshold—i.e. if "evidence was presented" to indicate a domain name is non-infringing or a "defense would have been possible" to show it is non-infringing. *Verizon (20 July 2010)*. *Hogan Lovells (21 July 2010)*. *IPOA (21 July 2010)*. *INTA Internet Committee (21 July 2010)*. *Microsoft (21 July 2010)*.

### Bad faith criteria.

To be truly rapid, the URS should use a conjunctive “OR” standard of bad faith. *IOC (21 July 2010).*

Criteria (iii) in paragraph 1.2 (g) should refer to the registrant having registered the name primarily for the purpose of disrupting the business of another, rather than of a competitor. There may be many reasons why someone might register a domain name in order to disrupt the business of a third party that is not a commercial competitor. *BBC (21 July 2010)*

The sale of traffic (5b) should be presumed to be bad faith, not merely a factor for consideration. The Registrant should bear the burden to prove that the sale of traffic is not bad faith, once it has been pled in the Complaint. *IPOA (21 July 2010). AIPLA (21 July 2010).*

“Pattern”. If the registrant exhibits a pattern of abusive registrations, it should not be a point in its favor that this particular registration does not seem to share the same abusive characteristics as those in the pattern (5.8(d)). *AIPLA (21 July 2010).*

## **Analysis of Comments**

Comments suggest that eligibility requirements for utilizing the URS are too high and limited to certain jurisdictions. The IRT developed the URS in order to provide a quick avenue for the most clear-cut cases of abuse. In order to provide such a process, some limitations on standing to file a complaint pursuant to the URS are necessary. Nevertheless, standing is not limited to those holding trademarks registered in jurisdictions that conduct substantive review. There will be a provider to validate use of marks if such validation was not conducted in the jurisdiction of the trademark registration, or the mark is not otherwise protected by statute or treaty. Such limitations are placed on the marks eligible for URS consideration in order to limit gaming of the system by those who simply register marks for no reason other than to obtain a domain name.

Some think a clear and convincing standard is appropriate while others do not. Further, some have pointed out that this is higher than the UDRP standards, and thus complainants will simply bypass the URS for the UDRP. Others suggest that the dismissal threshold for URS complaints is too low. It is true that a clear and convincing standard is higher than the UDRP; that is the intent. In addition, the threshold for dismissal of complaints is intended to be low. As noted above, the URS is meant to provide a quick process in the most clear-cut cases of abuse. Thus, a higher standard is appropriate. Further, as the IRT stated: “If there is a contestable issue, the matter is not appropriate for decision under the URS and the Complainant should pursue a decision in a different forum.” (See page 34 of IRT Final Report at: <http://www.icann.org/en/topics/new-gTlds/irt-final-report-trademark-protection-29may09-en.pdf>).

Therefore, neither the clear and convincing standard, nor the threshold for dismissal of a URS complaint will be revised.

The evidence needed to show bad faith has been the subject of commentary. Some comments have suggested that a disjunctive requirement should comprise the standard of review in a URS case, i.e., that the domain name was registered **or** is being used in bad faith. Further, it has been suggested that the requirement of bad faith reach would reach “disrupting the business of another”, instead of a “competitor.”

While two different types of possibly infringing conduct are captured by the disjunctive standard, the goal of the URS is to reach only the most clear cut cases of abuse. Because of this heightened standard, the decision was made to require a complainant to plead and prove both that the domain was registered and is being used in bad faith. Thus, the conjunctive will remain as the standard for a URS case. This is not the standard in every type of RPM. Further, because of the type of harm the URS is intended to address, the “competitor” standard will be retained.

One question above is, what is meant by 5.8(d). In addition, some think that the sale of traffic data, as referred to in 5.9, should be presumed bad faith. The language as proposed in section 5.8(d) is not meant to provide a way to avoid liability for deviating from previously abusive practices. The standard in this section is meant to capture the good faith registrant that does not register a series of typographical spellings of a registered trademark - it is not meant to provide a safe haven for serial cybersquatters. Further, given that the Complainant must show clear and convincing evidence to prove its case, a presumption against the respondent for a URS case is not appropriate. However, a factor that an examiner can consider as evidence of bad faith is the sale of traffic in the appropriate cases. Thus, the standards set forth in Section 5.9, allowing consideration without creating a presumption in favor of the complainant, will remain as written.

## Defenses

### Key Points

- The purpose of this more restrictive entry standard (as compared to UDRP) is to avoid time-consuming analysis over the question of rights, which would undermine the intended purpose and ability of the URS process to provide a fast inexpensive remedy for cases of clear abuse.
- Evidence of fair use of the disputed name must be analyzed by the Examiner to determine its validity

### Summary of Comments

#### Common law rights.

It is ironic that a complainant can only launch a URS complaint based on trademark rights but a registrant can defend such action on the basis of common law rights. We do not see why the procedure cannot accommodate a consideration of the complainant's common law rights also. *BBC (21 July 2010).*

Wider pattern—defense. We do not agree that the fact that the domain name is not part of a wider pattern or series of abusive registrations should in itself be a freestanding defense. *BBC (21 July 2010).*

Language change from “safe harbors” to “defenses”. ICANN should provide to the community the independent analysis that led to the change of wording from “safe harbors” to “defenses”. Instead of “defenses” the term should be changed to “absolute or complete defenses”, which is closer to the original term “safe harbors”. *K. Komaitis (21 July 2010). R. Dammak (22 July 2010).*

Paragraph 5, section 5.4—addition. Another paragraph (e) “Absolute/Complete Defenses” should be added. *K. Komaitis (21 July 2010). R. Dammak (22 July 2010).*

Fair use defense Paragraph 5, section 5.8(b). The current language implies that the Examiner has discretion to determine whether a fair use defense will be acceptable. This is against due process and would give Examiners too much power. The phrase “that is found by the Examiner” should be removed. Fair use is an affirmative defense and as long as the registrant can provide evidence of such use the Examiner should accept it unwittingly. *K. Komaitis (21 July 2010). R. Dammak (22 July 2010).*

Paragraph 5.9 edit. The word “not” is missing and this appears to be a typographical error. It should read: “Other considerations that are not examples...” *K. Komaitis (21 July 2010). R. Dammak (22 July 2010).*

#### To many defenses.

The current version of the URS adds more factors to support a defense that the registrant has not acted in bad faith, without adding any additional presumptions in favor of trademark owners, which seems to reflect a bias against trademark owners. *NCTA (Module 3, 21 July 2010).*

To be truly rapid, the URS should reduce the number of defenses for panelists to consider. *IOC (21 July 2010).*

## Analysis of Comments

One commenter challenges why a complaint cannot be based on common law rights. The intent for the URS is to be applicable only in cases of clear-cut abuse. The UDRP, which is still available to any URS complainant, allows for determination based upon common law rights. As stated in footnote 38 of the IRT Final report (see <http://www.icann.org/en/topics/new-gtlds/irt-final-report-trademark-protection-29may09-en.pdf>), the “IRT recognizes that entry standard for utilizing the URS is more limiting than the standard provided in the UDRP, which permits claims to proceed based on any registration of trademark rights or on common law rights. Parties that do not meet the higher entry standard proposed for utilization of the URS may, of course, still proceed with claims under the UDRP or in courts, as appropriate. Exclusion from the URS is not intended in any way to prejudice a party from proceeding under other available avenues. The purpose of this more restrictive standard is to avoid time consuming analysis over the question of rights, which would undermine the intended purpose and ability of the URS process to provide a fast inexpensive remedy for cases of clear abuse.” Thus, the URS will not entertain complaints from those with only common law rights.

Two commenters have asked for an explanation for changing “safe harbor” to “defense.” As explained in the comment summary and analysis posted on 28 May 2010, “[t]he language modification strikes a balance between the trademark holder bringing the claim and the rights of the registrant who remains free to allege a defense of good faith. However just as there is no absolute right for the trademark holder to prevail, similarly there is no absolute right to prevail in the basis of alleged good faith, otherwise all would allege it and no successful claim could ever be brought.” See <http://www.icann.net/en/topics/new-gtlds/urs-comment-summary-and-analysis-28may10-en.pdf>. Therefore, it is thought the term “defenses” is more accurate. These same commenters suggest that a new paragraph for absolute defense should be added. Absolute defenses, if any, are contained within the term defense.

Two comments suggest that that the Examiner must unconditionally accept evidence of fair use for trademarks from jurisdictions without substantive review. This is not correct. The Examiner will be required to determine whether evidence of fair use exists. Evidence of fair use must be analyzed by the Examiner to determine its validity, which is why the phrase “that is found by the Examiner” is included. Accordingly, a change of language in response to these comments is not required.

Two commenters suggest revision to some of the language of 5.9. While the word “not” was never intended to be part of this section, there may be some lack of clarity in the language. Thus, the language will be changed from “Other considerations that are examples of bad faith for the Examiner” to “Other factors for the Examiner to consider.”

One comment suggests that the defenses create bias for trademark holders and another says there are too many defenses for URS respondents. There is no intent to create a bias for trademark holders. The URS was developed by the IRT, subsequently modified by the STI and others, solely for the protection of trademark holders. The result is an attempt to balance the rights of a trademark holder, against a registrant of a domain name that may have the same words as a trademark, but is being used in a non-infringing manner.

## Default

### Key Points

- Full examination, even in cases of default, is intended to ensure all parties, whether or not they respond, are provided an opportunity to a fair analysis of the facts.

### Summary of Comments

#### No panel in cases of default.

Where a registrant fails to present a defense (default), an immediate judgment should be rendered in favor of the complainant. A panel should not be appointed to debate hypothetical points of defense. IHG (20 July 2010). IPOA (21 July 2010). Coca-Cola (21 July 2010). NCTA (Module 3, 21 July 2010).

Respondent default should result in suspension of the domain name. There is no need for panel appointment and substantive review in the event of a default. IPOA (21 July 2010). AIPLA (21 July 2010).

To be truly rapid, the URS should deny panel review in cases of respondent default. IOC (21 July 2010).

Returning name servers upon default response. In case of a default response, name servers should not immediately be returned to the state prior to “hold” status until an initial examination of a default response is completed to prevent frivolous filings and delays in implementing decisions. Allowing the return to initial status would be contrary to the “rapid” intent of the URS and provide a loophole for cybersquatters to extend the process. Grainger (Module 5, 19 July 2010).

No default responses should be allowed. No default responses should be allowed unless, upon initial examination, there is strong and compelling evidence that the decision was in error. As with a UDRP the registrant still has the option of filing suit in court to reclaim the disputed name. Grainger (Module 5, 19 July 2010).

### Analysis of Comments

Some commenters are against evaluation upon default and think an immediate ruling in favor of the complainant should be issued. Others think that default responses should be allowed. One commenter has suggested that until an initial examination of a default response is completed, the name server should not revert to allow the registrant to utilize the domain name.

Examination in case of default is something that was identified by the IRT, and accepted by the Special Trademark Issues Review Team (“STI”). The intent was to ensure that someone other than the Complainant had a chance to at least analyze the claim for merit. Thus, there is full review even when there is no response. Further, given the quick nature of the URS proceedings, the intent is to provide a balance to legitimate registrants that may not have been available to respond in a timely fashion. The ability to respond after default and revert to the same position as if the response had been timely filed, provides legitimate registrants the right to regain the use of a legitimate domain name, at least pending Determination. Thus, default responses will continue to be allowed under the URS.

## Appeals

### Key Points

- If there is an appeal, independent review (rather than review by the same panel that decided the complaint) seems to be in the best interest of all parties given the type of proceeding, and the bad faith standard a complainant must meet.
- The filing of an appeal will not change the domain name's registration until the appeal decision is issued.

### Summary of Comments

De novo appeals—statute of limitations. A proposed 2-year statute of limitations for filing a de novo appeal from a panel decision would address any concern about registrants missing the notice and having a review on the merits of every case. *IOC (21 July 2010)*.

Appeals must be efficient.

In case of any judgment (default or otherwise) the appeals process must be efficient and succinct. Allowing a defendant to appeal up to two years later is counter-intuitive and counter-productive. *IHG (20 July 2010)*. *Verizon (20 July 2010)*. *Hogan Lovells (21 July 2010)*. *IPOA (21 July 2010)*. *Rosetta Stone (21 July 2010)*. *AIPLA (21 July 2010)*. *NCTA (Module 3, 21 July 2010)*.

Two years for a defaulting registrant to reopen the proceeding is much too long. The window should be reduced to 30 days from issuance of the Notice of Default, and subject to a showing of good cause why the default should be lifted. *INTA Internet Committee (21 July 2010)*.

Two years for a defaulting registrant to reopen the proceeding is much too long. The window should be reduced to 90 days from issuance of the Notice of Default. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*. *BC (26 July 2010)*.

De Novo review.

The de novo appeal standard is inappropriate; it allows an unsuccessful appellant to simply hope for a different decision by a new reviewer. De novo appeals will take longer to resolve. *NCTA (Module 3, 21 July 2010)*.

De novo reviews by filing an answer during the life of the registration period should not be allowed. If the abuse is clear cut and obvious enough to warrant a decision in favor of the complainant, there should be nothing compelling enough in a response filed after default, and certainly not months or a year or more later, to warrant automatic reinstatement of the site. *Grainger (Module 5, 19 July 2010)*.

We strongly object to the proposal that a registrant who fails to file a response shall have the right to a de novo review at any time up to two years after the determination. Two years is much too long. We also object to the domain name resolving back to the original IP address where the registrant files a request for de novo review. The domain name should resolve back to the original IP address only where the response has been filed within a limited grace period, i.e. a few months. *BBC (21 July 2010)*

Time for filing appeal.

The window to file an appeal after issuance of a URS decision should be reduced to 14 days. *AAMC (21 July 2010)*. *Red Cross (21 July 2010)*. *NPOC-FC (21 July 2010)*.

There should be a de novo appeal by either party; the filing deadline should be shortened. *AIPLA (21 July 2010)*.

Notice of appeal should be filed within 10 days and a date for a decision on appeal must be set. *INTA Internet Committee (21 July 2010)*.

Limits on new evidence. Any new evidence submitted as part of the appeal should be limited to evidence that (1) was not available at the time of the initial proceeding; or (2) relates to an issue that was not raised by the parties but formed part of the basis for the decision. *NCTA (Module 3, 21 July 2010)*.

Fee for Evidence on Appeal. Making the introduction of new evidence contingent upon an additional fee is unfair and we fail to see the rationale for it. If an appellant pays the required fees for an appeal, there is no justification for another fee for introducing new evidence. ICANN should waive this requirement. *K. Komaitis (21 July 2010)*. *R. Dammak (22 July 2010)*.

Appeal procedures (paragraph 12) are inadequate. 12.5 merely says that “The Provider’s rules and procedures for appeals shall apply.” There must be explicit provision that notices will be sent via e-mail to the Registrant, the Complainant, the Registrar, and the Registry Operator. The current lack of specificity also exposes Registry Operators to needless liability and unpredictable procedures. If an appeal is successful, URS requires the Registry Operator to unlock the domain and possibly restore back to the previous name servers. Registry Operators should perform domain actions only under explicit and formal notification from the URS Provider, under fully documented procedures. *RySG (21 July 2010)*.

## **Analysis of Comments**

Questions have arisen with respect to why two years for an appeal is permitted. Some have suggested that this time period is too long. The only way in which an appeal can be taken two years later is if the respondent is seeking relief from Default. Otherwise, the appeal must be filed in 14 days pursuant to Section 12.4. To balance any perceived harm and to deter any gaming of the default mechanism, the filing of an appeal does not change the domain name’s resolution. So if there is a determination in favor of the Complainant, the domain will continue to point to the informational page of the URS provider. Given that the status quo is preserved, it is unlikely that the default/appeal procedure will be gamed for the two-year period. Also, the intent of the URS is to address clear-cut abuses. In these clear-cut cases, the appeal will be lightly used and have little effect on process administration.

Other comments have been submitted regarding the de novo review. Some commentators support it while others believe that it will lengthen the appeal process. Given the limited evidentiary submission before the URS examiner, it is unlikely that the de novo review will substantially increase the time in which review and appeal resolution are complete. Moreover, given the type of proceeding at issue, and the bad faith standard a complainant must meet, on balance, independent review of the materials submitted seems to be in the best interest of all parties. As such, the de novo standard should remain.

Additional comments question the right to introduce new evidence on appeal and suggest that it be limited only to evidence unavailable at the time of the initial proceeding or relates to an issue that was not raised by the parties but formed part of the basis for the decision. As the appeal standard is currently drafted, it reflects the intent to prevent handicapping an opponent on appeal with the requirement that the evidence be limited to that which predates the filing of the Complaint. The availability or unavailability of the evidence is a factor that could be considered by the appeal panel.

One commentator has suggested that since the registrant is filing an appeal, it should not have to pay to submit additional evidence. While costs are a concern, merely instituting an appeal does not carry with it the right to introduce new evidence. Also, the additional costs of the hearing associated with the introduction of new evidence must be recovered. As such, a separate payment will still be required.

One group has requested additional rules and procedures on appeal. In response, some additional notice requirements have been included in the current version of the URS posted in November 2010 at the same time as this analysis is posted. Further, the comment about time for filing an appeal seem reasonable and the time for doing so has been reduced from 20 to 14 days. Additional procedures will be developed once URS Providers have been selected.

## Abusive Filings

### Key Points

- The URS attempts to balance benefits and harms by permanently barring those who have submitted two material falsehoods, and barring those submitting two abusive complaints for just a year after the second complaint is deemed abusive.
- If persons have been found to be abusive in the complaint process an appeal of the finding must be only on very limited grounds.

### Summary of Comments

#### Abusive complaints and Deliberate Material Falsehoods.

The definition of “abusive” complaints is not clear; legitimate trademark owners could be labeled as having an abusive behavior and thus barred from using URS. *PMI (21 July 2010)*.

The standard for imposing a penalty on complainants has been unjustifiably lowered, and the process is silent on the burden of proof placed on the examiner making a finding of an abusive complaint. The bar should be set extremely high given the severe consequences of such a finding. *NCTA (Module 3, 21 July 2010)*.

IBM welcomes the clarifications provided for identifying an “abusive” complaint and for identifying a “deliberate material falsehood” (11.4). Clarification is required on what is considered “material”. *IBM (21 July 2010)*.

The abusive complaints section should be removed or reworked; the current section is troubling because it is highly likely that every registrant will plead the abusive nature of the complaint, thereby increasing costs and time to respond. *IPOA (21 July 2010)*. *AIPLA (21 July 2010)*.

The safeguards for abusive complaints go too far. The requirement in Section 11.4 that the false statement would have an “impact” on the outcome is too low for it to be held to be a deliberate “material” falsehood. *INTA Internet Committee (21 July 2010)*. *BC (26 July 2010)*.

No time period is set with regard to the two findings of “deliberate material falsehoods” that can permanently bar a party from using the URS. *INTA Internet Committee (21 July 2010)*.

The threshold for the sanction is too low. Perhaps two abusive complaints or deliberate material falsehoods within a five-year period should warrant the sanction (barred from URS for one year). *AIPLA (21 July 2010)*.

The “two strike policy” is unprecedented in international law (see URS sec. 11). Jurisdictions do not bar trademark owners from filing complaints—under any circumstances—and neither should ICANN. *IOC (21 July 2010)*.

IBM agrees that two findings of “deliberate material falsehood” by a party should permanently bar the party from utilizing the URS. *IBM (21 July 2010)*.

The abusive complaint provisions should not be diluted. Those who make deliberate misstatements of material facts to prevail in a URS should face sanctions stronger than being barred from using the process; such sanctions should include monetary fines for egregious cases. *ICA (21 July 2010)*.

The appeal standard of review for findings of abuse should be *de novo*—as is proposed for a default appeal or appeal of a determination. *INTA Internet Committee (21 July 2010)*.

## Analysis of Comments

There have been several comments about the terms and application of the abusive complaint standards. Some commenters think being barred from utilizing the URS requires a much higher standard or should not ever be allowed, some think that the stated standard is too lenient, and others think simply barring a complainant from the URS is not enough. What was provided for in the URS Proposal attempts to balance all of these positions, by only permanently barring those who have submitted two material falsehoods, and barring those submitting two abusive complaints for just a year after the second complaint is deemed abusive.

It is true that if trademark holders are found to have submitted abusive complaints, as they are defined in the AGBv4, they will be barred from using the URS. This will not bar them, however, from using other enforcement mechanisms, including the UDRP.

One commenter asked for a clarification of the term material and another has stated that a false statement simply having an impact should be insufficient to be deemed a deliberate material falsehood. We used section 11.4 of the URS, where deliberate material falsehood is one that “contained an assertion of fact, which at the time it was made, was made with the knowledge that it was false and which, if true, would have an impact on the outcome on the URS proceeding.” Something is material if it would have an impact on the outcome of the URS proceeding. Whether or not something would have an impact on the outcome, however, only goes materiality. This does not discount the fact that it must also be a “deliberate material falsehood,” and not merely a “false statement.”

One commenter has suggested that the appeal standard of review for findings of abuse should be *de novo*. But, the purpose of the URS is to address only the most clear-cut cases of abuse. Thus, if persons have been found to be abusive in the complaint process an appeal of the finding must be only on very limited grounds. This helps ensure that only legitimate trademark holders with legitimate reasons for filing a URS complaint are permitted to use the process in an unfettered manner.

## Remedies

### Key Points

- Both the IRT and the STI called for suspension, not transfer of a domain name in the event a URS complainant prevails.
- In addition to requiring the URS Provider to post the Determination on its web site, the requirement to provide electronic notice to relevant parties has been added.

### Summary of Comments

Notice of Determination. Section 9.2 says that “[i]f the Complainant satisfies the burden of proof, the Examiner will issue a Determination in favor of the Complainant. The Determination will be published on the URS Provider’s website. “There is a vital omission here: the procedures do not require any active notice to the various parties involved. The procedure MUST be amended so that the URS Provider sends a copy of the Determination via e-mail to the Registrant, the Complainant, the Registrar, and the Registry Operator. These formal notices MUST be sent. If the Determination is in favor of the Complainant, the Registry Operator is then required to suspend the domain as per 10.1. Registry Operators should act only under explicit notification from the URS Provider, and this notification should be documented in the URS requirements. And in general, it is only logical that the various parties should receive an e-mail notice of the Determination, as is done with UDRP decisions. *RySG (21 July 2010)*).

#### Remedies not sufficient.

The URS should provide trademark owners with the ability not only to temporarily suspend a domain name but also to have the option to transfer valuable domain names back into their portfolios. At best the URS as now proposed allows only a temporary suspension for the remainder of the registration period with the option to suspend for an additional year. During this time the trademark owner cannot make use of a valuable domain name itself. This forces trademark owners into perpetual monitoring and enforcement obligations as the frozen domain name eventually lapses, falls into the pool and is likely picked up by another cybersquatter. *Verizon (20 July 2010)*. *PMI (21 July 2010)*. *DuPont (21 July 2010)*. *IPOA (21 July 2010)*. *CADNA (21 July 2010)*. *Coca-Cola (21 July 2010)*. *News Corporation (21 July 2010)*. *Rosetta Stone (21 July 2010)*. *AIPLA (21 July 2010)*. *BC (26 July 2010)*. *NCTA (Module 3, 21 July 2010)*.

URS should offer a meaningful remedy—e.g., transfer, placement on a registry-maintained black list, or imposition of a presumption of bad faith for all domains that have already been suspended once (see URS sec. 10). *IOC (21 July 2010)*.

Suspension as the only remedy would not lower costs for the trademark owner because of the risk that the same squatter will or another squatter could register the name upon expiration. If a complainant opts for the 1-year extension of the suspended domain name, will the Whois information continue to reflect that of the respondent after the initial expiration date? Who will monitor suspended domain names to ensure that no changes are made to the Whois or the site during the suspension period? *Grainger (Module 5, 19 July 2010)*.

The URS decision should be binding for life, not a few months. *AIM (Module 5, 14 July 2010)*.

Regarding the remedy (10.2), a successful complainant should have the right to cancel the domain to avoid causing damage to the goodwill associated with its trademark through having the contest url containing its mark resolve to a website not under its control for a lengthy period of time. *IBM (21 July 2010)*.

If the point of the URS is to address blatant abuse, then the domain should not resolve past the point at which initial administrative review is passed in an initiated URS proceeding and internet access should be promptly disabled. *Coca-Cola (21 July 2010)*.

Transfer should not be available under the URS. The UDRP and URS remedies should remain distinct. *ICA (21 July 2010)*. *Domain Dimensions (22 July 2010)*. *M. Jaeger (22 July 2010)*.

No re-registration after an adverse URS decision. To not exacerbate the “revolving door” problem and the need for costly defensive registrations, registrants should not be able to re-register a domain name after an adverse URS decision. *IHG (20 July 2010)*.

Right of first refusal. At the very least the successful complainant should be given the right of first refusal to register the domain name when it next comes up for renewal. *BBC (21 July 2010)*

#### Paragraph 4 Domain lock.

Asking registry operators instead of registrars to perform the domain lock is highly problematic. This paragraph bypasses one layer of the registration hierarchy (registrars) and in this respect conflicts with the way the UDRP operates. Registrars should be the point of contact for the URS panel. Registrars have existing procedures in place to perform similar functions, have a direct relationship with registrants and already have customer services that seek to assist registrants. *K. Komaitis (21 July 2010)*. *R. Dammak (22 July 2010)*.

The lock process could cause substantial ongoing damage to a trademark owner whose rights are being infringed or to the public by virtue of how it operates (name still resolving for a period of time with website visible). There should be some provision for an interim remedy at least in cases of significant potential harm (akin to an interim injunction in court actions). *BBC (21 July 2010)*

Extension of registration period. Section 10.2 says: “There shall be an option for a successful complainant to pay Complainant to extend the registration period for one additional year at commercial rates.” The mechanism for this is unspecified. The RySG notes that Registry Operators are generally precluded from offering registration services directly to registrants, and the RySG assumes this option will be offered without Registry Operator involvement. *RySG (21 July 2010)*.

## **Analysis of Comments**

The method and manner in which notice should be provided to the parties has been the subject of comments. In addition to requiring the URS Provider to post the Determination on its web site, the requirement to provide electronic notice to relevant parties has been added.

Many comments submitted involve the nature of the remedy available to a URS complainant. Some have suggested that the remedy should be a transfer; others have suggested that the decision should be binding for longer periods of time. Both the IRT and the STI called for suspension, not transfer of a

domain name in the event a URS complainant prevails. As noted above, the URS is intended to be a way in which trademark holders can obtain prompt relief from the most clear cut cases of abuse. The remedy reflects the evil it is designed to prevent. If cancellation is sought, that option can be obtained through a different rights protection mechanism, such as the UDRP.

The manner in which registrants losing URS proceedings can continue to register domain names has been the subject of comments. It has been suggested that an adverse ruling should prevent the registrant from re-registering a domain name. Each case would be determined on its own basis. Accordingly, the URS procedure will not include a ban on future participation in the domain name registration process.

Some have suggested that a successful URS complainant should be given a right of first refusal for the domain name when it comes up for renewal. On balance, this remedy was rejected since the purpose is to stop blatant abuse and the remedy of suspension achieves that end. Another has suggested that an interim remedy, similar to that found in injunction proceedings, be imposed. The URS is designed to remedy a very specific harm and the remedy reflects that precise harm—clear-cut cases of abuse, and to do that quickly. Such a rapid process will obviate the need for any interim remedy. Further, the URS is not the only manner in which an aggrieved trademark holder can obtain relief, it is simply one of many different rights protection mechanisms available to it. If injunctive relief is sought, the trademark holder can proceed in the appropriate jurisdiction to obtain it.

With respect to the comment relating to the ability of a successful URS complainant to register a domain name for an additional year, we agree that this mechanism requires implementation details that will need to be resolved in consultation with the registries and the providers.

## ECONOMIC ANALYSIS

### Key Points

- Independent economists retained by ICANN will answer substantive comments.
